Note: The given device should not have device runtime enabled.

Parameters
• dev – Device instance.

void pm_device_state_unlock(const struct device *dev)
Unlock the current device state.
Unlocks a previously locked device pm.

See also:

pm_device_state_lock

Parameters
• dev – Device instance.

bool pm_device_state_is_locked(const struct device *dev)
Check if the device pm is locked.

Parameters
• dev – Device instance.
Return values

- **true** – If device is locked.
- **false** – If device is not locked.

```c
bool pm_device_on_power_domain(const struct device *dev)
```

Check if the device is on a switchable power domain.

**Parameters**

- `dev` – Device instance.

**Return values**

- **true** – If device is on a switchable power domain.
- **false** – If device is not on a switchable power domain.

```c
int pm_device_power_domain_add(const struct device *dev, const struct device *domain)
```

Add a device to a power domain.

This function adds a device to a given power domain.

**Parameters**

- `dev` – Device to be added to the power domain.
- `domain` – Power domain.

**Return values**

- `0` – If successful.
- `-EINVAL` – If device is already part of the power domain.
- `-ENOSYS` – If the application was built without power domain support.
- `-ENOMEM` – If there is no space available in the power domain to add the device.

```c
int pm_device_power_domain_remove(const struct device *dev, const struct device *domain)
```

Remove a device from a power domain.

This function removes a device from a given power domain.

**Parameters**

- `dev` – Device to be removed from the power domain.
- `domain` – Power domain.

**Return values**

- `0` – If successful.
- `-ENOSYS` – If the application was built without power domain support.
- `-ENOENT` – If device is not in the given domain.

```c
bool pm_device_is_powered(const struct device *dev)
```

Check if the device is currently powered.

**Parameters**

- `dev` – Device instance.

**Return values**

- **true** – If device is currently powered, or is assumed to be powered (i.e. it does not support PM or is not under a PM domain)
- **false** – If device is not currently powered
int pm_device_driver_init(const struct device *dev, pm_device_action_cb_t action_cb)

Setup a device driver into the lowest valid power mode.

This helper function is intended to be called at the end of a driver init function to automatically setup the device into the lowest power mode. It assumes that the device has been configured as if it is in `PMDEVICE_STATE_OFF`.

**Parameters**
- `dev` – Device instance.
- `action_cb` – Device PM control callback function.

**Return values**
- 0 – On success.
- `-errno` – Error code from `action_cb` on failure.

```c
#include <device.h>
```

**Device PM info.**

Structure holds fields which are common for two PM devices: generic and synchronous.

**Public Members**

- `atomic_t flags`
  Device PM status flags.

- `enum pm_device_state state`
  Device power state.

- `pm_device_action_cb_t action_cb`
  Device PM action callback.

- `uint32_t usage`
  Device usage count.

```c
#include <device.h>
```

**Runtime PM info for device with generic PM.**

Generic PM involves suspending and resuming operations which can be blocking, long lasting or asynchronous. Runtime PM API is limited when used from interrupt context.

**Public Members**

- `struct pm_device_base base`
  Base info.

- `const struct device *dev`
  Pointer to the device.
struct k_sem lock
    Lock to synchronize the get/put operations.

struct k_event event
    Event var to listen to the sync request events.

struct k_work_delayable work
    Work object for asynchronous calls.

struct pm_device_isr
#include <device.h> Runtime PM info for device with synchronous PM.

Synchronous PM can be used with devices which suspend and resume operations can be performed in the critical section as they are short and non-blocking. Runtime PM API can be used from any context in that case.

Public Members

struct pm_device_base base
    Base info.

struct k_spinlock lock
    Lock to synchronize the synchronous get/put operations.

Device Runtime PM APIs

/group subsys_pm_device_runtime
    Device Runtime Power Management API.

Functions

int pm_device_runtime_auto_enable(const struct device *dev)
    Automatically enable device runtime based on devicetree properties.

Note: Must not be called from application code. See the zephyr/pm-device-runtime-auto property in pm.yaml and z_sys_init_run_level.

Parameters

• dev – Device instance.

Return values

• 0 – If the device runtime PM is enabled successfully or it has not been requested for this device in devicetree.

• -errno – Other negative errno, result of enabled device runtime PM.
int pm_device_runtime_enable(const struct device *dev)

Enable device runtime PM.

This function will enable runtime PM on the given device. If the device is in PM_DEVICE_STATE_ACTIVE state, the device will be suspended.

See also:

pm_device_init_suspended()

Function properties (list may not be complete)

pre-kernel-ok

Parameters

• dev – Device instance.

Return values

• 0 – If the device runtime PM is enabled successfully.
• -EPERM – If device has power state locked.
• -ENOTSUP – If the device does not support PM.
• -errno – Other negative errno, result of suspending the device.

int pm_device_runtime_disable(const struct device *dev)

Disable device runtime PM.

If the device is currently suspended it will be resumed.

Function properties (list may not be complete)

pre-kernel-ok

Parameters

• dev – Device instance.

Return values

• 0 – If the device runtime PM is disabled successfully.
• -ENOTSUP – If the device does not support PM.
• -errno – Other negative errno, result of resuming the device.

int pm_device_runtime_get(const struct device *dev)

Resume a device based on usage count.

This function will resume the device if the device is suspended (usage count equal to 0). In case of a resume failure, usage count and device state will be left unchanged. In all other cases, usage count will be incremented.

If the device is still being suspended as a result of calling pm_device_runtime_put_async(), this function will wait for the operation to finish to then resume the device.

Function properties (list may not be complete)

pre-kernel-ok
Note: It is safe to use this function in contexts where blocking is not allowed, e.g. ISR, provided the device PM implementation does not block.

Parameters
- `dev` – Device instance.

Return values
- 0 – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- -EWOUDPLOCK – If call would block but it is not allowed (e.g. in ISR).
- -errno – Other negative errno, result of the PM action callback.

```c
int pm_device_runtime_put(const struct device *dev)
```
Suspend a device based on usage count.

This function will suspend the device if the device is no longer required (usage count equal to 0). In case of suspend failure, usage count and device state will be left unchanged. In all other cases, usage count will be decremented (down to 0).

See also:
- `pm_device_runtime_put_async()`

Function properties (list may not be complete)
- `pre-kernel-ok`

Parameters
- `dev` – Device instance.

Return values
- 0 – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- -EALREADY – If device is already suspended (can only happen if get/put calls are unbalanced).
- -errno – Other negative errno, result of the action callback.

```c
int pm_device_runtime_put_async(const struct device *dev, k_timeout_t delay)
```
Suspend a device based on usage count (asynchronously).

This function will schedule the device suspension if the device is no longer required (usage count equal to 0). In all other cases, usage count will be decremented (down to 0).

See also:
- `pm_device_runtime_put()`

Function properties (list may not be complete)
- `pre-kernel-ok`, `async`, `isr-ok`
Note: Asynchronous operations are not supported when in pre-kernel mode. In this case, the function will be blocking (equivalent to `pm_device_runtime_put()`).

Parameters
- `dev` – Device instance.
- `delay` – Minimum amount of time before triggering the action.

Return values
- 0 – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- -EBUSY – If the device is busy.
- -EALREADY – If device is already suspended (can only happen if get/put calls are unbalanced).

```c
bool pm_device_runtime_is_enabled(const struct device *dev)
```

Check if device runtime is enabled for a given device.

See also:
- `pm_device_runtime_enable()`

Function properties (list may not be complete)
- pre-kernel-ok

Parameters
- `dev` – Device instance.

Return values
- `true` – If device has device runtime PM enabled.
- `false` – If the device has device runtime PM disabled.

4.20 OS Abstraction

OS abstraction layers (OSAL) provide wrapper function APIs that encapsulate common system functions offered by any operating system. These APIs make it easier and quicker to develop for, and port code to multiple software and hardware platforms.

These sections describe the software and hardware abstraction layers supported by the Zephyr RTOS.

4.20.1 POSIX

Overview

The Portable Operating System Interface (POSIX) is a family of standards specified by the IEEE Computer Society for maintaining compatibility between operating systems. Zephyr implements a subset of the standard POSIX API specified by IEEE 1003.1-2017 (also known as POSIX-1.2017).
With the POSIX support available in Zephyr, an existing POSIX conformant application can be ported to run on the Zephyr kernel, and therefore leverage Zephyr features and functionality. Additionally, a library designed to be POSIX conformant can be ported to Zephyr kernel based applications with no changes.

The POSIX API is an increasingly popular OSAL (operating system abstraction layer) for IoT and embedded applications, as can be seen in Zephyr, AWS:FreeRTOS, TI-RTOS, and NuttX.

Benefits of POSIX support in Zephyr include:

• Offering a familiar API to non-embedded programmers, especially from Linux
• Enabling reuse (portability) of existing libraries based on POSIX APIs
• Providing an efficient API subset appropriate for small (MCU) embedded systems

**POSIX Subprofiles** While Zephyr supports running multiple threads <threads_v2> (possibly in an SMP <smp_arch> configuration), as well as Virtual Memory and MMUs <memory_management_api>, Zephyr code and data normally share a common address space. The Zephyr kernel executable code and the application executable code are typically compiled into the same binary artifact. From that perspective, Zephyr apps can be seen as running in the context of a single process.

While multi-purpose operating systems (OS) offer full POSIX conformance, Real-Time Operating Systems (RTOS) such as Zephyr typically serve a fixed-purpose, have limited hardware resources, and experience limited user interaction. In such systems, full POSIX conformance can be impractical and unnecessary.

For that reason, POSIX defined the following Application Environment Profiles (AEP) as part of IEEE 1003.13-2003 (also known as POSIX.13-2003).

• Minimal Realtime System Profile (PSE51)
• Realtime Controller System Profile (PSE52)
• Dedicated Realtime System Profile (PSE53)
• Multi-Purpose Realtime System (PSE54)

POSIX.13-2003 AEP were formalized in 2003 via “Units of Functionality” but the specification is now inactive (for reference only). Nevertheless, the intent is still captured as part of POSIX-1.2017 via Options and Option Groups.

For more information, please see IEEE 1003.1-2017, Section E, Subprofiling Considerations.

**POSIX Applications in Zephyr**  A POSIX app in Zephyr is built like any other app and therefore requires the usual prj.conf, CMakeLists.txt, and source code. For example, the app below leverages the `nanosleep()` and `perror()` POSIX functions.

**Listing 1: prj.conf** for a simple POSIX app in Zephyr

```
CONFIG_POSIX_API=y
```

**Listing 2: A simple app that uses Zephyr’s POSIX API**

```c
#include <stddef.h>
#include <stdio.h>
#include <time.h>

void megasleep(size_t megaseconds)
{
    struct timespec ts = {
        .tv_sec = megaseconds * 1000000,
        .tv_nsec = 0,
    };

    printf("See you in a while!\n");
    if (nanosleep(&ts, NULL) == -1) {
        perror("nanosleep");
    }
}

int main()
{
    megasleep(42);
    return 0;
}
```

For more examples of POSIX applications, please see the POSIX sample applications.

**Configuration**  Like most features in Zephyr, POSIX features are highly configurable but disabled by default. Users must explicitly choose to enable POSIX options via Kconfig selection. Indeed, there are many Kconfig options in Zephyr for the POSIX API to allow for feature selection at various levels of granularity.

Alternatively, users may enable one of the Kconfig options below as a shortcut to enable multiple Option Groups.

- CONFIG_POSIX_API
- CONFIG_PTHREAD_IPC

**Note:** Since the POSIX environment in Zephyr is fully configurable via Kconfig, configurations that require modifying features should not be made if strict compliance is required (POSIX-1.2017, section 2.1.3.1).
POSIX Conformance

As per IEEE 1003.1-2017, this section details Zephyr's POSIX conformance.

Note: As per POSIX 1003.13, single process mode is supported directly by both PSE51 and PSE52 profiles. While Zephyr includes support for many features found in PSE53, PSE53 itself requires supporting multiple processes. Since supporting multiple processes is beyond the scope of Zephyr's current design, some features requiring multi-process capabilities may exhibit undefined behaviour, which we denote with the † (obelus) symbol.

Note: Features listed in various POSIX Options or Option Groups may be provided in whole or in part by a conformant C library implementation. This includes (but is not limited to) POSIX Extensions to the ISO C Standard (CX).

POSIX Application Environment Profiles (AEP)

Although inactive, IEEE 1003.13-2003 defined a number of AEP that inspired the modern subprofiling options ofIEEE 1003.1-2017. The single-purpose realtime system profiles are listed below, for reference, in terms that agree with the current POSIX-1 standard. PSE54 is not considered at this time.

4.20. OS Abstraction
### Implementation Details

In many ways, Zephyr provides support like any POSIX OS; API bindings are provided in the C programming language, POSIX headers are available in the standard include path, when configured.

Unlike other multi-purpose POSIX operating systems

- Zephyr is not “a POSIX OS”. The Zephyr kernel was not designed around the POSIX standard, and POSIX support is an opt-in feature
- Zephyr apps are not linked separately, nor do they execute as subprocesses
- Zephyr, libraries, and application code are compiled and linked together, running similarly to a single-process application, in a single (possibly virtual) address space
- Zephyr does not provide a POSIX shell, compiler, utilities, and is not self-hosting.

**Note:** Unlike the Linux kernel or FreeBSD, Zephyr does not maintain a static table of system call numbers for each supported architecture, but instead generates system calls dynamically at build time. See System Calls <syscalls> for more information.

### Design

As a library, Zephyr's POSIX API implementation makes an effort to be a thin abstraction layer between the application, middleware, and the Zephyr kernel.

Some general design considerations:

- The POSIX interface and implementations should be part of Zephyr's POSIX library, and not elsewhere, unless required both by the POSIX API implementation and some other feature. An example where the implementation should remain part of the POSIX implementation is getopt(). Examples where the implementation should be part of separate libraries are multithreading and networking.
- When the POSIX API and another Zephyr subsystem both rely on a feature, the implementation of that feature should be as a separate Zephyr library that can be used by both the POSIX API and the other library or subsystem. This reduces the likelihood of dependency cycles in code. When practical, that rule should expand to include macros. In the example below, libposix depends on libzfoo for the implementation of some functionality “foo” in Zephyr. If libzfoo also depends on libposix, then there is a dependency cycle. The cycle can be removed via mutual dependency, libcommon.
- POSIX API calls should be provided as regular callable C functions; if a Zephyr System Call <syscalls> is needed as part of the implementation, the declaration and the implementation of that system call should be hidden behind the POSIX API.

### Subprofiling Option Groups

**POSIX_THREADS_BASE**  The basic assumption in this profile is that the system consists of a single (implicit) process with multiple threads. Therefore, the standard requires all basic thread services, except those related to multiple processes.
Fig. 13: Dependency cycle between POSIX and another Zephyr library

Fig. 14: Mutual dependencies between POSIX and other Zephyr libraries

Table 20: POSIX_THREADS_BASE

POSIX_THREADS_EXT  This table lists service support status in Zephyr:

<table>
<thead>
<tr>
<th>API</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>pthread_attr_getguardsize()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_attr_setguardsize()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_mutexattr_gettype()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_mutexattr_settype()</td>
<td>yes</td>
</tr>
</tbody>
</table>

XSI_THREADS_EXT  The XSI_THREADS_EXT option group is required because it provides functions to control a thread’s stack. This is considered useful for any real-time application.

This table lists service support status in Zephyr:

<table>
<thead>
<tr>
<th>API</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>pthread_attr_getstack()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_attr_setstack()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_getconcurrency()</td>
<td>yes</td>
</tr>
<tr>
<td>pthread_setconcurrency()</td>
<td>yes</td>
</tr>
</tbody>
</table>

POSIX_C_LANG_JUMP  The POSIX_C_LANG_JUMP Option Group is included in the ISO C standard.

Note: When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the POSIX_C_LANG_JUMP Option Group is considered supported.
Table 23: POSIX_C_LANG_JUMP

<table>
<thead>
<tr>
<th>API</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>setjmp()</td>
<td>yes</td>
</tr>
<tr>
<td>longjmp()</td>
<td>yes</td>
</tr>
</tbody>
</table>

**POSIX_C_LANG_MATH**  The POSIX_C_LANG_MATH Option Group is included in the ISO C standard.

**Note:** When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the POSIX_C_LANG_MATH Option Group is considered supported.

Please refer to Subprofiling Considerations for details on the POSIX_C_LANG_MATH Option Group.

**POSIX_C_LANG_SUPPORT**  The POSIX_C_LANG_SUPPORT option group contains the general ISO C Library.

**Note:** When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the entire POSIX_C_LANG_SUPPORT Option Group is considered supported.

Please refer to Subprofiling Considerations for details on the POSIX_C_LANG_SUPPORT Option Group.

For more information on developing Zephyr applications in the C programming language, please refer to details.

**POSIX_SINGLEPROCESS**  The POSIX_SINGLEPROCESS option group contains services for single process applications.

Table 24: POSIX_SINGLE_PROCESS

<table>
<thead>
<tr>
<th>API</th>

### Configuration Options

This is a non-exhaustive list of specific Configuration System (Kconfig) options relating to Zephyr's implementation of the POSIX API.

- CONFIG_EVENTFD
- CONFIG_EVENTFD_MAX
- CONFIG_FDTABLE
- CONFIG_FNMATCH
- CONFIG_GETOPT
- CONFIG_GETOPT_LONG
- CONFIG_MAX_PTHREAD_BARRIER_COUNT
- CONFIG_MAX_PTHREAD_COUNT
- CONFIG_MAX_PTHREAD_KEY_COUNT
- CONFIG_MAX_PTHREAD_MUTEX_COUNT
- CONFIG_MAX_PTHREAD_SPINLOCK_COUNT
- CONFIG_MAX_TIMER_COUNT
- CONFIG_MQUEUE_NAMELEN_MAX
- CONFIG_MSG_COUNT_MAX

4.20. OS Abstraction
• CONFIG_MSG_SIZE_MAX
• CONFIG_NET_SOCKETPAIR
• CONFIG_NET_SOCKETS
• CONFIG_NET_SOCKETS_POLL_MAX
• CONFIG_NET_SOCKETS_POSIX_NAMES
• CONFIG_POSIX_API
• CONFIG_POSIX_CLOCK
• CONFIG_POSIX_FS
• CONFIG_POSIX_LIMITS_RTSIG_MAX
• CONFIG_POSIX_MAX_FDS
• CONFIG_POSIX_MAX_OPEN_FILES
• CONFIG_POSIX_MQUEUE
• CONFIG_POSIX_RTSIG_MAX
• CONFIG_POSIX_SIGNAL
• CONFIG_POSIX_SIGNAL_STRING_DESC
• CONFIG_POSIX_UNAME
• CONFIG_POSIX_UNAME_NODENAME_LEN
• CONFIG_POSIX_UNAME_VERSION_LEN
• CONFIG_PTHREAD
• CONFIG_PTHREAD_BARRIER
• CONFIG_PTHREAD_COND
• CONFIG_PTHREAD_CREATE_BARRIER
• CONFIG_PTHREAD_IPC
• CONFIG_PTHREAD_KEY
• CONFIG_PTHREAD_MUTEX
• CONFIG_PTHREAD_RECYCLER_DELAY_MS
• CONFIG_PTHREAD_SPINLOCK
• CONFIG_SEM_VALUE_MAX
• CONFIG_TIMER

### 4.20.2 CMSIS RTOS v1

Cortex-M Software Interface Standard (CMSIS) RTOS is a vendor-independent hardware abstraction layer for the ARM Cortex-M processor series and defines generic tool interfaces. Though it was originally defined for ARM Cortex-M microcontrollers alone, it could be easily extended to other microcontrollers making it generic. For more information on CMSIS RTOS v1, please refer to [http://www.keil.com/pack/doc/CMSIS/RTOS/html/index.html](http://www.keil.com/pack/doc/CMSIS/RTOS/html/index.html)
4.20.3 CMSIS RTOS v2

Cortex-M Software Interface Standard (CMSIS) RTOS is a vendor-independent hardware abstraction layer for the ARM Cortex-M processor series and defines generic tool interfaces. Though it was originally defined for ARM Cortex-M microcontrollers alone, it could be easily extended to other microcontrollers making it generic. For more information on CMSIS RTOS v2, please refer to the CMSIS-RTOS2 Documentation.

Features not supported in Zephyr implementation

Kernel
osKernelGetState, osKernelSuspend, osKernelResume, osKernelInitialize and osKernelStart are not supported.

Mutex
osMutexPrioInherit is supported by default and is not configurable, you cannot select/unselect this attribute.

osMutexRecursive is also supported by default. If this attribute is not set, an error is thrown when the same thread tries to acquire it the second time.

osMutexRobust is not supported in Zephyr.

Return values not supported in the Zephyr implementation

osKernelUnlock, osKernelLock, osKernelRestoreLock
osError (Unspecified error) is not supported.

osSemaphoreDelete
osErrorResource (the semaphore specified by parameter semaphore_id is in an invalid semaphore state) is not supported.

osMutexDelete
osErrorResource (mutex specified by parameter mutex_id is in an invalid mutex state) is not supported.

osTimerDelete
osErrorResource (the timer specified by parameter timer_id is in an invalid timer state) is not supported.

osMessageQueueReset
osErrorResource (the message queue specified by parameter msgq_id is in an invalid message queue state) is not supported.

osMessageQueueDelete
osErrorResource (the message queue specified by parameter msgq_id is in an invalid message queue state) is not supported.

osMemoryPoolFree
osErrorResource (the memory pool specified by parameter mp_id is in an invalid memory pool state) is not supported.

osMemoryPoolDelete
osErrorResource (the memory pool specified by parameter mp_id is in an invalid memory pool state) is not supported.

osEventFlagsSet, osEventFlagsClear
osFlagsErrorUnknown (Unspecified error) and osFlagsErrorResource (Event flags object specified by parameter ef_id is not ready to be used) are not supported.

osEventFlagsDelete
osErrorParameter (the value of the parameter ef_id is incorrect) is not supported.
osThreadFlagsSet

- osFlagsErrorUnknown (Unspecified error) and osFlagsErrorResource (Thread specified by parameter thread_id is not active to receive flags) are not supported.

osThreadFlagsClear

- osFlagsErrorResource (Running thread is not active to receive flags) is not supported.

osDelayUntil

- osParameter (the time cannot be handled) is not supported.

## 4.21 Power off

### group sys_poweroff

#### Functions

FUNC_NORETURN void sys_poweroff(void)

Perform a system power off.

This function will perform an immediate power off of the system. It is the responsibility of the caller to ensure that the system is in a safe state to be powered off. Any required wake up sources must be enabled before calling this function.

CONFIG_POWEROFF needs to be enabled to use this API.

## 4.22 Shell

- **Overview**
  - Connecting to Segger RTT via TCP (on macOS, for example)
  - Telnet Backend
- **Commands**
  - Creating commands
  - Dictionary commands
  - Commands execution
  - Built-in commands
- **Tab Feature**
- **History Feature**
- **Wildcards Feature**
- **Meta Keys Feature**
- **Getopt Feature**
- **Obscured Input Feature**
- **Shell Logger Backend Feature**
- **RTT Backend Channel Selection**
- **Usage**
4.22.1 Overview

This module allows you to create and handle a shell with a user-defined command set. You can use it in examples where more than simple button or LED user interaction is required. This module is a Unix-like shell with these features:

- Support for multiple instances.
- Advanced cooperation with the Logging.
- Support for static and dynamic commands.
- Support for dictionary commands.
- Smart command completion with the Tab key.
- Built-in commands: clear, shell, colors, echo, history and resize.
- Viewing recently executed commands using keys: ↑ ↓ or meta keys.
- Support for ANSI escape codes: VT100 and ESC[ n~ for cursor control and color printing.
- Support for editing multiline commands.
- Built-in handler to display help for the commands.
- Support for wildcards: * and ?.
- Support for meta keys.
- Support for getopt and getopt_long.
- Kconfig configuration to optimize memory usage.

Note: Some of these features have a significant impact on RAM and flash usage, but many can be disabled when not needed. To default to options which favor reduced RAM and flash requirements instead of features, you should enable CONFIG_SHELL_MINIMAL and selectively enable just the features you want.

The module can be connected to any transport for command input and output. At this point, the following transport layers are implemented:

- MQTT
- Segger RTT
- SMP
- Telnet
- UART
- USB
- DUMMY - not a physical transport layer.

Connecting to Segger RTT via TCP (on macOS, for example)

On macOS JLinkRTTClient won’t let you enter input. Instead, please use following procedure:

- Open up a first Terminal window and enter:
Telnet Backend

Enabling CONFIG_SHELL_BACKEND_TELNET will allow users to use telnet as a shell backend. Connecting to it can be done using PuTTY or any telnet client. For example:

```
telnet <ip address> <port>
```

By default the telnet client won’t handle telnet commands and configuration. Although command support can be enabled with CONFIG_SHELL_TELNET_SUPPORT_COMMAND. This will give the telnet client access to a very limited set of supported commands but still can be turned on if needed. One of the command options it supports is the ECHO option. This will allow the client to be in character mode (character at a time), similar to a UART backend in that regard. This will make the client send a character as soon as it is typed having the effect of increasing the network traffic considerably. For that cost, it will enable the line editing, tab completion, and history features of the shell.

4.22.2 Commands

Shell commands are organized in a tree structure and grouped into the following types:

- Root command (level 0): Gathered and alphabetically sorted in a dedicated memory section.
- Static subcommand (level > 0): Number and syntax must be known during compile time. Created in the software module.
- Dynamic subcommand (level > 0): Number and syntax does not need to be known during compile time. Created in the software module.

Creating commands

Use the following macros for adding shell commands:

- `SHELL_CMD_REGISTER` - Create root command. All root commands must have different name.
- `SHELL_COND_CMD_REGISTER` - Conditionally (if compile time flag is set) create root command. All root commands must have different name.
- `SHELL_CMD_ARG_REGISTER` - Create root command with arguments. All root commands must have different name.
- `SHELL_COND_CMD_ARG_REGISTER` - Conditionally (if compile time flag is set) create root command with arguments. All root commands must have different name.
- `SHELL_CMD` - Initialize a command.
- `SHELL_COND_CMD` - Initialize a command if compile time flag is set.
- `SHELL_EXPR_CMD` - Initialize a command if compile time expression is non-zero.
- `SHELL_CMD_ARG` - Initialize a command with arguments.
Commands can be created in any file in the system that includes include/zephyr/shell/shell.h. All created commands are available for all shell instances.

**Static commands**  Example code demonstrating how to create a root command with static subcommands.

```c
/* Creating subcommands (level 1 command) array for command "demo". */
SHELL_STATIC_SUBCMD_SET_CREATE(sub_demo,
    SHELL_CMD(params, NULL, "Print params command.", cmd_demo_params),
    SHELL_CMD(ping, NULL, "Ping command.", cmd_demo_ping),
    SHELL_SUBCMD_SET_END
);
/* Creating root (level 0) command "demo" */
SHELL_CMD_REGISTER(demo, &sub_demo, "Demo commands", NULL);
```

Example implementation can be found under following location: samples/subsys/shell/shell_module/src/main.c.

**Dictionary commands**

This is a special kind of static commands. Dictionary commands can be used every time you want to use a pair: (string <-> corresponding data) in a command handler. The string is usually a verbal description of a given data. The idea is to use the string as a command syntax that can be prompted by the shell and corresponding data can be used to process the command.

Let's use an example. Suppose you created a command to set an ADC gain. It is a perfect place where a dictionary can be used. The dictionary would be a set of pairs: (string: gain_value, int: value) where int value could be used with the ADC driver API.

Abstract code for this task would look like this:

```c
static int gain_cmd_handler(const struct shell *sh,
    size_t argc, char **argv, void *data)
{
    int gain;
```
/* data is a value corresponding to called command syntax */
gain = (int)data;
adc_set_gain(gain);

shell_print(sh, "ADC gain set to: %s\n" "Value send to ADC driver: %d",
argv[0],
gain);

return 0;
}

SHELL_SUBCMD_DICT_SET_CREATE(sub_gain, gain_cmd_handler,
(gain_1, 1, "gain 1"), (gain_2, 2, "gain 2"),
(gain_1_2, 3, "gain 1/2"), (gain_1_4, 4, "gain 1/4")
);
SHELL_CMD_REGISTER(gain, &sub_gain, "Set ADC gain", NULL);

This is how it would look like in the shell:

```
uart:~$ gain ga
  gain_1  gain_2  gain_1_2  gain_1_4
uart:~$ gain gain_1
ADC gain set to: gain_1
Value send to ADC driver: 1
uart:~$ gain gain_2
ADC gain set to: gain_2
Value send to ADC driver: 2
uart:~$ gain gain_1_2
ADC gain set to: gain_1_2
Value send to ADC driver: 3
uart:~$ gain gain_1_4
ADC gain set to: gain_1_4
Value send to ADC driver: 4
uart:~$
```

**Dynamic commands**  Example code demonstrating how to create a root command with static and dynamic subcommands. At the beginning dynamic command list is empty. New commands can be added by typing:

```
dynamic add <new_dynamic_command>
```

Newly added commands can be prompted or autocompleted with the Tab key.
/* Buffer for 10 dynamic commands */
static char dynamic_cmd_buffer[10][50];

/* commands counter */
static uint8_t dynamic_cmd_cnt;

/* Function returning command dynamically created * in dynamic_cmd_buffer. */
static void dynamic_cmd_get(size_t idx, struct shell_static_entry *entry) {
    if (idx < dynamic_cmd_cnt) {
        entry->syntax = dynamic_cmd_buffer[idx];
        entry->handler = NULL;
        entry->subcmd = NULL;
        entry->help = "Show dynamic command name."
    } else {
        /* if there are no more dynamic commands available *
         * syntax must be set to NULL. */
        entry->syntax = NULL;
    }
}

SHELL_DYNAMIC_CMD_CREATE(m_sub_dynamic_set, dynamic_cmd_get);
SHELL_STATIC_SUBCMD_SET_CREATE(m_sub_dynamic,
    SHELL_CMD(add, NULL, "Add new command to dynamic_cmd_buffer and"
        " sort them alphabetically.", cmd_dynamic_add),
    SHELL_CMD(execute, &m_sub_dynamic_set,
        "Execute a command.", cmd_dynamic_execute),
    SHELL_CMD(remove, &m_sub_dynamic_set,
        "Remove a command from dynamic_cmd_buffer.", cmd_dynamic_remove),
    SHELL_CMD(show, NULL,
        "Show all commands in dynamic_cmd_buffer.",
        cmd_dynamic_show),
    SHELL_SUBCMD_SET_END
); S
HELL_CMD_REGISTER(dynamic, &m_sub_dynamic,
    "Demonstrate dynamic command usage.", cmd_dynamic);

Example implementation can be found under following location: samples/subsys/shell/shell_module/src/dynamic_cmd.c.
Commands execution

Each command or subcommand may have a handler. The shell executes the handler that is found deepest in the command tree and further subcommands (without a handler) are passed as arguments. Characters within parentheses are treated as one argument. If shell won’t find a handler it will display an error message.

Commands can be also executed from a user application using any active backend and a function `shell_execute_cmd()`, as shown in this example:

```c
int main(void)
{
    /* Below code will execute "clear" command on a DUMMY backend */
    shell_execute_cmd(NULL, "clear");

    /* Below code will execute "shell colors off" command on * an UART backend */
    shell_execute_cmd(shell_backend_uart_get_ptr(), "shell colors off");
}
```

Enable the DUMMY backend by setting the Kconfig `CONFIG_SHELL_BACKEND_DUMMY` option.

Commands execution example  Let’s assume a command structure as in the following figure, where:

- **root_cmd** - root command without a handler
- **cmd_xxx_h** - command has a handler
- **cmd_xxx** - command does not have a handler

**Example 1**  Sequence: `root_cmd cmd_1_h cmd_12_h cmd_121_h parameter` will execute command `cmd_121_h` and parameter will be passed as an argument.
Example 2  Sequence: root_cmd cmd_2 cmd_22_h parameter1 parameter2 will execute command cmd_22_h and parameter1 parameter2 will be passed as an arguments.

Example 3  Sequence: root_cmd cmd_1_h parameter1 cmd_121_h parameter2 will execute command cmd_1_h and parameter1, cmd_121_h and parameter2 will be passed as an arguments.

Example 4  Sequence: root_cmd parameter cmd_121_h parameter2 will not execute any command.

Command handler  Simple command handler implementation:

```c
static int cmd_handler(const struct shell *sh, size_t argc, char **argv)
{
    ARG_UNUSED(argc);
    ARG_UNUSED(argv);
    shell_fprintf(shell, SHELL_INFO, "Print info message\n");
    shell_print(sh, "Print simple text.\n");
    shell_warn(sh, "Print warning text.\n");
    shell_error(sh, "Print error text.\n");
    return 0;
}
```

Function `shell_fprintf()` or the shell print macros: `shell_print`, `shell_info`, `shell_warn` and `shell_error` can be used from the command handler or from threads, but not from an interrupt context. Instead, interrupt handlers should use Logging for printing.

Command help  Every user-defined command or subcommand can have its own help description. The help for commands and subcommands can be created with respective macros: `SHELL_CMD_REGISTER`, `SHELL_CMD_ARG_REGISTER`, `SHELL_CMD`, and `SHELL_CMD_ARG`.

Shell prints this help message when you call a command or subcommand with -h or --help parameter.

Parent commands  In the subcommand handler, you can access both the parameters passed to commands or the parent commands, depending on how you index argv.

- When indexing argv with positive numbers, you can access the parameters.
- When indexing argv with negative numbers, you can access the parent commands.
- The subcommand to which the handler belongs has the argv index of 0.

```c
static int cmd_handler(const struct shell *sh, size_t argc, char **argv)
{
    ARG_UNUSED(argc);

    /* If it is a subcommand handler parent command syntax
     * can be found using argv[-1].
     * /
    shell_print(sh, "This command has a parent command: %s", (continues on next page)
argv[-1]);
/* Print this command syntax */
shell_print(sh, "This command syntax is: %s", argv[0]);
/* Print first argument */
shell_print(sh, "%s", argv[1]);
return 0;
}

### Built-in commands

These commands are activated by CONFIG_SHELL_CMDS set to y.

- **clear** - Clears the screen.
- **history** - Shows the recently entered commands.
- **resize** - Must be executed when terminal width is different than 80 characters or after each change of terminal width. It ensures proper multiline text display and +, -, ->, End, Home keys handling. Currently this command works only with UART flow control switched on. It can be also called with a subcommand:
  - **default** - Shell will send terminal width = 80 to the terminal and assume successful delivery.

These command needs extra activation: CONFIG_SHELL_CMDS_RESIZE set to y.

- **select** - It can be used to set new root command. Exit to main command tree is with alt+r. This command needs extra activation: CONFIG_SHELL_CMDS_SELECT set to y.
- **shell** - Root command with useful shell-related subcommands like:
  - **echo** - Toggles shell echo.
  - **colors** - Toggles colored syntax. This might be helpful in case of Bluetooth shell to limit the amount of transferred bytes.
  - **stats** - Shows shell statistics.

### 4.22.3 Tab Feature

The Tab button can be used to suggest commands or subcommands. This feature is enabled by CONFIG_SHELL_TAB set to y. It can also be used for partial or complete auto-completion of commands. This feature is activated by CONFIG_SHELL_TAB_AUTOCOMPLETION set to y. When user starts writing a command and presses the Tab button then the shell will do one of 3 possible things:

- Autocomplete the command.
- Prompts available commands and if possible partly completes the command.
- Will not do anything if there are no available or matching commands.
4.22.4 History Feature

This feature enables commands history in the shell. It is activated by: CONFIG_SHELL_HISTORY set to y. History can be accessed using keys: ↑ ↓ or Ctrl+n and Ctrl+p if meta keys are active. Number of commands that can be stored depends on size of CONFIG_SHELL_HISTORY_BUFFER parameter.

4.22.5 Wildcards Feature

The shell module can handle wildcards. Wildcards are interpreted correctly when expanded command and its subcommands do not have a handler. For example, if you want to set logging level to err for the app and app_test modules you can execute the following command:

```
log enable err a*
```

This feature is activated by CONFIG_SHELL_WILDCARD set to y.

4.22.6 Meta Keys Feature

The shell module supports the following meta keys:
Table 41: Implemented meta keys

<table>
<thead>
<tr>
<th>Meta keys</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+a</td>
<td>Moves the cursor to the beginning of the line.</td>
</tr>
<tr>
<td>Ctrl+b</td>
<td>Moves the cursor backward one character.</td>
</tr>
<tr>
<td>Ctrl+c</td>
<td>Preserves the last command on the screen and starts a new command in a new line.</td>
</tr>
<tr>
<td>Ctrl+d</td>
<td>Deletes the character under the cursor.</td>
</tr>
<tr>
<td>Ctrl+e</td>
<td>Moves the cursor to the end of the line.</td>
</tr>
<tr>
<td>Ctrl+f</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>Ctrl+k</td>
<td>Deletes from the cursor to the end of the line.</td>
</tr>
<tr>
<td>Ctrl+l</td>
<td>Clears the screen and leaves the currently typed command at the top of the screen.</td>
</tr>
<tr>
<td>Ctrl+n</td>
<td>Moves in history to next entry.</td>
</tr>
<tr>
<td>Ctrl+p</td>
<td>Moves in history to previous entry.</td>
</tr>
<tr>
<td>Ctrl+u</td>
<td>Clears the currently typed command.</td>
</tr>
<tr>
<td>Ctrl+w</td>
<td>Removes the word or part of the word to the left of the cursor. Words separated by period instead of space are treated as one word.</td>
</tr>
<tr>
<td>Alt+b</td>
<td>Moves the cursor backward one word.</td>
</tr>
<tr>
<td>Alt+f</td>
<td>Moves the cursor forward one word.</td>
</tr>
</tbody>
</table>

This feature is activated by CONFIG_SHELL_METAKEYS set to y.

4.22.7 Getopt Feature

Some shell users apart from subcommands might need to use options as well, the arguments string, looking for supported options. Typically, this task is accomplished by the getopt family functions.

For this purpose shell supports the getopt and getopt_long libraries available in the FreeBSD project. This feature is activated by: CONFIG_GETOPT set to y and CONFIG_GETOPT_LONG set to y.

This feature can be used in thread safe as well as non thread safe manner. The former is full compatible with regular getopt usage while the latter a bit differs.

An example non-thread safe usage:

```c
char *cvalue = NULL;
while ((char c = getopt(argc, argv, "abhc:")) != -1) {
    switch (c) {
    case 'c':
        cvalue = optarg;
        break;
    default:
        break;
    }
}
```

An example thread safe usage:

```c
char *cvalue = NULL;
struct getopt_state *state;
while ((char c = getopt(argc, argv, "abhc:")) != -1) {
    state = getopt_state_get();
    switch (c) {
    case 'c':
        cvalue = state->optarg;
        break;
    }
```
Thread safe getopt functionality is activated by CONFIG_SHELL_GETOPT set to y.

### 4.22.8 Obscured Input Feature

With the obscured input feature, the shell can be used for implementing a login prompt or other user interaction whereby the characters the user types should not be revealed on screen, such as when entering a password.

Once the obscured input has been accepted, it is normally desired to return the shell to normal operation. Such runtime control is possible with the `shell_obscure_set` function.

An example of login and logout commands using this feature is located in `samples/subsys/shell/shell_module/src/main.c` and the config file `samples/subsys/shell/shell_module/prj_login.conf`.

This feature is activated upon startup by `CONFIG_SHELL_START_OBSCURED` set to y. With this set either way, the option can still be controlled later at runtime. `CONFIG_SHELL_CMDS_SELECT` is useful to prevent entry of any other command besides a login command, by means of the `shell_set_root_cmd` function. Likewise, `CONFIG_SHELL_PROMPT_UART` allows you to set the prompt upon startup, but it can be changed later with the `shell_prompt_change` function.

### 4.22.9 Shell Logger Backend Feature

Shell instance can act as the Logging backend. Shell ensures that log messages are correctly multiplexed with shell output. Log messages from logger thread are enqueued and processed in the shell thread. Logger thread will block for configurable amount of time if queue is full, blocking logger thread context for that time. Oldest log message is removed from the queue after timeout and new message is enqueued. Use the `shell stats show` command to retrieve number of log messages dropped by the shell instance. Log queue size and timeout are `SHELL_DEFINE` arguments.

This feature is activated by: `CONFIG_SHELL_LOG_BACKEND` set to y.

**Warning:** Enqueuing timeout must be set carefully when multiple backends are used in the system. The shell instance could have a slow transport or could block, for example, by a UART with hardware flow control. If timeout is set too high, the logger thread could be blocked and impact other logger backends.

**Warning:** As the shell is a complex logger backend, it can not output logs if the application crashes before the shell thread is running. In this situation, you can enable one of the simple logging backends instead, such as UART (`CONFIG_LOG_BACKEND_UART`) or RTT (`CONFIG_LOG_BACKEND_RTT`), which are available earlier during system initialization.

### 4.22.10 RTT Backend Channel Selection

Instead of using the shell as a logger backend, RTT shell backend and RTT log backend can also be used simultaneously, but over different channels. By separating them, the log can be captured or

---

4.22. Shell 1037
monitored without shell output or the shell may be scripted without log interference. Enabling both the Shell RTT backend and the Log RTT backend does not work by default, because both default to channel 0. There are two options:

1. The Shell buffer can use an alternate channel, for example using CONFIG_SHELL_BACKEND_RTT_BUFFER set to 1. This allows monitoring the log using JLinkRTTViewer while a script interfaces over channel 1.

2. The Log buffer can use an alternate channel, for example using CONFIG_LOG_BACKEND_RTT_BUFFER set to 1. This allows interactive use of the shell through JLinkRTTViewer, while the log is written to file.

**Warning:** Regardless of the channel selection, the RTT log backend must be explicitly enabled using CONFIG_LOG_BACKEND_RTT set to y, because it defaults to n when the Shell RTT backend is also enabled using CONFIG_SHELL_BACKEND_RTT being set to y.

### 4.22.11 Usage

To create a new shell instance user needs to activate requested backend using menuconfig.

The following code shows a simple use case of this library:

```c
int main(void)
{

}

static int cmd_demo_ping(const struct shell *sh, size_t argc, char **argv)
{
    ARG_UNUSED(argc);
    ARG_UNUSED(argv);
    shell_print(sh, "pong");
    return 0;
}

static int cmd_demo_params(const struct shell *sh, size_t argc, char **argv)
{
    int cnt;
    shell_print(sh, "argc = \%d", argc);
    for (cnt = 0; cnt < argc; cnt++) {
        shell_print(sh, " argv[%d] = \%s", cnt, argv[cnt]);
    }
    return 0;
}

/* Creating subcommands (level 1 command) array for command "demo". */
SHELL_STATIC_SUBCMD_SET_CREATE(sub_demo,
    SHELL_CMD(params, NULL, "Print params command.", cmd_demo_params),
    SHELL_CMD(ping, NULL, "Ping command.", cmd_demo_ping),
    SHELL_SUBCMD_SET_END
);
/* Creating root (level 0) command "demo" without a handler */
SHELL_CMD_REGISTER(demo, &sub_demo, "Demo commands", NULL);
```

(continues on next page)
Users may use the Tab key to complete a command/subcommand or to see the available subcommands for the currently entered command level. For example, when the cursor is positioned at the beginning of the command line and the Tab key is pressed, the user will see all root (level 0) commands:

```
clear  demo  shell  history  log  resize  version
```

**Note:** To view the subcommands that are available for a specific command, you must first type a space after this command and then hit Tab.

These commands are registered by various modules, for example:

- `clear`, `shell`, `history`, and `resize` are built-in commands which have been registered by `subsys/shell/shell.c`
- `demo` and `version` have been registered in example code above by `main.c`
- `log` has been registered by `subsys/logging/log_cmds.c`

Then, if a user types a `demo` command and presses the Tab key, the shell will only print the subcommands registered for this command:

```
params  ping
```

### 4.22.12 API Reference

**Related code samples**

**Telnet console**

Access Zephyr shell over telnet.

**group shell_api**

Shell API.

**Defines**

```
SHELL_CMD_ARG_REGISTER(syntax, subcmd, help, handler, mandatory, optional)
```

Macro for defining and adding a root command (level 0) with required number of arguments.

**Note:** Each root command shall have unique syntax. If a command will be called with wrong number of arguments shell will print an error message and command handler will not be called.

**Parameters**

- `syntax` – **[in]** Command syntax (for example: `history`).
- `subcmd` – **[in]** Pointer to a subcommands array.
• help – [in] Pointer to a command help string.
• handler – [in] Pointer to a function handler.
• mandatory – [in] Number of mandatory arguments including command name.
• optional – [in] Number of optional arguments.

SHELL_COND_CMD_ARG_REGISTER(flag, syntax, subcmd, help, handler, mandatory, optional)
Macro for defining and adding a conditional root command (level 0) with required number of arguments.

Macro can be used to create a command which can be conditionally present. It is an alternative to #ifdefs around command registration and command handler. If command is disabled handler and subcommands are removed from the application.

See also:
SHELL_CMD_ARG_REGISTER for details.

Parameters
• flag – [in] Compile time flag. Command is present only if flag exists and equals 1.
• syntax – [in] Command syntax (for example: history).
• subcmd – [in] Pointer to a subcommands array.
• help – [in] Pointer to a command help string.
• handler – [in] Pointer to a function handler.
• mandatory – [in] Number of mandatory arguments including command name.
• optional – [in] Number of optional arguments.

SHELL_CMD_REGISTER(syntax, subcmd, help, handler)
Macro for defining and adding a root command (level 0) with arguments.

Note: All root commands must have different name.

Parameters
• syntax – [in] Command syntax (for example: history).
• subcmd – [in] Pointer to a subcommands array.
• help – [in] Pointer to a command help string.
• handler – [in] Pointer to a function handler.

SHELL_COND_CMD_REGISTER(flag, syntax, subcmd, help, handler)
Macro for defining and adding a conditional root command (level 0) with arguments.

See also:
SHELL_COND_CMD_ARG_REGISTER.

Parameters
• **flag** – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
• **syntax** – **[in]** Command syntax (for example: history).
• **subcmd** – **[in]** Pointer to a subcommands array.
• **help** – **[in]** Pointer to a command help string.
• **handler** – **[in]** Pointer to a function handler.

**SHELL_STATIC_SUBCMD_SET_CREATE**(name, ...)
Macro for creating a subcommand set.
It must be used outside of any function body.
Example usage:
```
SHELL_STATIC_SUBCMD_SET_CREATE(
    foo,
    SHELL_CMD(abc, ...),
    SHELL_CMD(def, ...),
    SHELL_SUBCMD_SET_END
)
```

**Parameters**
- **name** – **[in]** Name of the subcommand set.
- **...** – **[in]** List of commands created with **SHELL_CMD_ARG** or **SHELL_CMD**

**SHELL_SUBCMD_SET_CREATE**(_name, _parent)
Create set of subcommands.
Commands to this set are added using **SHELL_SUBCMD_ADD** and **SHELL_SUBCMD_COND_ADD**. Commands can be added from multiple files.

**Parameters**
- **_name** – **[in]** Name of the set. _name is used to refer the set in the parent command.
- **_parent** – **[in]** Set of comma separated parent commands in parenthesis, e.g. (foo_cmd) if subcommands are for the root command “foo_cmd”.

**SHELL_SUBCMD_COND_ADD**( _flag, _parent, _syntax, _subcmd, _help, _handler, _mand, _opt)
Conditionally add command to the set of subcommands.
Add command to the set created with **SHELL_SUBCMD_SET_CREATE**.

**Note:** The name of the section is formed as concatenation of number of parent commands, names of all parent commands and own syntax. Number of parent commands is added to ensure that section prefix is unique. Without it subcommands of (foo) and (foo, cmd1) would mix.

**Parameters**
- **_flag** – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- **_parent** – **[in]** Parent command sequence. Comma separated in parenthesis.
- **_syntax** – **[in]** Command syntax (for example: history).
• \_subcmd – [in] Pointer to a subcommands array.
• \_help – [in] Pointer to a command help string.
• \_handler – [in] Pointer to a function handler.
• \_mand – [in] Number of mandatory arguments including command name.
• \_opt – [in] Number of optional arguments.

SHELL\_SUBCMD\_ADD(\_parent, \_syntax, \_subcmd, \_help, \_handler, \_mand, \_opt)
Add command to the set of subcommands.

Add command to the set created with SHELL\_SUBCMD\_SET\_CREATE.

Parameters
• \_syntax – [in] Command syntax (for example: history).
• \_subcmd – [in] Pointer to a subcommands array.
• \_help – [in] Pointer to a command help string.
• \_handler – [in] Pointer to a function handler.
• \_mand – [in] Number of mandatory arguments including command name.
• \_opt – [in] Number of optional arguments.

SHELL\_SUBCMD\_SET\_END
Define ending subcommands set.

SHELL\_DYNAMIC\_CMD\_CREATE(name, get)
Macro for creating a dynamic entry.

Parameters
• name – [in] Name of the dynamic entry.
• get – [in] Pointer to the function returning dynamic commands array

SHELL\_CMD\_ARG(syntax, subcmd, help, handler, mand, opt)
Initializes a shell command with arguments.

Note: If a command will be called with wrong number of arguments shell will print an error message and command handler will not be called.

Parameters
• syntax – [in] Command syntax (for example: history).
• subcmd – [in] Pointer to a subcommands array.
• help – [in] Pointer to a command help string.
• handler – [in] Pointer to a function handler.
• mand – [in] Number of mandatory arguments including command name.
• opt – [in] Number of optional arguments.
SHELL_COND_CMD_ARG(flag, syntax, subcmd, help, handler, mand, opt)

Initializes a conditional shell command with arguments.

See also:

SHELL_CMD_ARG. Based on the flag, creates a valid entry or an empty command which is ignored by the shell. It is an alternative to #ifdefs around command registration and command handler. However, empty structure is present in the flash even if command is disabled (subcommands and handler are removed). Macro internally handles case if flag is not defined so flag must be provided without any wrapper, e.g.: 

SHELL_COND_CMD_ARG(CONFIG_FOO, ...)

Parameters

- **flag** – [in] Compile time flag. Command is present only if flag exists and equals 1.
- **syntax** – [in] Command syntax (for example: history).
- **subcmd** – [in] Pointer to a subcommands array.
- **help** – [in] Pointer to a command help string.
- **handler** – [in] Pointer to a function handler.
- **mand** – [in] Number of mandatory arguments including command name.
- **opt** – [in] Number of optional arguments.

SHELL_EXPR_CMD_ARG(_expr, _syntax, _subcmd, _help, _handler, _mand, _opt)

Initializes a conditional shell command with arguments if expression gives non-zero result at compile time.

See also:

SHELL_CMD_ARG. Based on the expression, creates a valid entry or an empty command which is ignored by the shell. It should be used instead of SHELL_COND_CMD_ARG if condition is not a single configuration flag, e.g.: 

SHELL_EXPR_CMD_ARG(IS_ENABLED(CONFIG_FOO) && IS_ENABLED(CONFIG_FOO_SETTING_1), ...)

Parameters

- **_syntax** – [in] Command syntax (for example: history).
- **_subcmd** – [in] Pointer to a subcommands array.
- **_help** – [in] Pointer to a command help string.
- **_handler** – [in] Pointer to a function handler.
- **_mand** – [in] Number of mandatory arguments including command name.
- **_opt** – [in] Number of optional arguments.

SHELL_CMD(_syntax, _subcmd, _help, _handler)

Initializes a shell command.

Parameters

- **_syntax** – [in] Command syntax (for example: history).
• _subcmd – [in] Pointer to a subcommands array.
• _help – [in] Pointer to a command help string.
• _handler – [in] Pointer to a function handler.

SHELL_COND_CMD(_flag, _syntax, _subcmd, _help, _handler)
Initializes a conditional shell command.

See also:
SHELL_COND_CMD_ARG.

Parameters
• _flag – [in] Compile time flag. Command is present only if flag exists and equals 1.
• _syntax – [in] Command syntax (for example: history).
• _subcmd – [in] Pointer to a subcommands array.
• _help – [in] Pointer to a command help string.
• _handler – [in] Pointer to a function handler.

SHELL_EXPR_CMD(_expr, _syntax, _subcmd, _help, _handler)
Initializes shell command if expression gives non-zero result at compile time.

See also:
SHELL_EXPR_CMD_ARG.

Parameters
• _expr – [in] Compile time expression. Command is present only if expression is non-zero.
• _syntax – [in] Command syntax (for example: history).
• _subcmd – [in] Pointer to a subcommands array.
• _help – [in] Pointer to a command help string.
• _handler – [in] Pointer to a function handler.

SHELL_CMD_DICT_CREATE(_data, _handler)
SHELL_SUBCMD_DICT_SET_CREATE(_name, _handler, ...)
Initializes shell dictionary commands.

This is a special kind of static commands. Dictionary commands can be used every time you want to use a pair: (string <-> corresponding data) in a command handler. The string is usually a verbal description of a given data. The idea is to use the string as a command syntax that can be prompted by the shell and corresponding data can be used to process the command.

Example usage:
```c
static int my_handler(const struct shell *sh, size_t argc, char **argv, void *data)
{
    int val = (int)data;
    shell_print(sh, "(syntax, value) : (%s, %d)", argv[0], val);
    return 0;
}
```

SHELL_SUBCMD_DICT_SET_CREATE(sub_dict_cmds, my_handler,
    (value_0, 0, "value 0"), (value_1, 1, "value 1"),
    (value_2, 2, "value 2"), (value_3, 3, "value 3")
);
SHELL_CMD_REGISTER(dictionary, &sub_dict_cmds, NULL, NULL);

See also:

*shell_dict_cmd_handler*

**Parameters**

- **_name** – [in] Name of the dictionary subcommand set
- **...** – [in] Dictionary triplets: (command_syntax, value, helper). Value will be passed to the _handler as user data.

**SHELL_DEFAULT_BACKEND_CONFIG_FLAGS**

SHELL_DEFINE(_name, _prompt, _transport_iface, _log_queue_size, _log_timeout, _shell_flag)

Macro for defining a shell instance.

**Parameters**

- **_name** – [in] Instance name.
- **_transport_iface** – [in] Pointer to the transport interface.
- **_log_queue_size** – [in] Logger processing queue size.
- **_log_timeout** – [in] Logger thread timeout in milliseconds on full log queue. If queue is full logger thread is blocked for given amount of time before log message is dropped.
- **_shell_flag** – [in] Shell output newline sequence.

**SHELL_NORMAL**

Terminal default text color for shell_fprintf function.

**SHELL_INFO**

Green text color for shell_fprintf function.

**SHELL_OPTION**

Cyan text color for shell_fprintf function.

**SHELL_WARNING**

Yellow text color for shell_fprintf function.
SHELL_ERROR
Red text color for shell_fprintf function.

shell_info(_sh, _ft, ...)
Print info message to the shell.
See shell_fprintf.

Parameters
• _sh – [in] Pointer to the shell instance.
• ... – [in] List of parameters to print.

shell_print(_sh, _ft, ...)
Print normal message to the shell.
See shell_fprintf.

Parameters
• _sh – [in] Pointer to the shell instance.
• ... – [in] List of parameters to print.

shell_warn(_sh, _ft, ...)
Print warning message to the shell.
See shell_fprintf.

Parameters
• _sh – [in] Pointer to the shell instance.
• ... – [in] List of parameters to print.

shell_error(_sh, _ft, ...)
Print error message to the shell.
See shell_fprintf.

Parameters
• _sh – [in] Pointer to the shell instance.
• ... – [in] List of parameters to print.

SHELL_CMD_HELP_PRINTED
Command's help has been printed.

Typedefs

typedef void (*shell_dynamic_get)(size_t idx, struct shell_static_entry *entry)
Shell dynamic command descriptor.

Function shall fill the received shell_static_entry structure with requested (idx) dynamic subcommand data. If there is more than one dynamic subcommand available, the function shall ensure that the returned commands: entry->syntax are sorted in
alphabetical order. If idx exceeds the available dynamic subcommands, the function
must write to entry->syntax NULL value. This will indicate to the shell module that
there are no more dynamic commands to read.

typedef int (*shell_cmd_handler)(const struct shell *sh, size_t argc, char **argv)
Shell command handler prototype.

Param sh
Shell instance.

Param argc
Arguments count.

Param argv
Arguments.

Retval 0
Successful command execution.

Retval 1
Help printed and command not executed.

Retval -EINVAL
Argument validation failed.

Retval -ENOEXEC
Command not executed.

typedef int (*shell_dict_cmd_handler)(const struct shell *sh, size_t argc, char **argv, void *data)
Shell dictionary command handler prototype.

Param sh
Shell instance.

Param argc
Arguments count.

Param argv
Arguments.

Param data
Pointer to the user data.

Retval 0
Successful command execution.

Retval 1
Help printed and command not executed.

Retval -EINVAL
Argument validation failed.

Retval -ENOEXEC
Command not executed.

typedef void (*shell_transport_handler_t)(enum shell_transport_evt evt, void *context)

typedef void (*shell_uninit_cb_t)(const struct shell *sh, int res)

typedef void (*shell_bypass_cb_t)(const struct shell *sh, uint8_t *data, size_t len)
Bypass callback.
**Param sh**  
Shell instance.

**Param data**  
Raw data from transport.

**Param len**  
Data length.

---

**Enums**

enum shell_receive_state  
*Values:*

- enumerator SHELL_RECEIVE_DEFAULT
- enumerator SHELL_RECEIVE_ESC
- enumerator SHELL_RECEIVE_ESC_SEQ
- enumerator SHELL_RECEIVE_TILDE_EXP

enum shell_state  
*Values:*

- enumerator SHELL_STATE_UNINITIALIZED
- enumerator SHELL_STATE_INITIALIZED
- enumerator SHELL_STATE_ACTIVE
- enumerator SHELL_STATE_PANIC_MODE_ACTIVE  
  Panic activated.
- enumerator SHELL_STATE_PANIC_MODE_INACTIVE  
  Panic requested, not supported.

enum shell_transport_evt  
Shell transport event.  
*Values:*

- enumerator SHELL_TRANSPORT_EVT_RX_RDY
- enumerator SHELL_TRANSPORT_EVT_TX_RDY

enum shell_signal  
*Values:*

---

1048 Chapter 4. OS Services
enumerator SHELL_SIGNAL_RXRDY

enumerator SHELL_SIGNAL_LOG_MSG

enumerator SHELL_SIGNAL_KILL

enumerator SHELL_SIGNAL_TXDONE

enumerator SHELL_SIGNALS

enum shell_flag
Flags for setting shell output newline sequence.
Values:

enumerator SHELL_FLAG_CRLF_DEFAULT = (1 << 0)
  Do not map CR or LF.

enumerator SHELL_FLAG_OLF_CRLF = (1 << 1)
  Map LF to CRLF on output.

**Functions**

const struct device *shell_device_lookup(size_t idx, const char *prefix)
Get by index a device that matches.
This can be used, for example, to identify I2C_1 as the second I2C device.
Devices that failed to initialize or do not have a non-empty name are excluded from
the candidates for a match.

**Parameters**
  * idx – the device number starting from zero.
  * prefix – optional name prefix used to restrict candidate devices. Indexing
    is done relative to devices with names that start with this text. Pass
    null if no prefix match is required.

int shell_init(const struct shell *sh, const void *transport_config, struct
  shell_backend_config_flags cfg_flags, bool log_backend, uint32_t
  init_log_level)
Function for initializing a transport layer and internal shell state.

**Parameters**
  * sh – **[in]** Pointer to shell instance.
  * transport_config – **[in]** Transport configuration during initialization.
  * cfg_flags – **[in]** Initial backend configuration flags. Shell will copy this
    data.
  * log_backend – If true, the console will be used as logger backend.
  * init_log_level – **[in]** Default severity level for the logger.

**Returns**
Standard error code.
void shell_uninit(const struct shell *sh, shell_uninit_cb_t cb)
    Uninitializes the transport layer and the internal shell state.

Parameters

• sh – Pointer to shell instance.
• cb – Callback called when uninitialization is completed.

int shell_start(const struct shell *sh)
    Function for starting shell processing.

Parameters

• sh – Pointer to the shell instance.

Returns

Standard error code.

int shell_stop(const struct shell *sh)
    Function for stopping shell processing.

Parameters

• sh – Pointer to shell instance.

Returns

Standard error code.

void shell_fprintf(const struct shell *sh, enum shell_vt100_color color, const char *fmt, ...
    printf-like function which sends formatted data stream to the shell.
    This function can be used from the command handler or from threads, but not from
    an interrupt context.

Parameters

• sh – [in] Pointer to the shell instance.
• color – [in] Printed text color.
• ... – [in] List of parameters to print.

void shell_vfprintf(const struct shell *sh, enum shell_vt100_color color, const char *fmt, va_list args)
    vprintf-like function which sends formatted data stream to the shell.
    This function can be used from the command handler or from threads, but not from an
    interrupt context. It is similar to shell_fprintf() but takes a va_list instead of variable
    arguments.

Parameters

• sh – [in] Pointer to the shell instance.
• color – [in] Printed text color.
• args – [in] List of parameters to print.

void shell_hexdump_line(const struct shell *sh, unsigned int offset, const uint8_t *data, size_t len)
    Print a line of data in hexadecimal format.
    Each line shows the offset, bytes and then ASCII representation.
For example:
00008010: 20 25 00 20 2f 48 00 08 80 05 00 20 af 46 00 | %. /H. ... .F. |

**Parameters**

- `offset` – `[in]` Offset to show for this line.
- `data` – `[in]` Pointer to data.
- `len` – `[in]` Length of data.

```c
void shell_hexdump(const struct shell *sh, const uint8_t *data, size_t len)
```
Print data in hexadecimal format.

**Parameters**

- `data` – `[in]` Pointer to data.
- `len` – `[in]` Length of data.

```c
void shell_process(const struct shell *sh)
```
Process function, which should be executed when data is ready in the transport interface.

To be used if shell thread is disabled.

**Parameters**

```c
int shell_prompt_change(const struct shell *sh, const char *prompt)
```
Change displayed shell prompt.

**Parameters**

**Returns**

0 Success.

-EINVAL Pointer to new prompt is not correct.

```c
void shell_help(const struct shell *sh)
```
Prints the current command help.

Function will print a help string with: the currently entered command and subcommands (if they exist).

**Parameters**

```c
int shell_execute_cmd(const struct shell *sh, const char *cmd)
```
Execute command.

Pass command line to shell to execute.

Note: This by no means makes any of the commands a stable interface, so this function should only be used for debugging/diagnostic.

This function must not be called from shell command context!

**Parameters**

- **sh** – [in] Pointer to the shell instance. It can be NULL when the CONFIG_SHELL_BACKEND_DUMMY option is enabled.
- **cmd** – [in] Command to be executed.

**Returns**

Result of the execution

```c
int shell_set_root_cmd(const char *cmd)
```

Set root command for all shell instances.

It allows setting from the code the root command. It is an equivalent of calling select command with one of the root commands as the argument (e.g “select log”) except it sets command for all shell instances.

**Parameters**

- **cmd** – String with one of the root commands or null pointer to reset.

**Return values**

- **0** – if root command is set.
- **-EINVAL** – if invalid root command is provided.

```c
void shell_set_bypass(const struct shell *sh, shell_bypass_cb_t bypass)
```

Set bypass callback.

Bypass callback is called whenever data is received. Shell is bypassed and data is passed directly to the callback. Use null to disable bypass functionality.

**Parameters**

- **sh** – [in] Pointer to the shell instance.
- **bypass** – [in] Bypass callback or null to disable.

```c
bool shell_ready(const struct shell *sh)
```

Get shell readiness to execute commands.

**Parameters**

- **sh** – [in] Pointer to the shell instance.

**Return values**

- **true** – Shell backend is ready to execute commands.
- **false** – Shell backend is not initialized or not started.

```c
int shell_insert_mode_set(const struct shell *sh, bool val)
```

Allow application to control text insert mode.

Value is modified atomically and the previous value is returned.

**Parameters**

- **sh** – [in] Pointer to the shell instance.
- **val** – [in] Insert mode.

**Return values**

- **0** – or 1: previous value
- **-EINVAL** – if shell is NULL.

```c
int shell_use_colors_set(const struct shell *sh, bool val)
```

Allow application to control whether terminal output uses colored syntax.

Value is modified atomically and the previous value is returned.
Parameters
• sh – [in] Pointer to the shell instance.
• val – [in] Color mode.

Return values
• 0 – or 1: previous value
• -EINVAL – if shell is NULL.

int shell_use_vt100_set(const struct shell *sh, bool val)
Allow application to control whether terminal is using vt100 commands.
Value is modified atomically and the previous value is returned.

Parameters
• sh – [in] Pointer to the shell instance.
• val – [in] vt100 mode.

Return values
• 0 – or 1: previous value
• -EINVAL – if shell is NULL.

int shell_echo_set(const struct shell *sh, bool val)
Allow application to control whether user input is echoed back.
Value is modified atomically and the previous value is returned.

Parameters
• sh – [in] Pointer to the shell instance.
• val – [in] Echo mode.

Return values
• 0 – or 1: previous value
• -EINVAL – if shell is NULL.

int shell_obscure_set(const struct shell *sh, bool obscure)
Allow application to control whether user input is obscured with asterisks \
useful for implementing passwords.
Value is modified atomically and the previous value is returned.

Parameters
• sh – [in] Pointer to the shell instance.
• obscure – [in] Obscure mode.

Return values
• 0 – or 1: previous value.
• -EINVAL – if shell is NULL.

int shell_mode_delete_set(const struct shell *sh, bool val)
Allow application to control whether the delete key backspaces or deletes.
Value is modified atomically and the previous value is returned.

Parameters
• sh – [in] Pointer to the shell instance.
• val – [in] Delete mode.
Return values

- 0 – or 1: previous value
- -EINVAL – if shell is NULL.

```c
int shell_get_return_value(const struct shell *sh)
```

Retrieve return value of most recently executed shell command.

Parameters

- sh – ![in] Pointer to the shell instance

Return values

return – value of previous command

Variables

```c
const struct log_backend_api log_backend_shell_api
```

union shell_cmd_entry

```c
#include <shell.h> Shell command descriptor.
```

Public Members

```c
shell_dynamic_get dynamic_get
```

Pointer to function returning dynamic commands.

```c
const struct shell_static_entry *entry
```

Pointer to array of static commands.

```c
struct shell_static_args
```

```c
#include <shell.h>
```

Public Members

```c
uint8_t mandatory
```

Number of mandatory arguments.

```c
uint8_t optional
```

Number of optional arguments.

```c
struct shell_static_entry
```

```c
#include <shell.h>
```

Public Members

```c
const char *syntax
```

Command syntax strings.
const char *help
   Command help string.

const union shell_cmd_entry *subcmd
   Pointer to subcommand.

shell_cmd_handler handler
   Command handler.

struct shell_static_args args
   Command arguments.

struct shell_transport_api
   #include <shell.h> Unified shell transport interface.

**Public Members**

int (*init)(const struct shell_transport *transport, const void *config,
   shell_transport_handler_t evt_handler, void *context)
   Function for initializing the shell transport interface.
   **Param transport**
      [in] Pointer to the transfer instance.
   **Param config**
      [in] Pointer to instance configuration.
   **Param evt_handler**
   **Param context**
      [in] Pointer to the context passed to event handler.
   **Return**
      Standard error code.

int (*uninit)(const struct shell_transport *transport)
   Function for uninitializing the shell transport interface.
   **Param transport**
      [in] Pointer to the transfer instance.
   **Return**
      Standard error code.

int (*enable)(const struct shell_transport *transport, bool blocking_tx)
   Function for enabling transport in given TX mode.
   Function can be used to reconfigure TX to work in blocking mode.
   **Param transport**
      Pointer to the transfer instance.
   **Param blocking_tx**
      If true, the transport TX is enabled in blocking mode.
   **Return**
      NRF_SUCCESS on successful enabling, error otherwise (also if not sup-
      ported).

int (*write)(const struct shell_transport *transport, const void *data, size_t length,
   size_t *cnt)
Function for writing data to the transport interface.

```
Param transport
    [in] Pointer to the transfer instance.
Param data
    [in] Pointer to the source buffer.
Param length
    [in] Source buffer length.
Param cnt
    [out] Pointer to the sent bytes counter.
Return
    Standard error code.
```

```c
int (*read)(const struct shell_transport *transport, void *data, size_t length, size_t *cnt)
```

Function for reading data from the transport interface.

```
Param transport
    [in] Pointer to the transfer instance.
Param data
    [in] Pointer to the destination buffer.
Param length
    [in] Destination buffer length.
Param cnt
    [out] Pointer to the received bytes counter.
Return
    Standard error code.
```

```c
void (*update)(const struct shell_transport *transport)
```

Function called in shell thread loop.

Can be used for backend operations that require longer execution time

```
Param transport
    [in] Pointer to the transfer instance.
```

```c
struct shell_transport
    #include <shell.h>
```

```c
struct shell_stats
    #include <shell.h> Shell statistics structure.
```

### Public Members

```
atomic_t log_lost_cnt
    Lost log counter.
```

```c
struct shell_backend_config_flags
    #include <shell.h>
```

### Public Members

```
uint32_t insert_mode
    Controls insert mode for text introduction.
```
uint32_t echo
    Controls shell echo.

uint32_t obscure
    If echo on, print asterisk instead.

uint32_t mode_delete
    Operation mode of backspace key.

uint32_t use_colors
    Controls colored syntax.

uint32_t use_vt100
    Controls VT100 commands usage in shell.

struct shell_backend_ctx_flags
    #include <shell.h>

Public Members

uint32_t processing
    Shell is executing process function.

uint32_t history_exit
    Request to exit history mode.

uint32_t last_nl
    Last received new line character.

uint32_t cmd_ctx
    Shell is executing command.

uint32_t print_noinit
    Print request from not initialized shell.

uint32_t sync_mode
    Shell in synchronous mode.

uint32_t handle_log
    Shell is handling logger backend.

union shell_backend_cfg
    #include <shell.h>

Public Members
atomic_t value

struct shell_backend_config_flags flags

union shell_backend_ctx
    #include <shell.h>

Public Members

uint32_t value

struct shell_backend_ctx_flags flags

struct shell_ctx
    #include <shell.h> Shell instance context.

Public Members

const char *prompt
    shell current prompt.

enum shell_state state
    Internal module state.

enum shell_receive_state receive_state
    Escape sequence indicator.

struct shell_static_entry active_cmd
    Currently executed command.

const struct shell_static_entry *selected_cmd
    New root command.
    If NULL shell uses default root commands.

struct shell_vt100_ctx vt100_ctx
    VT100 color and cursor position, terminal width.

shell_uninit_cb_t uninit_cb
    Callback called from shell thread context when unitialization is completed just before aborting shell thread.

shell_bypass_cb_t bypass
    When bypass is set, all incoming data is passed to the callback.
    Logging level for a backend.
uint16_t cmd_buff_len
    Command length.

uint16_t cmd_buff_pos
    Command buffer cursor position.

uint16_t cmd_tmp_buff_len
    Command length in tmp buffer.

char cmd_buff[0]
    Command input buffer.

char temp_buff[0]
    Command temporary buffer.

char printf_buff[0]
    Printf buffer size.

struct k_poll_event events[SHELL_SIGNALS]
    Events that should be used only internally by shell thread.
    Event for SHELL_SIGNAL_TXDONE is initialized but unused.

struct shell
    #include <shell.h> Shell instance internals.

Public Members

const char *default_prompt
    Shell default prompt.

const struct shell_transport *iface
    Transport interface.

struct shell_ctx *ctx
    Internal context.

4.23 Serialization

Zephyr has support for several data serialization subsystems. These can be used to encode/decode structured data with a known format on-the-wire.

4.23.1 Nanopb

Nanopb is a C implementation of Google's Protocol Buffers.
Requirements

Nanopb uses the protocol buffer compiler to generate source and header files, make sure the protoc executable is installed and available.

Ubuntu
Use **apt** to install dependency:

```
sudo apt install protobuf-compiler
```

macOS
Use **brew** to install dependency:

```
brew install protobuf
```

Windows
Use **choco** to install dependency:

```
choco install protoc
```

Additionally, Nanopb is an optional module and needs to be added explicitly to the workspace:

```
west config manifest.project-filter -- +nanopb
west update
```

Configuration

Make sure to include nanopb within your **CMakeLists.txt** file as follows:

```
list(APPEND CMAKE_MODULE_PATH ${ZEPHYR_BASE}/modules/nanopb)
include(nanopb)
```

Adding proto files can be done with the **zephyr_nanopb_sources()** CMake function which ensures the generated header and source files are created before building the specified target.

Nanopb has **generator options** that can be used to configure messages or fields. This allows to set fixed sizes or skip fields entirely.

The internal CMake generator has an extension to configure ***.options.in** files automatically with CMake variables.

See samples/modules/nanopb/src/simple.options.in and samples/modules/nanopb/CMakeLists.txt for usage example.

4.24 Settings

The settings subsystem gives modules a way to store persistent per-device configuration and runtime state. A variety of storage implementations are provided behind a common API using FCB, NVS, or a file system. These different implementations give the application developer flexibility to select an appropriate storage medium, and even change it later as needs change. This subsystem is used by various Zephyr components and can be used simultaneously by user applications.

Settings items are stored as key-value pair strings. By convention, the keys can be organized by the package and subtree defining the key, for example the key **id/serial** would define the serial configuration element for the package id.

Convenience routines are provided for converting a key value to and from a string type.
For an example of the settings subsystem refer to settings sample.

Note: As of Zephyr release 2.1 the recommended backend for non-filesystem storage is NVS.

### 4.24.1 Handlers

Settings handlers for subtree implement a set of handler functions. These are registered using a call to settings_register().

**h_get**

This gets called when asking for a settings element value by its name using settings_runtime_get() from the runtime backend.

**h_set**

This gets called when the value is loaded from persisted storage with settings_load(), or when using settings_runtime_set() from the runtime backend.

**h_commit**

This gets called after the settings have been loaded in full. Sometimes you don’t want an individual setting value to take effect right away, for example if there are multiple settings which are interdependent.

**h_export**

This gets called to write all current settings. This happens when settings_save() tries to save the settings or transfer to any user-implemented back-end.

### 4.24.2 Backends

Backends are meant to load and save data to/from setting handlers, and implement a set of handler functions. These are registered using a call to settings_src_register() for backends that can load data, and/or settings_dst_register() for backends that can save data. The current implementation allows for multiple source backends but only a single destination backend.

**csi_load**

This gets called when loading values from persistent storage using settings_load().

**csi_save**

This gets called when saving a single setting to persistent storage using settings_save_one().

**csi_save_start**

This gets called when starting a save of all current settings using settings_save().

**csi_save_end**

This gets called after having saved of all current settings using settings_save().

### 4.24.3 Zephyr Storage Backends

Zephyr has three storage backends: a Flash Circular Buffer (CONFIG_SETTINGS_FCB), a file in the filesystem (CONFIG_SETTINGS_FILE), or non-volatile storage (CONFIG_SETTINGS_NVS).

You can declare multiple sources for settings; settings from all of these are restored when settings_load() is called.

There can be only one target for writing settings; this is where data is stored when you call settings_save(), or settings_save_one().
FCB read target is registered using `settings_fcb_src()`, and write target using `settings_fcb_dst()`. As a side-effect, `settings_fcb_src()` initializes the FCB area, so it must be called before calling `settings_fcb_dst()`. File read target is registered using `settings_file_src()`, and write target by using `settings_file_dst()`. Non-volatile storage read target is registered using `settings_nvs_src()`, and write target by using `settings_nvs_dst()`.

### 4.24.4 Storage Location

The FCB and non-volatile storage (NVS) backends both look for a fixed partition with label “storage” by default. A different partition can be selected by setting the `zephyr,settings-partition` property of the chosen node in the devicetree.

The file path used by the file backend to store settings is selected via the option `CONFIG_SETTINGS_FILE_PATH`.

### 4.24.5 Loading data from persisted storage

A call to `settings_load()` uses an `h_set` implementation to load settings data from storage to volatile memory. After all data is loaded, the `h_commit` handler is issued, signalling the application that the settings were successfully retrieved.

Technically FCB and file backends may store some history of the entities. This means that the newest data entity is stored after any older existing data entities. Starting with Zephyr 2.1, the back-end must filter out all old entities and call the callback with only the newest entity.

### 4.24.6 Storing data to persistent storage

A call to `settings_save_one()` uses a backend implementation to store settings data to the storage medium. A call to `settings_save()` uses an `h_export` implementation to store different data in one operation using `settings_save_one()`. A key need to be covered by a `h_export` only if it is supposed to be stored by `settings_save()` call.

For both FCB and file back-end only storage requests with data which changes most actual key's value are stored, therefore there is no need to check whether a value changed by the application. Such a storage mechanism implies that storage can contain multiple value assignments for a key, while only the last is the current value for the key.

#### Garbage collection

When storage becomes full (FCB) or consumes too much space (file), the backend removes non-recent key-value pairs records and unnecessary key-delete records.

### 4.24.7 Secure domain settings

Currently settings doesn’t provide scheme of being secure, and non-secure configuration storage simultaneously for the same instance. It is recommended that secure domain uses its own settings instance and it might provide data for non-secure domain using dedicated interface if needed (case dependent).
4.24.8  Example: Device Configuration

This is a simple example, where the settings handler only implements `h_set` and `h_export`. `h_set` is called when the value is restored from storage (or when set initially), and `h_export` is used to write the value to storage thanks to `storage_func()`. The user can also implement some other export functionality, for example, writing to the shell console.

```c
#define DEFAULT_FOO_VAL_VALUE 1

static int8 foo_val = DEFAULT_FOO_VAL_VALUE;

static int foo_settings_set(const char *name, size_t len, settings_read_cb read_cb, void *cb_arg)
{
    const char *next;
    int rc;

    if (settings_name_steq(name, "bar", &next) && !next) {
        if (len != sizeof(foo_val)) {
            return -EINVAL;
        }
    }

    rc = read_cb(cb_arg, &foo_val, sizeof(foo_val));
    if (rc >= 0) {
        /* key-value pair was properly read.
         * rc contains value length.
         */
        return 0;
    }

    /* read-out error */
    return rc;
}

static int foo_settings_export(int (*storage_func)(const char *name, const void *value, size_t val_len))
{
    return storage_func("foo/bar", &foo_val, sizeof(foo_val));
}

struct settings_handler my_conf = {
    .name = "Foo",
    .h_set = foo_settings_set,
    .h_export = foo_settings_export
};
```

4.24.9  Example: Persist Runtime State

This is a simple example showing how to persist runtime state. In this example, only `h_set` is defined, which is used when restoring value from persisted storage.

In this example, the main function increments `foo_val`, and then persists the latest number. When the system restarts, the application calls `settings_load()` while initializing, and `foo_val` will continue counting up from where it was before restart.

```c
#include <zephyr/kernel.h>
#include <zephyr/sys/reboot.h>

(continues on next page)
```
#include <zephyr/settings/settings.h>
#include <zephyr/sys/printk.h>
#include <inttypes.h>

#define DEFAULT_FOO_VAL_VALUE 0

static uint8_t foo_val = DEFAULT_FOO_VAL_VALUE;

static int foo_settings_set(const char *name, size_t len, settings_read_cb read_cb, void *cb_arg)
{
    const char *next;
    int rc;

    if (settings_name_steq(name, "bar", &next) && !next) {
        if (len != sizeof(foo_val)) {
            return -EINVAL;
        }
        rc = read_cb(cb_arg, &foo_val, sizeof(foo_val));
        if (rc >= 0) {
            return 0;
        }
    }

    return rc;
}

struct settings_handler my_conf = {
    .name = "foo",
    .h_set = foo_settings_set
};

int main(void)
{
    settings_subsys_init();
    settings_register(&my_conf);
    settings_load();

    foo_val++;
    settings_save_one("foo/bar", &foo_val, sizeof(foo_val));

    printk("foo: %d\n", foo_val);
    k_msleep(1000);
    sys_reboot(SYS_REBOOT_COLD);
}

4.24.10 Example: Custom Backend Implementation

This is a simple example showing how to register a simple custom backend handler (CONFIG_SETTINGS_CUSTOM).

static int settings_custom_load(struct settings_store *cs, const struct settings_load_arg *arg)
{
(continues on next page)
```c
static int settings_custom_save(struct settings_store *cs, const char *name, const char *value, size_t val_len)
{
    //...
}

/* custom backend interface */
static struct settings_store_itf settings_custom_itf = {
    .csi_load = settings_custom_load,
    .csi_save = settings_custom_save,
};

/* custom backend node */
static struct settings_store settings_custom_store = {
    .cs_itf = &settings_custom_itf
};

int settings_backend_init(void)
{
    /* register custom backend */
    settings_dst_register(&settings_custom_store);
    settings_src_register(&settings_custom_store);
    return 0;
}
```

### 4.24.11 API Reference

The Settings subsystem APIs are provided by `settings.h`:

**API for general settings usage**

**Related code samples**

**Settings API**

Load and save configuration values using the settings API.

**group settings**

**Defines**

- SETTINGS_MAX_DIR_DEPTH
- SETTINGS_MAX_NAME_LEN
- SETTINGS_MAX_VAL_LEN
- SETTINGS_NAME_SEPARATOR
Define a static handler for settings items. This creates a variable *hname prepended by* settings_handler.

**Parameters**

- `_hname` – handler name
- `_tree` – subtree name
- `_get` – get routine (can be NULL)
- `_set` – set routine (can be NULL)
- `_commit` – commit routine (can be NULL)
- `_export` – export routine (can be NULL)

**Typedefs**

typedef ssize_t (*settings_read_cb)(void *cb_arg, void *data, size_t len)

Function used to read the data from the settings storage in h_set handler implementations.

**Param cb_arg**

[in] arguments for the read function. Appropriate cb_arg is transferred to h_set handler implementation by the backend.

**Param data**

[out] the destination buffer

**Param len**

[in] length of read

**Return**

positive: Number of bytes read, 0: key-value pair is deleted. On error returns -ERRNO code.

typedef int (*settings_load_direct_cb)(const char *key, size_t len, settings_read_cb read_cb, void *cb_arg, void *param)

Callback function used for direct loading.

Used by settings_load_subtree_direct function.

**Param key**

[in] the name with skipped part that was used as name in handler registration

**Param len**

[in] the size of the data found in the backend.

**Param read_cb**

[in] function provided to read the data from the backend.

**Param cb_arg**

[inout] arguments for the read function provided by the backend.
Param param
[inout] parameter given to the settings_load_subtree_direct function.

Return
When nonzero value is returned, further subtree searching is stopped.

Functions

int settings_subsys_init(void)
Initialization of settings and backend.
Can be called at application startup. In case the backend is a FS Remember to call it after the FS was mounted. For FCB backend it can be called without such a restriction.

Returns
0 on success, non-zero on failure.

int settings_register(struct settings_handler *cf)
Register a handler for settings items stored in RAM.

Parameters
• cf – Structure containing registration info.

Returns
0 on success, non-zero on failure.

int settings_load(void)
Load serialized items from registered persistence sources.
Handlers for serialized item subtrees registered earlier will be called for encountered values.

Returns
0 on success, non-zero on failure.

int settings_load_subtree(const char *subtree)
Load limited set of serialized items from registered persistence sources.
Handlers for serialized item subtrees registered earlier will be called for encountered values that belong to the subtree.

Parameters
• subtree – [in] name of the subtree to be loaded.

Returns
0 on success, non-zero on failure.

int settings_load_subtree_direct(const char *subtree, settings_load_direct_cb cb, void *param)
Load limited set of serialized items using given callback.
This function bypasses the normal data workflow in settings module. All the settings values that are found are passed to the given callback.

Note: This function does not call commit function. It works as a blocking function, so it is up to the user to call any kind of commit function when this operation ends.

Parameters
• subtree – [in] subtree name of the subtree to be loaded.
• cb – [in] pointer to the callback function.
• **param** – [inout] parameter to be passed when callback function is called.

**Returns**
0 on success, non-zero on failure.

```c
int settings_save(void)
```
Save currently running serialized items.
All serialized items which are different from currently persisted values will be saved.

**Returns**
0 on success, non-zero on failure.

```c
int settings_save_one(const char *name, const void *value, size_t val_len)
```
Write a single serialized value to persisted storage (if it has changed value).

**Parameters**

- **name** – Name/key of the settings item.
- **value** – Pointer to the value of the settings item. This value will be transferred to the `settings_handler::h_export` handler implementation.
- **val_len** – Length of the value.

**Returns**
0 on success, non-zero on failure.

```c
int settings_delete(const char *name)
```
Delete a single serialized in persisted storage.
Deleting an existing key-value pair in the settings mean to set its value to NULL.

**Parameters**

- **name** – Name/key of the settings item.

**Returns**
0 on success, non-zero on failure.

```c
int settings_commit(void)
```
Call commit for all settings handler.
This should apply all settings which has been set, but not applied yet.

**Returns**
0 on success, non-zero on failure.

```c
int settings_commit_subtree(const char *subtree)
```
Call commit for settings handler that belong to subtree.
This should apply all settings which has been set, but not applied yet.

**Parameters**

- **subtree** – [in] name of the subtree to be committed.

**Returns**
0 on success, non-zero on failure.

```c
struct settings_handler
```

```c
#include <settings.h> Config handlers for subtree implement a set of handler functions.
These are registered using a call to `settings_register`.
```
Public Members

const char *name
Name of subtree.

int (*h_get)(const char *key, char *val, int val_len_max)
Get values handler of settings items identified by keyword names.
Parameters:
• key[in] the name with skipped part that was used as name in handler registration
• val[out] buffer to receive value.
• val_len_max[in] size of that buffer.
Return: length of data read on success, negative on failure.

int (*h_set)(const char *key, size_t len, settings_read_cb read_cb, void *cb_arg)
Set value handler of settings items identified by keyword names.
Parameters:
• key[in] the name with skipped part that was used as name in handler registration
• len[in] the size of the data found in the backend.
• read_cb[in] function provided to read the data from the backend.
• cb_arg[in] arguments for the read function provided by the backend.
Return: 0 on success, non-zero on failure.

int (*h_commit)(void)
This handler gets called after settings has been loaded in full.
User might use it to apply setting to the application.
Return: 0 on success, non-zero on failure.

int (*h_export)(int (*export_func)(const char *name, const void *val, size_t val_len))
This gets called to dump all current settings items.
This happens when settings_save tries to save the settings. Parameters:
• export_func: the pointer to the internal function which appends a single key-value pair to persisted settings. Don’t store duplicated value. The name is subtree/key string, val is the string with value.
Return: 0 on success, non-zero on failure.

Remark
The User might limit a implementations of handler to serving only one keyword at one call - what will impose limit to get/set values using full subtree/key name.

sys_snodo_t node
Linked list node info for module internal usage.

struct settings_handler_static
#include <settings.h> Config handlers without the node element, used for static handlers.
These are registered using a call to SETTINGS_STATIC_HANDLER_DEFINE().

4.24. Settings 1069
Public Members

const char *name
    Name of subtree.

int (*h_get)(const char *key, char *val, int val_len_max)
    Get values handler of settings items identified by keyword names.
    Parameters:
    • key[in] the name with skipped part that was used as name in handler registration
    • val[out] buffer to receive value.
    • val_len_max[in] size of that buffer.
    Return: length of data read on success, negative on failure.

int (*h_set)(const char *key, size_t len, settings_read_cb read_cb, void *cb_arg)
    Set value handler of settings items identified by keyword names.
    Parameters:
    • key[in] the name with skipped part that was used as name in handler registration
    • len[in] the size of the data found in the backend.
    • read_cb[in] function provided to read the data from the backend.
    • cb_arg[in] arguments for the read function provided by the backend.
    Return: 0 on success, non-zero on failure.

int (*h_commit)(void)
    This handler gets called after settings has been loaded in full.
    User might use it to apply setting to the application.

int (*h_export)(int (*export_func)(const char *name, const void *val, size_t val_len))
    This gets called to dump all current settings items.
    This happens when settings_save tries to save the settings. Parameters:
    • export_func: the pointer to the internal function which appends a single key-value pair to persisted settings. Don’t store duplicated value. The name is subtree/key string, val is the string with value.
    Return: 0 on success, non-zero on failure.

Remark
The User might limit a implementations of handler to serving only one keyword at one call - what will impose limit to get/set values using full subtree/key name.

API for key-name processing

Related code samples
Settings API
    Load and save configuration values using the settings API.
\textit{group settings\_name\_proc}

API for const name processing.

\textbf{Functions}

\texttt{int settings\_name\_steq(const char *name, const char *key, const char **next)}

Compares the start of name with a key.

Some examples: \texttt{settings\_name\_steq(“bt/btmesh/iv”, “b”, &next) returns 1, next=“t/btmesh/iv”} \texttt{settings\_name\_steq(“bt/btmesh/iv”, “bt”, &next) returns 1, next=“btmesh/iv”} \texttt{settings\_name\_steq(“bt/btmesh/iv”, “bt/”, &next) returns 0, next=NULL settings\_name\_steq(“bt/btmesh/iv”, “bta”, &next) returns 0, next=NULL}

REMARK: This routine could be simplified if the \texttt{settings\_handler} names would include a separator at the end.

\textbf{Parameters}

- \texttt{name} – [\texttt{in}] in string format
- \texttt{key} – [\texttt{in}] comparison string
- \texttt{next} – [\texttt{out}] pointer to remaining of name, when the remaining part starts with a separator the separator is removed from next

\textbf{Returns}

0: no match 1: match, next can be used to check if match is full

\texttt{int settings\_name\_next(const char *name, const char **next)}

determine the number of characters before the first separator

\textbf{Parameters}

- \texttt{name} – [\texttt{in}] in string format
- \texttt{next} – [\texttt{out}] pointer to remaining of name (excluding separator)

\textbf{Returns}

index of the first separator, in case no separator was found this is the size of name

\textbf{API for runtime settings manipulation}

\textbf{Related code samples}

\textbf{Settings API}

Load and save configuration values using the settings API.

\textit{group settings\_rt}

API for runtime settings.

\textbf{Functions}
int settings_runtime_set(const char *name, const void *data, size_t len)
Set a value with a specific key to a module handler.

Parameters
• name – Key in string format.
• data – Binary value.
• len – Value length in bytes.

Returns
0 on success, non-zero on failure.

int settings_runtime_get(const char *name, void *data, size_t len)
Get a value corresponding to a key from a module handler.

Parameters
• name – Key in string format.
• data – Returned binary value.
• len – requested value length in bytes.

Returns
length of data read on success, negative on failure.

int settings_runtime_commit(const char *name)
Apply settings in a module handler.

Parameters
• name – Key in string format.

Returns
0 on success, non-zero on failure.

API of backend interface

group settings_backend
settings

Functions

void settings_src_register(struct settings_store *cs)
Register a backend handler acting as source.

Parameters
• cs – Backend handler node containing handler information.

void settings_dst_register(struct settings_store *cs)
Register a backend handler acting as destination.

Parameters
• cs – Backend handler node containing handler information.

struct settings_handler_*settings_parse_and_lookup(const char *name, const char **next)
 Parses a key to an array of elements and locate corresponding module handler.

Parameters
• name – [in] in string format
• next – [out] remaining of name after matched handler

Returns
settings_handler_static on success, NULL on failure.

int settings_call_set_handler(const char *name, size_t len, settings_read_cb read_cb, void *read_cb_arg, const struct settings_load_arg *load_arg)

Calls settings handler.

Parameters
• name – [in] The name of the data found in the backend.
• len – [in] The size of the data found in the backend.
• read_cb – [in] Function provided to read the data from the backend.
• read_cb_arg – [inout] Arguments for the read function provided by the backend.

Returns
0 or negative error code

struct settings_store
#include <settings.h> Backend handler node for storage handling.

Public Members

sys_snnode_t cs_next
Linked list node info for internal usage.

const struct settings_store_itf *cs_iff
Backend handler structure.

struct settings_load_arg
#include <settings.h> Arguments for data loading.
Holds all parameters that changes the way data should be loaded from backend.

Public Members

const char *subtree
Name of the subtree to be loaded.
If NULL, all values would be loaded.

settings_load_direct_cb cb
Pointer to the callback function.
If NULL then matching registered function would be used.
void *param
    Parameter for callback function.
    Parameter to be passed to the callback function.

struct settings_store_itf
    #include <settings.h> Backend handler functions.
    Sources are registered using a call to settings_src_register. Destinations are registered using a call to settings_dst_register.

Public Members

int (*csi_load)(struct settings_store *cs, const struct settings_load_arg *arg)
    Loads values from storage limited to subtree defined by subtree.
    Parameters:
    • cs - Corresponding backend handler node,
    • arg - Structure that holds additional data for data loading.
    Note: Backend is expected not to provide duplicates of the entities. It means that if the backend does not contain any functionality to really delete old keys, it has to filter out old entities and call load callback only on the final entity.

int (*csi_save_start)(struct settings_store *cs)
    Handler called before an export operation.
    Parameters:
    • cs - Corresponding backend handler node

int (*csi_save)(struct settings_store *cs, const char *name, const char *value, size_t val_len)
    Save a single key-value pair to storage.
    Parameters:
    • cs - Corresponding backend handler node
    • name - Key in string format
    • value - Binary value
    • val_len - Length of value in bytes.

int (*csi_save_end)(struct settings_store *cs)
    Handler called after an export operation.
    Parameters:
    • cs - Corresponding backend handler node Get pointer to the storage instance used by the backend.

4.25 State Machine Framework
4.25.1 Overview

The State Machine Framework (SMF) is an application agnostic framework that provides an easy way for developers to integrate state machines into their application. The framework can be added to any project by enabling the CONFIG_SMF option.

4.25.2 State Creation

A state is represented by three functions, where one function implements the Entry actions, another function implements the Run actions, and the last function implements the Exit actions. The prototype for these functions is as follows: `void funct(void *obj)`, where the `obj` parameter is a user defined structure that has the state machine context, `struct smf_ctx`, as its first member.

For example:

```c
struct user_object {
    struct smf_ctx ctx;
    /* All User Defined Data Follows */
};
```

The `struct smf_ctx` member must be first because the state machine framework's functions casts the user defined object to the `struct smf_ctx` type with the following macro: `SMF_CTX(o)`

For example instead of doing this `(struct smf_ctx *)&user_obj`, you could use `SMF_CTX(&user_obj)`.

By default, a state can have no ancestor states, resulting in a flat state machine. But to enable the creation of a hierarchical state machine, the `CONFIG_SMF_ANCESTOR_SUPPORT` option must be enabled.

The following macro can be used for easy state creation:

- `SMF_CREATE_STATE` Create a state

**NOTE:** The `SMF_CREATE_STATE` macro takes an additional parameter when `CONFIG_SMF_ANCESTOR_SUPPORT` is enabled.

4.25.3 State Machine Creation

A state machine is created by defining a table of states that's indexed by an enum. For example, the following creates three flat states:

```c
enum demo_state { S0, S1, S2 };

const struct smf_state demo_states[] = {
    [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit),
    [S1] = SMF_CREATE_STATE(s1_entry, s1_run, s1_exit),
    [S2] = SMF_CREATE_STATE(s2_entry, s2_run, s2_exit)
};
```

And this example creates three hierarchical states:

```c
enum demo_state { S0, S1, S2 };

const struct smf_state demo_states[] = {
    [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit, parent_s0),
    [S1] = SMF_CREATE_STATE(s1_entry, s1_run, s1_exit, parent_s12),
    [S2] = SMF_CREATE_STATE(s2_entry, s2_run, s2_exit, parent_s12)
};
```
To set the initial state, the \texttt{smf\_set\_initial} function should be called. It has the following prototype: \texttt{void smf\_set\_initial(smf\_ctx *ctx, smf\_state *state)}

To transition from one state to another, the \texttt{smf\_set\_state} function is used and it has the following prototype: \texttt{void smf\_set\_state(smf\_ctx *ctx, smf\_state *state)}

\textbf{NOTE}: While the state machine is running, \texttt{smf\_set\_state} should only be called from the Entry and Run functions. Calling \texttt{smf\_set\_state} from the Exit functions doesn’t make sense and will generate a warning.

### 4.25.4 State Machine Execution

To run the state machine, the \texttt{smf\_run\_state} function should be called in some application dependent way. An application should cease calling \texttt{smf\_run\_state} if it returns a non-zero value. The function has the following prototype: \texttt{int32\_t smf\_run\_state(smf\_ctx *ctx)}

### 4.25.5 State Machine Termination

To terminate the state machine, the \texttt{smf\_terminate} function should be called. It can be called from the entry, run, or exit action. The function takes a non-zero user defined value that's returned by the \texttt{smf\_run\_state} function. The function has the following prototype: \texttt{void smf\_terminate(smf\_ctx *ctx, int32\_t val)}

### 4.25.6 Flat State Machine Example

This example turns the following state diagram into code using the SMF, where the initial state is S0.

![Flat state machine diagram](image_url)

Fig. 15: Flat state machine diagram
/** Forward declaration of state table */
static const struct smf_state demo_states[];

/** List of demo states */
enum demo_state { S0, S1, S2 };

/** User defined object */
struct s_object {
    /* This must be first */
    struct smf_ctx ctx;
    /* Other state specific data add here */
} s_obj;

/* State S0 */
static void s0_entry(void *o) {
    /* Do something */
}
static void s0_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S1]);
}
static void s0_exit(void *o) {
    /* Do something */
}

/* State S1 */
static void s1_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S2]);
}
static void s1_exit(void *o) {
    /* Do something */
}

/* State S2 */
static void s2_entry(void *o) {
    /* Do something */
}
static void s2_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S0]);
}

/* Populate state table */
static const struct smf_state demo_states[] = {
    [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit),
    /* State S1 does not have an entry action */
    [S1] = SMF_CREATE_STATE(NULL, s1_run, s1_exit),
    /* State S2 does not have an exit action */
    [S2] = SMF_CREATE_STATE(s2_entry, s2_run, NULL),
};

int main(void) {
    (continues on next page)
4.25.7 Hierarchical State Machine Example

This example turns the following state diagram into code using the SMF, where S0 and S1 share a parent state and S0 is the initial state.

Fig. 16: Hierarchical state machine diagram

Code:

```c
#include <zephyr/smf.h>

/* Forward declaration of state table */
static const struct smf_state demo_states[];
```
/* List of demo states */
enum demo_state { PARENT, S0, S1, S2 };

/* User defined object */
struct s_object {
    /* This must be first */
    struct smf_ctx ctx;
    /* Other state specific data add here */
}s_obj;

/* Parent State */
static void parent_entry(void *o) {
    /* Do something */
}
static void parent_exit(void *o) {
    /* Do something */
}

/* State S0 */
static void s0_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S1]);
}

/* State S1 */
static void s1_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S2]);
}

/* State S2 */
static void s2_run(void *o) {
    smf_set_state(SMF_CTX(&s_obj), &demo_states[S0]);
}

/* Populate state table */
static const struct smf_state demo_states[] = {
    [PARENT] = SMF_CREATE_STATE(parent_entry, NULL, parent_exit, NULL),
    [S0] = SMF_CREATE_STATE(NULL, s0_run, NULL, &demo_states[PARENT]),
    [S1] = SMF_CREATE_STATE(NULL, s1_run, NULL, &demo_states[PARENT]),
    /* State S2 do ot have entry or exit actions and no parent */
    [S2] = SMF_CREATE_STATE(NULL, s2_run, NULL, NULL),
};

int main(void) {
    int32_t ret;

    /* Set initial state */
    smf_set_initial(SMF_CTX(&s_obj), &demo_states[S0]);

    /* Run the state machine */
    while(1) {
        /* State machine terminates if a non-zero value is returned */
    }
}
When designing hierarchical state machines, the following should be considered:

- Ancestor entry actions are executed before the sibling entry actions. For example, the parent_entry function is called before the s0_entry function.

- Transitioning from one sibling to another with a shared ancestry does not re-execute the ancestor's entry action or execute the exit action. For example, the parent_entry function is not called when transitioning from S0 to S1, nor is the parent_exit function called.

- Ancestor exit actions are executed after the sibling exit actions. For example, the s1_exit function is called before the parent_exit function is called.

- The parent_run function only executes if the child_run function returns without transitioning to another state, i.e. calling smf_set_state.

### 4.25.8 Event Driven State Machine Example

Events are not explicitly part of the State Machine Framework but an event driven state machine can be implemented using Zephyr Events.
#include <zephyr/smf.h>

#define SW0_NODE DT_ALIAS(sw0)

/* List of events */
#define EVENT_BTN_PRESS BIT(0)

static const struct gpio_dt_spec button =
    GPIO_DT_SPEC_GET_OR(SW0_NODE, gpios, {0});

static struct gpio_callback button_cb_data;

/* Forward declaration of state table */
static const struct smf_state demo_states[];

/* List of demo states */
enum demo_state {
    S0, S1
};

/* User defined object */
struct s_object {
    /* This must be first */
    struct smf_ctx ctx;

    /* Events */
    struct k_event smf_event;
    int32_t events;

    /* Other state specific data add here */
} s_obj;

/* State S0 */
static void s0_entry(void *o)
{
    printk("STATE0\n");
}

static void s0_run(void *o)
{
    struct s_object *s = (struct s_object *)o;

    /* Change states on Button Press Event */
    if (s->events & EVENT_BTN_PRESS) {
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S1]);
    }
}

/* State S1 */
static void s1_entry(void *o)
{
    printk("STATE1\n");
}

static void s1_run(void *o)
{
    struct s_object *s = (struct s_object *)o;

    /* Change states on Button Press Event */
    if (s->events & EVENT_BTN_PRESS) {
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S0]);
    }
}  

4.25. State Machine Framework
/* Populate state table */
static const struct smf_state demo_states[] = {
    [S0] = SMF_CREATE_STATE(s0_entry, s0_run, NULL),
    [S1] = SMF_CREATE_STATE(s1_entry, s1_run, NULL),
};

void button_pressed(const struct device *dev,
    struct gpio_callback *cb, uint32_t pins)
{
    /* Generate Button Press Event */
    k_event_post(&s_obj.smf_event, EVENT_BTN_PRESS);
}

int main(void)
{
    int ret;
    if (!gpio_is_ready_dt(&button)) {
        printk("Error: button device %s is not ready\n",
            button.port->name);
        return;
    }
    ret = gpio_pin_configure_dt(&button, GPIO_INPUT);
    if (ret != 0) {
        printk("Error %d: failed to configure %s pin %d\n",
            ret, button.port->name, button.pin);
        return;
    }
    ret = gpio_pin_interrupt_configure_dt(&button, GPIO_INT_EDGE_TO_ACTIVE);
    if (ret != 0) {
        printk("Error %d: failed to configure interrupt on %s pin %d\n",
            ret, button.port->name, button.pin);
        return;
    }
    gpio_init_callback(&button_cb_data, button_pressed, BIT(button.pin));
    gpio_add_callback(button.port, &button_cb_data);

    /* Initialize the event */
    k_event_init(&s_obj.smf_event);

    /* Set initial state */
    smf_set_initial(SMF_CTX(&s_obj), &demo_states[S0]);

    /* Run the state machine */
    while(1) {
        /* Block until an event is detected */
        s_obj.events = k_event_wait(&s_obj.smf_event,
            EVENTBTN_PRESS, true, K_FOREVER);

        /* State machine terminates if a non-zero value is returned */
        ret = smf_run_state(SMF_CTX(&s_obj));
        if (ret) {
            /* handle return code and terminate state machine */
            break;
        }
    }
4.26 Storage

4.26.1 Non-Volatile Storage (NVS)

Elements, represented as id-data pairs, are stored in flash using a FIFO-managed circular buffer. The flash area is divided into sectors. Elements are appended to a sector until storage space in the sector is exhausted. Then a new sector in the flash area is prepared for use (erased). Before erasing the sector it is checked that identifier - data pairs exist in the sectors in use, if not the id-data pair is copied.

The id is a 16-bit unsigned number. NVS ensures that for each used id there is at least one id-data pair stored in flash at all time.

NVS allows storage of binary blobs, strings, integers, longs, and any combination of these.

Each element is stored in flash as metadata (8 byte) and data. The metadata is written in a table starting from the end of a nvs sector, the data is written one after the other from the start of the sector. The metadata consists of: id, data offset in sector, data length, part (unused), and a CRC. The CRC is only calculated over the metadata and only ensures that a write has been completed. The actual data of the element is not protected by a CRC. It is encouraged to include a CRC as part of the data and to take appropriate corrective actions when the data CRC does not match its expected value.

A write of data to nvs always starts with writing the data, followed by a write of the metadata. Data that is written in flash without metadata is ignored during initialization.

During initialization NVS will verify the data stored in flash, if it encounters an error it will ignore any data with missing/incorrect metadata.

NVS checks the id-data pair before writing data to flash. If the id-data pair is unchanged no write to flash is performed.

To protect the flash area against frequent erases it is important that there is sufficient free space. NVS has a protection mechanism to avoid getting in a endless loop of flash page erases when there is limited free space. When such a loop is detected NVS returns that there is no more space available.

For NVS the file system is declared as:

```c
static struct nvs_fs fs = {
    .flash_device = NVS_FLASH_DEVICE,
    .sector_size = NVS_SECTOR_SIZE,
    .sector_count = NVS_SECTOR_COUNT,
    .offset = NVS_STORAGE_OFFSET,
};
```

where

- NVS_FLASH_DEVICE is a reference to the flash device that will be used. The device needs to be operational.
- NVS_SECTOR_SIZE is the sector size, it has to be a multiple of the flash erase page size and a power of 2.
- NVS_SECTOR_COUNT is the number of sectors, it is at least 2, one sector is always kept empty to allow copying of existing data.
- NVS_STORAGE_OFFSET is the offset of the storage area in flash.
Flash wear

When writing data to flash a study of the flash wear is important. Flash has a limited life which is determined by the number of times flash can be erased. Flash is erased one page at a time and the pagesize is determined by the hardware. As an example a nRF51822 device has a pagesize of 1024 bytes and each page can be erased about 20,000 times.

Calculating expected device lifetime

Suppose we use a 4 bytes state variable that is changed every minute and needs to be restored after reboot. NVS has been defined with a sector_size equal to the pagesize (1024 bytes) and 2 sectors have been defined.

Each write of the state variable requires 12 bytes of flash storage: 8 bytes for the metadata and 4 bytes for the data. When storing the data the first sector will be full after 1024/12 = 85.33 minutes. After another 85.33 minutes, the second sector is full. When this happens, because we’re using only two sectors, the first sector will be used for storage and will be erased after 171 minutes of system time. With the expected device life of 20,000 writes, with two sectors writing every 171 minutes, the device should last about 171 * 20,000 minutes, or about 6.5 years.

More generally then, with

- NS as the number of storage requests per minute,
- DS as the data size in bytes,
- SECTOR_SIZE in bytes, and
- PAGE_ERASES as the number of times the page can be erased,

the expected device life (in minutes) can be calculated as:

\[
\text{SECTOR_COUNT} \times \text{SECTOR_SIZE} \times \text{PAGE_ERASES} / (\text{NS} \times (\text{DS}+8)) \text{ minutes}
\]

From this formula it is also clear what to do in case the expected life is too short: increase SECTOR_COUNT or SECTOR_SIZE.

Flash write block size migration

It is possible that during a DFU process, the flash driver used by the NVS changes the supported minimal write block size. The NVS in-flash image will stay compatible unless the physical ATE size changes. Especially, migration between 1,2,4,8-bytes write block sizes is allowed.

Sample

A sample of how NVS can be used is supplied in samples/subsys/nvs.

Troubleshooting

MPU fault while using NVS, or -ETIMEDOUT error returned

NVS can use the internal flash of the SoC. While the MPU is enabled, the flash driver requires MPU RWX access to flash memory, configured using CONFIG_MPU_ALLOW_FLASH_WRITE. If this option is disabled, the NVS application will get an MPU fault if it references the internal SoC flash and it’s the only thread running. In a multi-threaded application, another thread might intercept the fault and the NVS API will return an -ETIMEDOUT error.
API Reference

The NVS subsystem APIs are provided by \textit{nvs.h}:

\textit{group nvs\_data\_structures}
Non-volatile Storage Data Structures.

\begin{verbatim}
struct nvs\_fs
#include \langle nvs.h \rangle Non-volatile Storage File system structure.
\end{verbatim}

### Public Members

\texttt{off\_t offset}
File system offset in flash.

\texttt{uint32\_t ate\_wra}
Allocation table entry write address.
Addresses are stored as \texttt{uint32\_t}:
\begin{itemize}
  \item high 2 bytes correspond to the sector
  \item low 2 bytes are the offset in the sector
\end{itemize}

\texttt{uint32\_t data\_wra}
Data write address.

\texttt{uint16\_t sector\_size}
File system is split into sectors, each sector must be multiple of erase-block-size.

\texttt{uint16\_t sector\_count}
Number of sectors in the file system.

\texttt{bool ready}
Flag indicating if the file system is initialized.

\texttt{struct k_mutex nvs\_lock}
Mutex.

\texttt{const struct device *flash\_device}
Flash device runtime structure.

\texttt{const struct flash\_parameters *flash\_parameters}
Flash memory parameters structure.

### Related code samples

Non-Volatile Storage (NVS)
Store and retrieve data from flash using the NVS API.

\textit{group nvs\_high\_level\_api}
Non-volatile Storage APIs.
Functions

int nvs_mount(struct nvs_fs *fs)
Mount an NVS file system onto the flash device specified in fs.

Parameters
• fs – Pointer to file system

Return values
• 0 – Success
• -ERRNO – errno code if error

int nvs_clear(struct nvs_fs *fs)
Clear the NVS file system from flash.

Parameters
• fs – Pointer to file system

Return values
• 0 – Success
• -ERRNO – errno code if error

ssize_t nvs_write(struct nvs_fs *fs, uint16_t id, const void *data, size_t len)
Write an entry to the file system.

Note: When len parameter is equal to 0 then entry is effectively removed (it is equivalent to calling of nvs_delete). Any calls to nvs_read for entries with data of length 0 will return error.

It is not possible to distinguish between deleted entry and entry with data of length 0.

Parameters
• fs – Pointer to file system
• id – Id of the entry to be written
• data – Pointer to the data to be written
• len – Number of bytes to be written

Returns
Number of bytes written. On success, it will be equal to the number of bytes requested to be written. When a rewrite of the same data already stored is attempted, nothing is written to flash, thus 0 is returned. On error, returns negative value of errno.h defined error codes.

int nvs_delete(struct nvs_fs *fs, uint16_t id)
Delete an entry from the file system.

Parameters
• fs – Pointer to file system
• id – Id of the entry to be deleted

Return values
• 0 – Success
• -ERRNO – errno code if error
ssize_t nvs_read(struct nvs_fs *fs, uint16_t id, void *data, size_t len)
Read an entry from the file system.

Parameters
- \(fs\) – Pointer to file system
- \(id\) – Id of the entry to be read
- \(data\) – Pointer to data buffer
- \(len\) – Number of bytes to be read

Returns
Number of bytes read. On success, it will be equal to the number of bytes requested to be read. When the return value is larger than the number of bytes requested to read this indicates not all bytes were read, and more data is available. On error, returns negative value of errno.h defined error codes.

ssize_t nvs_read_hist(struct nvs_fs *fs, uint16_t id, void *data, size_t len, uint16_t cnt)
Read a history entry from the file system.

Parameters
- \(fs\) – Pointer to file system
- \(id\) – Id of the entry to be read
- \(data\) – Pointer to data buffer
- \(len\) – Number of bytes to be read
- \(cnt\) – History counter: 0: latest entry, 1: one before latest ...

Returns
Number of bytes read. On success, it will be equal to the number of bytes requested to be read. When the return value is larger than the number of bytes requested to read this indicates not all bytes were read, and more data is available. On error, returns negative value of errno.h defined error codes.

ssize_t nvs_calc_free_space(struct nvs_fs *fs)
Calculate the available free space in the file system.

Parameters
- \(fs\) – Pointer to file system

Returns
Number of bytes free. On success, it will be equal to the number of bytes that can still be written to the file system. Calculating the free space is a time consuming operation, especially on spi flash. On error, returns negative value of errno.h defined error codes.

4.26.2 Disk Access

Overview
The disk access API provides access to storage devices.
SD Card support

Zephyr has support for some SD card controllers and support for interfacing SD cards via SPI. These drivers use disk driver interface and a file system can access the SD cards via disk access API. Both standard and high-capacity SD cards are supported.

**Note:** The system does not support inserting or removing cards while the system is running. The cards must be present at boot and must not be removed. This may be fixed in future releases. FAT filesystems are not power safe so the filesystem may become corrupted if power is lost or if the card is removed.

SD Memory Card subsystem  Zephyr supports SD memory cards via the disk driver API, or via the SDMMC subsystem. This subsystem can be used transparently via the disk driver API, but also supports direct block level access to cards. The SDMMC subsystem interacts with the *sd host controller api* to communicate with attached SD cards.

SD Card support via SPI  Example devicetree fragment below shows how to add SD card node to *spi1* interface. Example uses pin *PA27* for chip select, and runs the SPI bus at 24 MHz once the SD card has been initialized:

```plaintext
&amp;spi1 {
  status = "okay";
  cs-gpios = &porta 27 GPIO_ACTIVE_LOW;
  sdhc0: sdhc@ { 
    compatible = "zephyr,sdhc-spi-slot";
    reg = <0>;
    status = "okay";
    mmc { 
      compatible = "zephyr,sdmmc-disk";
      status = "okay";
    };
    spi-max-frequency = <24000000>;
  };
}
```

The SD card will be automatically detected and initialized by the filesystem driver when the board boots.

To read and write files and directories, see the *File Systems* in *include/zephyr/fs/fs.h* such as *fs_open()* , *fs_read()* , and *fs_write()*.

eMMC Device Support

Zephyr also has support for eMMC devices using the Disk Access API. MMC in zephyr is implemented using the SD subsystem because the MMC bus shares a lot of similarity with the SD bus. MMC controllers also use the SDHC device driver API.

Emulated block device on flash partition support

Zephyr flashdisk driver makes it possible to use flash memory partition as a block device. The flashdisk instances are defined in devicetree:
The cache size specified in `zephyr,flash-disk` node should be equal to backing partition minimum erasable block size.

**NVMe disk support**   NVMe disks are also supported

NVMe is a standardized logical device interface on PCIe bus exposing storage devices. NVMe controllers and disks are supported. Disks can be accessed via the Disk Access API they expose and thus be used through the File System API.

**Driver design**  The driver is sliced up in 3 main parts: - NVMe controller drivers/disk/nvme/nvme_controller.c - NVMe commands drivers/disk/nvme/nvme_cmd.c - NVMe namespace drivers/disk/nvme/nvme_namespace.c

Where the NVMe controller is the root of the device driver. This is the one that will get device driver instances. Note that this is only what DTS describes: the NVMe controller, and none of its namespaces (disks). The NVMe command is the generic logic used to communicate with the controller and the namespaces it exposes. Finally the NVMe namespace is the dedicated part to deal with an actual namespace which, in turn, enables applications accessing each ones through the Disk Access API drivers/disk/nvme/nvme_disk.c.

If a controller exposes more than 1 namespace (disk), it will be possible to raise the amount of built-in namespace support by tweaking the configuration option CONFIG_NVME_MAX_NAMESPACES (see below).

Each exposed disk, via it's related disk_info structure, will be distinguished by its name which is inherited from it's related namespace. As such, the disk name follows NVMe naming which is nvme<k>-n<n> where k is the controller number and n the namespace number. Most of the time, if only one NVMe disk is plugged into the system, one will see ‘nvme0n0’ as an exposed disk.

**NVMe configuration**

**DTS**  Any board exposing an NVMe disk should provide a DTS overlay to enable its use within Zephyr

```c
#include <zephyr/dt-bindings/pcie/pcie.h>
/

pcie0 {
    nvme0: nvme0 {
        compatible = "nvme-controller";
        vendor-id = <VENDOR_ID>;
        device-id = <DEVICE_ID>;
        status = "okay";
    };
};
```

4.26. Storage  1089
Where VENDOR_ID and DEVICE_ID are the ones from the exposed NVMe controller.

**Options**

- **CONFIG_NVME**

Note that NVME requires the target to support PCIe multi-vector MSI-X in order to function.

- **CONFIG_NVME_MAX_NAMESPACES**

**Important note for users** NVMe specifications mandate the data buffer to be placed in a dword (4 bytes) aligned address. While this is not a problem for advanced OS managing virtual memory and dynamic allocations below the user processes, this can become an issue in Zephyr as soon as buffer addresses map directly to physical memory.

At this stage then, it is up to the user to make sure the buffer address being provided to `disk_access_read()` and `disk_access_write()` are dword aligned.

**Disk Access API Configuration Options**

Related configuration options:

- **CONFIG_DISK_ACCESS**

**API Reference**

**Related code samples**

**File system manipulation**

Use file system API with various filesystems and storage devices.

```c
int disk_access_init(const char *pdrv)
{
    perform any initialization

    This call is made by the consumer before doing any IO calls so that the disk or the backing device can do any initialization.

    **Parameters**

    - **pdrv** – [in] Disk name

    **Returns**

    0 on success, negative errno code on fail

int disk_access_status(const char *pdrv)
{
    Get the status of disk.

    This call is used to get the status of the disk

    **Parameters**

    - **pdrv** – [in] Disk name
```
**Returns**
DISK_STATUS_OK or other DISK_STATUS_*s

```c
int disk_access_read(const char *pdrv, uint8_t *data_buf, uint32_t start_sector, uint32_t num_sector)
```
read data from disk

Function to read data from disk to a memory buffer.

Note: if the disk is of NVMe type, user will need to ensure data_buf pointer is 4-bytes aligned.

**Parameters**
- `pdrv` – [in] Disk name
- `data_buf` – [in] Pointer to the memory buffer to put data.
- `start_sector` – [in] Start disk sector to read from
- `num_sector` – [in] Number of disk sectors to read

**Returns**
0 on success, negative errno code on fail

```c
int disk_access_write(const char *pdrv, const uint8_t *data_buf, uint32_t start_sector, uint32_t num_sector)
```
write data to disk

Function write data from memory buffer to disk.

Note: if the disk is of NVMe type, user will need to ensure data_buf pointer is 4-bytes aligned.

**Parameters**
- `pdrv` – [in] Disk name
- `data_buf` – [in] Pointer to the memory buffer
- `start_sector` – [in] Start disk sector to write to
- `num_sector` – [in] Number of disk sectors to write

**Returns**
0 on success, negative errno code on fail

```c
int disk_access_ioctl(const char *pdrv, uint8_t cmd, void *buff)
```
Get/Configure disk parameters.

Function to get disk parameters and make any special device requests.

**Parameters**
- `pdrv` – [in] Disk name
- `cmd` – [in] DISK_IOCTL_* code describing the request
- `buff` – [in] Command data buffer

**Returns**
0 on success, negative errno code on fail

---

**Disk Driver Configuration Options**

Related driver configuration options:
- `CONFIG_DISK_DRIVERS`
Disk Driver Interface

**group disk_driver_interface**
Disk Driver Interface.

**Defines**

- **DISK_IOCTL_GET_SECTOR_COUNT**
  Possible Cmd Codes for disk_ioctl()
  Get the number of sectors in the disk

- **DISK_IOCTL_GET_SECTOR_SIZE**
  Get the size of a disk SECTOR in bytes.

- **DISK_IOCTL_RESERVED**
  reserved.
  It used to be DISK_IOCTL_GET_DISK_SIZE

- **DISK_IOCTL_GET_ERASE_BLOCK_SZ**
  How many sectors constitute a FLASH Erase block.

- **DISK_IOCTL_CTRL_SYNC**
  Commit any cached read/writes to disk.

- **DISK_STATUS_OK**
  Possible return bitmasks for disk_status()
  Disk status okay

- **DISK_STATUS_UNINIT**
  Disk status uninitialized.

- **DISK_STATUS_NOMEDIA**
  Disk status no media.

- **DISK_STATUS_WR_PROTECT**
  Disk status write protected.

**Functions**

- **int disk_access_register**(struct *disk_info* *disk**)
  Register disk.

  **Parameters**
  - *disk* – [in] Pointer to the disk info structure

  **Returns**
  0 on success, negative errno code on fail
int disk_access_unregister(struct disk_info *disk)
    Unregister disk.

    **Parameters**
    - disk – [in] Pointer to the disk info structure

    **Returns**
    0 on success, negative errno code on fail

struct disk_info
    #include <disk.h> Disk info.

    **Public Members**

    **sys_dnode_t node**
    Internally used list node.

    char *name
    Disk name.

    const struct disk_operations *ops
    Disk operations.

    const struct device *dev
    Device associated to this disk.

    **struct disk_operations**
    #include <disk.h> Disk operations.

4.26.3 **Flash map**

The `<zephyr/storage/flash_map.h>` API allows accessing information about device flash partitions via `flash_area` structures.

Each `flash_area` describes a flash partition. The API provides access to a “flash map”, which contains predefined flash areas accessible via globally unique ID numbers. The map is created from “fixed-partition” compatible entries in DTS file. Users may also create `flash_area` objects at runtime for application-specific purposes.

This documentation uses “flash area” when referencing single “fixed-partition” entities.

The `flash_area` contains a pointer to a `device`, which can be used to access the flash device an area is placed on directly with the flash API. Each flash area is characterized by a device it is placed on, offset from the beginning of the device and size on the device. An additional identifier parameter is used by the `flash_area_open()` function to find flash area in flash map.

The flash_map.h API provides functions for operating on a `flash_area`. The main examples are `flash_area_read()` and `flash_area_write()`. These functions are basically wrappers around the flash API with additional offset and size checks, to limit flash operations to a predefined area.

Most `<zephyr/storage/flash_map.h>` API functions require a `flash_area` object pointer characterizing the flash area they will be working on. There are two possible methods to obtain such a pointer:
obtain it using `flash_area_open`;
- defining a `flash_area` type object, which requires providing a valid `device` object pointer with offset and size of the area within the flash device.

`flash_area_open()` uses numeric identifiers to search flash map for `flash_area` objects and returns, if found, a pointer to an object representing area with given ID. The ID number for a flash area can be obtained from a fixed-partition DTS node label using `FIXED_PARTITION_ID()`; these labels are obtained from the devicetree as described below.

### Relationship with Devicetree

The `flash_map.h` API uses data generated from the `Devicetree API`, in particular its `Fixed flash partitions`. Zephyr additionally has some partitioning conventions used for `Device Firmware Upgrade` via the MCUboot bootloader, as well as defining partitions usable by `file systems` or other nonvolatile storage.

Here is an example devicetree fragment which uses fixed flash partitions for both MCUboot and a storage partition. Some details were left out for clarity.

```devicetree
/ {
  soc {
    flashctrl: flash-controller@deadbeef {
      flash0: flash@0 {
        compatible = "soc-nv-flash";
        reg = <0x0 0x100000>;
      }
    }
    partitions {
      compatible = "fixed-partitions";
      #address-cells = <0x1>;
      #size-cells = <0x1>;

      boot_partition: partition@0 {
        reg = <0x0 0x10000>;
        read-only;
      };
      storage_partition: partition@1e000 {
        reg = <0x1e000 0x2000>;
      };
      slot0_partition: partition@20000 {
        reg = <0x20000 0x60000>;
      };
      slot1_partition: partition@80000 {
        reg = <0x80000 0x60000>;
      };
      scratch_partition: partition@e0000 {
        reg = <0xe0000 0x20000>;
      };
    }
  }
};
```

Partition offset shall be expressed in relation to the flash memory beginning address, to which the partition belongs to.

The `boot_partition`, `slot0_partition`, `slot1_partition`, and `scratch_partition` node labels are defined for MCUboot, though not all MCUboot configurations require all of them to be defined. See the [MCUboot documentation](#) for more details.

The `storage_partition` node is defined for use by a file system or other nonvolatile storage API.
Numeric flash area ID is obtained by passing DTS node label to `FIXED_PARTITION_ID()`. For example to obtain ID number for `slot0_partition`, user would invoke `FIXED_PARTITION_ID(slot0_partition)`.

All `FIXED_PARTITION_` macros take DTS node labels as partition identifiers.

Users do not have to obtain a `flash_area` object pointer using `flash_map_open()` to get information on flash area size, offset or device, if such area is defined in DTS file. Knowing the DTS node label of an area, users may use `FIXED_PARTITION_OFFSET()`, `FIXED_PARTITION_SIZE()` or `FIXED_PARTITION_DEVICE()` respectively to obtain such information directly from DTS node definition. For example to obtain offset of `storage_partition` it is enough to invoke `FIXED_PARTITION_OFFSET(storage_partition)`.

Below example shows how to obtain a `flash_area` object pointer using `flash_area_open()` and DTS node label:

```c
const struct flash_area *my_area;

int err = flash_area_open(FIXED_PARTITION_ID(slot0_partition), &my_area);

if (err != 0) {
    handle_the_error(err);
} else {
    flash_area_read(my_area, ...);
}
```

**API Reference**

**Related code samples**

- **LittleFS filesystem**
  Use file system API over LittleFS.

- **nRF SoC flash**
  Use the flash API to interact with the SoC flash.

**group flash_area_api**

Abstraction over flash partitions/areas and their drivers.

**Defines**

- **SOC_FLASH_0_ID**
  Provided for compatibility with MCUboot.

- **SPI_FLASH_0_ID**
  Provided for compatibility with MCUboot.

- **FIXED_PARTITION_EXISTS(label)**
  Returns non-0 value if fixed-partition of given DTS node label exists.

  **Parameters**
  - `label` – DTS node label

  **Returns**
  non-0 if fixed-partition node exists and is enabled; 0 if node does not exist, is not enabled or is not fixed-partition.
FIXED_PARTITION_ID(label)
Get flash area ID from fixed-partition DTS node label.

Parameters
• label – DTS node label of a partition

Returns
flash area ID

FIXED_PARTITION_OFFSET(label)
Get fixed-partition offset from DTS node label.

Parameters
• label – DTS node label of a partition

Returns
fixed-partition offset, as defined for the partition in DTS.

FIXED_PARTITION_SIZE(label)
Get fixed-partition size for DTS node label.

Parameters
• label – DTS node label

Returns
fixed-partition offset, as defined for the partition in DTS.

FLASH_AREADEVICE(label)
Get device pointer for device the area/partition resides on.

Parameters
• label – DTS node label of a partition

Returns
const struct device type pointer

FIXED_PARTITIONDEVICE(label)
Get device pointer for device the area/partition resides on.

Parameters
• label – DTS node label of a partition

Returns
Pointer to a device.

Typedefs

typedef void (*flash_area_cb_t)(const struct flash_area *fa, void *user_data)
Flash map iteration callback.

Param fa
flash area

Param user_data
User supplied data
Functions

int flash_area_open(uint8_t id, const struct flash_area **fa)
Retrieve partitions flash area from the flash_map.

Function Retrieves flash_area from flash_map for given partition.

Parameters

  • id – [in] ID of the flash partition.
  • fa – [out] Pointer which has to reference flash_area. If ID is unknown, it will be NULL on output.

Returns

  0 on success, -EACCES if the flash_map is not available, -ENOENT if ID is unknown, -ENODEV if there is no driver attached to the area.

void flash_area_close(const struct flash_area *fa)
Close flash_area.
Reserved for future usage and external projects compatibility reason. Currently is NOP.

Parameters

  • fa – [in] Flash area to be closed.

int flash_area_read(const struct flash_area *fa, off_t off, void *dst, size_t len)
Read flash area data.
Read data from flash area. Area readout boundaries are asserted before read request. API has the same limitation regard read-block alignment and size as wrapped flash driver.

Parameters

  • fa – [in] Flash area
  • off – [in] Offset relative from beginning of flash area to read
  • dst – [out] Buffer to store read data
  • len – [in] Number of bytes to read

Returns

  0 on success, negative errno code on fail.

int flash_area_write(const struct flash_area *fa, off_t off, const void *src, size_t len)
Write data to flash area.
Write data to flash area. Area write boundaries are asserted before write request. API has the same limitation regard write-block alignment and size as wrapped flash driver.

Parameters

  • fa – [in] Flash area
  • off – [in] Offset relative from beginning of flash area to write
  • src – [in] Buffer with data to be written
  • len – [in] Number of bytes to write

Returns

  0 on success, negative errno code on fail.
int flash_area_erase(const struct flash_area *fa, off_t off, size_t len)
Erase flash area.

Erase given flash area range. Area boundaries are asserted before erase request. API has the same limitation regard erase-block alignment and size as wrapped flash driver.

Parameters
• fa – [in] Flash area
• off – [in] Offset relative from beginning of flash area.
• len – [in] Number of bytes to be erase

Returns
0 on success, negative errno code on fail.

uint32_t flash_area_align(const struct flash_area *fa)
Get write block size of the flash area.

Currently write block size might be treated as read block size, although most of drivers supports unaligned readout.

Parameters
• fa – [in] Flash area

Returns
Alignment restriction for flash writes in [B].

int flash_area_get_sectors(int fa_id, uint32_t *count, struct flash_sector *sectors)
Retrieve info about sectors within the area.

Parameters
• fa_id – [in] Given flash area ID
• sectors – [out] buffer for sectors data
• count – [inout] On input Capacity of sectors, on output number of sectors Retrieved.

Returns
0 on success, negative errno code on fail. Especially returns -ENOMEM if There are too many flash pages on the flash_area to fit in the array.

void flash_area_foreach(flash_area_cb_t user_cb, void *user_data)
Iterate over flash map.

Parameters
• user_cb – User callback
• user_data – User supplied data

int flash_area_has_driver(const struct flash_area *fa)
Check whether given flash area has supporting flash driver in the system.

Parameters
• fa – [in] Flash area.

Returns
1 On success. -ENODEV if no driver match.

const struct device *flash_area_get_device(const struct flash_area *fa)
Get driver for given flash area.

Parameters
• fa – [in] Flash area.
Returns
device driver.

uint8_t flash_area_erased_val(const struct flash_area *fa)
Get the value expected to be read when accessing any erased flash byte.
This API is compatible with the MCUBoot’s porting layer.

Parameters
  • fa – Flash area.

Returns
Byte value of erase memory.

struct flash_area
#include <flash_map.h> Flash partition.
This structure represents a fixed-size partition on a flash device. Each partition con-
tains one or more flash sectors.

Public Members

uint8_t fa_id
ID number.

off_t fa_off
Start offset from the beginning of the flash device.

size_t fa_size
Total size.

const struct device *fa_dev
Backing flash device.

struct flash_sector
#include <flash_map.h> Structure for transfer flash sector boundaries.
This template is used for presentation of flash memory structure. It consumes much less RAM than flash_area

Public Members

off_t fs_off
Sector offset from the beginning of the flash device.

size_t fs_size
Sector size in bytes.
4.26.4 Flash Circular Buffer (FCB)

Flash circular buffer provides an abstraction through which you can treat flash like a FIFO. You append entries to the end, and read data from the beginning.

Note: As of Zephyr release 2.1 the NVS storage API is recommended over FCB for use as a backend for the settings API.

Description

Entries in the flash contain the length of the entry, the data within the entry, and checksum over the entry contents.

Storage of entries in flash is done in a FIFO fashion. When you request space for the next entry, space is located at the end of the used area. When you start reading, the first entry served is the oldest entry in flash.

Entries can be appended to the end of the area until storage space is exhausted. You have control over what happens next; either erase oldest block of data, thereby freeing up some space, or stop writing new data until existing data has been collected. FCB treats underlying storage as an array of flash sectors; when it erases old data, it does this a sector at a time.

Entries in the flash are checksummed. That is how FCB detects whether writing entry to flash completed ok. It will skip over entries which don't have a valid checksum.

Usage

To add an entry to circular buffer:

- Call `fcb_append()` to get the location where data can be written. If this fails due to lack of space, you can call `fcb_rotate()` to erase the oldest sector which will make the space. And then call `fcb_append()` again.
- Use `flash_area_write()` to write entry contents.
- Call `fcb_append_finish()` when done. This completes the writing of the entry by calculating the checksum.

To read contents of the circular buffer:

- Call `fcb_walk()` with a pointer to your callback function.
- Within callback function copy in data from the entry using `flash_area_read()`. You can tell when all data from within a sector has been read by monitoring the returned entry's area pointer. Then you can call `fcb_rotate()`, if you're done with that data.

Alternatively:

- Call `fcb_getnext()` with 0 in entry offset to get the pointer to the oldest entry.
- Use `flash_area_read()` to read entry contents.
- Call `fcb_getnext()` with pointer to current entry to get the next one. And so on.

API Reference

The FCB subsystem APIs are provided by `fcb.h`:
Data structures

*group fcb_data_structures*

**Defines**

`FCB_MAX_LEN`
Max length of element.

`FCB_ENTRY_FA_DATA_OFF(entry)`
Helper macro for calculating the data offset related to the fcb *flash_area* start offset.

**Parameters**

- `entry` – fcb entry structure

`FCB_FLAGS_CRC_DISABLED`
Flag to disable CRC for the fcb_entries in flash.

**struct fcb_entry**

*include <fcb.h>* FCB entry info structure.

This data structure describes the element location in the flash.

You would use it to figure out what parameters to pass to *flash_area_read()* to read element contents. Or to *flash_area_write()* when adding a new element. Entry location is pointer to area (within fcb->f_sectors), and offset within that area.

**Public Members**

**struct flash_sector** *fe_sector*
Pointer to info about sector where data are placed.

`uint32_t fe_elem_off`
Offset from the start of the sector to beginning of element.

`uint32_t fe_data_off`
Offset from the start of the sector to the start of element.

`uint16_t fe_data_len`
Size of data area in fcb entry.

**struct fcb_entry_ctx**

*include <fcb.h>* Structure for transferring complete information about FCB entry location within flash memory.

**Public Members**

**struct fcb_entry** *loc*
FCB entry info.
const struct flash_area *fap
   Flash area where the entry is placed.

struct fcb
   #include <fcb.h> FCB instance structure.
   The following data structure describes the FCB itself. First part should be filled in by
   the user before calling fcb_init. The second part is used by FCB for its internal book-
   keeping.

Public Members

uint32_t f_magic
   Magic value, should not be 0xFFFFFFFF.
   It is xored with inversion of f_erase_value and placed in the beginning of FCB flash
   sector. FCB uses this when determining whether sector contains valid data or not.
   Giving it value of 0xFFFFFFFF means leaving bytes of the file in “erased” state.

uint8_t f_version
   Current version number of the data.

uint8_t f_sector_cnt
   Number of elements in sector array.

uint8_t f_scratch_cnt
   Number of sectors to keep empty.
   This can be used if you need to have scratch space for garbage collecting when FCB
   fills up.

struct flash_sector *f_sectors
   Array of sectors, must be contiguous.

struct k_mutex f_mtx
   Locking for accessing the FCB data, internal state.

struct flash_sector *f_oldest
   Pointer to flash sector containing the oldest data, internal state.

struct fcb_entry f_active
   internal state

uint16_t f_active_id
   Flash location where the newest data is, internal state.

uint8_t f_align
   writes to flash have to aligned to this, internal state
const struct flash_area *fap
Flash area used by the fcb instance, internal state.
This can be transfer to FCB user

uint8_t f_erase_value
The value flash takes when it is erased.
This is read from flash parameters and initialized upon call to fcb_init.

API functions

**group fcb_api**
Flash Circular Buffer APIs.

**Typedefs**

typedef int (*fcb_walk_cb)(struct fcb_entry_ctx *loc_ctx, void *arg)
FCB Walk callback function type.
Type of function which is expected to be called while walking over fcb entries thanks to a fcb_walk call.

Entry data can be read using flash_area_read(), using loc_ctx fields as arguments. If cb wants to stop the walk, it should return non-zero value.

**Param loc_ctx**
[in] entry location information (full context)

**Param arg**
[inout] callback context, transferred from fcb_walk.

**Return**
0 continue walking, non-zero stop walking.

**Functions**

**int fcb_init(int f_area_id, struct fcb *fcb)**
Initialize FCB instance.

**Parameters**
- **f_area_id** – [in] ID of flash area where fcb storage resides.
- **fcb** – [inout] FCB instance structure.

**Returns**
0 on success, non-zero on failure.

**int fcb_append(struct fcb *fcb, uint16_t len, struct fcb_entry *loc)**
Appends an entry to circular buffer.

When writing the contents for the entry, use loc->fe_sector and loc->fe_data_off with flash_area_write() to fcb flash_area. When you’re finished, call fcb_append_finish() with loc as argument.

**Parameters**
- **fcb** – [in] FCB instance structure.
• **len** – [in] Length of data which are expected to be written as the entry payload.

• **loc** – [out] entry location information

**Returns**
0 on success, non-zero on failure.

```c
int fcb_append_finish(struct fcb *fcb, struct fcb_entry *append_loc)
```
Finishes entry append operation.

**Parameters**

• **fcb** – [in] FCB instance structure.

• **append_loc** – [in] entry location information

**Returns**
0 on success, non-zero on failure.

```c
int fcb_walk(struct fcb *fcb, struct flash_sector *sector , fcb_walk_cb cb, void *cb_arg)
```
Walk over all entries in the FCB sector.

**Parameters**

• **sector** – [in] fcb sector to be walked. If null, traverse entire storage.

• **fcb** – [in] FCB instance structure.

• **cb** – [in] pointer to the function which gets called for every entry. If cb wants to stop the walk, it should return non-zero value.

• **cb_arg** – [inout] callback context, transferred to the callback implementation.

**Returns**
0 on success, negative on failure (or transferred form callback return-value), positive transferred form callback return-value

```c
int fcb_getnext(struct fcb *fcb, struct fcb_entry *loc)
```
Get next fcb entry location.

Function to obtain fcb entry location in relation to entry pointed by loc. If loc->fe_sector is set and loc->fe_elem_off is not 0 function fetches next fcb entry location. If loc->fe_sector is NULL function fetches the oldest entry location within FCB storage. loc->fe_sector is set and loc->fe_elem_off is 0 function fetches the first entry location in the fcb sector.

**Parameters**

• **fcb** – [in] FCB instance structure.

• **loc** – [inout] entry location information

**Returns**
0 on success, non-zero on failure.

```c
int fcb_rotate(struct fcb *fcb)
```
Rotate fcb sectors.

Function erases the data from oldest sector. Upon that the next sector becomes the oldest. Active sector is also switched if needed.

**Parameters**

• **fcb** – [in] FCB instance structure.
int fcb_append_to_scratch(struct fcb *fcb)
Start using the scratch block.
Take one of the scratch blocks into use. So a scratch sector becomes active sector to
which entries can be appended.

Parameters
  • fcb – [in] FCB instance structure.

Returns
  0 on success, non-zero on failure.

int fcb_free_sector_cnt(struct fcb *fcb)
Get free sector count.

Parameters
  • fcb – [in] FCB instance structure.

Returns
  Number of free sectors.

int fcb_is_empty(struct fcb *fcb)
Check whether FCB has any data.

Parameters
  • fcb – [in] FCB instance structure.

Returns
  Positive value if fcb is empty, otherwise 0.

int fcb_offset_last_n(struct fcb *fcb, uint8_t entries, struct fcb_entry *last_n_entry)
Finds the fcb entry that gives back up to n entries at the end.

Parameters
  • fcb – [in] FCB instance structure.
  • entries – [in] number of fcb entries the user wants to get
  • last_n_entry – [out] last_n_entry the fcb_entry to be returned

Returns
  0 on there are any fcbs available; -ENOENT otherwise

int fcb_clear(struct fcb *fcb)
Clear fcb instance storage.

Parameters
  • fcb – [in] FCB instance structure.

Returns
  0 on success; non-zero on failure

4.26.5 Stream Flash

The Stream Flash module takes contiguous fragments of a stream of data (e.g. from radio packs-
et), aggregates them into a user-provided buffer, then when the buffer fills (or stream ends)
writes it to a raw flash partition. It supports providing the read-back buffer to the client to use
in validating the persisted stream content.

One typical use of a stream write operation is when receiving a new firmware image to be used
in a DFU operation.
There are several reasons why one might want to use buffered writes instead of writing the data directly as it is made available. Some devices have hardware limitations which does not allow flash writes to be performed in parallel with other operations, such as radio RX and TX. Also, fewer write operations result in faster response times seen from the application.

**Persistent stream write progress**

Some stream write operations, such as DFU operations, may run for a long time. When performing such long running operations it can be useful to be able to save the stream write progress to persistent storage so that the operation can resume at the same point after an unexpected interruption.

The Stream Flash module offers an API for loading, saving and clearing stream write progress to persistent storage using the `Settings` module. The API can be enabled using `CONFIG_STREAM_FLASH_PROGRESS`.

**API Reference**

```c
typedef int (*stream_flash_callback_t)(uint8_t *buf, size_t len, size_t offset)
```

Signature for callback invoked after flash write completes.

Functions of this type are invoked with a buffer containing data read back from the flash after a flash write has completed. This enables verifying that the data has been correctly stored (for instance by using a SHA function). The write buffer ‘buf’ provided in `stream_flash_init` is used as a read buffer for this purpose.

**Param buf**

Pointer to the data read.

**Param len**

The length of the data read.

**Param offset**

The offset the data was read from.

```c
int stream_flash_init(struct stream_flash_ctx *ctx, const struct device *fdev, uint8_t *buf, size_t buf_len, size_t offset, size_t size, stream_flash_callback_t cb)
```

Initialize context needed for stream writes to flash.

**Parameters**

- `ctx` – context to be initialized
- `fdev` – Flash device to operate on
- `buf` – Write buffer
- `buf_len` – Length of write buffer. Can not be larger than the page size. Must be multiple of the flash device write-block-size.
• **offset** – Offset within flash device to start writing to
• **size** – Number of bytes available for performing buffered write. If this is '0', the size will be set to the total size of the flash device minus the offset.
• **cb** – Callback to be invoked on completed flash write operations.

**Returns**
non-negative on success, negative errno code on fail

```c
size_t stream_flash_bytes_written(struct stream_flash_ctx *ctx)
```
Read number of bytes written to the flash.

**Note:** api-tags: pre-kernel-ok isr-ok

**Parameters**
- **ctx** – context

**Returns**
Number of payload bytes written to flash.

```c
int stream_flash_buffered_write(struct stream_flash_ctx *ctx, const uint8_t *data, size_t len, bool flush)
```
Process input buffers to be written to flash device in single blocks.
Will store remainder between calls.
A final call to this function with flush set to true will write out the remaining block buffer to flash.

**Parameters**
- **ctx** – context
- **data** – data to write
- **len** – Number of bytes to write
- **flush** – when true this forces any buffered data to be written to flash
  A flush write should be the last write operation in a sequence of write operations for given context (although this is not mandatory if the total data size is a multiple of the buffer size).

**Returns**
non-negative on success, negative errno code on fail

```c
int stream_flash_erase_page(struct stream_flash_ctx *ctx, off_t off)
```
Erase the flash page to which a given offset belongs.
This function erases a flash page to which an offset belongs if this page is not the page previously erased by the provided ctx (ctx->last_erased_page_start_offset).

**Parameters**
- **ctx** – context
- **off** – offset from the base address of the flash device

**Returns**
non-negative on success, negative errno code on fail
int stream_flash_progress_load(struct stream_flash_ctx *ctx, const char *settings_key)
Load persistent stream write progress stored with key settings_key.

This function should be called directly after stream_flash_init to load previous stream write progress before writing any data. If the loaded progress has fewer bytes written than ctx then it will be ignored.

**Parameters**
- **ctx** – context
- **settings_key** – key to use with the settings module for loading the stream write progress

**Returns**
- non-negative on success, negative errno code on fail

int stream_flash_progress_save(struct stream_flash_ctx *ctx, const char *settings_key)
Save persistent stream write progress using key settings_key.

**Parameters**
- **ctx** – context
- **settings_key** – key to use with the settings module for storing the stream write progress

**Returns**
- non-negative on success, negative errno code on fail

int stream_flash_progress_clear(struct stream_flash_ctx *ctx, const char *settings_key)
Clear persistent stream write progress stored with key settings_key.

**Parameters**
- **ctx** – context
- **settings_key** – key previously used for storing the stream write progress

**Returns**
- non-negative on success, negative errno code on fail

```c
struct stream_flash_ctx
#include <stream_flash.h> Structure for stream flash context.
```

Users should treat these structures as opaque values and only interact with them through the below API.

## 4.27 Sensing Subsystem

- **Overview**
- **Configurability**
- **Main Features**
- **Major Flows**
- **Sensor Types And Instance**
- **Sensor Instance Handler**
- **Sensor Sample Value**
4.27.1 Overview

Sensing Subsystem is a high level sensor framework inside the OS user space service layer. It is a framework focused on sensor fusion, client arbitration, sampling, timing, scheduling and sensor based power management.

Key concepts in Sensing Subsystem include physical sensor and virtual sensor objects, and a scheduling framework over sensor object relationships. Physical sensors do not depend on any other sensor objects for input, and will directly interact with existing zephyr sensor device drivers. Virtual sensors rely on other sensor objects (physical or virtual) as report inputs.

The sensing subsystem relies on Zephyr sensor device APIs (existing version or update in future) to leverage Zephyr’s large library of sensor device drivers (100+).

Use of the sensing subsystem is optional. Applications that only need to access simple sensors devices can use the Zephyr Sensors API directly.

Since the sensing subsystem is separated from device driver layer or kernel space and could support various customizations and sensor algorithms in user space with virtual sensor concepts. The existing sensor device driver can focus on low layer device side works, can keep simple as much as possible, just provide device HW abstraction and operations etc. This is very good for system stability.

The sensing subsystem is decoupled with any sensor expose/transfer protocols, the target is to support various up-layer frameworks and Applications with different sensor expose/transfer protocols, such as CHRE, HID sensors Applications, MQTT sensor Applications according different products requirements. Or even support multiple Applications with different up-layer sensor protocols at the same time with it’s multiple clients support design.

Sensing subsystem can help build a unified Zephyr sensing architecture for cross host OSes support and as well as IoT sensor solutions.

The diagram below illustrates how the Sensing Subsystem integrates with up-layer frameworks.
4.27.2 Configurability

- Reusable and configurable standalone subsystem.
- Based on Zephyr existing low-level Sensor API (reuse 100+ existing sensor device drivers)
- Provide Zephyr high-level Sensing Subsystem API for Applications.
- Separate option CHRE Sensor PAL Implementation module to support CHRE.
- Decoupled with any host link protocols, it's Zephyr Application's role to handle different protocols (MQTT, HID or Private, all configurable)

4.27.3 Main Features

- **Scope**
  - Focus on framework for sensor fusion, multiple clients, arbitration, data sampling, timing management and scheduling.

- **Sensor Abstraction**
  - Physical sensor: interacts with Zephyr sensor device drivers, focus on data collecting.
  - Virtual sensor: relies on other sensor(s), physical or virtual, focus on data fusion.

- **Data Driven Model**
  - Polling mode: periodical sampling rate
  - Interrupt mode: data ready, threshold interrupt etc.

- **Scheduling**
  - single thread main loop for all sensor objects sampling and process.

- **Buffer Mode for Batching**
- **Configurable Via Device Tree**

Below diagram shows the API position and scope:
Sensing Subsystem API is for Applications. Sensing Sensor API is for development sensors.

### 4.27.4 Major Flows

- Sensor Configuration Flow
4.27.5 Sensor Types And Instance

The Sensing Subsystem supports multiple instances of the same sensor type, there’re two methods for Applications to identify and open an unique sensor instance:

- Enumerate all sensor instances
  
  `sensing_get_sensors()` returns all current board configuration supported sensor instances’ information in a `sensing_sensor_info` pointer array.

  Then Applications can use `sensing_open_sensor()` to open specific sensor instance for future accessing, configuration and receive sensor data etc.

  This method is suitable for supporting some up-layer frameworks like CHRE, HID which need to dynamically enumerate the underlying platform's sensor instances.

- Open the sensor instance by devicetree node directly
  
  Applications can use `sensing_open_sensor_by_dt()` to open a sensor instance directly with sensor devicetree node identifier.

  For example:

  ```c
  sensing_open_sensor_by_dt(DEVICE_DT_GET(DT_NODELABEL(base_accel)), cb_list, handle);
  sensing_open_sensor_by_dt(DEVICE_DT_GET(DT_CHOSEN(zephyr_sensing_base_accel)), cb_list, handle);
  ```

  This method is useful and easy use for some simple Application which just want to access specific sensor(s).

  Sensor type follows the HID standard sensor types definition.

  See `include/zephyr/sensing/sensing_sensor_types.h`

4.27.6 Sensor Instance Handler

Clients using a `sensing_sensor_handle_t` type handler to handle a opened sensor instance, and all subsequent operations on this sensor instance need use this handler, such as set configurations, read sensor sample data, etc.
For a sensor instance, could have two kinds of clients: Application clients and Sensor clients. Application clients can use `sensing_open_sensor()` to open a sensor instance and get its handler.

For Sensor clients, there is no open API for opening a reporter, because the client-report relationship is built at the sensor's registration stage with devicetree.

The Sensing Subsystem will auto open and create handlers for client sensor to its reporter sensors. Sensor clients can get its reporters' handlers via `sensing_sensor_get_reporters()`.

**Note:** Sensors inside the Sensing Subsystem, the reporting relationship between them are all auto generated by Sensing Subsystem according devicetree definitions, handlers between client sensor and reporter sensors are auto created. Application(s) need to call `sensing_open_sensor()` to explicitly open the sensor instance.

### 4.27.7 Sensor Sample Value

- **Data Structure**
  
  Each sensor sample value defines as a common header + readings[] data structure, like `sensing_sensor_value_3d_q31`, `sensing_sensor_value_q31`, and `sensing_sensor_value_uint32`.

  The header definition `sensing_sensor_value_header()`.

- **Time Stamp**
  
  Time stamp unit in sensing subsystem is micro seconds.

  The header defines a `base_timestamp`, and each element in the `readings[]` array defines `timestamp_delta`.

  The `timestamp_delta` is in relation to the previous `readings` (or the `base_timestamp`)

  For example:
- timestamp of readings[0] is header.base_timestamp + readings[0].timestamp_delta.
- timestamp of readings[1] is timestamp of readings[0] + readings[1].timestamp_delta.

Since timestamp unit is micro seconds, the max timestamp_delta (uint32_t) is 4295 seconds.

If a sensor has batched data where two consecutive readings differ by more than 4295 seconds, the sensing subsystem runtime will split them across multiple instances of the readings structure, and send multiple events.

This concept is referred from CHRE Sensor API.

- Data Format

  Sensing Subsystem uses per sensor type defined data format structure, and support Q Format defined in include/zephyr/dsp/types.h for zdsp lib support.

  For example sensing_sensor_value_3d_q31 can be used by 3D IMU sensors like SENSING_SENSOR_TYPE_MOTION_ACCELEROMETER_3D, SENSING_SENSOR_TYPE_MOTION_UNCALIB_ACCELEROMETER_3D, and SENSING_SENSOR_TYPE_MOTION_GYROMETER_3D.

  sensing_sensor_value_uint32 can be used by SENSING_SENSOR_TYPE_LIGHT_AMBIENTLIGHT sensor;

  and sensing_sensor_value_q31 can be used by SENSING_SENSOR_TYPE_MOTION_HINGE_ANGLE sensor.

  See include/zephyr/sensing/sensing_datatypes.h

4.27.8 Device Tree Configuration

Sensing subsystem using device tree to configuration all sensor instances and their properties, reporting relationships.

See the example samples/subsys/sensing/simple/boards/native_sim.overlay

SENSING_SENSOR_TYPE_ALL

group sensing_datatypes
    Data Types.

struct sensing_sensor_value_header
    #include <sensing_datatypes.h> sensor value header
    Each sensor value data structure should have this header
    Here use ‘base_timestamp’ (uint64_t) and ‘timestamp_delta’ (uint32_t) to save memory usage in batching mode.
    The ‘base_timestamp’ is for readings[0], the ‘timestamp_delta’ is relation to the previous ‘readings’. So, timestamp of readings[0] is header.base_timestamp + readings[0].timestamp_delta. timestamp of readings[1] is timestamp of readings[0] + readings[1].timestamp_delta.
    Since timestamp unit is micro seconds, the max ‘timestamp_delta’ (uint32_t) is 4295 seconds.
    If a sensor has batched data where two consecutive readings differ by more than 4295 seconds, the sensor subsystem core will split them across multiple instances of the readings structure, and send multiple events.
    This concept is borrowed from CHRE: https://cs.android.com/android/platform/superproject+/master:
        system/chre/chre_api/include/chre_api/chre/sensor_types.h

Public Members

SENSEING_SENSOR_FLAG_REPORT_ON_EVENT
Sensor flag indicating if this sensor is on event reporting data.
Reporting sensor data when the sensor event occurs, such as a motion detect sensor reporting a motion or motionless detected event.

SENSEING_SENSOR_FLAG_REPORT_ON_CHANGE
Sensor flag indicating if this sensor is on change reporting data.
Reporting sensor data when the sensor data changes.
Exclusive with SENSEING_SENSOR_FLAG_REPORT_ON_EVENT

SENSEING_SENSITIVITY_INDEX_ALL
SENSEING_SENSITIVITY_INDEX_ALL indicating sensitivity of each data field should be set.

Typedefs

typedef void *sensing_sensor_handle_t
Define Sensing subsystem sensor handle.
typedef void (*sensing_data_event_t)(sensing_sensor_handle_t handle, const void *buf, void *context)

Sensor data event receive callback.

**Param handle**
The sensor instance handle.

**Param buf**
The data buffer with sensor data.

**Param context**
User provided context pointer.

** Enums **

enum sensing_sensor_state
Sensing subsystem sensor state.

Values:

enumerator SENSING_SENSOR_STATE_READY = 0
enumerator SENSING_SENSOR_STATE_OFFLINE = 1

enum sensing_sensor_attribute
Sensing subsystem sensor config attribute.

Values:

enumerator SENSING_SENSOR_ATTRIBUTE_INTERVAL = 0
enumerator SENSING_SENSOR_ATTRIBUTE_SENSITIVITY = 1
enumerator SENSING_SENSOR_ATTRIBUTE_LATENCY = 2
enumerator SENSING_SENSOR_ATTRIBUTE_MAX

** Functions **

int sensing_get_sensors(int *num_sensors, const struct sensing_sensor_info **info)
Get all supported sensor instances' information.

This API just returns read only information of sensor instances, pointer info will directly point to internal buffer, no need for caller to allocate buffer, no side effect to sensor instances.

**Parameters**

- num_sensors – Get number of sensor instances.
- info – For receiving sensor instances' information array pointer.

**Returns**

0 on success or negative error value on failure.
int sensing_open_sensor(const struct sensing_sensor_info *info, struct sensing_callback_list *cb_list, sensing_sensor_handle_t *handle)

Open sensor instance by sensing sensor info.

Application clients use it to open a sensor instance and get its handle. Support multiple Application clients for open same sensor instance, in this case, the returned handle will different for different clients. meanwhile, also register sensing callback list

Parameters

- `info` – The sensor info got from `sensing_get_sensors`
- `cb_list` – callback list to be registered to sensing, must have a static lifetime.
- `handle` – The opened instance handle, if failed will be set to NULL.

Returns

0 on success or negative error value on failure.

int sensing_open_sensor_by_dt(const struct device *dev, struct sensing_callback_list *cb_list, sensing_sensor_handle_t *handle)

Open sensor instance by device.

Application clients use it to open a sensor instance and get its handle. Support multiple Application clients for open same sensor instance, in this case, the returned handle will different for different clients. meanwhile, also register sensing callback list.

Parameters

- `dev` – pointer device get from device tree.
- `cb_list` – callback list to be registered to sensing, must have a static lifetime.
- `handle` – The opened instance handle, if failed will be set to NULL.

Returns

0 on success or negative error value on failure.

int sensing_close_sensor(sensing_sensor_handle_t *handle)

Close sensor instance.

Parameters

- `handle` – The sensor instance handle need to close.

Returns

0 on success or negative error value on failure.

int sensing_set_config(sensing_sensor_handle_t handle, struct sensing_sensor_config *configs, int count)

Set current config items to Sensing subsystem.

Parameters

- `handle` – The sensor instance handle.
- `configs` – The configs to be set according to config attribute.
- `count` – count of configs.

Returns

0 on success or negative error value on failure, not support etc.

int sensing_get_config(sensing_sensor_handle_t handle, struct sensing_sensor_config *configs, int count)

Get current config items from Sensing subsystem.
Parameters

- **handle** – The sensor instance handle.
- **configs** – The configs to be get according to config attribute.
- **count** – count of configs.

Returns

0 on success or negative error value on failure, not support etc.

```c
const struct sensing_sensor_info *sensing_get_sensor_info(sensing_sensor_handle_t handle)
```

Get sensor information from sensor instance handle.

Parameters

- **handle** – The sensor instance handle.

Returns

a const pointer to `sensing_sensor_info` on success or NULL on failure.

```c
struct sensing_sensor_version
#include <sensing.h> Sensor Version.
```

```c
struct sensing_sensor_info
#include <sensing.h> Sensor basic constant information.
```

**Public Members**

```c
c const char *name
Name of the sensor instance.

SENSING_SENSORS_DEFINE(node, reg_ptr , cb_list_ptr)
SENSING_SENSORS_DT_DEFINE(node, reg_ptr , cb_list_ptr, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)

Like SENSOR_DEVICE_DT_DEFINE() with sensing specifics.

Defines a sensor which implements the sensor API. May define an element in the sensing sensor iterable section used to enumerate all sensing sensors.

Parameters

- node – The devicetree node identifier.
- reg_ptr – Pointer to the device's sensing_sensor_register_info.
- cb_list_ptr – Pointer to devices callback list.
- init_fn – Name of the init function of the driver.
- pm_device – PM device resources reference (NULL if device does not use PM).
- data_ptr – Pointer to the device's private data.
- cfg_ptr – The address to the structure containing the configuration information for this instance of the driver.
- level – The initialization level. See SYS_INIT() for details.
• **prio** – Priority within the selected initialization level. See SYS_INIT() for details.

• **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

**SENSING_SENSORS_DT_INST_DEFINE**(inst, ...)

Like **SENSING_SENSORS_DT_DEFINE()** for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to **SENSING_SENSORS_DT_DEFINE()**.

• ... – other parameters as expected by **SENSING_SENSORS_DT_DEFINE()**.

**Enums**

**Values:**

enumerator EVENT_CONFIG_READY

**Values:**

enumerator SENSOR_LATER_CFG_BIT

**Functions**

```c
int sensing_sensor_get_reporters(const struct device *dev, int type, sensing_sensor_handle_t *reporter_handles, int max_handles)
```

Get reporter handles of a given sensor instance by sensor type.

**Parameters**

• **dev** – The sensor instance device structure.

• **type** – The given type, **SENSING_SENSOR_TYPE_ALL** to get reporters with all types.

• **max_handles** – The max count of the reporter_handles array input. Can get real count number via **sensing_sensor_get_reporters_count**

• **reporter_handles** – Input handles array for receiving found reporter sensor instances

**Returns**

number of reporters found, 0 returned if not found.

```c
int sensing_sensor_get_reporters_count(const struct device *dev, int type)
```

Get reporters count of a given sensor instance by sensor type.

**Parameters**

• **dev** – The sensor instance device structure.

• **type** – The sensor type for checking, **SENSING_SENSOR_TYPE_ALL**
Returns
Count of reporters by type, 0 returned if no reporters by type.

```c
int sensing_sensor_get_state(const struct device *dev, enum sensing_sensor_state *state)
```
Get this sensor's state.

Parameters
- `dev` – The sensor instance device structure.
- `state` – Returned sensor state value

Returns
0 on success or negative error value on failure.

```c
struct sensing_sensor_register_info
#include <sensing_sensor.h> Sensor registration information.
```

Public Members

```c
uint16_t flags
 Sensor flags.
```

```c
uint16_t sample_size
 Sample size in bytes for a single sample of the registered sensor.
 sensing runtime need this information for internal buffer allocation.
```

```c
uint8_t sensitivity_count
 The number of sensor sensitivities.
```

```c
struct sensing_sensor_version version
 Sensor version.
 Version can be used to identify different versions of sensor implementation.
```

```c
struct sensing_connection
#include <sensing_sensor.h> Connection between a source and sink of sensor data.
```

```c
struct sensing_sensor
#include <sensing_sensor.h> Internal sensor instance data structure.
 Each sensor instance will have its unique data structure for storing all it's related information.
 Sensor management will enumerate all these instance data structures, build report relationship model base on them, etc.
```

```c
struct sensing_submit_config
#include <sensing_sensor.h>
```
4.28 Task Watchdog

4.28.1 Overview

Many microcontrollers feature a hardware watchdog timer peripheral. Its purpose is to trigger an action (usually a system reset) in case of severe software malfunctions. Once initialized, the watchdog timer has to be restarted (“fed”) in regular intervals to prevent it from timing out. If the software got stuck and does not manage to feed the watchdog anymore, the corrective action is triggered to bring the system back to normal operation.

In real-time operating systems with multiple tasks running in parallel, a single watchdog instance may not be sufficient anymore, as it can be used for only one task. This software watchdog based on kernel timers provides a method to supervise multiple threads or tasks (called watchdog channels).

An existing hardware watchdog can be used as an optional fallback if the task watchdog itself or the scheduler has a malfunction.

The task watchdog uses a kernel timer as its backend. If configured properly, the timer ISR is never actually called during normal operation, as the timer is continuously updated in the feed calls.

It's currently not possible to have multiple instances of task watchdogs. Instead, the task watchdog API can be accessed globally to add or delete new channels without passing around a context or device pointer in the firmware.

The maximum number of channels is predefined via Kconfig and should be adjusted to match exactly the number of channels required by the application.

4.28.2 Configuration Options

Related configuration options can be found under `subsys/task_wdt/Kconfig`.

- `CONFIG_TASK_WDT`
- `CONFIG_TASK_WDT_CHANNELS`
- `CONFIG_TASK_WDT_HW_FALLBACK`
- `CONFIG_TASK_WDT_MIN_TIMEOUT`
- `CONFIG_TASK_WDT_HW_FALLBACK_DELAY`

4.28.3 API Reference

#define CONFIG_TASK_WDT_MIN_TIMEOUT
#define CONFIG_TASK_WDT_HW_FALLBACK_DELAY

#include "subsys/task_wdt/Kconfig"
```

**Typedefs**

```c
/*
 * Task Watchdog APIs.
 */

#include "task_wdt_api.h"

#include "subsys/task_wdt/Kconfig"
```

4.28. Task Watchdog 1123
typedef void (*task_wdt_callback_t)(int channel_id, void *user_data)
    Task watchdog callback.

Functions

int task_wdt_init(const struct device *hw_wdt)
    Initialize task watchdog.

This function sets up necessary kernel timers and the hardware watchdog (if desired as fallback). It has to be called before task_wdt_add() and task_wdt_feed().

Parameters

• hw_wdt – Pointer to the hardware watchdog device used as fallback. Pass NULL if no hardware watchdog fallback is desired.

Return values

• 0 – If successful.
• -ENOTSUP – If assigning a hardware watchdog is not supported.
• -Errno – Negative errno if the fallback hw_wdt is used and the install timeout API fails. See wdt_install_timeout() API for possible return values.

int task_wdt_add(uint32_t reload_period, task_wdt_callback_t callback, void *user_data)
    Install new timeout.

Adds a new timeout to the list of task watchdog channels.

Parameters

• reload_period – Period in milliseconds used to reset the timeout
• callback – Function to be called when watchdog timer expired. Pass NULL to use system reset handler.
• user_data – User data to associate with the watchdog channel.

Return values

• channel_id – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This ID is supposed to be used as the parameter in calls to task_wdt_feed().
• -EINVAL – If the reload_period is invalid.
• -ENOMEM – If no more timeouts can be installed.

int task_wdt_delete(int channel_id)
    Delete task watchdog channel.

Deletes the specified channel from the list of task watchdog channels. The channel is now available again for other tasks via task_wdt_add() function.

Parameters

• channel_id – Index of the channel as returned by task_wdt_add().

Return values

• 0 – If successful.
• -EINVAL – If there is no installed timeout for supplied channel.
int task_wdt_feed(int channel_id)
Feed specified watchdog channel.
This function loops through all installed task watchdogs and updates the internal kernel timer used as for the software watchdog with the next due timeout.

Parameters

- channel_id – Index of the fed channel as returned by task_wdt_add().

Return values

- 0 – If successful.
- -EINVAL – If there is no installed timeout for supplied channel.

4.29 Trusted Firmware-M

4.29.1 Trusted Firmware-M Overview

Trusted Firmware-M (TF-M) is a reference implementation of the Platform Security Architecture (PSA) IoT Security Framework. It defines and implements an architecture and a set of software components that aim to address some of the main security concerns in IoT products.

Zephyr RTOS has been PSA Certified since Zephyr 2.0.0 with TF-M 1.0, and is currently integrated with TF-M 2.0.0.

What Does TF-M Offer?

Through a set of secure services and by design, TF-M provides:

- Isolation of secure and non-secure resources
- Embedded-appropriate crypto
- Management of device secrets (keys, etc.)
- Firmware verification (and encryption)
- Protected off-chip data storage and retrieval
- Proof of device identity (device attestation)
- Audit logging

Build System Integration

When using TF-M with a supported platform, TF-M will be automatically built and link in the background as part of the standard Zephyr build process. This build process makes a number of assumptions about how TF-M is being used, and has certain implications about what the Zephyr application image can and can not do:

- The secure processing environment (secure boot and TF-M) starts first
- Resource allocation for Zephyr relies on choices made in the secure image.
Architecture Overview

A TF-M application will, generally, have the following three parts, from most to least trusted, left-to-right, with code execution happening in the same order (secure boot > secure image > ns image).

While the secure bootloader is optional, it is enabled by default, and secure boot is an important part of providing a secure solution:

Communication between the (Zephyr) Non-Secure Processing Environment (NSPE) and the (TF-M) Secure Processing Environment image happens based on a set of PSA APIs, and normally makes use of an IPC mechanism that is included as part of the TF-M build, and implemented in Zephyr (see modules/trusted-firmware-m/interface).

Root of Trust (RoT) Architecture  

TF-M is based upon a Root of Trust (RoT) architecture. This allows for hierarchies of trust from most, to least, to least trusted, providing a sound foundation upon which to build or access trusted services and resources.

The benefit of this approach is that less trusted components are prevented from accessing or compromising more critical parts of the system, and error conditions in less trusted environments won’t corrupt more trusted, isolated resources.

The following RoT hierarchy is defined for TF-M, from most to least trusted:

- **PSA Root of Trust (PRoT)**, which consists of:
  - PSA Immutable Root of Trust: secure boot
  - PSA Updateable Root of Trust: most trusted secure services
- **Application Root of Trust (ARoT)**: isolated secure services

The **PSA Immutable Root of Trust** is the most trusted piece of code in the system, to which subsequent Roots of Trust are anchored. In TF-M, this is the secure boot image, which verifies that the secure and non-secure images are valid, have not been tampered with, and come from a reliable source. The secure bootloader also verifies new images during the firmware update process, thanks to the public signing key(s) built into it. As the name implies, this image is immutable.

The **PSA Updateable Root of Trust** implements the most trusted secure services and components in TF-M, such as the Secure Partition Manager (SPM), and shared secure services like PSA Crypto, Internal Trusted Storage (ITS), etc. Services in the PSA Updateable Root of Trust have access to other resources in the same Root of Trust.

The **Application Root of Trust** is a reduced-privilege area in the secure processing environment which, depending on the isolation level chosen when building TF-M, has limited access to the PRoT, or even other ARoT services at the highest isolation levels. Some standard services exist in the ARoT, such as Protected Storage (PS), and generally custom secure services that you implement should be placed in the ARoT, unless a compelling reason is present to place them in the PRoT.

These divisions are distinct from the **untrusted code**, which runs in the non-secure environment, and has the least privilege in the system. This is the Zephyr application image in this case.
Isolation Levels  At present, there are three distinct isolation levels defined in TF-M, with increasingly rigid boundaries between regions. The isolation level used will depend on your security requirements, and the system resources available to you.

- **Isolation Level 1** is the lowest isolation level, and the only major boundary is between the secure and non-secure processing environment, usually by means of Arm TrustZone on Armv8-M processors. There is no distinction here between the PSA Updateable Root of Trust (PRoT) and the Application Root of Trust (ARoT). They execute at the same privilege level. This isolation level will lead to the smallest combined application images.

- **Isolation Level 2** builds upon level one by introducing a distinction between the PSA Updateable Root of Trust and the Application Root of Trust, where ARoT services have limited access to PRoT services, and can only communicate with them through public APIs exposed by the PRoT services. ARoT services, however, are not strictly isolated from one another.

- **Isolation Level 3** is the highest isolation level, and builds upon level 2 by isolating ARoT services from each other, so that each ARoT is essentially silo'ed from other services. This provides the highest level of isolation, but also comes at the cost of additional overhead and code duplication between services.

The current isolation level can be checked via CONFIG_TFM_ISOLATION_LEVEL.

Secure Boot  The default secure bootloader in TF-M is based on MCUBoot, and is referred to as BL2 in TF-M (for the second-stage bootloader, potentially after a HW-based bootloader on the secure MCU, etc.).

All images in TF-M are hashed and signed, with the hash and signature verified by MCUBoot during the firmware update process.

Some key features of MCUBoot as used in TF-M are:

- Public signing key(s) are baked into the bootloader
- S and NS images can be signed using different keys
- Firmware images can optionally be encrypted
- Client software is responsible for writing a new image to the secondary slot
- By default, uses static flash layout of two identically-sized memory regions
- Optional security counter for rollback protection

When dealing with (optionally) encrypted images:

- Only the payload is encrypted (header, TLVs are plain text)
- Hashing and signing are applied over the un-encrypted data
- Uses AES-CTR-128 or AES-CTR-256 for encryption
- Encryption key randomized every encryption cycle (via imgtool)
- The AES-CTR key is included in the image and can be encrypted using:
  - RSA-OAEP
  - AES-KW (128 or 256 bits depending on the AES-CTR key length)
  - ECIES-P256
  - ECIES-X25519

Key config properties to control secure boot in Zephyr are:

- CONFIG_TFM_BL2 toggles the bootloader (default = y).
- CONFIG_TFM_KEY_FILE_S overrides the secure signing key.
- CONFIG_TFM_KEY_FILE_NS overrides the non-secure signing key.
Secure Processing Environment  Once the secure bootloader has finished executing, a TF-M based secure image will begin execution in the secure processing environment. This is where our device will be initially configured, and any secure services will be initialised.

Note that the starting state of our device is controlled by the secure firmware, meaning that when the non-secure Zephyr application starts, peripherals may not be in the HW-default reset state. In case of doubts, be sure to consult the board support packages in TF-M, available in the platform/ext/target/ folder of the TF-M module (which is in modules/tee/tf-m/trusted-firmware-m/ within a default Zephyr west workspace.)

Secure Services As of TF-M 1.8.0, the following secure services are generally available (although vendor support may vary):

- Crypto
- Firmware Update (FWU)
- Initial Attestation
- Platform
- Secure Storage, which has two parts:
  - Internal Trusted Storage (ITS)
  - Protected Storage (PS)

A template also exists for creating your own custom services.

For full details on these services, and their exposed APIs, please consult the TF-M Documentation.

Key Management and Derivation  Key and secret management is a critical part of any secure device. You need to ensure that key material is available to regions that require it, but not to anything else, and that it is stored securely in a way that makes it difficult to tamper with or maliciously access.

The Internal Trusted Storage service in TF-M is used by the PSA Crypto service (which itself makes use of mbedtls) to store keys, and ensure that private keys are only ever accessible to the secure processing environment. Crypto operations that make use of key material, such as when signing payloads or when decrypting sensitive data, all take place via key handles. At no point should the key material ever be exposed to the NS environment.

One exception is that private keys can be provisioned into the secure processing environment as a one-way operation, such as during a factory provisioning process, but even this should be avoided where possible, and a request should be made to the SPE (via the PSA Crypto service) to generate a new private key itself, and the public key for that can be requested during provisioning and logged in the factory. This ensures the private key material is never exposed, or even known during the provisioning phase.

TF-M also makes extensive use of the Hardware Unique Key (HUK), which every TF-M device must provide. This device-unique key is used by the Protected Storage service, for example, to encrypt information stored in external memory. For example, this ensures that the contents of flash memory can't be decrypted if they are removed and placed on a new device, since each device has its own unique HUK used while encrypting the memory contents the first time.

HUKs provide an additional advantage for developers, in that they can be used to derive new keys, and the derived keys don't need to be stored since they can be regenerated from the HUK at startup, using an additional salt/seed value (depending on the key derivation algorithm used). This removes the storage issue and a frequent attack vector. The HUK itself is usually highly protected in secure devices, and inaccessible directly by users.

TFM_CRYPTO_ALG_HUK_DERIVATION identifies the default key derivation algorithm used if a software implementation is used. The current default algorithm is HKDF (RFC 5869) with a SHA-256 hash. Other hardware implementations may be available on some platforms.
Non-Secure Processing Environment  Zephyr is used for the NSPE, using a board that is supported by TF-M where the CONFIG_BUILD_WITH_TFM flag has been enabled.

Generally, you simply need to select the *_ns variant of a valid target (for example mps2_an521_ns), which will configure your Zephyr application to run in the NSPE, correctly build and link it with the TF-M secure images, sign the secure and non-secure images, and merge the three binaries into a single tfm_merged.hex file. The west flash command will flash tfm_merged.hex by default in this configuration.

At present, Zephyr can not be configured to be used as the secure processing environment.

4.29.2  TF-M Requirements

The following are some of the boards that can be used with TF-M:

<table>
<thead>
<tr>
<th>Board</th>
<th>NSPE board name</th>
</tr>
</thead>
<tbody>
<tr>
<td>mps2_an521_board</td>
<td>mps2_an521_ns (qemu supported)</td>
</tr>
<tr>
<td>mps3_an547_board</td>
<td>mps3_an547_ns (qemu supported)</td>
</tr>
<tr>
<td>bl5340_dvk</td>
<td>bl5340_dvk/nrf5340/cpuapp/ns</td>
</tr>
<tr>
<td>lpccxpresso55s69</td>
<td>lpccxpresso55s69/ns</td>
</tr>
<tr>
<td>nrf9160dk_nrf9160</td>
<td>nrf9160dk/nrf9160/ns</td>
</tr>
<tr>
<td>nrf5340dk_nrf5340</td>
<td>nrf5340dk/nrf5340/cpuapp/ns</td>
</tr>
<tr>
<td>h_u5851_iot02a_board</td>
<td>b_u5851_iot02a/stm32u585xx/ns</td>
</tr>
<tr>
<td>nucleo_l552ze_q_board</td>
<td>nucleo_l552ze_q/stm32l552xx/ns</td>
</tr>
<tr>
<td>stm32l562e_dk_board</td>
<td>stm32l562e_dk/stm32l562xx/ns</td>
</tr>
<tr>
<td>v2m_musca_b1_board</td>
<td>v2m_musca_b1_ns</td>
</tr>
<tr>
<td>v2m_musca_s1_board</td>
<td>v2m_musca_s1_ns</td>
</tr>
</tbody>
</table>

You can run west boards -n _ns$ to search for non-secure variants of different board targets. To make sure TF-M is supported for a board in its output, check that CONFIG_TRUSTED_EXECUTION_NONSECURE is set to y in that board's default configuration.

Software Requirements

The following Python modules are required when building TF-M binaries:

- cryptography
- pyasn1
- pyyaml
- cbor>=1.0.0
- imgtool>=1.9.0
- jinja2
- click

You can install them via:

```bash
$ pip3 install --user cryptography pyasn1 pyyaml cbor>=1.0.0 imgtool>=1.9.0 jinja2 click
```

They are used by TF-M's signing utility to prepare firmware images for validation by the bootloader.

Part of the process of generating binaries for QEMU and merging signed secure and non-secure binaries on certain platforms also requires the use of the srec_cat utility.
Zephyr Project Documentation, Release 3.6.99

This can be installed on Linux via:

```bash
sudo apt-get install srecord
```

And on OS X via:

```bash
brew install srecord
```

For Windows-based systems, please make sure you have a copy of the utility available on your system path. See, for example: [SRecord for Windows](https://www.sop全GET.COM/SRecord)

### 4.29.3 TF-M Build System

When building a valid `_ns` board target, TF-M will be built in the background, and linked with the Zephyr non-secure application. No knowledge of TF-M’s build system is required in most cases, and the following will build a TF-M and Zephyr image pair, and run it in qemu with no additional steps required:

```bash
$ west build -p auto -b mps2_an521_ns samples/tfm_integration/psa_protected_storage/ -t run
```

The outputs and certain key steps in this build process are described here, however, since you will need to understand and interact with the outputs, and deal with signing the secure and non-secure images before deploying them.

**Images Created by the TF-M Build**

The TF-M build system creates the following executable files:

- `tfm_s` - TF-M secure firmware
- `tfm_ns` - TF-M non-secure app (only used by regression tests).
- `bl2` - TF-M MCUboot, if enabled

For each of these, it creates `.bin`, `.hex`, `.elf`, and `.axf` files.

The TF-M build system also creates signed variants of `tfm_s` and `tfm_ns`, and a file which combines them:

- `tfm_s_signed`
- `tfm_ns_signed`
- `tfm_s_ns_signed`

For each of these, only `.bin` files are created.

The TF-M non-secure app is discarded in favor of Zephyr non-secure app except when running the TF-M regression test suite.

The Zephyr build system usually signs both `tfm_s` and the Zephyr non-secure app itself. See below for details.

The ‘`tfm`’ target contains properties for all these paths. For example, the following will resolve to `<path>/tfm_s.hex`:

```bash
$<TARGET_PROPERTY:tfm,TFM_S_HEX_FILE>
```

See the top level CMakeLists.txt file in the tfm module for an overview of all the properties.
Signing Images

When CONFIG_TFM_BL2 is set to y, TF-M uses a secure bootloader (BL2) and firmware images must be signed with a private key. The firmware image is validated by the bootloader during updates using the corresponding public key, which is stored inside the secure bootloader firmware image.

By default, <tfm-dir>/bl2/ext/mcuboot/root-rsa-3072.pem is used to sign secure images, and <tfm-dir>/bl2/ext/mcuboot/root-rsa-3072_1.pem is used to sign non-secure images. These default .pem keys can (and should) be overridden using the CONFIG_TFM_KEY_FILE_S and CONFIG_TFM_KEY_FILE_NS config flags.

To satisfy PSA Certified Level 1 requirements, You MUST replace the default .pem file with a new key pair!

To generate a new public/private key pair, run the following commands:

```
$ imgtool keygen -k root-rsa-3072_s.pem -t rsa-3072
$ imgtool keygen -k root-rsa-3072_ns.pem -t rsa-3072
```

You can then place the new .pem files in an alternate location, such as your Zephyr application folder, and reference them in the prj.conf file via the CONFIG_TFM_KEY_FILE_S and CONFIG_TFM_KEY_FILE_NS config flags.

**Warning:** Be sure to keep your private key file in a safe, reliable location! If you lose this key file, you will be unable to sign any future firmware images, and it will no longer be possible to update your devices in the field!

After the built-in signing script has run, it creates a tfm_merged.hex file that contains all three binaries: bl2, tfm_s, and the zephyr app. This hex file can then be flashed to your development board or run in QEMU.

**Custom CMake arguments** When building a Zephyr application with TF-M it might be necessary to control the CMake arguments passed to the TF-M build.

Zephyr TF-M build offers several Kconfig options for controlling the build, but doesn’t cover every CMake argument supported by the TF-M build system.

The TFM_CMAKE_OPTIONS property on the zephyr_property_target can be used to pass custom CMake arguments to the TF-M build system.

To pass the CMake argument -DFOO=bar to the TF-M build system, place the following CMake snippet in your CMakeLists.txt file.

```
set_property(TARGET zephyr_property_target
    APPEND PROPERTY TFM_CMAKE_OPTIONS
    -DFOO=bar
)
```

**Note:** The TFM_CMAKE_OPTIONS is a list so it is possible to append multiple options. Also CMake generator expressions are supported, such as $<1:-DFOO=bar>

Since TFM_CMAKE_OPTIONS is a list argument it will be expanded before it is passed to the TF-M build system. Options that have list arguments must therefore be properly escaped to avoid being expanded as a list.
Footprint and Memory Usage

The build system offers targets to view and analyse RAM and ROM usage in generated images. The tools run on the final images and give information about size of symbols and code being used in both RAM and ROM. For more information on these tools look here: Footprint and Memory Usage

Use the `tfm_ram_report` to get the RAM report for TF-M secure firmware (tfm_s).

Using west:
```bash
west build -b mps2_an521_ns samples/hello_world
west build -t tfm_ram_report
```

Using CMake and ninja:
```bash
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world
# Now run the build tool on the generated build system:
ninja -Cbuild tfm_ram_report
```

Use the `tfm_rom_report` to get the ROM report for TF-M secure firmware (tfm_s).

Using west:
```bash
west build -b mps2_an521_ns samples/hello_world
west build -t tfm_rom_report
```

Using CMake and ninja:
```bash
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world
# Now run the build tool on the generated build system:
ninja -Cbuild tfm_rom_report
```

Use the `bl2_ram_report` to get the RAM report for TF-M MCUboot, if enabled.

Using west:
```bash
west build -b mps2_an521_ns samples/hello_world
west build -t bl2_ram_report
```

Using CMake and ninja:
```bash
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world
# Now run the build tool on the generated build system:
ninja -Cbuild bl2_ram_report
```

Use the `bl2_rom_report` to get the ROM report for TF-M MCUboot, if enabled.

Using west:
```bash
west build -b mps2_an521_ns samples/hello_world
west build -t bl2_rom_report
```

Using CMake and ninja:
```bash
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world
# Now run the build tool on the generated build system:
ninja -Cbuild bl2_rom_report
```
Using CMake and ninja:

```bash
# Use cmake to configure a Ninja-based build system:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild bl2_rom_report
```

### 4.29.4 Trusted Firmware-M Integration

The Trusted Firmware-M (TF-M) section contains information about the integration between TF-M and Zephyr RTOS. Use this information to help understand how to integrate TF-M with Zephyr for Cortex-M platforms and make use of its secure run-time services in Zephyr applications.

#### Board Definitions

TF-M will be built for the secure processing environment along with Zephyr if the `CONFIG_BUILD_WITH_TFM` flag is set to `y`.

Generally, this value should never be set at the application level, however, and all config flags required for TF-M should be set in a board variant with the `_ns` suffix.

This board variant must define an appropriate flash, SRAM and peripheral configuration that takes into account the initialisation process in the secure processing environment. `CONFIG_TFM_BOARD` must also be set via `modules/trusted-firmware-m/Kconfig.tfm` to the board name that TF-M expects for this target, so that it knows which target to build for the secure processing environment.

**Example: mps2_an521_ns** The mps2_an521 target is a dual-core Arm Cortex-M33 evaluation board that, when using the default board variant, would generate a secure Zephyr binary.

The optional `mps2_an521_ns` target, however, sets these additional kconfig flags that indicate that Zephyr should be built as a non-secure image, linked with TF-M as an external project, and optionally the secure bootloader:

- `CONFIG_TRUSTED_EXECUTION_NONSECURE y`
- `CONFIG_ARM_TRUSTZONE_M y`

Comparing the `mps2_an521.dts` and `mps2_an521_ns.dts` files, we can see that the `_ns` version defines offsets in flash and SRAM memory, which leave the required space for TF-M and the secure bootloader:

```diff
reserved-memory {
    #address-cells = <1>;
    #size-cells = <1>;
    ranges;

    /* The memory regions defined below must match what the TF-M
     * project has defined for that board - a single image boot is
     * assumed. Please see the memory layout in:
     * https://git.trustedfirmware.org/TF-M/trusted-firmware-m.git/tree/platform/
     * ext/target/mps2/an521/partition/flash_layout.h
     */
    code: memory@100000 {
        reg = <0x00100000 DT_SIZE_K(512)>;
    };
```

(continues on next page)
This reserves 1 MB of code memory and 1 MB of RAM for secure boot and TF-M, such that our non-secure Zephyr application code will start at 0x10000, with RAM at 0x28100000. 512 KB code memory is available for the NS zephyr image, along with 1 MB of RAM.

This matches the flash memory layout we see in flash_layout.h in TF-M:

```
* 0x0000_0000 BL2 - MCUBoot (0.5 MB)
* 0x0008_0000 Secure image primary slot (0.5 MB)
* 0x0010_0000 Non-secure image primary slot (0.5 MB)
* 0x0018_0000 Secure image secondary slot (0.5 MB)
* 0x0020_0000 Non-secure image secondary slot (0.5 MB)
* 0x0028_0000 Scratch area (0.5 MB)
* 0x0030_0000 Protected Storage Area (20 KB)
* 0x0030_5000 Internal Trusted Storage Area (16 KB)
* 0x0030_9000 NV counters area (4 KB)
* 0x0030_A000 Unused (984 KB)
```

mps2/an521 will be passed in to TF-M as the board target, specified via CONFIG_TFM_BOARD.

### 4.29.5 Test Suites

TF-M includes two sets of test suites:

- `tf-m-tests` - Standard TF-M specific regression tests
- `psa-arch-tests` - Test suites for specific PSA APIs (secure storage, etc.)

These test suites can be run from Zephyr via an appropriate sample application in the samples/tfm_integration folder.

#### TF-M Regression Tests

The regression test suite can be run via the `tfm_regression_test` sample.

This sample tests various services and communication mechanisms across the NS/S boundary via the PSA APIs. They provide a useful sanity check for proper integration between the NS RTOS (Zephyr in this case) and the secure application (TF-M).

#### PSA Arch Tests

The PSA Arch Test suite, available via `tfm_psa_test`, contains a number of test suites that can be used to validate that PSA API specifications are being followed by the secure application, TF-M being an implementation of the Platform Security Architecture (PSA).

Only one of these suites can be run at a time, with the available test suites described via `CONFIG_TFM_PSA_TEST_*` KConfig flags:

#### Purpose

The output of these test suites is required to obtain PSA Certification for your specific board, RTOS (Zephyr here), and PSA implementation (TF-M in this case).
They also provide a useful test case to validate any PRs that make meaningful changes to TF-M, such as enabling a new TF-M board target, or making changes to the core TF-M module(s). They should generally be run as a coherence check before publishing a new PR for new board support, etc.

4.30 Virtualization

4.30.1 Inter-VM Shared Memory

Overview

As Zephyr is enabled to run as a guest OS on Qemu and ACRN it might be necessary to make VMs aware of each other, or aware of the host. This is made possible by exposing a shared memory among parties via a feature called ivshmem, which stands for inter-VM Shared Memory.

The two types are supported: a plain shared memory (ivshmem-plain) or a shared memory with the ability for a VM to generate an interruption on another, and thus to be interrupted as well itself (ivshmem-doorbell).

Please refer to the official Qemu ivshmem documentation for more information.

Support

Zephyr supports both versions: plain and doorbell. Ivshmem driver can be built by enabling CONFIG_IVSHMEM. By default, this will expose the plain version. CONFIG_IVSHMEM_DOORBELL needs to be enabled to get the doorbell version.

Because the doorbell version uses MSI-X vectors to support notification vectors, the CONFIG_IVSHMEM_MSI_X_VECTORS has to be tweaked to the number of vectors that will be needed.

Note that a tiny shell module can be exposed to test the ivshmem feature by enabling CONFIG_IVSHMEM_SHELL.

ivshmem-v2

Zephyr also supports ivshmem-v2:

This is primarily used for IPC in the Jailhouse hypervisor (e.g. eth-ivshmem). It is also possible to use ivshmem-v2 without Jailhouse by building the Siemens fork of QEMU, and modifying the QEMU launch flags:

https://github.com/siemens/qemu/tree/wip/ivshmem2

Defines

IVSHMEM_V2_PROTO_UNDEFINED

IVSHMEM_V2_PROTO_NET

Typedefs

typedef size_t (*ivshmem_get_mem_f)(const struct device *dev, uintptr_t *memmap)

typedef uint32_t (*ivshmem_get_id_f)(const struct device *dev)

typedef uint16_t (*ivshmem_get_vectors_f)(const struct device *dev)

typedef int (*ivshmem_int_peer_f)(const struct device *dev, uint32_t peer_id, uint16_t vector)

typedef int (*ivshmem_register_handler_f)(const struct device *dev, struct k_poll_signal *signal, uint16_t vector)

Functions

size_t ivshmem_get_mem(const struct device *dev, uintptr_t *memmap)
Get the inter-VM shared memory.

Note: This API is not supported for ivshmem-v2, as the R/W and R/O areas may not be mapped contiguously. For ivshmem-v2, use the ivshmem_get_rw_mem_section, ivshmem_get_output_mem_section and ivshmem_get_state APIs to access the shared memory.

Parameters

• dev – Pointer to the device structure for the driver instance
• memmap – A pointer to fill in with the memory address
Returns
the size of the memory mapped, or 0

uint32_t ivshmem_get_id(const struct device *dev)
Get our VM ID.

Parameters
• dev – Pointer to the device structure for the driver instance

Returns
our VM ID or 0 if we are not running on doorbell version

uint16_t ivshmem_get_vectors(const struct device *dev)
Get the number of interrupt vectors we can use.

Parameters
• dev – Pointer to the device structure for the driver instance

Returns
the number of available interrupt vectors

int ivshmem_int_peer(const struct device *dev, uint32_t peer_id, uint16_t vector)
Interrupt another VM.

Parameters
• dev – Pointer to the device structure for the driver instance
• peer_id – The VM ID to interrupt
• vector – The interrupt vector to use

Returns
0 on success, a negative errno otherwise

int ivshmem_register_handler(const struct device *dev, struct k_poll_signal *signal, uint16_t vector)
Register a vector notification (interrupt) handler.

Note: The returned status, if positive, to a raised signal is the vector that generated the signal. This lets the possibility to the user to have one signal for all vectors, or one per-vector.

Parameters
• dev – Pointer to the device structure for the driver instance
• signal – A pointer to a valid and ready to be signaled struct k_poll_signal.
  Or NULL to unregister any handler registered for the given vector.
• vector – The interrupt vector to get notification from

Returns
0 on success, a negative errno otherwise

struct ivshmem_driver_api
   #include <ivshmem.h>

4.31 Retention System

The retention system provides an API which allows applications to read and write data from and to memory areas or devices that retain the data while the device is powered. This allows
for sharing information between different applications or within a single application without losing state information when a device reboots. The stored data should not persist in the event of a power failure (or during some low-power modes on some devices) nor should it be stored to a non-volatile storage like Flash, Electrically Erasable Programmable Read-Only Memory (EEPROM), or battery-backed RAM.

The retention system builds on top of the retained data driver, and adds additional software-level features to it for ensuring the validity of data. Optionally, a magic header can be used to check if the front of the retained data memory section contains this specific value, and an optional checksum (1, 2, or 4-bytes in size) of the stored data can be appended to the end of the data. Additionally, the retention system API allows partitioning of the retained data sections into multiple distinct areas. For example, a 64-byte retained data area could be split up into 4 bytes for a boot mode, 16 bytes for a timestamp, 44 bytes for a last log message. All of these sections can be accessed or updated independently. The prefix and checksum can be set per-instance using devicetree.

### 4.31.1 Devicetree setup

To use the retention system, a retained data driver must be setup for the board you are using, there is a zephyr driver which can be used which will use some RAM as non-init for this purpose. The retention system is then initialised as a child node of this device 1 or more times - note that the memory region will need to be decremented to account for this reserved portion of RAM. See the following example (examples in this guide are based on the nrf52840dk_nrf52840 board and memory layout):

```c
/* This creates a 256-byte partition */
retention0: retention0 {
    compatible = "zephyr,retention";
    status = "okay";
    reg = <0x0 0x100>
    prefix = [08 04];
}

/* This uses a 1-byte checksum */
checksum = <1>
```

(continues on next page)
Zephyr Project Documentation, Release 3.6.99

/* This creates a 768-byte partition */
retention1: retention@100 {
    compatible = "zephyr,retention";
    status = "okay";
    reg = <0x100 0x300>;
}

prefix = [00 11 55 88 fa bc];

The retention areas can then be accessed using the data retention API (once enabled with CONFIG_RETENTION, which requires that CONFIG_RETAINED_MEM be enabled) by getting the device by using:

```c
#include <zephyr/device.h>
#include <zephyr/retention/retention.h>

const struct device *retention1 = DEVICE_DT_GET(DT_NODELABEL(retention1));
const struct device *retention2 = DEVICE_DT_GET(DT_NODELABEL(retention2));
```

When the write function is called, the magic header and checksum (if enabled) will be set on the area, and it will be marked as valid from that point onwards.

### 4.31.2 Mutex protection

Mutex protection of retention areas is enabled by default when applications are compiled with multithreading support. This means that different threads can safely call the retention functions without clashing with other concurrent thread function usage, but means that retention functions cannot be used from ISRs. It is possible to disable mutex protection globally on all retention areas by enabling CONFIGRETENTION_MUTEX_FORCE_DISABLE - users are then responsible for ensuring that the function calls do not conflict with each other. Note that to use this, retention driver mutex support must also be disabled by enabling CONFIGRETAINED_MEM_MUTEX_FORCE_DISABLE.
4.31.3 Boot mode

An addition to the retention subsystem is a boot mode interface, this can be used to dynamically change the state of an application or run a different application with a minimal set of functions when a device is rebooted (an example is to have a buttonless way of entering mcuboot's serial recovery feature from the main application).

To use the boot mode feature, a data retention entry must exist in the device tree, which is dedicated for use as the boot mode selection (the user area data size only needs to be a single byte), and this area be assigned to the chosen node of `zephyr,boot-mode`. See the following example:

```c
/ {
    sram@2003FFFF {
        compatible = "zephyr,memory-region", "mmio-sram";
        reg = <0x2003FFFF 0x1>;
        zephyr,memory-region = "RetainedMem";
        status = "okay";
        retainedmem {
            compatible = "zephyr,retained-ram";
            status = "okay";
            #address-cells = <1>;
            #size-cells = <1>;
            retention0: retention@0 {
                compatible = "zephyr,retention";
                status = "okay";
                reg = <0x0 0x1>;
            };
        };
        chosen {
            zephyr,boot-mode = &retention0;
        };
    };
    /* Reduce SRAM0 usage by 1 byte to account for non-init area */
    &sram0 {
        reg = <0x20000000 0x3FFFF>;
    };
}
```

The boot mode interface can be enabled with `CONFIG_RETENTION_BOOT_MODE` and then accessed by using the boot mode functions. If using mcuboot with serial recovery, it can be built with `CONFIG_MCUBOOT_SERIAL` and `CONFIG_BOOT_SERIAL_BOOT_MODE` enabled which will allow rebooting directly into the serial recovery mode by using:

```c
#include <zephyr/retention/bootmode.h>
#include <zephyr/sys/reboot.h>

bootmode_set(BOOT_MODE_TYPE_BOOTLOADER);
sys_reboot(0);
```

4.31.4 Retention system modules

Modules can expand the functionality of the retention system by using it as a transport (e.g. between a bootloader and application).
Bootloader Information

The bootloader information (abbreviated to blinfo) subsystem is an extension of the Retention System which allows for reading shared data from a bootloader and allowing applications to query it. It has an optional feature of organising the information retrieved from the bootloader and storing it in the Settings with the blinfo/ prefix.

Devicetree setup  To use the bootloader information subsystem, a retention area needs to be created which has a retained data section as its parent, generally non-init RAM is used for this purpose. See the following example (examples in this guide are based on the nrf52840dk_nrf52840 board and memory layout):

```c
/ {
    sram@2003F000 {
        compatible = "zephyr,memory-region", "mmio-sram";
        reg = <0x2003F000 DT_SIZE_K(1)>;
        zephyr,memory-region = "RetainedMem";
        status = "okay";

        retainedmem {
            compatible = "zephyr,retained-ram";
            status = "okay";
            #address-cells = <1>;
            #size-cells = <1>;

            boot_info0: boot_info@0 {
                compatible = "zephyr,retention";
                status = "okay";
                reg = <0x0 0x100>;
            };
        };

        chosen {
            zephyr,bootloader-info = &boot_info0;
        };
    };

    /* Reduce SRAM0 usage by 1KB to account for non-init area */
    &sram0 {
        reg = <0x20000000 DT_SIZE_K(255)>;
    };
}
```

Note that this configuration needs to be applied on both the bootloader (MCUboot) and application to be usable. It can be combined with other retention system APIs such as the Boot mode

MCUboot setup  Once the above devicetree configuration is applied, MCUboot needs to be configured to store the shared data in this area, the following Kconfigs need to be set for this:

- **CONFIG_RETAINED_MEM** - Enables retained memory driver
- **CONFIG_RETENTION** - Enables retention system
- **CONFIG_BOOT_SHARE_DATA** - Enables shared data
- **CONFIG_BOOT_SHARE_DATA_BOOTINFO** - Enables boot information shared data type
- **CONFIG_BOOT_SHARE_BACKEND_RETENTION** - Stores shared data using retention/blinfo subsystem
**Application setup**   The application must enable the following base Kconfig options for the bootloader information subsystem to function:

- CONFIG_retained_mem
- CONFIG_retention
- CONFIG_retention_bootloader_info
- CONFIG_retention_bootloader_info_type_mcuboot

The following include is needed to use the bootloader information subsystem:

```c
#include <zephyr/retention/blinfo.h>
```

By default, only the lookup function is provided: `blinfo_lookup()`, the application can call this to query the information from the bootloader. This function is enabled by default with `CONFIG_RETENTION_BOOTLOADER_INFO_OUTPUT_FUNCTION`, however, applications can optionally choose to use the settings storage feature instead. In this mode, the bootloader information can be queried by using settings keys, the following Kconfig options need to be enabled for this mode:

- CONFIG_SETTINGS
- CONFIG_SETTINGS_RUNTIME
- CONFIG_RETENTION_BOOTLOADER_INFO_OUTPUT_SETTINGS

This allows the information to be queried via the `settings_runtime_get()` function with the following keys:

- blinfo/mode The mode that MCUboot is configured for (enum mcuboot_mode value)
- blinfo/signature_type The signature type MCUboot is configured for (enum mcuboot_signature_type value)
- blinfo/recovery The recovery type enabled in MCUboot (enum mcuboot_recovery_mode value)
- blinfo/running_slot The running slot, useful for direct-XIP mode to know which slot to use for an update
- blinfo/bootloader_version Version of the bootloader (struct image_version object)
- blinfo/max_application_size Maximum size of an application (in bytes) that can be loaded

In addition to the previous include, the following includes are required for this mode:

```c
#include <bootutil/boot_status.h>
#include <bootutil/image.h>
#include <mcuboot_version.h>
#include <zephyr/settings/settings.h>
```

**API Reference**

**Bootloader information API**

*group bootloader_info_interface*

Bootloader info interface.

**Functions**
int blinfo_lookup(uint16_t key, char *val, int val_len_max)
    Returns bootinfo information.

Parameters
    • key – The information to return (for MCUboot: minor TLV).
    • val – Where the return information will be placed.
    • val_len_max – The maximum size of the provided buffer.

Return values
    • 0 – If successful.
    • -E OVERFLOW – If the data is too large to fit the supplied buffer.
    • -E IO – If the requested key was not found.
    • -errno – Error code.

4.31.5 API Reference

Retention system API

group retention_api
    Retention API.

Typedefs

typedef ssize_t (*retention_size_api)(const struct device *dev)

typedef int (*retention_is_valid_api)(const struct device *dev)

typedef int (*retention_read_api)(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)

typedef int (*retention_write_api)(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)

typedef int (*retention_clear_api)(const struct device *dev)

Functions

ssize_t retention_size(const struct device *dev)
    Returns the size of the retention area.

Parameters
    • dev – Retention device to use.

Return values
    Positive – value indicating size in bytes on success, else negative errno code.
int retention_is_valid(const struct device *dev)
    Checks if the underlying data in the retention area is valid or not.

Parameters
• dev – Retention device to use.

Return values
• 1 – If successful and data is valid.
• 0 – If data is not valid.
• -ENOTSUP – If there is no header/checksum configured for the retention area.
• -errno – Error code code.

int retention_read(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)
    Reads data from the retention area.

Parameters
• dev – Retention device to use.
• offset – Offset to read data from.
• buffer – Buffer to store read data in.
• size – Size of data to read.

Return values
• 0 – If successful.
• -errno – Error code code.

int retention_write(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)
    Writes data to the retention area (underlying data does not need to be cleared prior to writing), once function returns with a success code, the data will be classed as valid if queried using retention_is_valid().

Parameters
• dev – Retention device to use.
• offset – Offset to write data to.
• buffer – Data to write.
• size – Size of data to be written.

Return values
0 – on success else negative errno code.

int retention_clear(const struct device *dev)
    Clears all data in the retention area (sets it to 0)

Parameters
• dev – Retention device to use.

Return values
0 – on success else negative errno code.

struct retention_api
    #include <retention.h>
Boot mode interface

*group* `boot_mode_interface`

Boot mode interface.

** Enums **

```c
enum BOOT_MODE_TYPES
{
    enum BOOT_MODE_TYPE_NORMAL = 0x00
    {
        Default (normal) boot, to user application.
    },

    enum BOOT_MODE_TYPE_BOOTLOADER
    {
        Bootloader boot mode (e.g. serial recovery for MCUboot)
    }
};
```

** Functions **

```c
int bootmode_check(uint8_t boot_mode)
{
    Checks if the boot mode of the device is set to a specific value.

    ** Parameters **
    • `boot_mode` – Expected boot mode to check.

    ** Return values **
    • 1 – If successful and boot mode matches.
    • 0 – If boot mode does not match.
    • -errno – Error code code.
}
```

```c
int bootmode_set(uint8_t boot_mode)
{
    Sets boot mode of device.

    ** Parameters **
    • `boot_mode` – Boot mode value to set.

    ** Return values **
    • 0 – If successful.
    • -errno – Error code code.
}
```

```c
int bootmode_clear(void)
{
    Clear boot mode value (sets to 0) - which corresponds to `BOOT_MODE_TYPE_NORMAL`.

    ** Return values **
    • 0 – If successful.
    • -errno – Error code code.
}
4.32 Real Time I/O (RTIO)

RTIO provides a framework for doing asynchronous operation chains with event driven I/O. This section covers the RTIO API, queues, executor, iodev, and common usage patterns with peripheral devices.

RTIO takes a lot of inspiration from Linux’s io_uring in its operations and API as that API matches up well with hardware transfer queues and descriptions such as DMA transfer lists.

4.32.1 Problem

An application wishing to do complex DMA or interrupt driven operations today in Zephyr requires direct knowledge of the hardware and how it works. There is no understanding in the DMA API of other Zephyr devices and how they relate.
This means doing complex audio, video, or sensor streaming requires direct hardware knowledge or leaky abstractions over DMA controllers. Neither is ideal.

To enable asynchronous operations, especially with DMA, a description of what to do rather than direct operations through C and callbacks is needed. Enabling DMA features such as channels with priority, and sequences of transfers requires more than a simple list of descriptions.

Using DMA and/or interrupt driven I/O shouldn’t dictate whether or not the call is blocking or not.

4.32.2 Inspiration, introducing io_uring

It’s better not to reinvent the wheel (or ring in this case) and io_uring as an API from the Linux kernel provides a winning model. In io_uring there are two lock-free ring buffers acting as queues shared between the kernel and a userland application. One queue for submission entries which may be chained and flushed to create concurrent sequential requests. A second queue for completion queue events. Only a single syscall is actually required to execute many operations, the io_uring_submit call. This call may block the caller when a number of operations to wait on is given.

This model maps well to DMA and interrupt driven transfers. A request to do a sequence of operations in an asynchronous way directly relates to the way hardware typically works with interrupt driven state machines potentially involving multiple peripheral IPs like bus and DMA controllers.

4.32.3 Submission Queue

The submission queue (sq), is the description of the operations to perform in concurrent chains. For example imagine a typical SPI transfer where you wish to write a register address to then read from. So the sequence of operations might be...

1. Chip Select
2. Clock Enable
3. Write register address into SPI transmit register
4. Read from the SPI receive register into a buffer
5. Disable clock
6. Disable Chip Select

If anything in this chain of operations fails give up. Some of those operations can be embodied in a device abstraction that understands a read or write implicitly means setup the clock and chip select. The transactional nature of the request also needs to be embodied in some manner. Of the operations above perhaps the read could be done using DMA as its large enough make sense. That requires an understanding of how to setup the device’s particular DMA to do so.

The above sequence of operations is embodied in RTIO as chain of submission queue entries (sqe). Chaining is done by setting a bitflag in an sqe to signify the next sqe must wait on the current one.

Because the chip select and clocking is common to a particular SPI controller and device on the bus it is embodied in what RTIO calls an iodev.

Multiple operations against the same iodev are done in the order provided as soon as possible. If two operation chains have varying points using the same device its possible one chain will have to wait for another to complete.
4.32.4 Completion Queue

In order to know when a sqe has completed there is a completion queue (cq) with completion queue events (cqe). A sqe once completed results in a cqe being pushed into the cq. The ordering of cqe may not be the same order of sqe. A chain of sqe will however ensure ordering and failure cascading.

Other potential schemes are possible but a completion queue is a well trod idea with io_uring and other similar operating system APIs.

4.32.5 Executor

The RTIO executor is a low overhead concurrent I/O task scheduler. It ensures certain request flags provide the expected behavior. It takes a list of submissions working through them in order. Various flags allow for changing the behavior of how submissions are worked through. Flags to form in order chains of submissions, transactional sets of submissions, or create multi-shot (continuously producing) requests are all possible!

4.32.6 IO Device

Turning submission queue entries (sqe) into completion queue events (cqe) is the job of objects implementing the iodev (IO device) API. This API accepts requests in the form of the iodev submit API call. It is the io devices job to work through its internal queue of submissions and convert them into completions. In effect every io device can be viewed as an independent, event driven actor like object, that accepts a never ending queue of I/O like requests. How the iodev does this work is up to the author of the iodev, perhaps the entire queue of operations can be converted to a set of DMA transfer descriptors, meaning the hardware does almost all of the real work.

4.32.7 Cancellation

Canceling an already queued operation is possible but not guaranteed. If the SQE has not yet started, it's likely that a call to `rtio_sqe_cancel()` will remove the SQE and never run it. If, however, the SQE already started running, the cancel request will be ignored.

4.32.8 Memory pools

In some cases requests to read may not know how much data will be produced. Alternatively, a reader might be handling data from multiple io devices where the frequency of the data is unpredictable. In these cases it may be wasteful to bind memory to in flight read requests. Instead with memory pools the memory to read into is left to the iodev to allocate from a memory pool associated with the RTIO context that the read was associated with. To create such an RTIO context the `RTIO_DEFINE_WITH_MEMPOOL` can be used. It allows creating an RTIO context with a dedicated pool of “memory blocks” which can be consumed by the iodev. Below is a snippet setting up the RTIO context with a memory pool. The memory pool has 128 blocks, each block has the size of 16 bytes, and the data is 4 byte aligned.

```c
#include <zephyr/rtio/rtio.h>

#define SQ_SIZE 4
#define CQ_SIZE 4
#define MEM_BLK_COUNT 128
#define MEM_BLK_SIZE 16
#define MEM_BLK_ALIGN 4
```
When a read is needed, the caller simply needs to replace the call \texttt{rtio_sqe Prep read()} (which takes a pointer to a buffer and a length) with a call to \texttt{rtio_sqe_prep_read_with_pool()}. The iodev requires only a small change which works with both pre-allocated data buffers as well as the mempool. When the read is ready, instead of getting the buffers directly from the \texttt{rtio_iodev_sqe}, the iodev should get the buffer and count by calling \texttt{rtio_sqe_rx_buf()} like so:

```c
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_sqe_rx_buf(iodev_sqe, MIN_BUF_LEN, DESIRED_BUF_LEN, &buf, &buf_len);
if (rc != 0) {
    LOG_ERR("Failed to get buffer of at least %u bytes", MIN_BUF_LEN);
    return;
}
```

Finally, the consumer will be able to access the allocated buffer via \texttt{rtio_cqe_get_mempool_buffer()}.  
```c
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_cqe_get_mempool_buffer(&rtio_context, &cqe, &buf, &buf_len);
if (rc != 0) {
    LOG_ERR("Failed to get mempool buffer");
    return rc;
}
/* Release the cqe events (note that the buffer is not released yet */
rtio_cqe_release_all(&rtio_context);
/* Do something with the memory */
/* Release the mempool buffer */
rtio_release_buffer(&rtio_context, buf);
```

### 4.32.9 When to Use

RTIO is useful in cases where concurrent or hatch like I/O flows are useful. From the driver/hardware perspective the API enables batching of I/O requests, potentially in an optimal way. Many requests to the same SPI peripheral for example might be translated to hardware command queues or DMA transfer descriptors entirely. Meaning the hardware can potentially do more than ever.

There is a small cost to each RTIO context and iodev. This cost could be weighed against using a thread for each concurrent I/O operation or custom queues and threads per peripheral. RTIO is much lower cost than that.

### 4.32.10 API Reference

```
group rtio
  RTIO.
```
Defines

RTIO_IODEV_I2C_STOP
Equivalent to the I2C_MSG_STOP flag.

RTIO_IODEV_I2C_RESTART
Equivalent to the I2C_MSG_RESTART flag.

RTIO_IODEV_I2C_10_BITS
Equivalent to the I2C_MSG_ADDR_10_BITS.

RTIO_OP_NOP
An operation that does nothing and will complete immediately.

RTIO_OP_RX
An operation that receives (reads)

RTIO_OP_TX
An operation that transmits (writes)

RTIO_OP_TINY_TX
An operation that transmits tiny writes by copying the data to write.

RTIO_OP_CALLBACK
An operation that calls a given function (callback)

RTIO_OP_TXRX
An operation that transceives (reads and writes simultaneously)

RTIO_IODEV_DEFINE(name, iodev_api, iodev_data)
Statically define and initialize an RTIO IODev.

Parameters
- name – Name of the iodev
- iodev_api – Pointer to struct rtio_iodev_api
- iodev_data – Data pointer

RTIO_BMEM
Allocate to bss if available.
If CONFIG_USERSPACE is selected, allocate to the rtio_partition bss. Maps to:
K_APP_BMEM(rtio_partition) static
If CONFIG_USERSPACE is disabled, allocate as plain static: static

RTIO_DMEM
Allocate as initialized memory if available.
If CONFIG_USERSPACE is selected, allocate to the rtio_partition init. Maps to:
K_APP_DMEM(rtio_partition) static
If CONFIG_USERSPACE is disabled, allocate as plain static: static
RTIO_DEFINE(name, sq_sz, cq_sz)
Statically define and initialize an RTIO context.

Parameters
• name – Name of the RTIO
• sq_sz – Size of the submission queue entry pool
• cq_sz – Size of the completion queue entry pool

RTIO_DEFINE_WITH_MEMPOOL(name, sq_sz, cq_sz, num_blks, blk_size, balign)
Statically define and initialize an RTIO context.

Parameters
• name – Name of the RTIO
• sq_sz – Size of the submission queue, must be power of 2
• cq_sz – Size of the completion queue, must be power of 2
• num_blks – Number of blocks in the memory pool
• blk_size – The number of bytes in each block
• balign – The block alignment

Typedefs

typedef void (*rtio_callback_t)(struct rtio *r, const struct rtio_sqe *sqe, void *arg0)
Callback signature for RTIO_OP_CALLBACK.

Param r
RTIO context being used with the callback

Param sqe
Submission for the callback op

Param arg0
Argument option as part of the sqe

Functions

static inline size_t rtio_mempool_block_size(const struct rtio *r)
Get the mempool block size of the RTIO context.

Parameters
• r – [in] The RTIO context

Returns
The size of each block in the context's mempool

Returns
0 if the context doesn't have a mempool

static inline void rtio_sqe_prep_nop(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, void *userdata)
Prepare a nop (no op) submission.
static inline void rtio_sqe_prep_read(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, uint8_t *buf, uint32_t len, void *userdata)

Prepare a read op submission.

static inline void rtio_sqe_prep_read_with_pool(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, void *userdata)

Prepare a read op submission with context's mempool.

See also:
rtio_sqe_prep_read()

static inline void rtio_sqe_prep_read_multishot(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, void *userdata)

static inline void rtio_sqe_prep_write(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, uint8_t *buf, uint32_t len, void *userdata)

Prepare a write op submission.

static inline void rtio_sqe_prep_tiny_write(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, const uint8_t *tiny_write_data, uint8_t tiny_write_len, void *userdata)

Prepare a tiny write op submission.

Unlike the normal write operation where the source buffer must outlive the call the tiny write data in this case is copied to the sqe. It must be tiny to fit within the specified size of a rtio_sqe.

This is useful in many scenarios with RTL logic where a write of the register to subsequently read must be done.

static inline void rtio_sqe_prep_callback(struct rtio_sqe *sqe, rtio_callback_t callback, void *arg0, void *userdata)

Prepare a callback op submission.

A somewhat special operation in that it may only be done in kernel mode.

Used where general purpose logic is required in a queue of io operations to do transforms or logic.

static inline void rtio_sqe_prep_transceive(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, uint8_t *tx_buf, uint8_t *rx_buf, uint32_t buf_len, void *userdata)

Prepare a transceive op submission.

static inline struct rtio_iodev_sqe *rtio_sqe_pool_alloc(struct rtio_sqe_pool *pool)

static inline void rtio_sqe_pool_free(struct rtio_sqe_pool *pool, struct rtio_iodev_sqe *iodev_sqe)

static inline struct rtio_cqe *rtio_cqe_pool_alloc(struct rtio_cqe_pool *pool)

static inline void rtio_cqe_pool_free(struct rtio_cqe_pool *pool, struct rtio_cqe *cqe)

static inline int rtio_block_pool_alloc(struct rtio *r, size_t min_sz, size_t max_sz, uint8_t **buf, uint32_t *buf_len)
static inline void rtio_block_pool_free(struct rtio *r, void *buf, uint32_t buf_len)

static inline uint32_t rtio_sqe_acquirable(struct rtio *r)
    Count of acquirable submission queue events.

Parameters
• r – RTIO context

Returns
Count of acquirable submission queue events

static inline struct rtio_iodev_sqe *rtio_txn_next(const struct rtio_iodev_sqe *iodev_sqe)
Get the next sqe in the transaction.

Parameters
• iodev_sqe – Submission queue entry

Return values
• NULL – if current sqe is last in transaction
• struct – rtio_sqe * if available

static inline struct rtio_iodev_sqe *rtio_iodev_sqe_next(const struct rtio_iodev_sqe *iodev_sqe)
Get the next sqe in the chain or transaction.

Parameters
• iodev_sqe – Submission queue entry

Return values
• NULL – if current sqe is last in chain
• struct – rtio_sqe * if available

Acquire a single submission queue event if available.

Parameters
• r – RTIO context

Return values
• sqe – A valid submission queue event acquired from the submission queue
• NULL – No submission queue event available
static inline void rtio_sqe_drop_all(struct rtio *r)
  Drop all previously acquired sqe.

Parameters
  • r – RTIO context

static inline struct rtio_cqe *rtio_cqe_acquire(struct rtio *r)
  Acquire a complete queue event if available.

static inline void rtio_cqe_produce(struct rtio *r, struct rtio_cqe *cqe)
  Produce a complete queue event if available.

static inline struct rtio_cqe *rtio_cqe_consume(struct rtio *r)
  Consume a single completion queue event if available.
  
  If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters
  • r – RTIO context

Return values
  • cqe – A valid completion queue event consumed from the completion queue
  • NULL – No completion queue event available

static inline struct rtio_cqe *rtio_cqe_consume_block(struct rtio *r)
  Wait for and consume a single completion queue event.
  
  If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters
  • r – RTIO context

Return values
  • cqe – A valid completion queue event consumed from the completion queue

static inline void rtio_cqe_release(struct rtio *r, struct rtio_cqe *cqe)
  Release consumed completion queue event.

Parameters
  • r – RTIO context
  • cqe – Completion queue entry

static inline uint32_t rtio_cqe_compute_flags(struct rtio_iodev_sqe *iodev_sqe)
  Compute the CQE flags from the rtio_iodev_sqe entry.

Parameters
  • iodev_sqe – The SQE entry in question.

Returns
  The value that should be set for the CQE's flags field.

int rtio_cqe_get_mempool_buffer(const struct rtio *r, struct rtio_cqe *cqe, uint8_t **buff, uint32_t *buff_len)
  Retrieve the mempool buffer that was allocated for the CQE.
If the RTIO context contains a memory pool, and the SQE was created by calling `rtio_sqe_read_with_pool()`, this function can be used to retrieve the memory associated with the read. Once processing is done, it should be released by calling `rtio_release_buffer()`.

**Parameters**
- `r` – [in] RTIO context
- `cqe` – [in] The CQE handling the event.
- `buff` – [out] Pointer to the mempool buffer
- `buff_len` – [out] Length of the allocated buffer

**Returns**
- 0 on success
- -EINVAL if the buffer wasn't allocated for this cqe
- -ENOTSUP if memory blocks are disabled

```c
void rtio_executor_submit(struct rtio *r)
void rtio_executor_ok(struct rtio_iodev_sqe *iodev_sqe, int result)
void rtio_executor_err(struct rtio_iodev_sqe *iodev_sqe, int result)
static inline void rtio_iodev_sqe_ok(struct rtio_iodev_sqe *iodev_sqe, int result)
static inline void rtio_iodev_sqe_err(struct rtio_iodev_sqe *iodev_sqe, int result)
static inline void rtio_iodev_cancel_all(struct rtio_iodev *iodev)
static inline void rtio_cqe_submit(struct rtio *r, int result, void *userdata, uint32_t flags)
```

Inform the executor of a submission completion with success. This may start the next asynchronous request if one is available.

**Parameters**
- `iodev_sqe` – IODev Submission that has succeeded
- `result` – Result of the request

Inform the executor of a submissions completion with error. This SHALL fail the remaining submissions in the chain.

**Parameters**
- `iodev_sqe` – Submission that has failed
- `result` – Result of the request

Cancel all requests that are pending for the iodev.

**Parameters**
- `iodev` – IODev to cancel all requests for

Submit a completion queue event with a given result and userdata. Called by the executor to produce a completion queue event, no inherent locking is performed and this is not safe to do from multiple callers.

**Parameters**
- `r` – RTIO context
- `result` – Integer result code (could be -errno)
static inline int rtio_sqe_rx_buf(const struct rtio_iodev_sqe *iodev_sqe, uint32_t min_buf_len, uint32_t max_buf_len, uint8_t **buf, uint32_t *buf_len)

Get the buffer associate with the RX submission.

**Parameters**

- **iodev_sqe** – [in] The submission to probe
- **min_buf_len** – [in] The minimum number of bytes needed for the operation
- **max_buf_len** – [in] The maximum number of bytes needed for the operation
- **buf** – [out] Where to store the pointer to the buffer
- **buf_len** – [out] Where to store the size of the buffer

**Returns**

- 0 if buf and buf_len were successfully filled
- -ENOMEM Not enough memory for min_buf_len

void rtio_release_buffer(struct rtio *r, void *buff, uint32_t buff_len)

Release memory that was allocated by the RTIO’s memory pool.

If the RTIO context was created by a call to **RTIO_DEFINE_WITH_MEMPOOL()**, then the cqe data might contain a buffer that’s owned by the RTIO context. In those cases (if the read request was configured via rtio_sqe_read_with_pool()) the buffer must be returned back to the pool.

Call this function when processing is complete. This function will validate that the memory actually belongs to the RTIO context and will ignore invalid arguments.

**Parameters**

- **r** – RTIO context
- **buff** – Pointer to the buffer to be released.
- **buff_len** – Number of bytes to free (will be rounded up to nearest memory block).

static inline void rtio_access_grant(struct rtio *r, struct k_thread *t)

Grant access to an RTIO context to a user thread.

int rtio_sqe_cancel(struct rtio_sqe *sqe)

Attempt to cancel an SQE.

If possible (not currently executing), cancel an SQE and generate a failure with -ECANCELED result.

**Parameters**

- **sqe** – [in] The SQE to cancel

**Returns**

- 0 if the SQE was flagged for cancellation
- <0 on error
int rtio_sqe_copy_in_get_handles(struct rtio *r, const struct rtio_sqe *sqes, struct rtio_sqe **handle, size_t sqe_count)

Copy an array of SQEs into the queue and get resulting handles back.

Copies one or more SQEs into the RTIO context and optionally returns their generated SQE handles. Handles can be used to cancel events via the rtio_sqe_cancel() call.

Parameters
- r – [in] RTIO context
- sqes – [in] Pointer to an array of SQEs
- handle – [out] Optional pointer to rtio_sqe pointer to store the handle of the first generated SQE. Use NULL to ignore.
- sqe_count – [in] Count of sqes in array

Return values
- 0 – success
- -ENOMEM – not enough room in the queue

static inline int rtio_sqe_copy_in(struct rtio *r, const struct rtio_sqe *sqes, size_t sqe_count)

Copy an array of SQEs into the queue.

Useful if a batch of submissions is stored in ROM or RTIO is used from user mode where a copy must be made.

Partial copying is not done as chained SQEs need to be submitted as a whole set.

Parameters
- r – RTIO context
- sqes – Pointer to an array of SQEs
- sqe_count – Count of sqes in array

Return values
- 0 – success
- -ENOMEM – not enough room in the queue

int rtio_cqe_copy_out(struct rtio *r, struct rtio_cqe *cqes, size_t cqe_count, k_timeout_t timeout)

Copy an array of CQEs from the queue.

Copies from the RTIO context and its queue completion queue events, waiting for the given time period to gather the number of completions requested.

Parameters
- r – RTIO context
- cqes – Pointer to an array of SQEs
- cqe_count – Count of sqes in array
- timeout – Timeout to wait for each completion event. Total wait time is potentially timeout*cqe_count at maximum.

Return values
- copy_count – Count of copied CQEs (0 to cqe_count)
int rtio_submit(struct rtio *r, uint32_t wait_count)
Submit I/O requests to the underlying executor.

Submits the queue of submission queue events to the executor. The executor will do
the work of managing tasks representing each submission chain, freeing submission
queue events when done, and producing completion queue events as submissions are
completed.

Parameters
- r – RTIO context
- wait_count – Number of submissions to wait for completion of.

Return values
- 0 – On success

Variables

struct k_mem_partition rtio_partition
The memory partition associated with all RTIO context information.

struct rtio_sqe
#include <rtio.h> A submission queue event.

Public Members

uint8_t op
Op code.

uint8_t prio
Op priority.

uint16_t flags
Op Flags.

uint16_t iodev_flags
Op iodev flags.

const struct rtio_iodev *iodev
Device to operation on.

void *userdata
User provided data which is returned upon operation completion.
Could be a pointer or integer.
If unique identification of completions is desired this should be unique as well.

uint32_t buf_len
Length of buffer.
uint8_t *buf
    Buffer to use.

uint8_t tiny_buf_len
    Length of tiny buffer.

uint8_t tiny_buf[7]
    Tiny buffer.

void *arg0
    Last argument given to callback.

struct rtio_cqe
    #include <rtio.h> A completion queue event.

    Public Members

    int32_t result
        Result from operation.

    void *userdata
        Associated userdata with operation.

    uint32_t flags
        Flags associated with the operation.

struct rtio_sqe_pool
    #include <rtio.h>

struct rtio_cqe_pool
    #include <rtio.h>

struct rtio
    #include <rtio.h> An RTIO context containing what can be viewed as a pair of queues.
    A queue for submissions (available and in queue to be produced) as well as a queue of completions (available and ready to be consumed).
    The rtio executor along with any objects implementing the rtio_iodev interface are the consumers of submissions and producers of completions.
    No work is started until rtio_submit() is called.

struct rtio_iodev_sqe
    #include <rtio.h> Compute the mempool block index for a given pointer.

    IO device submission queue entry
    May be cast safely to and from a rtio_sqe as they occupy the same memory provided by the pool

4.32. Real Time I/O (RTIO)
Param r
  [in] RTIO context

Param ptr
  [in] Memory pointer in the mempool

Return
  Index of the mempool block associated with the pointer. Or UINT16_MAX
  if invalid.

struct rtio_iodev_api
  #include <rtio.h> API that an RTIO IO device should implement.

Public Members

void (*submit)(struct rtio_iodev_sqe *iodev_sqe)
  Submit to the iodev an entry to work on.
  This call should be short in duration and most likely either enqueue or kick off an
  entry with the hardware.
  Param iodev_sqe
    Submission queue entry

struct rtio_iodev
  #include <rtio.h> An IO device with a function table for submitting requests.

MPSC Lock-free Queue API

group rtio_mpsc
  RTIO Multiple Producer Single Consumer (MPSC) Queue API.

Defines

mpsc_ptr_get(ptr)
mpsc_ptr_set(ptr, val)
mpsc_ptr_set_get(ptr, val)
RTIO_MPSC_INIT(symbol)
  Static initializer for a mpsc queue.
  Since the queue is

Parameters
  • symbol – name of the queue

Typedefs

typedef atomic_ptr_t mpsc_ptr_t
Functions

static inline void rtio_mpsc_init(struct rtio_mpsc *q)
  Initialize queue.

  Parameters
  • q – Queue to initialize or reset

ALWAYS_INLINE static void rtio_mpsc_push(struct rtio_mpsc *q, struct rtio_mpsc_node *n)
  Push a node.

  Parameters
  • q – Queue to push the node to
  • n – Node to push into the queue

static inline struct rtio_mpsc_node *rtio_mpsc_pop(struct rtio_mpsc *q)
  Pop a node off of the list.

  Return values
  • NULL – When no node is available
  • node – When node is available

SPSC Lock-free Queue API

#include <rtio_mpsc.h> Queue member.

struct rtio_mpsc_node
  #include <rtio_mpsc.h> MPSC Queue.

#include <rtio_mpsc.h> MPSC Queue.

struct rtio_mpsc
  #include <rtio_mpsc.h> MPSC Queue.

SPSC Lock-free Queue API

group rtio_spsc
  RTIO Single Producer Single Consumer (SPSC) Queue API.

Defines

RTIO_SPSC_INITIALIZER(sz, buf)
  Statically initialize an rtio_spsc.

  Parameters
  • sz – Size of the spsc, must be power of 2 (ex: 2, 4, 8)
  • buf – Buffer pointer

RTIO_SPSC_DECLARE(name, type)
  Declare an anonymous struct type for an rtio_spsc.

  Parameters
  • name – Name of the spsc symbol to be provided
  • type – Type stored in the spsc
RTIO_SPSC_DEFINE(name, type, sz)
Define an rtio_spsc with a fixed size.

Parameters
• name – Name of the spsc symbol to be provided
• type – Type stored in the spsc
• sz – Size of the spsc, must be power of 2 (ex: 2, 4, 8)

rtio_spsc_size(spsc)
Size of the SPSC queue.

Parameters
• spsc – SPSC reference

rtio_spsc_reset(spsc)
Initialize/reset a spsc such that its empty.
Note that this is not safe to do while being used in a producer/consumer situation with multiple calling contexts (isrs/threads).

Parameters
• spsc – SPSC to initialize/reset

rtio_spsc_acquire(spsc)
Acquire an element to produce from the SPSC.

Parameters
• spsc – SPSC to acquire an element from for producing

Returns
A pointer to the acquired element or null if the spsc is full

rtio_spsc_produce(spsc)
Produce one previously acquired element to the SPSC.
This makes one element available to the consumer immediately

Parameters
• spsc – SPSC to produce the previously acquired element or do nothing

rtio_spsc_produce_all(spsc)
Produce all previously acquired elements to the SPSC.
This makes all previous acquired elements available to the consumer immediately

Parameters
• spsc – SPSC to produce all previously acquired elements or do nothing

rtio_spsc_drop_all(spsc)
Drop all previously acquired elements.
This makes all previous acquired elements available to be acquired again

Parameters
• spsc – SPSC to drop all previously acquired elements or do nothing

rtio_spsc_consume(spsc)
Consume an element from the spsc.

Parameters
• spsc – Spsc to consume from
Returns
Pointer to element or null if no consumable elements left

`rtio_spsc_release(spsc)`
Release a consumed element.

Parameters
- `spsc` – SPSC to release consumed element or do nothing

`rtio_spsc_release_all(spsc)`
Release all consumed elements.

Parameters
- `spsc` – SPSC to release consumed elements or do nothing

`rtio_spsc_acquirable(spsc)`
Count of acquirable in spsc.

Parameters
- `spsc` – SPSC to get item count for

`rtio_spsc_consumable(spsc)`
Count of consumables in spsc.

Parameters
- `spsc` – SPSC to get item count for

`rtio_spsc_peek(spsc)`
 Peek at the first available item in queue.

Parameters
- `spsc` – Spsc to peek into

Returns
Pointer to element or null if no consumable elements left

`rtio_spsc_next(spsc, item)`
Peek at the next item in the queue from a given one.

Parameters
- `spsc` – SPSC to peek at
- `item` – Pointer to an item in the queue

Returns
Pointer to element or null if none left

`rtio_spsc_prev(spsc, item)`
Get the previous item in the queue from a given one.

Parameters
- `spsc` – SPSC to peek at
- `item` – Pointer to an item in the queue

Returns
Pointer to element or null if none left

`struct rtio_spsc`
Common SPSC attributes.
4.33 Zephyr bus (zbus)

The Zephyr bus - zbus is a lightweight and flexible software bus enabling a simple way for threads to talk to one another in a many-to-many way.

- **Concepts**
  - Virtual Distributed Event Dispatcher
  - Limitations

- **Usage**
  - Publishing to a channel
  - Reading from a channel
  - Notifying a channel
  - Declaring channels and observers
  - Iterating over channels and observers
  - Advanced channel control

- **Samples**
- **Suggested Uses**
- **Configuration Options**
- **API Reference**

4.33.1 Concepts

Threads can send messages to one or more observers using zbus. It makes the many-to-many communication possible. The bus implements message-passing and publish/subscribe communication paradigms that enable threads to communicate synchronously or asynchronously through shared memory.

The communication through zbus is channel-based. Threads (or callbacks) use channels to exchange messages. Additionally, besides other actions, threads can publish and observe channels. When a thread publishes a message on a channel, the bus will make the message available to all the published channel's observers. Based on the observer's type, it can access the message directly, receive a copy of it, or even receive only a reference of the published channel.

The figure below shows an example of a typical application using zbus in which the application logic (hardware independent) talks to other threads via software bus. Note that the threads are decoupled from each other because they only use zbus channels and do not need to know each other to talk.

The bus comprises:

- Set of channels that consists of the control metadata information, and the message itself;
- *Virtual Distributed Event Dispatcher* (VDED), the bus logic responsible for sending notifications/messages to the observers. The VDED logic runs inside the publishing action in the same thread context, giving the bus an idea of a distributed execution. When a thread publishes to a channel, it also propagates the notifications to the observers;
Fig. 18: A typical zbus application architecture.

- Threads (subscribers and message subscribers) and callbacks (listeners) publishing, reading, and receiving notifications from the bus.

Fig. 19: ZBus anatomy.

The bus makes the publish, read, claim, finish, notify, and subscribe actions available over channels. Publishing, reading, claiming, and finishing are available in all RTOS thread contexts, including ISRs. The publish and read operations are simple and fast; the procedure is channel locking followed by a memory copy to and from a shared memory region and then a channel unlocking. Another essential aspect of zbus is the observers. There are three types of observers:

- Listeners, a callback that the event dispatcher executes every time an observed channel is published or notified;
- Subscriber, a thread-based observer that relies internally on a message queue where the event dispatcher puts a changed channel’s reference every time an observed channel is published or notified. Note this kind of observer does not receive the message itself. It should read the message from the channel after receiving the notification;
- Message subscribers, a thread-based observer that relies internally on a FIFO where the event dispatcher puts a copy of the message every time an observed channel is published or notified.

Channel observation structures define the relationship between a channel and its observers.
For every observation, a pair channel/observer. Developers can statically allocate observation using the `ZBUS_CHAN_DEFINE` or `ZBUS_CHAN_ADD_OBS`. There are also runtime observers, enabling developers to create runtime observations. It is possible to disable an observer entirely or observations individually. The event dispatcher will ignore disabled observers and observations.

![ZBus observation mask](image)

Fig. 21: ZBus observation mask.

The above figure illustrates some states, from (a) to (d), for channels from C1 to C5, Subcriber 1, and the observations. The last two are in orange to indicate they are dynamically allocated (runtime observation). (a) shows that the observer and all observations are enabled. (b) shows the observer is disabled, so the event dispatcher will ignore it. (c) shows the observer enabled. However, there is one static observation disabled. The event dispatcher will only stop sending notifications from channel C3. In (d), the event dispatcher will stop sending notifications from channels C3 and C5 to Subscriber 1.

Suppose a usual sensor-based solution is in the figure below for illustration purposes. When triggered, the timer publishes to the Trigger channel. As the sensor thread subscribed to the Trigger channel, it receives the sensor data. Notice the VDED executes the Blink because it also listens to the Trigger channel. When the sensor data is ready, the sensor thread publishes it to the Sensor data channel. The core thread receives the message as a Sensor data channel message subscriber, processes the sensor data, and stores it in an internal sample buffer. It repeats until the sample buffer is full; when it happens, the core thread aggregates the sample buffer information, prepares a package, and publishes that to the Payload channel. The Lora thread receives that because it is a Payload channel message subscriber and sends the payload to the cloud. When it completes the transmission, the Lora thread publishes to the Transmission done channel. The VDED executes the Blink again since it listens to the Transmission done channel.

This way of implementing the solution makes the application more flexible, enabling us to change things independently. For example, we want to change the trigger from a timer to a button press. We can do that, and the change does not affect other parts of the system. Likewise, we would like to change the communication interface from LoRa to Bluetooth; we only need to change the LoRa thread. No other change is required in order to make that work. Thus, the developer would do that for every block of the image. Based on that, there is a sign zbus promotes decoupling in the system architecture.

Another important aspect of using zbus is the reuse of system modules. If a code portion with well-defined behaviors (we call that module) only uses zbus channels and not hardware inte-
faces, it can easily be reused in other solutions. The new solution must implement the interfaces (set of channels) the module needs to work. That indicates zbus could improve the module reuse.

The last important note is the zbus solution reach. We can count on many ways of using zbus to enable the developer to be as free as possible to create what they need. For example, messages can be dynamic or static allocated; notifications can be synchronous or asynchronous; the developer can control the channel in so many different ways claiming the channel, developers can add their metadata information to a channel by using the user-data field, the discretionary use of a validator enables the systems to be accurate over message format, and so on. Those characteristics increase the solutions that can be done with zbus and make it a good fit as an open-source community tool.

**Virtual Distributed Event Dispatcher**

The VDED execution always happens in the publisher's context. It can be a thread or an ISR. Be careful with publications inside ISR because the scheduler won't preempt the VDED. Use that wisely. The basic description of the execution is as follows:

- The channel lock is acquired;
- The channel receives the new message via direct copy (by a raw `memcpy()`);
- The event dispatcher logic executes the listeners, sends a copy of the message to the message subscribers, and pushes the channel's reference to the subscribers' notification message queue in the same sequence they appear on the channel observers' list. The listeners can perform non-copy quick access to the constant message reference directly (via the `zbus_chan_const_msg()` function) since the channel is still locked;
- At last, the publishing function unlocks the channel.

To illustrate the VDED execution, consider the example illustrated below. We have four threads in ascending priority $S_1$, $MS_2$, $MS_1$, and $T_1$ (the highest priority); two listeners, $L_1$ and $L_2$; and channel A. Supposing $L_1$, $L_2$, $MS_1$, $MS_2$, and $S_1$ observer channel A.

The following code implements channel A. Note the `struct a_msg` is illustrative only.

```c
ZBUS_CHAN_DEFINE(a_chan, /* Name */
    struct a_msg, /* Message type */
    NULL, /* Validator */
    NULL, /* User Data */
    ZBUS_OBSERVERS(L1, L2, MS1, MS2, S1), /* observers */
)
```

(continues on next page)
In the figure below, the letters indicate some action related to the VDED execution. The X-axis represents the time, and the Y-axis represents the priority of threads. Channel A's message, represented by a voice balloon, is only one memory portion (shared memory). It appears several times only as an illustration of the message at that point in time.

Fig. 24: ZBus VDED execution detail for priority T1 > MS1 > MS2 > S1.

The figure above illustrates the actions performed during the VDED execution when T1 publishes to channel A. Thus, the table below describes the activities (represented by a letter) of the VDED execution. The scenario considers the following priorities: T1 > MS1 > MS2 > S1. T1 has the highest priority.
Table 42: VDED execution steps in detail for priority T1 > MS1 > MS2 > S1.

<table>
<thead>
<tr>
<th>Actions</th>
<th>Description</th>

<td>The S1 leaves the pending state since channel A is not locked. It gets in the CPU again and starts executing. As it did receive a notification from channel A, it performs a channel read (as simple as lock, memory copy, unlock), continues its execution, and goes out the CPU.</td>
</tr>
</tbody>
</table>

**HLP priority boost**  ZBus implements the Highest Locker Protocol that relies on the observers’ thread priority to determine a temporary publisher priority. The protocol considers the channel's Highest Observer Priority (HOP); even if the observer is not waiting for a message on the channel, it is considered in the calculation. The VDED will elevate the publisher’s priority based on the HOP to ensure small latency and as few preemptions as possible.

**Note:** The priority boost is enabled by default. To deactivate it, you must set the `CONFIG_ZBUS_PRIORITY_BOOST` configuration.

**Warning:** ZBus priority boost does not consider runtime observers on the HOP calculations.

The figure below illustrates the actions performed during the VDED execution when T1 publishes to channel A. The scenario considers the priority boost feature and the following priorities: T1 < MS1 < MS2 < S1.

To properly use the priority boost, attaching the observer to a thread is necessary. When the subscriber is attached to a thread, it assumes its priority, and the priority boost algorithm will consider the observer's priority. The following code illustrates the thread-attaching function.

```c
ZBUS_SUBSCRIBER_DEFINE(s1, 4);
void s1_thread(void *ptr1, void *ptr2, void *ptr3)
{
    ARG_UNUSED(ptr1);
    ARG_UNUSED(ptr2);
    ARG_UNUSED(ptr3);

    const struct zbus_channel *chan;
    zbus_obs_attach_to_thread(&s1);

    while (!)
    {
        zbus_sub_wait(&s1, &chan, K_FOREVER);
    }
```

(continues on next page)
Fig. 26: ZBus VDED execution detail with priority boost enabled and for priority T1 < MS1 < MS2 < S1.

On the above code, the `zbus_obs_attach_to_thread()` will set the s1 observer with priority two as the thread has that priority. It is possible to reverse that by detaching the observer using the `zbus_obs_detach_from_thread()` function. Only enabled observers and observations will be considered on the channel HOP calculation. Masking a specific observation of a channel will affect the channel HOP.

In summary, the benefits of the feature are:

- The HLP is more effective for zbus than the mutexes priority inheritance;
- No bounded priority inversion will happen among the publisher and the observers;
- No other threads (that are not involved in the communication) with priority between T1 and S1 can preempt T1, avoiding unbounded priority inversion;
- Message subscribers will wait for the VDED to finish the message delivery process. So the VDED execution will be faster and more consistent;
- The HLP priority is dynamic and can change in execution;
- ZBus operations can be used inside ISRs;
- The priority boosting feature can be turned off, and plain semaphores can be used as the channel lock mechanism;
- The Highest Locker Protocol’s major disadvantage, the Inheritance-related Priority Inversion, is acceptable in the zbus scenario since it will ensure a small bus latency.
Limitations

Based on the fact that developers can use zbus to solve many different problems, some challenges arise. ZBus will not solve every problem, so it is necessary to analyze the situation to be sure zbus is applicable. For instance, based on the zbus benchmark, it would not be well suited to a high-speed stream of bytes between threads. The Pipe kernel object solves this kind of need.

Delivery guarantees ZBus always delivers the messages to the listeners and message subscribers. However, there are no message delivery guarantees for subscribers because zbus only sends the notification, but the message reading depends on the subscriber’s implementation. It is possible to increase the delivery rate by following design tips:

- Keep the listeners quick-as-possible (deal with them as ISRs). If some processing is needed, consider submitting a work item to a work-queue;
- Try to give producers a high priority to avoid losses;
- Leave spare CPU for observers to consume data produced;
- Consider using message queues or pipes for intensive byte transfers.

**Warning:** ZBus uses include/zephyr/net/buf.h (network buffers) to exchange data with message subscribers. So, chose carefully the configurations CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_SIZE and CONFIG_HEAP_MEM_POOL_SIZE. They are crucial to a proper VDED execution (delivery guarantee) considering message subscribers.

**Warning:** Subscribers will receive only the reference of the changing channel. A data loss may be perceived if the channel is published twice before the subscriber reads it. The second publication overwrites the value from the first. Thus, the subscriber will receive two notifications, but only the last data is there.

Message delivery sequence The message delivery will follow the precedence:

1. Observers defined in a channel using the ZBUS_CHAN_DEFINE (following the definition sequence);
2. Observers defined using the ZBUS_CHAN_ADD_OBS based on the sequence priority (parameter of the macro);
3. The latest is the runtime observers in the addition sequence using the zbus_chan_add_obs().

**Note:** The VDED will ignore all disabled observers or observations.

4.33.2 Usage

ZBus operation depends on channels and observers. Therefore, it is necessary to determine its message and observers list during the channel definition. A message is a regular C struct; the observer can be a subscriber (asynchronous), a message subscriber (asynchronous), or a listener (synchronous).

The following code defines and initializes a regular channel and its dependencies. This channel exchanges accelerometer data, for example.
struct acc_msg {
    int x;
    int y;
    int z;
};

ZBUS_CHAN_DEFINE(acc_chan, /* Name */
    struct acc_msg, /* Message type */
    NULL, /* Validator */
    NULL, /* User Data */
    ZBUS_OBSERVERS(my_listener, my_subscriber, my_msg_subscriber), /* observers */
    ZBUS_MSG_INIT(.x = 0, .y = 0, .z = 0) /* Initial value */
);

void listener_callback_example(const struct zbus_channel *chan) {
    const struct acc_msg *acc;
    if (&acc_chan == chan) {
        acc = zbus_chan_const_msg(chan); // Direct message access
        LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->z);
    }
}

ZBUS_LISTENER_DEFINE(my_listener, listener_callback_example);
ZBUS_LISTENER_DEFINE(my_listener2, listener_callback_example);
ZBUS_CHAN_ADD_OBS(acc_chan, my_listener2, 3);
ZBUS_SUBSCRIBER_DEFINE(my_subscriber, 4);

void subscriber_task(void) {
    const struct zbus_channel *chan;
    struct acc_msg acc = {0};
    while (!zbus_sub_wait(&my_subscriber, &chan, K_FOREVER)) {
        struct acc_msg acc = {0};
        if (&acc_chan == chan) { // Indirect message access
            zbus_chan_read(&acc_chan, &acc, K_NO_WAIT);
            LOG_DBG("From subscriber -> Acc x=%d, y=%d, z=%d", acc.x, acc.y,
            acc.z);
        }
    }
}

K_THREAD_DEFINE(subscriber_task_id, 512, subscriber_task, NULL, NULL, NULL, 3, 0, 0);

ZBUS_MSG_SUBSCRIBER_DEFINE(my_msg_subscriber);
static void msg_subscriber_task(void *ptr1, void *ptr2, void *ptr3) {
    ARG_UNUSED(ptr1);
    ARG_UNUSED(ptr2);
    ARG_UNUSED(ptr3);
    const struct zbus_channel *chan;
    struct acc_msg acc = {0};
    while (!zbus_sub_wait_msg(&my_msg_subscriber, &chan, &acc, K_FOREVER)) {
        if (&acc_chan == chan) {
            LOG_INF("From msg subscriber -> Acc x=%d, y=%d, z=%d", acc.x, acc.y,
            (continues on next page)
It is possible to add static observers to a channel using the \texttt{ZBUS_CHAN_ADD_OBS}. We call that a post-definition static observer. The command enables us to indicate an initialization priority that affects the observers' initialization order. The sequence priority param only affects the post-definition static observers. There is no possibility to overwrite the message delivery sequence of the static observers.

\textbf{Note:} It is unnecessary to claim/lock a channel before accessing the message inside the listener since the event dispatcher calls listeners with the notifying channel already locked. Subscribers, however, must claim/lock that or use regular read operations to access the message after being notified.

Channels can have a \textit{validator function} that enables a channel to accept only valid messages. Publish attempts invalidated by hard channels will return immediately with an error code. This allows original creators of a channel to exert some authority over other developers/publishers who may want to piggy-back on their channels. The following code defines and initializes a \textit{hard channel} and its dependencies. Only valid messages can be published to a \textit{hard channel}. It is possible because a \textit{validator function} was passed to the channel's definition. In this example, only messages with \texttt{move} equal to 0, -1, and 1 are valid. Publish function will discard all other values to \texttt{move}.

\begin{verbatim}
struct control_msg {
    int move;
};

bool control_validator(const void* msg, size_t msg_size) {
    const struct control_msg* cm = msg;
    bool is_valid = (cm->move == -1) || (cm->move == 0) || (cm->move == 1);
    return is_valid;
}

static int message_count = 0;

K_THREAD_DEFINE(msg_subscriber_task_id, 1024, msg_subscriber_task, NULL, NULL, NULL, 3, 0, ... -0);
\end{verbatim}

The following sections describe in detail how to use zbus features.

\section*{Publishing to a channel}

Messages are published to a channel in zbus by calling \texttt{zbus_chan_pub()}. For example, the following code builds on the examples above and publishes to channel \texttt{acc_chan}. The code is trying to publish the message \texttt{acc1} to channel \texttt{acc_chan}, and it will wait up to one second for the message to be published. Otherwise, the operation fails. As can be inferred from the code sample, it's OK to use stack allocated messages since VDED copies the data internally.
struct acc_msg acc1 = {.x = 1, .y = 1, .z = 1};
zbus_chan_pub(&acc_chan, &acc1, K_SECONDS(1));

**Warning:** Only use this function inside an ISR with a `K_NO_WAIT` timeout.

### Reading from a channel

Messages are read from a channel in zbus by calling `zbus_chan_read()`. So, for example, the following code tries to read the channel `acc_chan`, which will wait up to 500 milliseconds to read the message. Otherwise, the operation fails.

```c
struct acc_msg acc = {0};
zbus_chan_read(&acc_chan, &acc, K_MSEC(500));
```

**Warning:** Only use this function inside an ISR with a `K_NO_WAIT` timeout.

**Warning:** Choose the timeout of `zbus_chan_read()` after receiving a notification from `zbus_sub_wait()` carefully because the channel will always be unavailable during the VDED execution. Using `K_NO_WAIT` for reading is highly likely to return a timeout error if there are more than one subscriber. For example, consider the VDED illustration again and notice how S1 read attempts would definitely fail with `K_NO_WAIT`. For more details, check the [Virtual Distributed Event Dispatcher section](https://example.com).

### Notifying a channel

It is possible to force zbus to notify a channel's observers by calling `zbus_chan_notify()`. For example, the following code builds on the examples above and forces a notification for the channel `acc_chan`. Note this can send events with no message, which does not require any data exchange. See the code example under *Claim and finish a channel* where this may become useful.

```c
zbus_chan_notify(&acc_chan, K_NO_WAIT);
```

**Warning:** Only use this function inside an ISR with a `K_NO_WAIT` timeout.

### Declaring channels and observers

For accessing channels or observers from files other than its defining files, it is necessary to declare them by calling `ZBUS_CHAN_DECLARE` and `ZBUS_OBS_DECLARE`. In other words, zbus channel definitions and declarations with the same channel names in different files would point to the same (global) channel. Thus, developers should be careful about existing channels, and naming new channels or linking will fail. It is possible to declare more than one channel or observer on the same call. The following code builds on the examples above and displays the defined channels and observers.

```c
ZBUS_OBS_DECLARE(my_listener, my_subscriber);
ZBUS_CHAN_DECLARE(acc_chan, version_chan);
```
Iterating over channels and observers

ZBus subsystem also implements *Iterable Sections* for channels and observers, for which there are supporting APIs like `zbus_iterate_over_channels()`, `zbus_iterate_over_channels_with_user_data()`, `zbus_iterate_over_observers()` and `zbus_iterate_over_observers_with_user_data()`. This feature enables developers to call a procedure over all declared channels, where the procedure parameter is a `zbus_channel`. The execution sequence is in the alphabetical name order of the channels (see *Iterable Sections* documentation for details). ZBus also implements this feature for `zbus_observer`.

```c
static bool print_channel_data_iterator(const struct zbus_channel *chan, void *user_data) {
    int *count = user_data;

    LOG_INF("%d - Channel %s:", *count, zbus_chan_name(chan));
    LOG_INF(" Message size: %d", zbus_chan_msg_size(chan));
    LOG_INF(" Observers:");
    ++(*count);

    struct zbus_channel_observation *observation;

    for (int16_t i = chan->observers_start_idx, limit = chan->observers_end_idx; i < limit; ++i) {
        STRUCT_SECTION_GET(zbus_channel_observation, i, &observation);
        LOG_INF(" - %s", observation->obs->name);
    }

    return true;
}

static bool print_observer_data_iterator(const struct zbus_observer *obs, void *user_data) {
    int *count = user_data;

    LOG_INF("%d - %s %s", *count, obs->queue ? "Subscriber" : "Listener", zbus_obs_name(obs));
    ++(*count);

    return true;
}

int main(void) {
    int count = 0;

    LOG_INF("Channel list:");
    zbus_iterate_over_channels_with_user_data(print_channel_data_iterator, &count);
    count = 0;
    LOG_INF("Observers list:");
}
```

(continues on next page)
The code will log the following output:

D: Channel list:
D: 0 - Channel acc_chan:
D: Message size: 12
D: Observers:
D: - my_listener
D: - my_subscriber
D: 1 - Channel version_chan:
D: Message size: 4
D: Observers:
D: Observers list:
D: 0 - Listener my_listener
D: 1 - Subscriber my_subscriber

Advanced channel control

ZBus was designed to be as flexible and extensible as possible. Thus, there are some features designed to provide some control and extensibility to the bus.

Listeners message access For performance purposes, listeners can access the receiving channel message directly since they already have the channel locked for it. To access the channel's message, the listener should use the \texttt{zbus_chan_const_msg()} because the channel passed as an argument to the listener function is a constant pointer to the channel. The const pointer return type tells developers not to modify the message.

\begin{verbatim}
void listener_callback_example(const struct zbus_channel *chan)
{
    const struct acc_msg *acc;
    if (&acc_chan == chan) {
        acc = zbus_chan_const_msg(chan); // Use this
        // instead of zbus_chan_read(chan, &acc, K_MSEC(200))
        // or zbus_chan_msg(chan)
        LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->z);
    }
}
\end{verbatim}

User Data It is possible to pass custom data into the channel's user_data for various purposes, such as writing channel metadata. That can be achieved by passing a pointer to the channel definition macro's user_data field, which will then be accessible by others. Note that user_data is individual for each channel. Also, note that user_data access is not thread-safe. For thread-safe access to user_data, see the next section.

Claim and finish a channel To take more control over channels, two functions were added \texttt{zbus_chan_claim()} and \texttt{zbus_chan_finish()}. With these functions, it is possible to access the channel's metadata safely. When a channel is claimed, no actions are available to that channel. After finishing the channel, all the actions are available again.
**Warning:** Never change the fields of the channel struct directly. It may cause zbus behavior inconsistencies and scheduling issues.

**Warning:** Only use this function inside an ISR with a `K_NO_WAIT` timeout.

The following code builds on the examples above and claims the `acc_chan` to set the `user_data` to the channel. Suppose we would like to count how many times the channels exchange messages. We defined the `user_data` to have the 32 bits integer. This code could be added to the listener code described above.

```c
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
    int *message_counting = (int *) zbus_chan_user_data(&acc_chan);
    *message_counting += 1;
    zbus_chan_finish(&acc_chan);
}
```

The following code has the exact behavior of the code in *Publishing to a channel*.

```c
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
    struct acc_msg *accl = (struct acc_msg *) zbus_chan_msg(&acc_chan);
    accl.x = 1;
    accl.y = 1;
    accl.z = 1;
    zbus_chan_finish(&acc_chan);
    zbus_chan_notify(&acc_chan, K.SECONDS(1));
}
```

The following code has the exact behavior of the code in *Reading from a channel*.

```c
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
    const struct acc_msg *accl = (const struct acc_msg *) zbus_chan_const_msg(&acc_chan);
    // access the acc_msg fields directly.
    zbus_chan_finish(&acc_chan);
}
```

**Runtime observer registration**  It is possible to add observers to channels in runtime. This feature uses the heap to allocate the nodes dynamically. The heap size limits the number of dynamic observers zbus can create. Therefore, set the `CONFIG_ZBUS_RUNTIME_OBSERVERS` to enable the feature. It is possible to adjust the heap size by changing the configuration `CONFIG_HEAP_MEM_POOL_SIZE`. The following example illustrates the runtime registration usage.

```c
ZBUS_LISTENER_DEFINE(my_listener, callback);
// ...
void thread_entry(void) {
    // ...
    /* Adding the observer to channel chan1 */
    zbus_chan_add_obs(&chan1, &my_listener, K_NO_WAIT);
    /* Removing the observer from channel chan1 */
    zbus_chan_rm_obs(&chan1, &my_listener, K_NO_WAIT);
}
```

### 4.33.3 Samples

For a complete overview of zbus usage, take a look at the samples. There are the following samples available:
• `zbus-hello-world` illustrates the code used above in action;
• `zbus-work-queue` shows how to define and use different kinds of observers. Note there is an example of using a work queue instead of executing the listener as an execution option;
• `zbus-msg-subscriber` illustrates how to use message subscribers;
• `zbus-dyn-channel` demonstrates how to use dynamically allocated exchanging data in `zbus`;
• `zbus-uart-bridge` shows an example of sending the operation of the channel to a host via serial;
• `zbus-remote-mock` illustrates how to implement an external mock (on the host) to send and receive messages to and from the bus;
• `zbus-priority-boost` illustrates `zbus` priority boost feature with a priority inversion scenario;
• `zbus-runtime-obs-registration` illustrates a way of using the runtime observer registration feature;
• `zbus-confirmed-channel` implements a way of implementing confirmed channel only with subscribers;
• `zbus-benchmark` implements a benchmark with different combinations of inputs.

### 4.33.4 Suggested Uses

Use `zbus` to transfer data (messages) between threads in one-to-one, one-to-many, and many-to-many synchronously or asynchronously. Choosing the proper observer type is crucial. Use subscribers for scenarios that can tolerate message losses and duplications; when they cannot, use message subscribers (if you need a thread) or listeners (if you need to be lean and fast). In addition to the listener, another asynchronous message processing mechanism (like message queues) may be necessary to retain the pending message until it gets processed.

**Note:** `ZBus` can be used to transfer streams from the producer to the consumer. However, this can increase `zbus`' communication latency. So maybe consider a Pipe a good alternative for this communication topology.

### 4.33.5 Configuration Options

For enabling `zbus`, it is necessary to enable the `CONFIG_ZBUS` option.

Related configuration options:

- `CONFIG_ZBUS_PRIORITY_BOOST` `zbus` Highest Locker Protocol implementation;
- `CONFIG_ZBUS_CHANNELS_SYS_INIT_PRIORITY` determine the `SYS_INIT` priority used by `zbus` to organize the channels observations by channel;
- `CONFIG_ZBUS_CHANNEL_NAME` enables the name of channels to be available inside the channels metadata. The log uses this information to show the channels' names;
- `CONFIG_ZBUS_OBSERVER_NAME` enables the name of observers to be available inside the channels metadata;
- `CONFIG_ZBUS_MSG_SUBSCRIBER` enables the message subscriber observer type;
- `CONFIG_ZBUS_MSG_SUBSCRIBER_BUF_ALLOC_DYNAMIC` uses the heap to allocate message buffers;
- `CONFIG_ZBUS_MSG_SUBSCRIBER_BUF_ALLOC_STATIC` uses the stack to allocate message buffers;
• CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_SIZE the available number of message buffers to be used simultaneously;
• CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_STATIC_DATA_SIZE the biggest message of zbus channels to be transported into a message buffer;
• CONFIG_ZBUS_RUNTIME_OBSERVERS enables the runtime observer registration.

4.33.6 API Reference

Related code samples

Benchmarking
Measure the time for sending 256KB from a producer to N consumers.

Confirmed channel
Use confirmed zbus channels to ensure all subscribers consume a message.

Dynamic channel
Use zbus channels with dynamically allocated messages.

Message subscriber
Use zbus message subscribers to listen to messages published to channels.

Remote mock sample
Publish to a zbus instance using UART as a bridge.

Runtime observer registration
Use zbus’ runtime observer registration to filter data generated by a producer.

UART bridge
Redirect channel events to the host over UART.

Work queue
Use a work queue to process zbus messages in various ways.

zbus Hello World
Make three threads talk to each other using zbus.

zbus Priority Boost
Illustrates zbus priority boost feature with a priority inversion scenario.

group zbus_apis
Zbus API.

Defines

ZBUS_CHAN_ADD_OBS_WITH_MASK(_chan, _obs, _masked, _prio)
Add a static channel observation.

This macro initializes a channel observation by receiving the channel and the observer.

Parameters
• _chan – Channel instance.
• _obs – Observer instance.
• _masked – Observation state.
• _prio – Observer notification sequence priority.
ZBUS_CHAN_ADD_OBS(_chan, _obs, _prio)
Add a static channel observation.
This macro initializes a channel observation by receiving the channel and the observer.

Parameters
- _chan – Channel instance.
- _obs – Observer instance.
- _prio – Observer notification sequence priority.

ZBUS_OBS_DECLARE(…)
This macro list the observers to be used in a file.
Internally, it declares the observers with the extern statement. Note it is only necessary when the observers are declared outside the file.

ZBUS_CHAN_DECLARE(…)
This macro list the channels to be used in a file.
Internally, it declares the channels with the extern statement. Note it is only necessary when the channels are declared outside the file.

ZBUS_OBSERVERS_EMPTY
This macro indicates the channel has no observers.

ZBUS_OBSERVERS(…)
This macro indicates the channel has listed observers.
Note the sequence of observer notification will follow the same as listed.

ZBUS_CHAN_DEFINE(_name, _type, _validator, _user_data, _observers, _init_val)
Zbus channel definition.
This macro defines a channel.

See also:
struct zbus_channel

Parameters
- _name – The channel's name.
- _type – The Message type. It must be a struct or union.
- _validator – The validator function.
- _user_data – A pointer to the user data.
- _observers – The observers list. The sequence indicates the priority of the observer. The first the highest priority.
- _init_val – The message initialization.

ZBUS_MSG_INIT(_val, …)
Initialize a message.
This macro initializes a message by passing the values to initialize the message struct or union.

Parameters
- _val – [in] Variadic with the initial values. ZBUS_INIT(0) means \{0\}, as ZBUS_INIT(a=10, b=30) means \{.a=10, .b=30\}. 

4.33. Zephyr bus (zbus)
Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct `zbus_observer` defining the subscriber.

**Parameters**

Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct `zbus_observer` defining the subscriber. The subscribers are defined in the enabled state with this macro.

**Parameters**

Define and initialize a listener.

This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously, and initialize the struct `zbus_observer` defining the listener.

**Parameters**

Define and initialize a listener.

This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously and initialize the struct `zbus_observer` defining the listener. The listeners are defined in the enabled state with this macro.

**Parameters**

Define and initialize a message subscriber.

This macro defines an observer of `ZBUS_OBSERVER_SUBSCRIBER_TYPE` type. It defines a FIFO where the subscriber will receive the message asynchronously and initialize the `zbus_observer` defining the subscriber.

**Parameters**
ZBUS_MSG_SUBSCRIBER_DEFINE(_name)

Define and initialize an enabled message subscriber.

This macro defines an observer of message subscriber type. It defines a FIFO where the subscriber will receive the message asynchronously and initialize the `zbus_observer` defining the subscriber. The message subscribers are defined in the enabled state with this macro.

**Parameters**

** Enums**

```c
enum zbus_observer_type
/
Type used to represent an observer type.
A observer can be a listener or a subscriber.
 Values:

enumerator ZBUS_OBSERVER_LISTENER_TYPE

enumerator ZBUS_OBSERVER_SUBSCRIBER_TYPE

enumerator ZBUS_OBSERVER_MSG_SUBSCRIBER_TYPE
```

** Functions**

```c
int zbus_chan_pub(const struct zbus_channel *chan, const void *msg, k_timeout_t timeout)
```

Publish to a channel.

This routine publishes a message to a channel.

** Parameters**

- `chan` – The channel's reference.
- `msg` – Reference to the message where the publish function copies the channel's message data from.
- `timeout` – Waiting period to publish the channel, or one of the special values K_NO_WAIT and K_FOREVER.

** Return values**

- `0` – Channel published.
- `-ENOMEM` – The message is invalid based on the validator function or some of the observers could not receive the notification.
- `-EBUSY` – The channel is busy.
- `-EAGAIN` – Waiting period timed out.
- `-EFAULT` – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.
int zbus_chan_read(const struct zbus_channel *chan, void *msg, k_timeout_t timeout)

Read a channel.

This routine reads a message from a channel.

**Parameters**

- `chan` – **[in]** The channel’s reference.
- `msg` – **[out]** Reference to the message where the read function copies the channel’s message data to.
- `timeout` – **[in]** Waiting period to read the channel, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**

- 0 – Channel read.
- -EBUSY – The channel is busy.
- -EAGAIN – Waiting period timed out.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int zbus_chan_claim(const struct zbus_channel *chan, k_timeout_t timeout)

Claim a channel.

This routine claims a channel. During the claiming period the channel is blocked for publishing, reading, notifying or claiming again. Finishing is the only available action.

**Warning:** After calling this routine, the channel cannot be used by other thread until the zbus_chan_finish routine is performed.

**Warning:** This routine should only be called once before a zbus_chan_finish.

**Parameters**

- `chan` – **[in]** The channel’s reference.
- `timeout` – **[in]** Waiting period to claim the channel, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**

- 0 – Channel claimed.
- -EBUSY – The channel is busy.
- -EAGAIN – Waiting period timed out.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int zbus_chan_finish(const struct zbus_channel *chan)

Finish a channel claim.

This routine finishes a channel claim. After calling this routine with success, the channel will be able to be used by other thread.
**Warning:** This routine must only be used after a zbus_chan_claim.

### Parameters
- `chan` – The channel's reference.

### Return values
- **0** – Channel finished.
- **-EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
int zbus_chan_notify(const struct zbus_channel *chan, k_timeout_t timeout)
```

Force a channel notification.

This routine forces the event dispatcher to notify the channel's observers even if the message has no changes. Note this function could be useful after claiming/finishing actions.

### Parameters
- `chan` – The channel's reference.
- `timeout` – Waiting period to notify the channel, or one of the special values K_NO_WAIT and K_FOREVER.

### Return values
- **0** – Channel notified.
- **-EBUSY** – The channel's semaphore returned without waiting.
- **-EAGAIN** – Timeout to take the channel's semaphore.
- **-ENOMEM** – There is not more buffer on the message buffers pool.
- **-EFAULT** – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
static inline const char *zbus_chan_name(const struct zbus_channel *chan)
```

Get the channel's name.

This routine returns the channel's name reference.

### Parameters
- `chan` – The channel's reference.

### Returns
Channel's name reference.

```c
static inline void *zbus_chan_msg(const struct zbus_channel *chan)
```

Get the reference for a channel message directly.

This routine returns the reference of a channel message.

**Warning:** This function must only be used directly for already locked channels. This can be done inside a listener for the receiving channel or after claim a channel.

### Parameters
static inline const void *zbus_chan_const_msg(const struct zbus_channel *chan)
returns a constant reference of a channel message. This should be used inside listeners to access the message directly. In this way zbus prevents the listener of changing the notifying channel’s message during the notification process.

**Warning:** This function must only be used directly for already locked channels. This can be done inside a listener for the receiving channel or after claim a channel.

**Parameters**
- chan – The channel's constant reference.

**Returns**
A constant channel’s message reference.

static inline uint16_t zbus_chan_msg_size(const struct zbus_channel *chan)
Get the channel's message size.

**Parameters**
- chan – The channel's reference.

**Returns**
Channel's message size.

static inline void *zbus_chan_user_data(const struct zbus_channel *chan)
Get the channel's user data.

**Parameters**
- chan – The channel's reference.

**Returns**
Channel's user data.

int zbus_chan_add_obs(const struct zbus_channel *chan, const struct zbus_observer *obs,
`k_timeout_t` timeout)
Add an observer to a channel.

**Parameters**
- chan – The channel's reference.
- obs – The observer's reference to be added.
- timeout – Waiting period to add an observer, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**
- 0 – Observer added to the channel.
- -EALREADY – The observer is already present in the channel's runtime observers list.
-ENOMEM – Returned without waiting.
-EINVAL – Returned without waiting.
-EAGAIN – Waiting period timed out.
-EAGAIN – Waiting period timed out.

```c
int zbus_chan_rm_obs(const struct zbus_channel *chan, const struct zbus_observer *obs, k_timeout_t timeout)
```

Remove an observer from a channel.

This routine removes an observer to the channel.

**Parameters**
- **chan** – The channel's reference.
- **obs** – The observer's reference to be removed.
- **timeout** – Waiting period to remove an observer, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**
- 0 – Observer removed to the channel.
-EINVAL – Invalid data supplied.
-EBUSY – Returned without waiting.
-EAGAIN – Waiting period timed out.
-ENODATA – no observer found in channel's runtime observer list.
-ENOMEM – Returned without waiting.

```c
int zbus_obs_set_enable(struct zbus_observer *obs, bool enabled)
```

Change the observer state.

This routine changes the observer state. A channel when disabled will not receive notifications from the event dispatcher.

**Parameters**
- **enabled** – [in] State to be. When false the observer stops to receive notifications.

**Return values**
- 0 – Observer set enable.
-EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
static inline int zbus_obs_is_enabled(struct zbus_observer *obs, bool *enable)
```

Get the observer state.

This routine retrieves the observer state.

**Parameters**

**Returns**
Observer state.
int zbus_obs_set_chan_notification_mask(const struct zbus_observer *obs, const struct zbus_channel *chan, bool masked)

Mask notifications from a channel to an observer.

The observer can mask notifications from a specific observing channel by calling this function.

**Parameters**
- **obs** – The observer's reference to be added.
- **chan** – The channel's reference.
- **masked** – The mask state. When the mask is true, the observer will not receive notifications from the channel.

**Return values**
- **0** – Channel notifications masked to the observer.
- **-ESRCH** – No observation found for the related pair chan/obs.
- **-EINVAL** – Some parameter is invalid.

int zbus_obs_is_chan_notification_masked(const struct zbus_observer *obs, const struct zbus_channel *chan, bool *masked)

Get the notifications masking state from a channel to an observer.

**Parameters**
- **obs** – The observer's reference.
- **chan** – The channel's reference.
- **masked** – [out] The mask state. When the mask is true, the observer will not receive notifications from the channel.

**Return values**
- **0** – Retrieved the masked state.
- **-ESRCH** – No observation found for the related pair chan/obs.
- **-EINVAL** – Some parameter is invalid.

static inline const char *zbus_obs_name(const struct zbus_observer *obs)

Get the observer's name.

This routine returns the observer’s name reference.

**Parameters**
- **obs** – The observer’s reference.

**Returns**
The observer’s name reference.

int zbus_obs_attach_to_thread(const struct zbus_observer *obs)

Set the observer thread priority by attaching it to a thread.

**Parameters**

**Return values**
- **0** – Observer detached from the thread.
- **-EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.
int zbus_obs_detach_from_thread(const struct zbus_observer *obs)

Clear the observer thread priority by detaching it from a thread.

Parameters

Return values

- 0 – Observer detached from the thread.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int zbus_sub_wait(const struct zbus_observer *sub, const struct zbus_channel **chan, k_timeout_t timeout)

Wait for a channel notification.

This routine makes the subscriber to wait a notification. The notification comes as a channel reference.

Parameters

- timeout – [in] Waiting period for a notification arrival, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- 0 – Notification received.
- -ENOMSG – Returned without waiting.
- -EAGAIN – Waiting period timed out.
- -EINVAL – The observer is not a subscriber.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int zbus_sub_wait_msg(const struct zbus_observer *sub, const struct zbus_channel **chan, void *msg, k_timeout_t timeout)

Wait for a channel message.

This routine makes the subscriber wait for the new message in case of channel publication.

Parameters

- timeout – [in] Waiting period for a notification arrival, or one of the special values, K_NO_WAIT and K_FOREVER.

Return values

- 0 – Message received.
- -EINVAL – The observer is not a subscriber.
- -ENOMSG – Could not retrieve the net_buf from the subscriber FIFO.
- -EILSEQ – Received an invalid channel reference.
-EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
bool zbus_iterate_over_channels(bool (*iterator_func)(const struct zbus_channel *chan))
```

Iterate over channels.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

**Parameters**

- `iterator_func` – [in] The function that will be execute on each iteration.

**Return values**

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

```c
bool zbus_iterate_over_channels_with_user_data(bool (*iterator_func)(const struct zbus_channel *chan, void *user_data), void *user_data)
```

Iterate over channels with user data.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

**Parameters**

- `iterator_func` – [in] The function that will be execute on each iteration.
- `user_data` – [in] The user data that can be passed in the function.

**Return values**

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

```c
bool zbus_iterate_over_observers(bool (*iterator_func)(const struct zbus_observer *obs))
```

Iterate over observers.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.

**Parameters**

- `iterator_func` – [in] The function that will be execute on each iteration.

**Return values**

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

```c
bool zbus_iterate_over_observers_with_user_data(bool (*iterator_func)(const struct zbus_observer *obs, void *user_data), void *user_data)
```

Iterate over observers with user data.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.
Parameters

- `iterator_func` - [in] The function that will be executed on each iteration.
- `user_data` - [in] The user data that can be passed in the function.

Return values

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

```c
struct zbus_channel_data
#include <zbus.h> Type used to represent a channel mutable data.

Every channel has a `zbus_channel_data` structure associated.

Public Members

```

```c
int16_t observers_start_idx
Static channel observer list start index.
Considering the ITERABLE SECTIONS allocation order.

int16_t observers_end_idx
Static channel observer list end index.
Considering the ITERABLE SECTIONS allocation order.

struct k_sem sem
Access control semaphore.
Points to the semaphore used to avoid race conditions for accessing the channel.

sys_slist_t observers
Channel observer list.
Represents the channel's observers list, it can be empty or have listeners and subscribers mixed in any sequence. It can be changed in runtime.

struct zbus_channel
#include <zbus.h> Type used to represent a channel.

Every channel has a `zbus_channel` structure associated used to control the channel access and usage.

Public Members

```c
const char *const name
Channel name.

void *const message
Message reference.
Represents the message's reference that points to the actual shared memory region.
const size_t message_size
Message size.
Represents the channel's message size.

void *const user_data
User data available to extend zbus features.
The channel must be claimed before using this field.

bool (*const validator)(const void *msg, size_t msg_size)
Message validator.
Stores the reference to the function to check the message validity before actually performing the publishing. No invalid messages can be published. Every message is valid when this field is empty.

struct zbus_channel_data *const data
Mutable channel data struct.

struct zbus_observer_data
#include <zbus.h>

Public Members

bool enabled
Enabled flag.
Indicates if observer is receiving notification.

struct zbus_observer
#include <zbus.h> Type used to represent an observer.
Every observer has an representation structure containing the relevant information. An observer is a code portion interested in some channel. The observer can be notified synchronously or asynchronously and it is called listener and subscriber respectively. The observer can be enabled or disabled during runtime by change the enabled boolean field of the structure. The listeners have a callback function that is executed by the bus with the index of the changed channel as argument when the notification is sent. The subscribers have a message queue where the bus enqueues the index of the changed channel when a notification is sent.

See also:

zbus_obs_set_enable function to properly change the observer's enabled field.

Public Members

const char *const name
Observer name.
enum zbus_observer_type
type
Type indication.

struct zbus_observer_data *const data
Mutable observer data struct.

struct k_msgq *const queue
Observer message queue.
It turns the observer into a subscriber.

void (*const callback)(const struct zbus_channel *chan)
Observer callback function.
It turns the observer into a listener.

struct k_fifo *const message_fifo
Observer message FIFO.
It turns the observer into a message subscriber. It only exists if the CONFIG_ZBUS_MSG_SUBSCRIBER is enabled.

4.34 Miscellaneous

4.34.1 Checksum APIs

CRC

group crc

 Enums

enum crc_type
CRC algorithm enumeration.
These values should be used with the CRC dispatch function.
Values:

enumerator CRC4
Use crc4.

enumerator CRC4_TI
Use crc4_ti.

enumerator CRC7_BE
Use crc7_be.

enumerator CRC8
Use crc8.
enumerator CRC8_CCITT
    Use crc8_ccitt.
enumerator CRC16
    Use crc16.
enumerator CRC16_ANSI
    Use crc16_ansi.
enumerator CRC16_CCITT
    Use crc16_ccitt.
enumerator CRC16_ITU_T
    Use crc16_itu_t.
enumerator CRC32_C
    Use crc32_c.
enumerator CRC32_IEEE
    Use crc32_ieee.

**Functions**

```c
uint16_t crc16(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)
```
Generic function for computing a CRC-16 without input or output reflection.
Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is O(n*8) where n is the length of the buffer provided. No reflection is performed.

**Note:** If you are planning to use a CRC based on poly 0x1012 the functions `crc16_itu_t()` is faster and thus recommended over this one.

**Parameters**
- **poly** – The polynomial to use omitting the leading x^16 coefficient
- **seed** – Initial value for the CRC computation
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes

**Returns**
The computed CRC16 value (without any XOR applied to it)

```c
uint16_t crc16_reflect(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)
```
Generic function for computing a CRC-16 with input and output reflection.
Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is O(n*8) where n is the length of the buffer provided. Both input and output are reflected.
The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

- CRC-16/ANSI, CRC-16/MODBUS, CRC-16/USB, CRC-16/IBM  
  poly: 0x8005 (0xA001)  
  initial seed: 0xffff, xor output: 0x0000

**Note:** If you are planning to use a CRC based on poly 0x1012 the function `crc16_ccitt()` is faster and thus recommended over this one.

**Parameters**
- `poly` – The polynomial to use omitting the leading $x^{16}$ coefficient. Important: please reflect the poly. For example, use 0xA001 instead of 0x8005 for CRC-16-MODBUS.
- `seed` – Initial value for the CRC computation
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes

**Returns**
The computed CRC16 value (without any XOR applied to it)

```c
uint8_t crc8(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool reversed)
```

Generic function for computing CRC 8.

Compute CRC 8 by passing in the address of the input, the input length and polynomial used in addition to the initial value.

**Parameters**
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes
- `polynomial` – The polynomial to use omitting the leading $x^{8}$ coefficient
- `initial_value` – Initial value for the CRC computation
- `reversed` – Should we use reflected/reversed values or not

**Returns**
The computed CRC8 value

```c
uint16_t crc16_ccitt(uint16_t seed, const uint8_t *src, size_t len)
```

Compute the checksum of a buffer with polynomial 0x1021, reflecting input and output.

This function is able to calculate any CRC that uses 0x1021 as its polynomial and requires reflecting both the input and the output. It is a fast variant that runs in $O(n)$ time, where $n$ is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:
• CRC-16/CCITT, CRC-16/CCITT-TRUE, CRC-16/KERMIT  https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-kermit  initial seed: 0x0000, xor output: 0x0000

Note: To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

Parameters

• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes

Returns

The computed CRC16 value (without any XOR applied to it)

uint16_t crc16_itu_t(uint16_t seed, const uint8_t *src, size_t len)

Compute the checksum of a buffer with polynomial 0x1021, no reflection of input or output.

This function is able to calculate any CRC that uses 0x1021 as it polynomial and requires no reflection on both the input and the output. It is a fast variant that runs in O(n) time, where n is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

• CRC-16/XMODEM, CRC-16/ACORN, CRC-16/LTE  https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-xmodem  initial seed: 0x0000, xor output: 0x0000
• CRC16/CCITT-FALSE, CRC-16/IBM-3740, CRC-16/AUTOSAR  https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-ibm-3740  initial seed: 0xffff, xor output: 0xffff
• CRC-16/GSM  https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-gsm  initial seed: 0x0000, xor output: 0xffff

Note: To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

Parameters

• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes
Returns
The computed CRC16 value (without any XOR applied to it)

static inline uint16_t crc16_ansi(const uint8_t *src, size_t len)
Compute the ANSI (or Modbus) variant of CRC-16.
The ANSI variant of CRC-16 uses 0x8005 (0xA001 reflected) as its polynomial with the initial * value set to 0xffff.

Parameters
- src – Input bytes for the computation
- len – Length of the input in bytes

Returns
The computed CRC16 value

uint32_t crc32_ieee(const uint8_t *data, size_t len)
Generate IEEE conform CRC32 checksum.

Parameters
- data – Pointer to data on which the CRC should be calculated.
- len – Data length.

Returns
CRC32 value.

uint32_t crc32_ieee_update(uint32_t crc, const uint8_t *data, size_t len)
Update an IEEE conforming CRC32 checksum.

Parameters
- crc – CRC32 checksum that needs to be updated.
- data – Pointer to data on which the CRC should be calculated.
- len – Data length.

Returns
CRC32 value.

uint32_t crc32_c(uint32_t crc, const uint8_t *data, size_t len, bool first_pkt, bool last_pkt)
Calculate CRC32C (Castagnoli) checksum.

Parameters
- crc – CRC32C checksum that needs to be updated.
- data – Pointer to data on which the CRC should be calculated.
- len – Data length.
- first_pkt – Whether this is the first packet in the stream.
- last_pkt – Whether this is the last packet in the stream.

Returns
CRC32 value.

uint8_t crc8_ccitt(uint8_t initial_value, const void *buf, size_t len)
Compute CCITT variant of CRC 8.
Normal CCITT variant of CRC 8 is using 0x07.

Parameters
- initial_value – Initial value for the CRC computation
buf – Input bytes for the computation
len – Length of the input in bytes

Returns
The computed CRC8 value

uint8_t crc7_be(uint8_t seed, const uint8_t *src, size_t len)
Compute the CRC-7 checksum of a buffer.
See JESD84-A441. Used by the MMC protocol. Uses 0x09 as the polynomial with no reflection. The CRC is left justified, so bit 7 of the result is bit 6 of the CRC.

Parameters
• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes

Returns
The computed CRC7 value

uint8_t crc4_ti(uint8_t seed, const uint8_t *src, size_t len)
Compute the CRC-4 checksum of a buffer.

Parameters
• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes

Returns
The computed CRC4 value

uint8_t crc4(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool reversed)
Generic function for computing CRC 4.

Parameters
• src – Input bytes for the computation
• len – Length of the input in bytes
• polynomial – The polynomial to use omitting the leading x^4 coefficient
• initial_value – Initial value for the CRC computation
• reversed – Should we use reflected/reversed values or not

Returns
The computed CRC4 value

static inline uint32_t crc_by_type(enum crc_type type, const uint8_t *src, size_t len,
uint32_t seed, uint32_t poly, bool reflect, bool first, bool last)
Compute a CRC checksum, in a generic way.

This is a dispatch function that calls the individual CRC routine determined by type.
For 7, 8, and 16-bit CRCs, the relevant seed and poly values should be passed in via the least-significant byte(s).

Similarly, for 7, 8, and 16-bit CRCs, the relevant result is stored in the least-significant byte(s) of the returned value.

**Parameters**

- **type** – CRC algorithm to use.
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes
- **seed** – Value to seed the CRC with
- **poly** – The polynomial to use omitting the leading coefficient
- **reflect** – Should we use reflected/reversed values or not
- **first** – Whether this is the first packet in the stream.
- **last** – Whether this is the last packet in the stream.

**Returns**

uint32_t the computed CRC value

### 4.34.2 Structured Data APIs

**JSON**

**Related code samples**

**AWS IoT Core MQTT**

Connect to AWS IoT Core and publish messages using MQTT.

**group json**

**Defines**

JSON_OBJ_DESCR_PRIM(struct_, field_name_, type_)

Helper macro to declare a descriptor for supported primitive values.

Here’s an example of use:

```c
struct foo {
    int32_t some_int;
};

struct json_obj_descr foo[] = {
    JSON_OBJ_DESCR_PRIM(struct foo, some_int, JSON_TOK_NUMBER),
};
```

**Parameters**

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **type_** – Token type for JSON value corresponding to a primitive type. Must be one of: `JSON_TOK_STRING` for strings, `JSON_TOK_NUMBER` for numbers, `JSON_TOK_TRUE` (or `JSON_TOK_FALSE`) for booleans.

**JSON_OBJ_DESCR_OBJECT**(struct_, field_name_, sub_descr_)

Helper macro to declare a descriptor for an object value.

Here's an example of use:

```c
struct nested {
    int32_t foo;
    struct {
        int32_t baz;
    } bar;
};

struct json_obj_descr nested_bar[] = {
    { ... declare bar.baz descriptor ... },
};

struct json_obj_descr nested[] = {
    { ... declare foo descriptor ... },
    JSON_OBJ_DESCR_OBJECT(struct nested, bar, nested_bar),
};
```

**Parameters**

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **sub_descr_** – Array of `json_obj_descr` describing the subobject

**JSON_OBJ_DESCR_ARRAY**(struct_, field_name_, max_len_, len_field_, elem_type_)

Helper macro to declare a descriptor for an array of primitives.

Here's an example of use:

```c
struct example {
    int32_t foo[10];
    size_t foo_len;
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_ARRAY(struct example, foo, 10, foo_len,
        JSON_TOK_NUMBER)
};
```

**Parameters**

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **max_len_** – Maximum number of elements in array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_type_** – Element type, must be a primitive type
Helper macro to declare a descriptor for an array of objects.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY(struct people_heights, heights, 10,
        heights_len, person_height_descr,
        ARRAY_SIZE(person_height_descr)),
};
```

**Parameters**

- **struct** - Struct packing the values
- **field_name** - Field name in the struct containing the array
- **max_len** - Maximum number of elements in the array
- **len_field** - Field name in the struct for the number of elements in the array
- **elem_descr** - Element descriptor, pointer to a descriptor array
- **elem_descr_len** - Number of elements in elem_descr

Helper macro to declare a descriptor for an array of array.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct person_heights_array {
    struct person_height heights;
}

struct people_heights {
    struct person_height_array heights[10];
    size_t heights_len;
}
```
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr person_height_array_descr[] = {
    JSON_OBJ_DESCR_OBJECT(struct person_heights_array,
                           heights, person_height_descr),
};

struct json_obj_descr array_array[] = {
    JSON_OBJ_DESCR_ARRAY_ARRAY(struct people_heights, heights, 10, heights_len, person_height_array_descr,
                                ARRAY_SIZE(person_height_array_descr)),
};

Parameters

- **struct** - Struct packing the values
- **field_name** - Field name in the struct containing the array
- **max_len** - Maximum number of elements in the array
- **len_field** - Field name in the struct for the number of elements in the array
- **elem_descr** - Element descriptor, pointer to a descriptor array
- **elem_descr_len** - Number of elements in elem_descr

**JSON_OBJ_DESCR_ARRAY_ARRAY_NAMED**

Variant of JSON_OBJ_DESCR_ARRAY_ARRAY that can be used when the structure and JSON field names differ.
This is useful when the JSON field is not a valid C identifier.

See also:

**JSON_OBJ_DESCR_ARRAY_ARRAY**

Parameters

- **struct** - Struct packing the values
- **json_field_name** - String, field name in JSON strings
- **struct_field_name** - Field name in the struct containing the array
- **max_len** - Maximum number of elements in the array
- **len_field** - Field name in the struct for the number of elements in the array
- **elem_descr** - Element descriptor, pointer to a descriptor array
- **elem_descr_len** - Number of elements in elem_descr
JSON_OBJ_DESCR_PRIM_NAMED(struct_, json_field_name_, struct_field_name_, type_)

Variant of JSON_OBJ_DESCR_PRIM that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_PRIM

Parameters

• struct_ – Struct packing the values.
• json_field_name_ – String, field name in JSON strings
• struct_field_name_ – Field name in the struct
• type_ – Token type for JSON value corresponding to a primitive type.

JSON_OBJ_DESCR_OBJECT_NAMED(struct_, json_field_name_, struct_field_name_, sub_descr_)

Variant of JSON_OBJ_DESCR_OBJECT that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_OBJECT

Parameters

• struct_ – Struct packing the values
• json_field_name_ – String, field name in JSON strings
• struct_field_name_ – Field name in the struct
• sub_descr_ – Array of json_obj_descr describing the subobject

JSON_OBJ_DESCR_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_type_)

Variant of JSON_OBJ_DESCR_ARRAY that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_ARRAY

Parameters

• struct_ – Struct packing the values
• json_field_name_ – String, field name in JSON strings
• struct_field_name_ – Field name in the struct
• max_len_ – Maximum number of elements in array
• len_field_ – Field name in the struct for the number of elements in the array
• **elem_type_** – Element type, must be a primitive type

```c
JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_,
                                   max_len_, len_field_, elem_descr_, elem_descr_len_)
```

Variant of `JSON_OBJ_DESCR_OBJ_ARRAY` that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct people_heights,
                                    "people-heights", heights,
                                    10, heights_len,
                                    person_height_descr,
                                    ARRAY_SIZE(person_height_descr)),
};
```

**Parameters**

- **struct_** – Struct packing the values
- **json_field_name_** – String, field name of the array in JSON strings
- **struct_field_name_** – Field name in the struct containing the array
- **max_len_** – Maximum number of elements in the array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_descr_** – Element descriptor, pointer to a descriptor array
- **elem_descr_len_** – Number of elements in elem_descr

**Typedefs**

```c
typedef int (*json_append_bytes_t)(const char *bytes, size_t len, void *data)
```

Function pointer type to append bytes to a buffer while encoding JSON data.

**Param bytes**

Contents to write to the output

**Param len**

Number of bytes to append to output
**Param data**
User-provided pointer

**Return**
This callback function should return a negative number on error (which will be propagated to the return value of `json_obj_encode()`), or 0 on success.

**Enums**

class json_tokens

*Values:*

- `JSON_TOK_NONE = '_'`
- `JSON_TOK_OBJECT_START = '{'`
- `JSON_TOK_OBJECT_END = '}'`
- `JSON_TOK_LIST_START = '['`
- `JSON_TOK_ARRAY_START = '['`
- `JSON_TOK_LIST_END = ']'`
- `JSON_TOK_ARRAY_END = ']'`
- `JSON_TOK_STRING = '"'`
- `JSON_TOK_COLON = ':'`
- `JSON_TOK_COMMA = ','`
- `JSON_TOK_NUMBER = '0'`
- `JSON_TOK_FLOAT = '1'`
- `JSON_TOK_OPAQUE = '2'`
- `JSON_TOK_OBJ_ARRAY = '3'`
- `JSON_TOK_TRUE = 't'`
- `JSON_TOK_FALSE = 'f'`
- `JSON_TOK_NULL = 'n'`
- `JSON_TOK_ERROR = '!'`
enumerator JSON_TOK_EOF = '\0'

Functions

int64_t json_objParse(char *json, size_t len, const struct json_obj_descr *descr, size_t descr_len, void *val)

Parses the JSON-encoded object pointed to by json, with size len, according to the descriptor pointed to by descr.

Values are stored in a struct pointed to by val. Set up the descriptor like this:

```c
struct s { int32_t foo; char *bar; } struct json_obj_descr descr[] = {
    JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER),
    JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING),
};
```

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no strtod() in the minimal libc).

Parameters

- json – Pointer to JSON-encoded value to be parsed
- len – Length of JSON-encoded value
- descr – Pointer to the descriptor array
- descr_len – Number of elements in the descriptor array. Must be less than 63 due to implementation detail reasons (if more fields are necessary, use two descriptors)
- val – Pointer to the struct to hold the decoded values

Returns

< 0 if error, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

int json_arr_parse(char *json, size_t len, const struct json_obj_descr *descr, void *val)

Parses the JSON-encoded array pointed to by json, with size len, according to the descriptor pointed to by descr.

Values are stored in a struct pointed to by val. Set up the descriptor like this:

```c
struct s { int32_t foo; char *bar; } struct json_obj_descr descr[] = {
    JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER),
    JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING),
}; struct a { struct s baz[10]; size_t count; } struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY(struct a, baz, 10, count, descr, ARRAY_SIZE(descr)),
};
```

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no strtod() in the minimal libc).

Parameters

- json – Pointer to JSON-encoded array to be parsed
- len – Length of JSON-encoded array
- descr – Pointer to the descriptor array
- val – Pointer to the struct to hold the decoded values
**Returns**
0 if array has been successfully parsed. A negative value indicates an error (as defined on errno.h).

```c
int json_arr_separate_object_parse_init(struct json_obj *json, char *payload, size_t len)
```

Initialize single-object array parsing.

JSON-encoded array data is going to be parsed one object at a time. Data is provided by `payload` with the size of `len` bytes.

Function validate that Json Array start is detected and initialize `json` object for Json object parsing separately.

**Parameters**

- `json` – Provide storage for parser states. To be used when parsing the array.
- `payload` – Pointer to JSON-encoded array to be parsed
- `len` – Length of JSON-encoded array

**Returns**
0 if array start is detected and initialization is successful or negative error code in case of failure.

```c
int json_arr_separate_parse_object(struct json_obj *json, const struct json_obj_descr *descr, size_t descr_len, void *val)
```

Parse a single object from array.

 Parses the JSON-encoded object pointed to by `json` object array, with size `len`, according to the descriptor pointed to by `descr`.

**Parameters**

- `json` – Pointer to JSON-object message state
- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array. Must be less than 31.
- `val` – Pointer to the struct to hold the decoded values

**Returns**
< 0 if error, 0 for end of message, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

```c
ssize_t json_escape(char *str, size_t *len, size_t buf_size)
```

Escapes the string so it can be used to encode JSON objects.

**Parameters**

- `str` – The string to escape; the escape string is stored the buffer pointed to by this parameter
- `len` – Points to a size_t containing the size before and after the escaping process
- `buf_size` – The size of buffer `str` points to

**Returns**
0 if string has been escaped properly, or -ENOMEM if there was not enough space to escape the buffer
size_t json_calc_escaped_len(const char *str, size_t len)
Calculates the JSON-escaped string length.

Parameters
• str – The string to analyze
• len – String size

Returns
The length str would have if it were escaped

ssize_t json_calc_encoded_len(const struct json_obj_descr *descr, size_t descr_len, const void *val)
Calculates the string length to fully encode an object.

Parameters
• descr – Pointer to the descriptor array
• descr_len – Number of elements in the descriptor array
• val – Struct holding the values

Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

ssize_t json_calc_encoded_arr_len(const struct json_obj_descr *descr, const void *val)
Calculates the string length to fully encode an array.

Parameters
• descr – Pointer to the descriptor array
• val – Struct holding the values

Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

int json_obj_encode_buf(const struct json_obj_descr *descr, size_t descr_len, const void *val, char *buffer, size_t buf_size)
Encodes an object in a contiguous memory location.

Parameters
• descr – Pointer to the descriptor array
• descr_len – Number of elements in the descriptor array
• val – Struct holding the values
• buffer – Buffer to store the JSON data
• buf_size – Size of buffer, in bytes, with space for the terminating NUL character

Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).

int json_arr_encode_buf(const struct json_obj_descr *descr, const void *val, char *buffer, size_t buf_size)
Encodes an array in a contiguous memory location.

Parameters
• descr – Pointer to the descriptor array
• val – Struct holding the values
• buffer – Buffer to store the JSON data
• buf_size – Size of buffer, in bytes, with space for the terminating NUL character

Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).

int json_obj_encode(const struct json_obj_descr *descr, size_t descr_len, const void *val,
json_append_bytes_t append_bytes, void *data)
Encodes an object using an arbitrary writer function.

Parameters
• descr – Pointer to the descriptor array
• descr_len – Number of elements in the descriptor array
• val – Struct holding the values
• append_bytes – Function to append bytes to the output
• data – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

int json_arr_encode(const struct json_obj_descr *descr, const void *val,
json_append_bytes_t append_bytes, void *data)
Encodes an array using an arbitrary writer function.

Parameters
• descr – Pointer to the descriptor array
• val – Struct holding the values
• append_bytes – Function to append bytes to the output
• data – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

struct json_token
#include <json.h>

struct jsonLexer
#include <json.h>

struct json_obj
#include <json.h>

struct json_obj_token
#include <json.h>

struct json_obj_descr
#include <json.h>
JSON Web Tokens (JWT) are an open, industry standard [RFC 7519](https://tools.ietf.org/html/rfc7519) method for representing claims securely between two parties. Although JWT is fairly flexible, this API is limited to creating the simplistic tokens needed to authenticate with the Google Core IoT infrastructure.

### Functions

**jwt_init_builder**

```c
int jwt_init_builder(struct jwt_builder *builder, char *buffer, size_t buffer_size)
```

Initialize the JWT builder.

Initialize the given JWT builder for the creation of a fresh token. The buffer size should at least be as long as JWT_BUILDER_MAX_SIZE returns.

**Parameters**

- `builder` – The builder to initialize.
- `buffer` – The buffer to write the token to.
- `buffer_size` – The size of this buffer. The token will be NULL terminated, which needs to be allowed for in this size.

**Return values**

- 0 – Success
- -ENOSPC – Buffer is insufficient to initialize

**jwt_add_payload**

```c
int jwt_add_payload(struct jwt_builder *builder, int32_t exp, int32_t iat, const char *aud)
```

Add JWT primary payload.

**jwt_sign**

```c
int jwt_sign(struct jwt_builder *builder, const char *der_key, size_t der_key_len)
```

Sign the JWT token.

**jwt_payload_len**

```c
static inline size_t jwt_payload_len(struct jwt_builder *builder)
```

Get the length of the JWT primary payload.

```c
struct jwt_builder
```

#include <jwt.h> JWT data tracking.

JSON Web Tokens contain several sections, each encoded in base-64. This structure tracks the token as it is being built, including limits on the amount of available space. It should be initialized with jwt_init().

### Public Members

- `char *base`  
The base of the buffer we are writing to.

- `char *buf`  
The place in this buffer where we are currently writing.
size_t len
   The length remaining to write.

bool overflowed
   Flag that is set if we try to write past the end of the buffer.
   If set, the token is not valid.
Chapter 5

Build and Configuration Systems

5.1 Build System (CMake)

CMake is used to build your application together with the Zephyr kernel. A CMake build is done in two stages. The first stage is called **configuration**. During configuration, the CMakeLists.txt build scripts are executed. After configuration is finished, CMake has an internal model of the Zephyr build, and can generate build scripts that are native to the host platform.

CMake supports generating scripts for several build systems, but only Ninja and Make are tested and supported by Zephyr. After configuration, you begin the **build** stage by executing the generated build scripts. These build scripts can recompile the application without involving CMake following most code changes. However, after certain changes, the configuration step must be executed again before building. The build scripts can detect some of these situations and reconfigure automatically, but there are cases when this must be done manually.

Zephyr uses CMake's concept of a 'target' to organize the build. A target can be an executable, a library, or a generated file. For application developers, the library target is the most important to understand. All source code that goes into a Zephyr build does so by being included in a library target, even application code.

Library targets have source code, that is added through CMakeLists.txt build scripts like this:

```cmake
target_sources(app PRIVATE src/main.c)
```

In the above CMakeLists.txt, an existing library target named app is configured to include the source file src/main.c. The PRIVATE keyword indicates that we are modifying the internals of how the library is being built. Using the keyword PUBLIC would modify how other libraries that link with app are built. In this case, using PUBLIC would cause libraries that link with app to also include the source file src/main.c, behavior that we surely do not want. The PUBLIC keyword could however be useful when modifying the include paths of a target library.

5.1.1 Build and Configuration Phases

The Zephyr build process can be divided into two main phases: a configuration phase (driven by CMake) and a build phase (driven by Make or Ninja).

Configuration Phase

The configuration phase begins when the user invokes **CMake** to generate a build system, specifying a source application directory and a board target.
Configuration overview...

- `.dts` files
- C preprocessor
- Preprocessed devicetree...
- Kconfig files
- Scripts in `scripts/d...`
- Bindings (YAML files)

Outputs
- `prj.conf`...
- Makefile or Ninja file (...
- Final devicetree, `zephyr.dts`
- `dtc` (optional, for warning...)

Viewer does not support full SVG 1.1.
CMake begins by processing the CMakeLists.txt file in the application directory, which refers to the CMakeLists.txt file in the Zephyr top-level directory, which in turn refers to CMakeLists.txt files throughout the build tree (directly and indirectly). Its primary output is a set of Makefiles or Ninja files to drive the build process, but the CMake scripts also do some processing of their own, which is explained here.

Note that paths beginning with build/ below refer to the build directory you create when running CMake.

**Devicetree**

*.dts (devicetree source) and *.dtsi (devicetree source include) files are collected from the target's architecture, SoC, board, and application directories.

*.dtsi files are included by *.dts files via the C preprocessor (often abbreviated cpp, which should not be confused with C++). The C preprocessor is also used to merge in any devicetree *.overlay files, and to expand macros in *.dts, *.dtsi, and *.overlay files. The preprocessor output is placed in build/zephyr/zephyr.dts.pre.

The preprocessed devicetree sources are parsed by gen_defines.py to generate a build/zephyr/include/generated/devicetree_generated.h header with preprocessor macros.

Source code should access preprocessor macros generated from devicetree by including the devicetree.h header, which includes devicetree_generated.h.

gen_defines.py also writes the final devicetree to build/zephyr/zephyr.dts in the build directory. This file's contents may be useful for debugging.

If the devicetree compiler dtc is installed, it is run on build/zephyr/zephyr.dts to catch any extra warnings and errors generated by this tool. The output from dtc is unused otherwise, and this step is skipped if dtc is not installed.

The above is just a brief overview. For more information on devicetree, see [Devicetree Guide](#).

**Kconfig**

Kconfig files define available configuration options for the target architecture, SoC, board, and application, as well as dependencies between options.

Kconfig configurations are stored in configuration files. The initial configuration is generated by merging configuration fragments from the board and application (e.g. prj.conf).

The output from Kconfig is an autoconf.h header with preprocessor assignments, and a .config file that acts both as a saved configuration and as configuration output (used by CMake). The definitions in autoconf.h are automatically exposed at compile time, so there is no need to include this header.

Information from devicetree is available to Kconfig, through the functions defined in kconfigfunctions.py.

See the Kconfig section of the manual for more information.

**Build Phase**

The build phase begins when the user invokes make or ninja. Its ultimate output is a complete Zephyr application in a format suitable for loading/flashing on the desired target board (zephyr.elf, zephyr.hex, etc.). The build phase can be broken down, conceptually, into four stages: the pre-build, first-pass binary, final binary, and post-processing.

**Pre-build** Pre-build occurs before any source files are compiled, because during this phase header files used by the source files are generated.
Offset generation
Access to high-level data structures and members is sometimes required when the definitions of those structures is not immediately accessible (e.g., assembly language). The generation of offsets.h (by gen_offset_header.py) facilitates this.

System call boilerplate
The gen_syscall.py and parse_syscalls.py scripts work together to bind potential system call functions with their implementations.

Intermediate binaries Compilation proper begins with the first intermediate binary. Source files (C and assembly) are collected from various subsystems (which ones is decided during the configuration phase), and compiled into archives (with reference to header files in the tree, as well as those generated during the configuration phase and the pre-build stage(s)).

The exact number of intermediate binaries is decided during the configuration phase.
If memory protection is enabled, then:

**Partition grouping**

The `gen_app_partitions.py` script scans all the generated archives and outputs linker scripts to ensure that application partitions are properly grouped and aligned for the target’s memory protection hardware.

Then `cpp` is used to combine linker script fragments from the target’s architecture/SoC, the kernel tree, optionally the partition output if memory protection is enabled, and any other fragments selected during the configuration process, into a `linker.cmd` file. The compiled archives are then linked with `ld` as specified in the `linker.cmd`.

**Unfixed size binary**

The unfixed size intermediate binary is produced when *User Mode* is enabled or *Devicetree* is in use. It produces a binary where sizes are not fixed and thus it may be used by post-process steps that will impact the size of the final binary.

**Fixed size binary**

The fixed size intermediate binary is produced when *User Mode* is enabled or when generated IRQ tables are used, `CONFIG_GEN_ISR_TABLES`. It produces a binary where sizes are fixed and thus the size must not change between the intermediate binary and the final binary.

**Intermediate binaries post-processing**

The binaries from the previous stage are incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

To complete the build procedure the following scripts are executed on the intermediate binaries to produce the missing pieces needed for the final binary.

When *User Mode* is enabled:

**Partition alignment**

The `gen_app_partitions.py` script scans the unfixed size binary and generates an app shared memory aligned linker script snippet where the partitions are sorted in descending order.
When **Devicetree** is used:

**Device dependencies**

The `gen_device_deps.py` script scans the unfixed size binary to determine relationships between devices that were recorded from devicetree data, and replaces the encoded relationships with values that are optimized to locate the devices actually present in the application.

When **CONFIG_GEN_ISR_TABLES** is enabled:

The `gen_isr_tables.py` script scans the fixed size binary and creates an `isr_tables.c` source file with a hardware vector table and/or software IRQ table.

When **User Mode** is enabled:

**Kernel object hashing**

The `gen_kobject_list.py` scans the `ELF DWARF` debug data to find the address of all kernel objects. This list is passed to `gperf`, which generates a perfect hash function and table of those addresses, then that output is optimized by `process_gperf.py`, using known properties of our special case.

When no intermediate binary post-processing is required then the first intermediate binary will be directly used as the final binary.

**Final binary**  The binary from the previous stage is incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

The link from the previous stage is repeated, this time with the missing pieces populated.
Post processing  Finally, if necessary, the completed kernel is converted from ELF to the format expected by the loader and/or flash tool required by the target. This is accomplished in a straightforward manner with `objdump`.

5.1.2 Supporting Scripts and Tools

The following is a detailed description of the scripts used during the build process.

**scripts/build/gen_syscalls.py**

Script to generate system call invocation macros

This script parses the system call metadata JSON file emitted by `parse_syscalls.py` to create several files:

- A file containing weak aliases of any potentially unimplemented system calls, as well as the system call dispatch table, which maps system call type IDs to their handler functions.
- A header file defining the system call type IDs, as well as function prototypes for all system call handler functions.
- A directory containing header files. Each header corresponds to a header that was identified as containing system call declarations. These generated headers contain the inline invocation functions for each system call in that header.

**scripts/build/gen_device_deps.py**

Translate generic handles into ones optimized for the application.
Immutable device data includes information about dependencies, e.g. that a particular sensor is controlled through a specific I2C bus and that it signals event on a pin on a specific GPIO controller. This information is encoded in the first-pass binary using identifiers derived from the devicetree. This script extracts those identifiers and replaces them with ones optimized for use with the devices actually present.

For example the sensor might have a first-pass handle defined by its devicetree ordinal 52, with the I2C driver having ordinal 24 and the GPIO controller ordinal 14. The runtime ordinal is the index of the corresponding device in the static devicetree array, which might be 6, 5, and 3, respectively.

The output is a C source file that provides alternative definitions for the array contents referenced from the immutable device objects. In the final link these definitions supersede the ones in the driver-specific object file.

**scripts/build/gen_kobject_list.py**

Script to generate gperf tables of kernel object metadata

User mode threads making system calls reference kernel objects by memory address, as the kernel/driver APIs in Zephyr are the same for both user and supervisor contexts. It is necessary for the kernel to be able to validate accesses to kernel objects to make the following assertions:

- That the memory address points to a kernel object
- The kernel object is of the expected type for the API being invoked
- The kernel object is of the expected initialization state
- The calling thread has sufficient permissions on the object

For more details see the [Kernel Objects](#) section in the documentation.

The zephyr build generates an intermediate ELF binary, zephyr_prebuilt.elf, which this script scans looking for kernel objects by examining the DWARF debug information to look for instances of data structures that are considered kernel objects. For device drivers, the API struct pointer populated at build time is also examined to disambiguate between various device driver instances since they are all `struct device`.

This script can generate five different output files:

- A gperf script to generate the hash table mapping kernel object memory addresses to kernel object metadata, used to track permissions, object type, initialization state, and any object-specific data.
- A header file containing generated macros for validating driver instances inside the system call handlers for the driver subsystem APIs.
- A code fragment included by `kernel.h` with one enum constant for each kernel object type and each driver instance.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping the kernel object types and driver instances to their human-readable representation in the `otype_to_str()` function.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping kernel object types to their sizes. This is used for allocating instances of them at runtime (CONFIG_DYNAMIC_OBJECTS) in the `obj_size_get()` function.

**scripts/build/gen_offset_header.py**

This script scans a specified object file and generates a header file that defined macros for the offsets of various found structure members (particularly symbols ending with `_OFFSET` or `_SIZEOF`),
primarily intended for use in assembly code.

**scripts/build/parse_syscalls.py**

Script to scan Zephyr include directories and emit system call and subsystem metadata

System calls require a great deal of boilerplate code in order to implement completely. This script is the first step in the build system's process of auto-generating this code by doing a text scan of directories containing C or header files, and building up a database of system calls and their function call prototypes. This information is emitted to a generated JSON file for further processing.

This script also scans for struct definitions such as __subsystem and __net_socket, emitting a JSON dictionary mapping tags to all the struct declarations found that were tagged with them.

If the output JSON file already exists, its contents are checked against what information this script would have outputted; if the result is that the file would be unchanged, it is not modified to prevent unnecessary incremental builds.

**arch/x86/gen_idt.py**

Generate Interrupt Descriptor Table for x86 CPUs.

This script generates the interrupt descriptor table (IDT) for x86. Please consult the IA Architecture SW Developer Manual, volume 3, for more details on this data structure.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the IDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols. From the kernel binary we read a special section “intList” which contains the desired interrupt routing configuration for the kernel, populated by instances of the IRQ_CONNECT() macro.

This script outputs three binary tables:

1. The interrupt descriptor table itself.
2. A bitfield indicating which vectors in the IDT are free for installation of dynamic interrupts at runtime.
3. An array which maps configured IRQ lines to their associated vector entries in the IDT, used to program the APIC at runtime.

**arch/x86/gen_gdt.py**

Generate a Global Descriptor Table (GDT) for x86 CPUs.

For additional detail on GDT and x86 memory management, please consult the IA Architecture SW Developer Manual, vol. 3.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the GDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols.

The input kernel ELF binary is used to obtain the following information:

- Memory addresses of the Main and Double Fault TSS structures so GDT descriptors can be created for them
- Memory addresses of where the GDT lives in memory, so that this address can be populated in the GDT pseudo descriptor
whether userspace or HW stack protection are enabled in Kconfig

The output is a GDT whose contents depend on the kernel configuration. With no memory protection features enabled, we generate flat 32-bit code and data segments. If hardware-based stack overflow protection or userspace is enabled, we additionally create descriptors for the main and double-fault IA tasks, needed for userspace privilege elevation and double-fault handling. If userspace is enabled, we also create flat code/data segments for ring 3 execution.

scripts/build/gen_relocate_app.py

This script will relocate .text, .rodata, .data and .bss sections from required files and places it in the required memory region. This memory region and file are given to this python script in the form of a string.

Example of such a string would be:

```
SRAM2:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c,\
SRAM1:COPY:/home/xyz/zephyr/samples/hello_world/src/main2.c, \\nFLASH2:NOCOPY:/home/xyz/zephyr/samples/hello_world/src/main3.c
```

One can also specify the program header for a given memory region:

```
SRAM2\ :phdr0:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c
```

To invoke this script:

```
python3 gen_relocate_app.py -i input_string -o generated_linker -c generated_code
```

Configuration that needs to be sent to the python script.

- If the memory is like SRAM1/SRAM2/CCD/AON then place full object in the sections
- If the memory type is appended with _DATA / _TEXT/ _RODATA/ _BSS only the selected memory is placed in the required memory region. Others are ignored.
- COPY/NOCOPY defines whether the script should generate the relocation code in code_relocation.c or not
- NOKEEP will suppress the default behavior of marking every relocated symbol with KEEP() in the generated linker script.

Multiple regions can be appended together like SRAM2_DATA_BSS this will place data and bss inside SRAM2.

scripts/build/process_gperf.py

gperf C file post-processor

We use gperf to build up a perfect hashtable of pointer values. The way gperf does this is to create a table ‘wordlist’ indexed by a string representation of a pointer address, and then doing memcmp() on a string passed in for comparison

We are exclusively working with 4-byte pointer values. This script adjusts the generated code so that we work with pointers directly and not strings. This saves a considerable amount of space.

scripts/build/gen_app_partitions.py

Script to generate a linker script organizing application memory partitions

Applications may declare build-time memory domain partitions with K_APPMEM_PARTITION_DEFINE, and assign globals to them using K_APP_DMEM or K_APP_BMEM macros. For each of these partitions, we need to route all their data into
appropriately-sized memory areas which meet the size/alignment constraints of the memory protection hardware.

This linker script is created very early in the build process, before the build attempts to link the kernel binary, as the linker script this tool generates is a necessary pre-condition for kernel linking. We extract the set of memory partitions to generate by looking for variables which have been assigned to input sections that follow a defined naming convention. We also allow entire libraries to be pulled in to assign their globals to a particular memory partition via command line directives.

This script takes as inputs:

- The base directory to look for compiled objects
- key/value pairs mapping static library files to what partitions their globals should end up in.

The output is a linker script fragment containing the definition of the app shared memory section, which is further divided, for each partition found, into data and BSS for each partition.

**scripts/build/check_init_priorities.py**

Checks the initialization priorities

This script parses a Zephyr executable file, creates a list of known devices and their effective initialization priorities and compares that with the device dependencies inferred from the devicetree hierarchy.

This can be used to detect devices that are initialized in the incorrect order, but also devices that are initialized at the same priority but depends on each other, which can potentially break if the linking order is changed.

 Optionally, it can also produce a human readable list of the initialization calls for the various init levels.

### 5.2 Devicetree

A devicetree is a hierarchical data structure primarily used to describe hardware. Zephyr uses devicetree in two main ways:

- to describe hardware to the Device Driver Model
- to provide that hardware's initial configuration

This page links to a high level guide on devicetree as well as reference material.

#### 5.2.1 Devicetree Guide

The pages in this section are a high-level guide to using devicetree for Zephyr development.

**Introduction to devicetree**

**Tip:** This is a conceptual overview of devicetree and how Zephyr uses it. For step-by-step guides and examples, see Devicetree HOWTOs.

The following pages introduce general devicetree concepts and how they apply to Zephyr.
**Scope and purpose**  A devicetree is primarily a hierarchical data structure that describes hardware. The Devicetree specification defines its source and binary representations.

Zephyr uses devicetree to describe:

- the hardware available on its boards
- that hardware's initial configuration

As such, devicetree is both a hardware description language and a configuration language for Zephyr. See Devicetree versus Kconfig for some comparisons between devicetree and Zephyr's other main configuration language, Kconfig.

There are two types of devicetree input files: devicetree sources and devicetree bindings. The sources contain the devicetree itself. The bindings describe its contents, including data types. The build system uses devicetree sources and bindings to produce a generated C header. The generated header's contents are abstracted by the devicetree.h API, which you can use to get information from your devicetree.

Here is a simplified view of the process:

![Devicetree build flow](image)

Fig. 1: Devicetree build flow

All Zephyr and application source code files can include and use devicetree.h. This includes device drivers, applications, tests, the kernel, etc.

The API itself is based on C macros. The macro names all start with DT_. In general, if you see a macro that starts with DT_ in a Zephyr source file, it's probably a devicetree.h macro. The generated C header contains macros that start with DT_ as well; you might see those in compiler error messages. You always can tell a generated-from a non-generated macro: generated macros have some lowercased letters, while the devicetree.h macro names have all capital letters.

**Syntax and structure**  As the name indicates, a devicetree is a tree. The human-readable text format for this tree is called DTS (for devicetree source), and is defined in the Devicetree specification.

This page's purpose is to introduce devicetree in a more gradual way than the specification. However, you may still need to refer to the specification to understand some detailed cases.
Important properties
Writing property values
Aliases and chosen nodes

Example

Here is an example DTS file:

```
/dts-v1/;
/
  a-node {
    subnode_nodelabel: a-sub-node {
      foo = <3>;
    };
  };
```

The `/dts-v1/` line means the file's contents are in version 1 of the DTS syntax, which has replaced a now-obsolete “version 0”.

Nodes

Like any tree data structure, a devicetree has a hierarchy of nodes. The above tree has three nodes:

1. A root node: `/`
2. A node named `a-node`, which is a child of the root node
3. A node named `a-sub-node`, which is a child of `a-node`

Nodes can be assigned node labels, which are unique shorthands that refer to the labeled node. Above, `a-sub-node` has the node label `subnode_nodelabel`. A node can have zero, one, or multiple node labels. You can use node labels to refer to the node elsewhere in the devicetree.

Devicetree nodes have paths identifying their locations in the tree. Like Unix file system paths, devicetree paths are strings separated by slashes (`/`), and the root node's path is a single slash: `/`. Otherwise, each node's path is formed by concatenating the node's ancestors' names with the node's own name, separated by slashes. For example, the full path to `a-sub-node` is `/a-node/a-sub-node`.

Properties

Devicetree nodes can also have properties. Properties are name/value pairs. Property values can be any sequence of bytes. In some cases, the values are an array of what are called cells. A cell is just a 32-bit unsigned integer.

Node `a-sub-node` has a property named `foo`, whose value is a cell with value 3. The size and type of `foo`'s value are implied by the enclosing angle brackets (`<` and `>`) in the DTS.

See Writing property values below for more example property values.

Devicetrees reflect hardware

In practice, devicetree nodes usually correspond to some hardware, and the node hierarchy reflects the hardware's physical layout. For example, let's consider a board with three I2C peripherals connected to an I2C bus controller on an SoC, like this:

Nodes corresponding to the I2C bus controller and each I2C peripheral would be present in the devicetree. Reflecting the hardware layout, the I2C peripheral nodes would be children of the bus controller node. Similar conventions exist for representing other types of hardware.

The DTS would look something like this:
Properties in practice  In practice, properties usually describe or configure the hardware the node represents. For example, an I2C peripheral's node has a property whose value is the peripheral's address on the bus.

Here's a tree representing the same example, but with real-world node names and properties you might see when working with I2C devices.

This is the corresponding DTS:

```
/dts-v1/;
/
{
  soc {
    i2c-bus-controller {
      i2c-peripheral-1 {
      }
      i2c-peripheral-2 {
      }
      i2c-peripheral-3 {
      }
    }
  }
};
```

(continues on next page)
Unit addresses  In addition to showing more real-world names and properties, the above example introduces a new devicetree concept: unit addresses. Unit addresses are the parts of node names after an “at” sign (@), like 40003000 in i2c@40003000, or 39 in apds9960@39. Unit addresses are optional: the soc node does not have one.

In devicetree, unit addresses give a node’s address in the address space of its parent node. Here are some example unit addresses for different types of hardware.

**Memory-mapped peripherals**
The peripheral’s register map base address. For example, the node named i2c@40003000 represents an I2C controller whose register map base address is 0x40003000.

**I2C peripherals**
The peripheral’s address on the I2C bus. For example, the child node apds9960@39 of the I2C controller in the previous section has I2C address 0x39.

**SPI peripherals**
An index representing the peripheral’s chip select line number. (If there is no chip select line, 0 is used.)
Memory
The physical start address. For example, a node named `memory@2000000` represents RAM starting at physical address 0x2000000.

Memory-mapped flash
Like RAM, the physical start address. For example, a node named `flash@8000000` represents a flash device whose physical start address is 0x8000000.

Fixed flash partitions
This applies when the devicetree is used to store a flash partition table. The unit address is the partition's start offset within the flash memory. For example, take this flash device and its partitions:

```dts
flash@8000000 {
   /* ... */
   partitions {
      partition@0 { /* ... */ };
      partition@20000 { /* ... */ };
      /* ... */
   }
};
```

The node named `partition@0` has offset 0 from the start of its flash device, so its base address is 0x8000000. Similarly, the base address of the node named `partition@20000` is 0x8020000.

Important properties
The devicetree specification defines several standard properties. Some of the most important ones are:

compatible
The name of the hardware device the node represents.

The recommended format is "vendor, device", like "avago, apds9960", or a sequence of these, like "ti, hdc", "ti, hdc1010". The vendor part is an abbreviated name of the vendor. The file `dts/bindings/vendor-prefixes.txt` contains a list of commonly accepted vendor names. The device part is usually taken from the datasheet.

It is also sometimes a value like `gpio-keys`, `mmio-sram`, or `fixed-clock` when the hardware's behavior is generic.

The build system uses the compatible property to find the right bindings for the node. Device drivers use `devicetree.h` to find nodes with relevant compatibles, in order to determine the available hardware to manage.

The compatible property can have multiple values. Additional values are useful when the device is a specific instance of a more general family, to allow the system to match from most- to least-specific device drivers.

Within Zephyr's bindings syntax, this property has type `string-array`.

reg
Information used to address the device. The value is specific to the device (i.e. is different depending on the compatible property).

The reg property is a sequence of `(address, length)` pairs. Each pair is called a “register block”. Values are conventionally written in hex.

Here are some common patterns:

- Devices accessed via memory-mapped I/O registers (like `i2c@40003000`): address is usually the base address of the I/O register space, and length is the number of bytes occupied by the registers.

- I2C devices (like `apds9960@39` and its siblings): address is a slave address on the I2C bus. There is no length value.
• SPI devices: address is a chip select line number; there is no length.

You may notice some similarities between the reg property and common unit addresses described above. This is not a coincidence. The reg property can be seen as a more detailed view of the addressable resources within a device than its unit address.

status
A string which describes whether the node is enabled.

The devicetree specification allows this property to have values "okay", "disabled", "reserved", "fail", and "fail-sss". Only the values "okay" and "disabled" are currently relevant to Zephyr; use of other values currently results in undefined behavior.

A node is considered enabled if its status property is either "okay" or not defined (i.e. does not exist in the devicetree source). Nodes with status "disabled" are explicitly disabled. (For backwards compatibility, the value "ok" is treated the same as "okay", but this usage is deprecated.) Devicetree nodes which correspond to physical devices must be enabled for the corresponding struct device in the Zephyr driver model to be allocated and initialized.

interrupts
Information about interrupts generated by the device, encoded as an array of one or more interrupt specifiers. Each interrupt specifier has some number of cells. See section 2.4, Interrupts and Interrupt Mapping, in the Devicetree Specification release v0.3 for more details.

Zephyr's devicetree bindings language lets you give a name to each cell in an interrupt specifier.

Note: Earlier versions of Zephyr made frequent use of the label property, which is distinct from the standard node label. Use of the label property in new devicetree bindings, as well as use of the DT_LABEL macro in new code, are actively discouraged. Label properties continue to persist for historical reasons in some existing bindings and overlays, but should not be used in new bindings or device implementations.

Writing property values  This section describes how to write property values in DTS format. The property types in the table below are described in detail in Devicetree bindings. Some specifics are skipped in the interest of keeping things simple; if you're curious about details, see the devicetree specification.

<table>
<thead>
<tr>
<th>Property type</th>
<th>How to write</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Double quoted</td>
<td>a-string = &quot;hello, world!&quot;;</td>
</tr>
<tr>
<td>int</td>
<td>between angle brackets (&lt; and &gt;)</td>
<td>an-int = &lt;1&gt;;</td>
</tr>
<tr>
<td>boolean</td>
<td>for true, with no value (for false, use / delete-property/)</td>
<td>my-true-boolean;</td>
</tr>
<tr>
<td>array</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>foo = &lt;0xdeadbeef 1234 0&gt;;</td>
</tr>
<tr>
<td>uint8-array</td>
<td>in hexadecimal without leading 0x, between square brackets ( [ and ]).</td>
<td>a-byte-array = [00 01 ab];</td>
</tr>
<tr>
<td>string-array</td>
<td>separated by commas</td>
<td>a-string-array = &quot;string one&quot;, &quot;string two&quot;, &quot;string three&quot;;</td>
</tr>
<tr>
<td>phandle</td>
<td>between angle brackets (&lt; and &gt;)</td>
<td>a-phandle = &lt;&amp;mynode&gt;;</td>
</tr>
<tr>
<td>phandles</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>some-phandles = &lt;&amp;mynode0 &amp;mynode1 &amp;mynode2&gt;;</td>
</tr>
<tr>
<td>handle-array</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>a-phandle-array = &lt;&amp;mynode0 1 2&gt;, &lt;&amp;mynode1 3 4&gt;;</td>
</tr>
</tbody>
</table>
Additional notes on the above:

- The values in the phandle, phandles, and phandle-array types are described further in \textit{Phandles}.

- Boolean properties are true if present. They should not have a value. A boolean property is only false if it is completely missing in the DTS.

- The foo property value above has three \textit{cells} with values 0xdeadbeef, 1234, and 0, in that order. Note that hexadecimal and decimal numbers are allowed and can be intermixed. Since Zephyr transforms DTS to C sources, it is not necessary to specify the endianness of an individual cell here.

- 64-bit integers are written as two 32-bit cells in big-endian order. The value 0xaaaa0000b(bb1111 would be written \texttt{<0xaaaa0000 0xbbbb1111>}. 

- The \texttt{a-byte-array} property value is the three bytes 0x00, 0x01, and 0xab, in that order.

- Parentheses, arithmetic operators, and bitwise operators are allowed. The bar property contains a single cell with value 64:

\begin{verbatim}
bar = <((2 * (1 << 5))>;
\end{verbatim}

Note that the entire expression must be parenthesized.

- Property values refer to other nodes in the devicetree by their \textit{phandles}. You can write a phandle using \&\textit{foo}, where \textit{foo} is a \textit{node label}. Here is an example devicetree fragment:

\begin{verbatim}
foo: device@0 {
    sibling = <&foo 1 2>;
};
\end{verbatim}

The sibling property of node device@1 contains three cells, in this order:

1. The device@0 node's phandle, which is written here as &foo since the device@0 node has a node label foo
2. The value 1
3. The value 2

In the devicetree, a phandle value is a cell – which again is just a 32-bit unsigned int. However, the Zephyr devicetree API generally exposes these values as \textit{node identifiers}. Node identifiers are covered in more detail in \textit{Devicetree access from C/C++}.

- Array and similar type property values can be split into several \textit{<>} blocks, like this:

\begin{verbatim}
foo = <1 2>, <3 4>; // Okay for \texttt{type: array}
foo = <&label1 &label2>, <&label3 &label4>; // Okay for \texttt{type: phandles}
foo = <&label1 1 2>, <&label2 3 4>; // Okay for \texttt{type: phandle-array}
\end{verbatim}

This is recommended for readability when possible if the value can be logically grouped into blocks of sub-values.

\textbf{Aliases and chosen nodes} There are two additional ways beyond \textit{node labels} to refer to a particular node without specifying its entire path: by alias, or by chosen node.

Here is an example devicetree which uses both:

\begin{verbatim}
/dts-v1/;
/ {
    chosen {
        zephyr,console = &uart0;
    }
}(continues on next page)
The /aliases and /chosen nodes do not refer to an actual hardware device. Their purpose is to specify other nodes in the devicetree.

Above, my-uart is an alias for the node with path /soc/serial@12340000. Using its node label uart0, the same node is set as the value of the chosen zephyr,console node.

Zephyr sample applications sometimes use aliases to allow overriding the particular hardware device used by the application in a generic way. For example, blinky uses this to abstract the LED to blink via the led0 alias.

The /chosen node's properties are used to configure system- or subsystem-wide values. See Chosen nodes for more information.

**Input and output files** This section describes the input and output files shown in the figure in Scope and purpose in more detail.

**Input files** There are four types of devicetree input files:

- sources (.dts)
- includes (.dtsi)
- overlays (.overlay)
- bindings (.yaml)

The devicetree files inside the zephyr directory look like this:

```plaintext
boards/<ARCH>/<BOARD>/<BOARD>.dts
dts/common/skeleton.dtsi
dts/<ARCH>/.../<SOC>.dtsi
dts/bindings/.../binding.yaml
```

Generally speaking, every supported board has a BOARD.dts file describing its hardware. For example, the reel_board has boards/arm/reel_board/reel_board.dts.

BOARD.dts includes one or more .dtsi files. These .dtsi files describe the CPU or system-on-chip Zephyr runs on, perhaps by including other .dtsi files. They can also describe other common hardware features shared by multiple boards. In addition to these includes, BOARD.dts also describes the board's specific hardware.

The dts/common directory contains skeleton.dtsi, a minimal include file for defining a complete devicetree. Architecture-specific subdirectories (dts/<ARCH>) contain .dtsi files for CPUs or SoCs which extend skeleton.dtsi.

The C preprocessor is run on all devicetree files to expand macro references, and includes are generally done with #include <filename> directives, even though DTS has a /include/ "<filename>" syntax.
Fig. 3: Devicetree input (green) and output (yellow) files
Zephyr Project Documentation, Release 3.6.99

BOARD.dts can be extended or modified using overlays. Overlays are also DTS files; the .overlay extension is just a convention which makes their purpose clear. Overlays adapt the base devicetree for different purposes:

- Zephyr applications can use overlays to enable a peripheral that is disabled by default, select a sensor on the board for an application specific purpose, etc. Along with Configuration System (Kconfig), this makes it possible to reconfigure the kernel and device drivers without modifying source code.

- Overlays are also used when defining Shields.

The build system automatically picks up .overlay files stored in certain locations. It is also possible to explicitly list the overlays to include, via the DTC_OVERLAY_FILE CMake variable. See Set devicetree overlays for details.

The build system combines BOARD.dts and any .overlay files by concatenating them, with the overlays put last. This relies on DTS syntax which allows merging overlapping definitions of nodes in the devicetree. See Example: FRDM-K64F and Hexiwear K64 for an example of how this works (in the context of .dtsi files, but the principle is the same for overlays). Putting the contents of the .overlay files last allows them to override BOARD.dts.

Devicetree bindings (which are YAML files) are essentially glue. They describe the contents of devicetree sources, includes, and overlays in a way that allows the build system to generate C macros usable by device drivers and applications. The dts/bindings directory contains bindings.

**Scripts and tools**  The following libraries and scripts, located in scripts/dts/, create output files from input files. Their sources have extensive documentation.

- dtlib.py
  A low-level DTS parsing library.

- edtlib.py
  A library layered on top of dtlib that uses bindings to interpret properties and give a higher-level view of the devicetree. Uses dtlib to do the DTS parsing.

- gen_defines.py
  A script that uses edtlib to generate C preprocessor macros from the devicetree and bindings.

In addition to these, the standard dtc (devicetree compiler) tool is run on the final devicetree if it is installed on your system. This is just to catch errors or warnings. The output is unused. Boards may need to pass dtc additional flags, e.g. for warning suppression. Board directories can contain a file named pre_dt_board.cmake which configures these extra flags, like this:

```bash
list(APPEND EXTRA_DTC_FLAGS "-Wno-simple_bus_reg")
```

**Output files**  These are created in your application's build directory.

**Warning:**  Don't include the header files directly. Devicetree access from C/C++ explains what to do instead.

- `<build>/zephyr/zephyr.dts.pre`
  The preprocessed DTS source. This is an intermediate output file, which is input to gen_defines.py and used to create zephyr.dts and devicetree_generated.h.

- `<build>/zephyr/include/generated/devicetree_generated.h`
  The generated macros and additional comments describing the devicetree. Included by devicetree.h.

5.2. Devicetree
The final merged devicetree. This file is output by `gen_defines.py`. It is useful for debugging any issues. If the devicetree compiler `dtc` is installed, it is also run on this file, to catch any additional warnings or errors.

**Design goals**

Zephyr's use of devicetree has evolved significantly over time, and further changes are expected. The following are the general design goals, along with specific examples about how they impact Zephyr's source code, and areas where more work remains to be done.

**Single source for hardware information** Zephyr's built-in device drivers and sample applications shall obtain configurable hardware descriptions from devicetree.

**Examples**

- New device drivers shall use devicetree APIs to determine which devices to create.
- In-tree sample applications shall use aliases to determine which of multiple possible generic devices of a given type will be used in the current build. For example, the blinky sample uses this to determine the LED to blink.
- Boot-time pin muxing and pin control for new SoCs shall be accomplished via a devicetree-based pinctrl driver

**Example remaining work**

- Zephyr's Test Runner (Twister) currently use `board.yaml` files to determine the hardware supported by a board. This should be obtained from devicetree instead.
- Legacy device drivers currently use Kconfig to determine which instances of a particular compatible are enabled. This can and should be done with devicetree overlays instead.
- Board-level documentation still contains tables of hardware support which are generated and maintained by hand. This can and should be obtained from the board level devicetree instead.
- Runtime determination of struct device relationships should be done using information obtained from devicetree, e.g. for device power management.

**Source compatibility with other operating systems** Zephyr's devicetree tooling is based on a generic layer which is interoperable with other devicetree users, such as the Linux kernel.

Zephyr's binding language semantics can support Zephyr-specific attributes, but shall not express Zephyr-specific relationships.

**Examples**

- Zephyr's devicetree source parser, `dtlib.py`, is source-compatible with other tools like `dtc` in both directions: `dtlib.py` can parse `dtc` output, and `dtc` can parse `dtlib.py` output.
- Zephyr's “extended dtlib” library, `edtlib.py`, shall not include Zephyr-specific features. Its purpose is to provide a higher-level view of the devicetree for common elements like interrupts and buses.
  Only the high-level `gen_defines.py` script, which is built on top of `edtlib.py`, contains Zephyr-specific knowledge and features.
Example remaining work

- Zephyr has a custom Devicetree bindings language syntax. While Linux's dtschema does not yet meet Zephyr's needs, we should try to follow what it is capable of representing in Zephyr's own bindings.
- Due to inflexibility in the bindings language, Zephyr cannot support the full set of bindings supported by Linux.
- Devicetree source sharing between Zephyr and Linux is not done.

Devicetree bindings

A devicetree on its own is only half the story for describing hardware, as it is a relatively unstructured format. Devicetree bindings provide the other half.

A devicetree binding declares requirements on the contents of nodes, and provides semantic information about the contents of valid nodes. Zephyr devicetree bindings are YAML files in a custom format (Zephyr does not use the dt-schema tools used by the Linux kernel).

These pages introduce bindings, describe what they do, note where they are found, and explain their data format.

Note: See the Bindings index for reference information on bindings built in to Zephyr.

Introduction to Devicetree Bindings

Note: For a detailed syntax reference, see Devicetree bindings syntax.

Devicetree nodes are matched to bindings using their compatible properties.

During the Configuration Phase, the build system tries to match each node in the devicetree to a binding file. When this succeeds, the build system uses the information in the binding file both when validating the node's contents and when generating macros for the node.

A simple example

Here is an example devicetree node:

```c
/* Node in a DTS file */
bar-device {
    compatible = "foo-company,bar-device";
    num-foos = <3>;
};
```

Here is a minimal binding file which matches the node:

```yaml
# A YAML binding matching the node
compatible: "foo-company,bar-device"

properties:
    num-foos:
        type: int
        required: true
```

The build system matches the bar-device node to its YAML binding because the node's compatible property matches the binding's compatible: line.
What the build system does with bindings   The build system uses bindings both to validate devicetree nodes and to convert the devicetree’s contents into the generated `devicetree_generated.h` header file.

For example, the build system would use the above binding to check that the required `num-foos` property is present in the `bar-device` node, and that its value, `<3>`, has the correct type.

The build system will then generate a macro for the `bar-device` node’s `num-foos` property, which will expand to the integer literal 3. This macro lets you get the value of the property in C code using the API which is discussed later in this guide in Devicetree access from C/C++.

For another example, the following node would cause a build error, because it has no `num-foos` property, and this property is marked required in the binding:

```
bad-node {
    compatible = "foo-company,bar-device";
};
```

Other ways nodes are matched to bindings  If a node has more than one string in its `compatible` property, the build system looks for compatible bindings in the listed order and uses the first match.

Take this node as an example:

```
baz-device {
    compatible = "foo-company,baz-device", "generic-baz-device";
};
```

The `baz-device` node would get matched to a binding with a `compatible: "generic-baz-device"` line if the build system can’t find a binding with a `compatible: "foo-company,baz-device"` line.

Nodes without compatible properties can be matched to bindings associated with their parent nodes. These are called “child bindings”. If a node describes hardware on a bus, like I2C or SPI, then the bus type is also taken into account when matching nodes to bindings. (See On-bus for details).

See The/zephyr-user node for information about a special node that doesn’t require any binding.

Where bindings are located   Binding file names usually match their `compatible:` lines. For example, the above example binding would be named `foo-company,bar-device.yaml` by convention.

The build system looks for bindings in `dts/bindings` subdirectories of the following places:

- the zephyr repository
- your application source directory
- your board directory
- any shield directories
- any directories manually included in the `DTS_ROOT` CMake variable
- any module that defines a `dts_root` in its Build settings

The build system will consider any YAML file in any of these, including in any subdirectories, when matching nodes to bindings. A file is considered YAML if its name ends with `.yaml` or `.yml`.
Warning: The binding files must be located somewhere inside the dts/bindings subdirectory of the above places.

For example, if my-app is your application directory, then you must place application-specific bindings inside my-app/dts/bindings. So my-app/dts/bindings/serial/my-company, my-serial-port.yaml would be found, but my-app/my-company, my-serial-port.yaml would be ignored.

Devicetree bindings syntax This page documents the syntax of Zephyr's bindings format. Zephyr bindings files are YAML files. A simple example was given in the introduction page.

Contents

• Top level keys
• Description
• Compatible
• Properties
  – Property entry syntax
  – Example property definitions
  – required
  – type
  – deprecated
  – default
  – enum
  – const
  – specifier-space
• Child-binding
• Bus
• On-bus
• Specifier cell names (*-cells)
• Include
• Nexus nodes and maps

Top level keys The top level of a bindings file maps keys to values. The top-level keys look like this:

```
# A high level description of the device the binding applies to:
description: |
  This is the Vendomatic company's foo-device.

Descriptions which span multiple lines (like this) are OK, and are encouraged for complex bindings.

See https://yaml-multiline.info/ for formatting help.
```

(continues on next page)
# You can include definitions from other bindings using this syntax:
include: other.yaml

# Used to match nodes to this binding:
compatible: "manufacturer,foo-device"

properties:
  # Requirements for and descriptions of the properties that this
  # binding's nodes need to satisfy go here.
child-binding:
  # You can constrain the children of the nodes matching this binding
  # using this key.

# If the node describes bus hardware, like an SPI bus controller
# on an SoC, use 'bus:' to say which one, like this:
bus: spi

# If the node instead appears as a device on a bus, like an external
# SPI memory chip, use 'on-bus:' to say what type of bus, like this.
# Like 'compatible', this key also influences the way nodes match
# bindings.
on-bus: spi

foo-cells:
  # "Specifier" cell names for the 'foo' domain go here; example 'foo'
  # values are 'gpio', 'pwm', and 'dma'. See below for more information.

These keys are explained in the following sections.

**Description**  A free-form description of node hardware goes here. You can put links to datasheets or example nodes or properties as well.

**Compatible**  This key is used to match nodes to this binding as described in *Introduction to Devicetree Bindings*. It should look like this in a binding file:

```yaml
# Note the comma-separated vendor prefix and device name
compatible: "manufacturer,device"
```

This devicetree node would match the above binding:

```yaml
device {
    compatible = "manufacturer,device";
};
```

Assuming no binding has compatible: "manufacturer,device-v2", it would also match this node:

```yaml
device-2 {
    compatible = "manufacturer,device-v2", "manufacturer,device";
};
```

Each node's compatible property is tried in order. The first matching binding is used. The `on-bus:` key can be used to refine the search.

If more than one binding for a compatible is found, an error is raised.

The `manufacturer` prefix identifies the device vendor. See `dts/bindings/vendor-prefixes.txt` for a list of accepted vendor prefixes. The device part is usually from the datasheet.
Some bindings apply to a generic class of devices which do not have a specific vendor. In these cases, there is no vendor prefix. One example is the gpio-leds compatible which is commonly used to describe board LEDs connected to GPIOs.

Properties The properties: key describes properties that nodes which match the binding contain. For example, a binding for a UART peripheral might look something like this:

```json
compatible: "manufacturer,serial"
properties:
  reg:
    type: array
    description: UART peripheral MMIO register space
    required: true
  current-speed:
    type: int
    description: current baud rate
    required: true
```

In this example, a node with compatible "manufacturer,serial" must contain a node named current-speed. The property's value must be a single integer. Similarly, the node must contain a reg property.

The build system uses bindings to generate C macros for devicetree properties that appear in DTS files. You can read more about how to get property values in source code from these macros in Devicetree access from C/C++. Generally speaking, the build system only generates macros for properties listed in the properties: key for the matching binding. Properties not mentioned in the binding are generally ignored by the build system.

The one exception is that the build system will always generate macros for standard properties, like reg, whose meaning is defined by the devicetree specification. This happens regardless of whether the node has a matching binding or not.

Property entry syntax Property entries in properties: are written in this syntax:

```plaintext
<property name>:
  required: <true | false>
  type: <string | int | boolean | array | uint8-array | string-array | phandle | phandles | phandle-array | path | compound>
  deprecated: <true | false>
  default: <default>
  description: <description of the property>
  enum:
    - <item1>
    - <item2>
    ...
    - <itemN>
  const: <string | int | array | uint8-array | string-array>
  specifier-space: <space-name>
```

Example property definitions Here are some more examples.

```plaintext
properties:
  # Describes a property like 'current-speed = <115200>;'. We pretend that
  # it's obligatory for the example node and set 'required: true'.
  current-speed:
    type: int
    required: true
```

(continues on next page)
description: Initial baud rate for bar-device

# Describes an optional property like 'keys = "foo", "bar"';
keys:
  type: string-array
  description: Keys for bar-device

# Describes an optional property like 'maximum-speed = "full-speed"';
# the enum specifies known values that the string property may take
maximum-speed:
  type: string
  description: Configures USB controllers to work up to a specific speed.
  enum:
    - "low-speed"
    - "full-speed"
    - "high-speed"
    - "super-speed"

# Describes an optional property like 'resolution = <16>;'
# the enum specifies known values that the int property may take
resolution:
  type: int
  enum:
    - 8
    - 16
    - 24
    - 32

# Describes a required property '#address-cells = <1>,'
# the const specifies that the value for the property is expected to be the value 1
"#address-cells":
  type: int
  required: true
  const: 1

int-with-default:
  type: int
  default: 123
  description: Value for int register, default is power-up configuration.

array-with-default:
  type: array
  default: [1, 2, 3] # Same as 'array-with-default = <1 2 3>,'

string-with-default:
  type: string
  default: "foo"

string-array-with-default:
  type: string-array
  default: ["foo", "bar"] # Same as 'string-array-with-default = "foo", "bar"'

uint8-array-with-default:
  type: uint8-array
  default: [0x12, 0x34] # Same as 'uint8-array-with-default = [12 34]'

required  Adding required: true to a property definition will fail the build if a node matches the binding, but does not contain the property.
The default setting is required: false; that is, properties are optional by default. Using required: false is therefore redundant and strongly discouraged.
The type of a property constrains its values. The following types are available. See Writing property values for more details about writing values of each type in a DTS file. See Phandles for more information about the phandle* type properties.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example in DTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>exactly one string</td>
<td>status = &quot;disabled&quot;;</td>

</tr>
<tr>
<td>compound</td>
<td>a catch-all for more complex types (no macros will be generated)</td>
<td>foo = &lt;&amp;label&gt;, [01 02];</td>
</tr>
</tbody>
</table>

**deprecated** A property with deprecated: true indicates to both the user and the tooling that the property is meant to be phased out.

The tooling will report a warning if the devicetree includes the property that is flagged as deprecated. (This warning is upgraded to an error in the Test Runner (Twister) for upstream pull requests.)

The default setting is deprecated: false. Using deprecated: false is therefore redundant and strongly discouraged.

**default** The optional default: setting gives a value that will be used if the property is missing from the devicetree node.

For example, with this binding fragment:

```yaml
properties:
  foo:
    type: int
    default: 3
```

If property foo is missing in a matching node, then the output will be as if foo = <3>; had appeared in the DTS (except YAML data types are used for the default value).

Note that combining default: with required: true will raise an error.

For rules related to default in upstream Zephyr bindings, see Rules for default values.

See Example property definitions for examples. Putting default: on any property type besides those used in Example property definitions will raise an error.
**enum**  The enum: line is followed by a list of values the property may contain. If a property value in DTS is not in the enum: list in the binding, an error is raised. See *Example property definitions* for examples.

**const**  This specifies a constant value the property must take. It is mainly useful for constraining the values of common properties for a particular piece of hardware.

**Warning:** It is an abuse of this feature to use it to name properties in unconventional ways.

For example, this feature is not meant for cases like naming a property `my-pin`, then assigning it to the “gpio” specifier space using this feature. Properties which refer to GPIOs should use conventional names, i.e. end in `-gpios` or `-gpio`.

**specifier-space**  This property, if present, manually sets the specifier space associated with a property with type phandle-array.

Normally, the specifier space is encoded implicitly in the property name. A property named `foos` with type phandle-array implicitly has specifier space `foo`. As a special case, `-gpios` properties have specifier space “gpio”, so that `foo-gpios` will have specifier space “gpio” rather than “foo-gpio”.

You can use specifier-space to manually provide a space if using this convention would result in an awkward or unconventional name.

For example:

```plaintext
compatible: ...
properties:
  bar:
    type: phandle-array
    specifier-space: my-custom-space
```

Above, the bar property's specifier space is set to “my-custom-space”.

You could then use the property in a devicetree like this:

```plaintext
controller1: custom-controller@1000 {
  #my-custom-space-cells = <2>;
};
controller2: custom-controller@2000 {
  #my-custom-space-cells = <1>;
};
my-node {
  bar = <&controller1 10 20>, <&controller2 30>;
};
```

Generally speaking, you should reserve this feature for cases where the implicit specifier space naming convention doesn’t work. One appropriate example is an `mboxes` property with specifier space “mbox”, not “mboxe”. You can write this property as follows:

```plaintext
properties:
  mboxes:
    type: phandle-array
    specifier-space: mbox
```

---

1242  Chapter 5. Build and Configuration Systems
**Child-binding** child-binding can be used when a node has children that all share the same properties. Each child gets the contents of child-binding as its binding, though an explicit compatible = ... on the child node takes precedence, if a binding is found for it.

Consider a binding for a PWM LED node like this one, where the child nodes are required to have a `pwms` property:

```c
pwmleds {
    compatible = "pwm-leds";
    red_pwm_led {
        pwms = &pwm3 4 15625000;
    };
    green_pwm_led {
        pwms = &pwm3 0 15625000;
    };
    /* ... */
};
```

The binding would look like this:

```c
compatible: "pwm-leds"

child-binding:
    description: LED that uses PWM

properties:
    pwms:
        type: phandle-array
        required: true
```

child-binding also works recursively. For example, this binding:

```c
compatible: foo

child-binding:
    child-binding:
        properties:
            my-property:
                type: int
                required: true
```

will apply to the grandchild node in this DTS:

```c
parent {
    compatible = "foo";
    child {
        grandchild {
            my-property = <123>;
        };
    };
};
```

**Bus** If the node is a bus controller, use `bus:` in the binding to say what type of bus. For example, a binding for a SPI peripheral on an SoC would look like this:

```c
compatible: "manufacturer,spi-peripheral"
bus: spi
# ...
```

The presence of this key in the binding informs the build system that the children of any node matching this binding appear on this type of bus.
This in turn influences the way on-bus: is used to match bindings for the child nodes.

For a single bus supporting multiple protocols, e.g. I3C and I2C, the bus: in the binding can have a list as value:

```yaml
compatible: "manufacturer,i3c-controller"
bus: [i3c, i2c]
```

### On-bus

If the node appears as a device on a bus, use on-bus: in the binding to say what type of bus.

For example, a binding for an external SPI memory chip should include this line:

```yaml
on-bus: spi
```

And a binding for an I2C based temperature sensor should include this line:

```yaml
on-bus: i2c
```

When looking for a binding for a node, the build system checks if the binding for the parent node contains bus: <bus type>. If it does, then only bindings with a matching on-bus: <bus type> and bindings without an explicit on-bus are considered. Bindings with an explicit on-bus: <bus type> are searched for first, before bindings without an explicit on-bus. The search repeats for each item in the node’s compatible property, in order.

This feature allows the same device to have different bindings depending on what bus it appears on. For example, consider a sensor device with compatible manufacturer,sensor which can be used via either I2C or SPI.

The sensor node may therefore appear in the devicetree as a child node of either an SPI or an I2C controller, like this:

```yaml
spi-bus@0 {
    /* ... some compatible with 'bus: spi', etc. ... */
    sensor@0 {
        compatible = "manufacturer,sensor";
        reg = <0>;
        /* ... */
    };
}
```

```yaml
i2c-bus@0 {
    /* ... some compatible with 'bus: i2c', etc. ... */
    sensor@79 {
        compatible = "manufacturer,sensor";
        reg = <79>;
        /* ... */
    };
}
```

You can write two separate binding files which match these individual sensor nodes, even though they have the same compatible:

```yaml
# manufacturer,sensor-spi.yaml, which matches sensor@0 on the SPI bus:
compatible: "manufacturer,sensor"
on-bus: spi
```

```yaml
# manufacturer,sensor-i2c.yaml, which matches sensor@79 on the I2C bus:
compatible: "manufacturer,sensor"
```

(continues on next page)
Only sensor@79 can have a use-clock-stretching property. The bus-sensitive logic ignores manufacturer,sensor-i2c.yaml when searching for a binding for sensor@0.

Specifier cell names (*-cells) This section documents how to name the cells in a specifier within a binding. These concepts are discussed in detail later in this guide in phandle-array properties.

Consider a binding for a node whose phandle may appear in a phandle-array property, like the PWM controllers pwm1 and pwm2 in this example:

```yaml
pwm1: pwm@deadbeef {
    compatible = "foo,pwm";
    #pwm-cells = <2>;
};
pwm2: pwm@deadbeef {
    compatible = "bar,pwm";
    #pwm-cells = <1>;
};
my-node {
    pwms = <&pwm1 1200>, <&pwm2 3000>;
};
```

The bindings for compatible "foo,pwm" and "bar,pwm" must give a name to the cells that appear in a PWM specifier using pwn-cells:, like this:

```yaml
# foo,pwm.yaml
compatible: "foo,pwm"
...  
pwm-cells:  
    - channel  
    - period  

# bar,pwm.yaml
compatible: "bar,pwm"
...  
pwm-cells:  
    - period
```

A *-names (e.g. pwm-names) property can appear on the node as well, giving a name to each entry. This allows the cells in the specifiers to be accessed by name, e.g. using APIs like DT_PWMS_CHANNEL_BY_NAME.

If the specifier is empty (e.g. #clock-cells = <0>), then *-cells can either be omitted (recommended) or set to an empty array. Note that an empty array is specified as e.g. clock-cells: [] in YAML.

Include Bindings can include other files, which can be used to share common property definitions between bindings. Use the include: key for this. Its value is either a string or a list. In the simplest case, you can include another file by giving its name as a string, like this:
include: foo.yaml

If any file named foo.yaml is found (see *Where bindings are located* for the search process), it will be included into this binding.

Included files are merged into bindings with a simple recursive dictionary merge. The build system will check that the resulting merged binding is well-formed. It is allowed to include at any level, including child-binding, like this:

```
# foo.yaml will be merged with content at this level
include: foo.yaml

child-binding:
  # bar.yaml will be merged with content at this level
  include: bar.yaml
```

It is an error if a key appears with a different value in a binding and in a file it includes, with one exception: a binding can have `required: true` for a property definition for which the included file has `required: false`. The `required: true` takes precedence, allowing bindings to strengthen requirements from included files.

Note that weakening requirements by having `required: false` where the included file has `required: true` is an error. This is meant to keep the organization clean.

The file `base.yaml` contains definitions for many common properties. When writing a new binding, it is a good idea to check if `base.yaml` already defines some of the needed properties, and include it if it does.

Note that you can make a property defined in `base.yaml` obligatory like this, taking `reg` as an example:

```
reg:
  required: true
```

This relies on the dictionary merge to fill in the other keys for `reg`, like `type`.

To include multiple files, you can use a list of strings:

```
include:
  - foo.yaml
  - bar.yaml
```

This includes the files `foo.yaml` and `bar.yaml`. (You can write this list in a single line of YAML as `include: [foo.yaml, bar.yaml].`)

When including multiple files, any overlapping `required` keys on properties in the included files are ORed together. This makes sure that a `required: true` is always respected.

In some cases, you may want to include some property definitions from a file, but not all of them. In this case, `include: should be a list, and you can filter out just the definitions you want by putting a mapping in the list, like this:

```
include:
  - name: foo.yaml
    property-allowlist:
      - i-want-this-one
      - and-this-one
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Each map element must have a `name` key which is the filename to include, and may have `property-allowlist` and `property-blocklist` keys that filter which properties are included.
You cannot have a single map element with both property-allowlist and property-blocklist keys. A map element with neither property-allowlist nor property-blocklist is valid; no additional filtering is done.

You can freely intermix strings and mappings in a single include:

```yaml
include:
  - foo.yaml
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Finally, you can filter from a child binding like this:

```yaml
include:
  - name: bar.yaml
    child-binding:
      property-allowlist:
        - child-prop-to-allow
```

### Nexus nodes and maps
All phandle-array type properties support mapping through *-map properties, e.g. gpio-map, as defined by the Devicetree specification.

This is used, for example, to define connector nodes for common breakout headers, such as the arduino_header nodes that are conventionally defined in the devicetrees for boards with Arduino compatible expansion headers.

### Rules for upstream bindings
This section includes general rules for writing bindings that you want to submit to the upstream Zephyr Project. (You don’t need to follow these rules for bindings you don’t intend to contribute to the Zephyr Project, but it’s a good idea.)

Decisions made by the Zephyr devicetree maintainer override the contents of this section. If that happens, though, please let them know so they can update this page, or you can send a patch yourself.

### Contents

- Always check for existing bindings
- General rules
  - File names
  - Recommendations are requirements
  - Descriptions
  - Naming conventions
- Rules for vendor prefixes
- Rules for default values
- The zephyr, prefix

### Always check for existing bindings
Zephyr aims for devicetree Source compatibility with other operating systems. Therefore, if there is an existing binding for your device in an authoritative location, you should try to replicate its properties when writing a Zephyr binding, and you must justify any Zephyr-specific divergences.
In particular, this rule applies if:

- There is an existing binding in the mainline Linux kernel. See `Documentation/devicetree/bindings` in Linus's tree for existing bindings and the Linux devicetree documentation for more information.
- Your hardware vendor provides an official binding outside of the Linux kernel.

**General rules**

**File names**  
Bindings which match a compatible must have file names based on the compatible.

- For example, a binding for compatible `vnd,foo` must be named `vnd,foo.yaml`.
- If the binding is bus-specific, you can append the bus to the file name; for example, if the binding YAML has `on-bus: bar`, you may name the file `vnd,foo-bar.yaml`.

**Recommendations are requirements**  
All recommendations in `default` are requirements when submitting the binding.

In particular, if you use the `default:` feature, you must justify the value in the property's description.

**Descriptions**  
There are only two acceptable ways to write property description: strings.

If your description is short, it’s fine to use this style:

```
description: my short string
```

If your description is long or spans multiple lines, you must use this style:

```
description:
  My very long string
goes here.
Look at all these lines!
```

This | style prevents YAML parsers from removing the newlines in multi-line descriptions. This in turn makes these long strings display properly in the *Bindings index*.

**Naming conventions**  
Do not use uppercase letters (A through Z) or underscores (_) in property names. Use lowercase letters (a through z) instead of uppercase. Use dashes (-) instead of underscores. (The one exception to this rule is if you are replicating a well-established binding from somewhere like Linux.)

**Rules for vendor prefixes**  
The following general rules apply to vendor prefixes in `compatible` properties.

- If your device is manufactured by a specific vendor, then its compatible should have a vendor prefix.

  If your binding describes hardware with a well known vendor from the list in `dts/bindings/vendor-prefixes.txt`, you must use that vendor prefix.

- If your device is not manufactured by a specific hardware vendor, do not invent a vendor prefix. Vendor prefixes are not mandatory parts of compatible properties, and compatibles should not include them unless they refer to an actual vendor. There are some exceptions to this rule, but the practice is strongly discouraged.
• Do not submit additions to Zephyr's `dts/bindings/vendor-prefixes.txt` file unless you also include users of the new prefix. This means at least a binding and a devicetree using the vendor prefix, and should ideally include a device driver handling that compatible.

For custom bindings, you can add a custom `dts/bindings/vendor-prefixes.txt` file to any directory in your `DTS_ROOT`. The devicetree tooling will respect these prefixes, and will not generate warnings or errors if you use them in your own bindings or devicetrees.

• We sometimes synchronize Zephyr's `vendor-prefixes.txt` file with the Linux kernel's equivalent file; this process is exempt from the previous rule.

• If your binding is describing an abstract class of hardware with Zephyr specific drivers handling the nodes, it's usually best to use `zephyr` as the vendor prefix. See Zephyr-specific binding (zephyr) for examples.

Rules for default values  In any case where `default:` is used in a devicetree binding, the description: for that property **must** explain why the value was selected and any conditions that would make it necessary to provide a different value. Additionally, if changing one property would require changing another to create a consistent configuration, then those properties should be made required.

There is no need to document the default value itself; this is already present in the **Bindings index** output.

There is a risk in using `default:` when the value in the binding may be incorrect for a particular board or hardware configuration. For example, defaulting the capacity of the connected power cell in a charging IC binding is likely to be incorrect. For such properties it's better to make the property `required: true`, forcing the user to make an explicit choice.

Driver developers should use their best judgment as to whether a value can be safely defaulted. Candidates for default values include:

- delays that would be different only under unusual conditions (such as intervening hardware)
- configuration for devices that have a standard initial configuration (such as a USB audio headset)
- defaults which match the vendor-specified power-on reset value (as long as they are independent from other properties)

Examples of how to write descriptions according to these rules:

```properties
properties:
  cs-interval:
    type: int
    default: 0
    description:
      Minimum interval between chip select deassertion and assertion.
      The default corresponds to the reset value of the register field.

  hold-time-ms:
    type: int
    default: 20
    description:
      Amount of time to hold the power enable GPIO asserted before
      initiating communication. The default was recommended in the
      manufacturer datasheet, and would only change under very
      cold temperatures.
```

Some examples of what **not** to do, and why:

```properties
# Description doesn't mention anything about the default
```

(continues on next page)
foo:
  type: int
  default: 1
  description: number of foos

# Description mentions the default value instead of why it was chosen
bar:
  type: int
  default: 2
  description: bar size; default is 2

# Explanation of the default value is in a comment instead of the description. This won't be shown in the bindings index.
baz:
  type: int
  # This is the recommended value chosen by the manufacturer.
  default: 2
  description: baz time in milliseconds

The zephyr, prefix You must add this prefix to property names in the following cases:

- Zephyr-specific extensions to bindings we share with upstream Linux. One example is the zephyr,vref-mv ADC channel property which is common to ADC controllers defined in `dts/bindings/adc/adc-controlleryaml`. This channel binding is partially shared with an analogous Linux binding, and Zephyr-specific extensions are marked as such with the prefix.

- Configuration values that are specific to a Zephyr device driver. One example is the zephyr, lazy-load property in the ti,bq274xx binding. Though devicetree in general is a hardware description and configuration language, it is Zephyr's only mechanism for configuring driver behavior for an individual `struct device`. Therefore, as a compromise, we do allow some software configuration in Zephyr's devicetree bindings, as long as they use this prefix to show that they are Zephyr specific.

You may use the zephyr, prefix when naming a devicetree compatible that is specific to Zephyr. One example is zephyr,ipc-openamp-static-vrings. In this case, it's permitted but not required to add the zephyr, prefix to properties defined in the binding.

Devicetree access from C/C++

This guide describes Zephyr's `<zephyr/devicetree.h>` API for reading the devicetree from C source files. It assumes you're familiar with the concepts in `Introduction to devicetree` and `Devicetree bindings`. See `Devicetree Reference` for reference material.

A note for Linux developers Linux developers familiar with devicetree should be warned that the API described here differs significantly from how devicetree is used on Linux.

Instead of generating a C header with all the devicetree data which is then abstracted behind a macro API, the Linux kernel would instead read the devicetree data structure in its binary form. The binary representation is parsed at runtime, for example to load and initialize device drivers.

Zephyr does not work this way because the size of the devicetree binary and associated handling code would be too large to fit comfortably on the relatively constrained devices Zephyr supports.
Node identifiers To get information about a particular devicetree node, you need a **node identifier** for it. This is a just a C macro that refers to the node.

These are the main ways to get a node identifier:

**By path**
Use `DT_PATH()` along with the node's full path in the devicetree, starting from the root node. This is mostly useful if you happen to know the exact node you're looking for.

**By node label**
Use `DT_NODELABEL()` to get a node identifier from a node label. Node labels are often provided by SoC .dtsi files to give nodes names that match the SoC datasheet, like i2c1, spi2, etc.

**By alias**
Use `DT_ALIAS()` to get a node identifier for a property of the special /aliases node. This is sometimes done by applications (like blinky, which uses the led0 alias) that need to refer to some device of a particular type (“the board's user LED”) but don’t care which one is used.

**By instance number**
This is done primarily by device drivers, as instance numbers are a way to refer to individual nodes based on a matching compatible. Get these with `DT_INST()`, but be careful doing so. See below.

**By chosen node**
Use `DT_CHOSEN()` to get a node identifier for /chosen node properties.

**By parent/child**
Use `DT_PARENT()` and `DT_CHILD()` to get a node identifier for a parent or child node, starting from a node identifier you already have.

Two node identifiers which refer to the same node are identical and can be used interchangeably.

Here's a DTS fragment for some imaginary hardware we'll return to throughout this file for examples:

```dts
/dts-v1/;
/
   
   aliases {
       sensor-controller = &i2c1;
   };
   
   soc {
      i2c1: i2c@40002000 {
         compatible = "vnd,soc-i2c";
         label = "I2C_1";
         reg = <0x40002000 0x1000>;
         status = "okay";
         clock-frequency = < 10000 >;
      }
   };
```

Here are a few ways to get node identifiers for the i2c@40002000 node:

- `DT_PATH(soc, i2c_40002000)`
- `DT_NODELABEL(i2c1)`
- `DT_ALIAS(sensor_controller)`
- `DT_INST(x, vnd_soc_i2c) for some unknown number x. See the `DT_INST()` documentation for details.`
Important: Non-alphanumeric characters like dash (-) and the at sign (@) in devicetree names are converted to underscores (_). The names in a DTS are also converted to lowercase.

Node identifiers are not values There is no way to store one in a variable. You cannot write:

```c
/* These will give you compiler errors: */

void *i2c_0 = DT_INST(0, vnd_soc_i2c);
unsigned int i2c_1 = DT_INST(1, vnd_soc_i2c);
long my_i2c = DT_NODELABEL(i2c1);
```

If you want something short to save typing, use C macros:

```c
/* Use something like this instead: */

#define MY_I2C DT_NODELABEL(i2c1)
#define INST(i) DT_INST(i, vnd_soc_i2c)
#define I2C_0 INST(0)
#define I2C_1 INST(1)
```

Property access The right API to use to read property values depends on the node and property.

- Checking properties and values
- Simple properties
- reg properties
- interrupts properties
- phandle properties

Checking properties and values You can use `DT_NODE_HAS_PROP()` to check if a node has a property. For the example devicetree above:

```c
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), clock_frequency)  /* expands to 1 */
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), not_a_property)   /* expands to 0 */
```

Simple properties Use `DT_PROP(node_id, property)` to read basic integer, boolean, string, numeric array, and string array properties.

For example, to read the clock-frequency property's value in the above example:

```c
DT_PROP(DT_PATH(soc, i2c_40002000), clock_frequency)  /* This is 100000, */
DT_PROP(DT_NODELABEL(i2c1), clock_frequency)            /* and so is this, */
DT_PROP(DT_ALIAS(sensor_controller), clock_frequency)  /* and this. */
```

Important: The DTS property clock-frequency is spelled clock_frequency in C. That is, properties also need special characters converted to underscores. Their names are also forced to lowercase.

Properties with string and boolean types work the exact same way. The `DT_PROP()` macro expands to a string literal in the case of strings, and the number 0 or 1 in the case of booleans. For example:
#define I2C1 DT_NODELABEL(i2c1)

DT_PROP(I2C1, status) /* expands to the string literal "okay" */

**Note:** Don’t use DT_NODE_HAS_PROP() for boolean properties. Use DT_PROP() instead as shown above. It will expand to either 0 or 1 depending on if the property is present or absent.

Properties with type array, uint8-array, and string-array work similarly, except DT_PROP() expands to an array initializer in these cases. Here is an example devicetree fragment:

```
foo: foo@1234 {
  a = <1000 2000 3000>; /* array */
  b = [aa bb cc dd]; /* uint8-array */
  c = "bar", "baz"; /* string-array */
};
```

Its properties can be accessed like this:

```
#define FOO DT_NODELABEL(foo)

int a[] = DT_PROP(FOO, a); /* {1000, 2000, 3000} */
unsigned char b[] = DT_PROP(FOO, b); /* {0xaa, 0xbb, 0xcc, 0xdd} */
char* c[] = DT_PROP(FOO, c); /* {"foo", "bar"} */
```

You can use **DT_PROP_LEN()** to get logical array lengths in number of elements.

```
size_t a_len = DT_PROP_LEN(FOO, a); /* 3 */
size_t b_len = DT_PROP_LEN(FOO, b); /* 4 */
size_t c_len = DT_PROP_LEN(FOO, c); /* 2 */
```

DT_PROP_LEN() cannot be used with the special reg or interrupts properties. These have alternative macros which are described next.

**reg properties**  
See **Important properties** for an introduction to reg.

Given a node identifier node_id, DT_NUM_REGS(node_id) is the total number of register blocks in the node's reg property.

You cannot read register block addresses and lengths with DT_PROP(node, reg). Instead, if a node only has one register block, use **DT_REG_ADDR()** or **DT_REG_SIZE()**:

- DT_REG_ADDR(node_id): the given node's register block address
- DT_REG_SIZE(node_id): its size

Use **DT_REG_ADDR_BY_IDX()** or **DT_REG_SIZE_BY_IDX()** instead if the node has multiple register blocks:

- DT_REG_ADDR_BY_IDX(node_id, idx): address of register block at index idx
- DT_REG_SIZE_BY_IDX(node_id, idx): size of block at index idx

The idx argument to these must be an integer literal or a macro that expands to one without requiring any arithmetic. In particular, idx cannot be a variable. This won't work:

```
/* This will cause a compiler error. */
for (size_t i = 0; i < DT_NUM_REGS(node_id); i++) {
  size_t addr = DT_REG_ADDR_BY_IDX(node_id, i);
}
```
**interrupts properties** See *Important properties* for a brief introduction to interrupts.

Given a node identifier `node_id`, `DT_NUM_IRQS(node_id)` is the total number of interrupt specifiers in the node's interrupts property.

The most general purpose API macro for accessing these is `DT_IRQ_BY_IDX()`:

```
DT_IRQ_BY_IDX(node_id, idx, val)
```

Here, `idx` is the logical index into the `interrupts` array, i.e. it is the index of an individual interrupt specifier in the property. The `val` argument is the name of a cell within the interrupt specifier. To use this macro, check the bindings file for the node you are interested in to find the `val` names.

Most Zephyr devicetree bindings have a cell named `irq`, which is the interrupt number. You can use `DT_IRQN()` as a convenient way to get a processed view of this value.

**Warning:** Here, “processed” reflects Zephyr’s devicetree *Scripts and tools*, which change the `irq` number in *zephyr.dts* to handle hardware constraints on some SoCs and in accordance with Zephyr’s multilevel interrupt numbering.

This is currently not very well documented, and you’ll need to read the scripts’ source code and existing drivers for more details if you are writing a device driver.

**phandle properties**

*Note:* See *Phandles* for a detailed guide to phandles.

Property values can refer to other nodes using the `&another-node` phandle syntax introduced in *Writing property values*. Properties which contain phandles have type phandle, phandles, or phandle-array in their bindings. We’ll call these “phandle properties” for short.

You can convert a phandle to a node identifier using `DT_PHANDLE()`, `DT_PHANDLE_BY_IDX()`, or `DT_PHANDLE_BY_NAME()`, depending on the type of property you are working with.

One common use case for phandle properties is referring to other hardware in the tree. In this case, you usually want to convert the devicetree-level phandle to a Zephyr driver-level `struct device`. See *Get a struct device from a devicetree node* for ways to do that.

Another common use case is accessing specifier values in a phandle array. The general purpose APIs for this are `DT_PHA_BY_IDX()` and `DT_PHA()`. There are also hardware-specific short-hands like `DT_GPIO_CTLR_BY_IDX()`, `DT_GPIO_CTLR()`, `DT_GPIO_PIN_BY_IDX()`, `DT_GPIO_PIN()`, `DT_GPIO_FLAGS_BY_IDX()`, and `DT_GPIO_FLAGS()`.

See `DT_PHA_HAS_CELL_AT_IDX()` and `DT_PROP_HAS_IDX()` for ways to check if a specifier value is present in a phandle property.

**Other APIs** Here are pointers to some other available APIs.

- `DT_CHOSEN()`, `DT_HAS_CHOSEN()`: for properties of the special `/chosen` node
- `DT_HAS_COMPAT_STATUS_OKAY()`, `DT_NODE_HAS_COMPAT()`: global- and node-specific tests related to the compatible property
- `DT_BUS()`: get a node's bus controller, if there is one
- `DT_ENUM_IDX()`: for properties whose values are among a fixed list of choices
- *Fixed flash partitions*: APIs for managing fixed flash partitions. Also see *Flash map*, which wraps this in a more user-friendly API.
Device driver conveniences  Special purpose macros are available for writing device drivers, which usually rely on instance identifiers.

To use these, you must define DT_DRV_COMPAT to the compat value your driver implements support for. This compat value is what you would pass to DT_INST().

If you do that, you can access the properties of individual instances of your compatible with less typing, like this:

```c
#include <zephyr/devicetree.h>
#define DT_DRV_COMPAT my_driver_compat
/* This is same thing as DT_INST(0, my_driver_compat): */
DT_DRV_INST(0)

/* This is the same thing as */
/* DT_PROP(DT_INST(0, my_driver_compat), clock_frequency) */
DT_INST_PROP(0, clock_frequency)
```

See Instance-based APIs for a generic API reference.

Hardware specific APIs  Convenience macros built on top of the above APIs are also defined to help readability for hardware specific code. See Hardware specific APIs for details.

Generated macros  While the zephyr/devicetree.h API is not generated, it does rely on a generated C header which is put into every application build directory: devicetree_generated.h. This file contains macros with devicetree data.

These macros have tricky naming conventions which the Devicetree API abstracts away. They should be considered an implementation detail, but it’s useful to understand them since they will frequently be seen in compiler error messages.

This section contains an Augmented Backus-Naur Form grammar for these generated macros, with examples and more details in comments. See RFC 7405 (which extends RFC 5234) for a syntax specification.

```
; An RFC 7405 ABNF grammar for devicetree macros.
; This does *not* cover macros pulled out of DT via Kconfig,
; like CONFIG_SRAM_BASE_ADDRESS, etc. It only describes the
; ones that start with DT_ and are directly generated.

; dt-macro: the top level nonterminal for a devicetree macro
;
; A dt-macro starts with uppercase "DT_", and is one of:
;
; - a <node-macro>, generated for a particular node
; - some <other-macro>, a catch-all for other types of macros

dt-macro = node-macro / other-macro

; node-macro: a macro related to a node

node-macro = property-macro
node-macro = pinctrl-macro
```

; #define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_flags_EXISTS 1
; #define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_flags_EXISTS 1

gpiohogs-macro =/ %s"DT_N" %s"_GPIO_HOGS_IDX_" %s"DIGIT %s"_VAL_flags_EXISTS"

; The value of the flags cell of a logical index in the GPIO hogs array.

; #define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_VAL_flags 0x10
; #define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_flags 0x20
; #define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_flags 0x30

gpiohogs-macro =/ %s"DT_N" %s"_GPIO_HOGS_IDX_" %s"DIGIT %s"_VAL_flags"

; --------------------------------------------------------------------
property-macro: a macro related to a node property

; These combine a node identifier with a "lowercase-and-underscores form"
; property name. The value expands to something related to the property's
; value.

; The optional prop-suf suffix is when there's some specialized
; subvalue that deserves its own macro, like the macros for an array
; property's individual elements

; The "plain vanilla" macro for a property's value, with no prop-suf,
; looks like this:

; DT_N.<node path>._P_<property name>

Components:

- path-id: node's devicetree path converted to a C token
- prop-id: node's property name converted to a C token
- prop-suf: an optional property-specific suffix

property-macro = %s"DT_N" %s"_P_" %s"_PROP [prop-suf]

; --------------------------------------------------------------------
path-id: a node's path-based macro identifier

; This in "lowercase-and-underscores form". I.e. it is
; the node's devicetree path converted to a C token by changing:
; - each slash (/) to _S_
; - all letters to lowercase
; - non-alphanumerics characters to underscores

; For example, the leaf node "bar-BAZ" in this devicetree:
; /
; | foo@123 {
; |   bar-BAZ {};
; | }
; |
; has path-id "_S_foo_123_S_bar_baz".

(continues on next page)
path-id = 1*('%s"_S_" dt-name')

; prop-id: a property identifier

; A property name converted to a C token by changing:
; - all letters to lowercase
; - non-alphanumeric characters to underscores

; Example node:
; chosen {
;  zephyr,console = &uart1;
;  WHY,AM_I_SHOUTING = "unclear";
; };

; The 'zephyr,console' property has prop-id 'zephyr_console'.
; 'WHY,AM_I_SHOUTING' has prop-id 'why_am_i_shouting'.
prop-id = dt-name

; prop-suf: a property-specific macro suffix

; Extra macros are generated for properties:
; - that are special to the specification ("reg", "interrupts", etc.)
; - with array types (uint8-array, phandle-array, etc.)
; - with "enum:" in their bindings
; - that have zephyr device API specific macros for phandle-arrays
; - related to phandle specifier names ("foo-names")

; Here are some examples:
; - _EXISTS: property, index or name existence flag
; - _SIZE: logical property length
; - _IDX_<i>: values of individual array elements
; - _IDX_<DIGIT>_VAL_<dt-name>: values of individual specifier
;  cells within a phandle array
; - _ADDR_<i>: for reg properties, the i-th register block address
; - _LEN_<i>: for reg properties, the i-th register block length

; The different cases are not exhaustively documented here to avoid
; this file going stale. Please see devicetree.h if you need to know
; the details.
prop-suf = 1*('%s alternate-id

; other-macro: grab bag for everything that isn't a node-macro.

; See examples below.
other-macro = %s"DT_N_" alternate-id
; Total count of enabled instances of a compatible.
other-macro = %s"DT_N_INST_" dt-name %s"_NUM_OKAY"
; These are used internally by DT_FOREACH.NODE and
; DT_FOREACH_STATUS_OKAY.NODE respectively.
other-macro = %s"DT_FOREACH_HELPER"
other-macro = %s"DT_FOREACH_OKAY_HELPER"
; These are used internally by DT_FOREACH_STATUS_OKAY,
; which iterates over each enabled node of a compatible.
other-macro = %s"DT_FOREACH_OKAY_" dt-name

(continues on next page)
other-macro =/ %s"DT_FOREACH_OKAY_VARGS_" dt-name
  ; These are used internally by DT_INST_FOREACH_STATUS_OKAY,
  ; which iterates over each enabled instance of a compatible.
other-macro =/ %s"DT_FOREACH_OKAY_INST_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_INST_VARGS_" dt-name
  ; E.g.: #define DT_CHOSEN_zephyr_flash
other-macro =/ %s"DT_CHOSEN_" dt-name
  ; Declares that a compatible has at least one node on a bus.
  ; Example:
  ;
  ; #define DT_COMPAT_vnd_dev_BUS_spi 1
other-macro =/ %s"DT_COMPAT_" dt-name %s"_BUS_" dt-name
  ; Declares that a compatible has at least one status "okay" node.
  ; Example:
  ;
  ; #define DT_COMPAT_HAS_OKAY_vnd_dev 1
other-macro =/ %s"DT_COMPAT_" dt-name %s"_LABEL_" dt-name
  ; Currently used to allow mapping a lowercase-and-underscores "label"
  ; property to a fixed-partitions node. See the flash map API docs
  ; for an example.
other-macro =/ %s"DT_COMPAT_" dt-name %s"_P_<prop-id>_
  ; alternate-id: another way to specify a node besides a path-id
  ; Example devicetree:
  ; /
  ;   aliases {
  ;     dev = &dev_1;
  ;   };
  ;   soc {
  ;     dev_1: device@123 {
  ;       compatible = "vnd,device";
  ;     };
  ;   };
  ;
  ; Node device@123 has these alternate-id values:
  ;
  ; - ALIAS_dev
  ; - NODELABEL_dev_1
  ; - INST_0_vnd_device
  ;
  ; The full alternate-id macros are:
  ;
  ; #define DT_N_INST_0_vnd_device DT_N_S_soc_S_device_123
  ; #define DT_N_ALIAS_dev DT_N_S_soc_S_device_123
  ; #define DT_N_NODELABEL_dev_1 DT_N_S_soc_S_device_123
  ;
  ; These mainly exist to allow pasting an alternate-id macro onto a
  ; "P/<prop-id>" to access node properties given a node's alias, etc.
  ;
  ; Notice that "inst"-type IDs have a leading instance identifier,
  ; which is generated by the devicetree scripts. The other types of
  ; alternate-id begin immediately with names taken from the devicetree.
alternate-id = ( %s"ALIAS" / %s"NODELABEL" ) dt-name
alternate-id =/ %s"INST_" 1*DIGIT "_" dt-name

(continues on next page)
; miscellaneous helper definitions
; A dt-name is one or more:
; - lowercase ASCII letters (a-z)
; - numbers (0-9)
; - underscores ("_")
; They are the result of converting names or combinations of names
; from devicetree to a valid component of a C identifier by
; lowercasing letters (in practice, this is a no-op) and converting
; non-alphanumeric characters to underscores.
; You'll see these referred to as "lowercase-and-underscores" forms of
; various devicetree identifiers throughout the documentation.

```
dt-name = 1*( lower / DIGIT / "_" )
```

; gen-name is used as a stand-in for a component of a generated macro
; name which does not come from devicetree (dt-name covers that case).
;
; - uppercase ASCII letters (a-z)
; - numbers (0-9)
; - underscores ("_")

```
gen-name = upper 1*( upper / DIGIT / "_" )
```

; "lowercase ASCII letter" turns out to be pretty annoying to specify
; in RFC-7405 syntax.
;
; This is just ASCII letters a (0x61) through z (0x7a).

```
lower = \%x61-7A
```

; "uppercase ASCII letter" in RFC-7405 syntax

```
upper = \%x41-5A
```

Phandles

The devicetree concept of a phandle is very similar to pointers in C. You can use phandles to refer
to nodes in devicetree similarly to the way you can use pointers to refer to structures in C.

Getting phandles  The usual way to get a phandle for a devicetree node is from one of its node labels. For example, with this devicetree:

```plaintext
/ {
  lbl_a: node-1 {};
  lbl_b: lbl_c: node-2 {};
};
```

You can write the phandle for:
  • `/node-1` as `&lbl_a`
  • `/node-2` as either `&lbl_b` or `&lbl_c`

Notice how the `&nodelabel` devicetree syntax is similar to the “address of” C syntax.

Using phandles

Note: “Type” in this section refers to one of the type names documented in Properties in the devicetree bindings documentation.

Here are the main ways you will use phandles.

One node: phandle type  You can use phandles to refer to `node-b` from `node-a`, where `node-b` is related to `node-a` in some way.

One common example is when `node-a` represents some hardware that generates an interrupt, and `node-b` represents the interrupt controller that receives the asserted interrupt. In this case, you could write:

```plaintext
node_b: node-b {
  interrupt-controller;
};

node-a {
  interrupt-parent = <&node_b>;
};
```

This uses the standard interrupt-parent property defined in the devicetree specification to capture the relationship between the two nodes.

These properties have type phandle.

Zero or more nodes: phandles type  You can use phandles to make an array of references to other nodes.

One common example occurs in pin control. Pin control properties like pinctrl-0, pinctrl-1 etc. may contain multiple phandles, each of which “points” to a node containing information
related to pin configuration for that hardware peripheral. Here's an example of six phandles in a single property:

```plaintext
pinctrl-0 = 
    &quadspi_clk_pe10 &quadspi_ncs_pe11 
    &quadspi_bk1_io0_pe12 &quadspi_bk1_io1_pe13 
    &quadspi_bk1_io2_pe14 &quadspi_bk1_io3_pe15;
```

These properties have type `phandles`.

**Zero or more nodes with metadata: phandle-array type** You can use phandles to refer to and configure one or more resources that are “owned” by some other node. This is the most complex case. There are examples and more details in the next section. These properties have type `phandle-array`.

**phandle-array properties** These properties are commonly used to specify a resource that is owned by another node along with additional metadata about the resource.

**High level description** Usually, properties with this type are written like `phandle-array-prop` in this example:

```plaintext
node {
    phandle-array-prop = 
        &foo 1 2, &bar 3, &baz 4 5;
};
```

That is, the property's value is written as a comma-separated sequence of “groups”, where each “group” is written inside of angle brackets (`< ... >`). Each “group” starts with a phandle (`&foo`, `&bar`, `&baz`). The values that follow the phandle in each “group” are called *specifiers*. There are three specifiers in the above example:

1. 1 2
2. 3
3. 4 5

The phandle in each “group” is used to “point” to the hardware that controls the resource you are interested in. The specifier describes the resource itself, along with any additional necessary metadata.

The rest of this section describes a common example. Subsequent sections document more rules about how to use phandle-array properties in practice.

**Example phandle-arrays: GPIOs** Perhaps the most common use case for phandle-array properties is specifying one or more GPIOs on your SoC that another chip on your board connects to. For that reason, we'll focus on that use case here. However, there are many other use cases that are handled in devicetree with phandle-array properties.

For example, consider an external chip with an interrupt pin that is connected to a GPIO on your SoC. You will typically need to provide that GPIO's information (GPIO controller and pin number) to the device driver for that chip. You usually also need to provide other metadata about the GPIO, like whether it is active low or high, what kind of internal pull resistor within the SoC should be enabled in order to communicate with the device, etc., to the driver.

In the devicetree, there will be a node that represents the GPIO controller that controls a group of pins. This reflects the way GPIO IP blocks are usually developed in hardware. Therefore, there is no single node in the devicetree that represents a GPIO pin, and you can’t use a single phandle to represent it.

Instead, you would use a phandle-array property, like this:
In this example, irq-gpios is a phandle-array property with just one “group” in its value. &gpioX is the phandle for the GPIO controller node that controls the pin. pin is the pin number (0, 1, 2, ...). flags is a bit mask describing pin metadata (for example (GPIO_ACTIVE_LOW | GPIO_PULL_UP)); see include/zephyr/dt-bindings/gpio/gpio.h for more details.

The device driver handling the my-external-ic node can then use the irq-gpios property's value to set up interrupt handling for the chip as it is used on your board. This lets you configure the device driver in dtc, without changing the driver's source code.

Such properties can contain multiple values as well:

```
my-other-external-ic {
    handshake-gpios = <&gpioX pinX flagsX>, <&gpioY pinY flagsY>;
};
```

The above example specifies two pins:

- pinX on the GPIO controller with phandle &gpioX, flags flagsX
- pinY on &gpioY, flags flagsY

You may be wondering how the “pin and flags” convention is established and enforced. To answer this question, we'll need to introduce a concept called specifier spaces before moving on to some information about dtc.

Specifier spaces Specifier spaces are a way to allow nodes to describe how you should use them in phandle-array properties.

We'll start with an abstract, high level description of how specifier spaces work in DTS files, before moving on to a concrete example and providing references to further reading for how this all works in practice using DTS files and bindings files.

**High level description** As described above, a phandle-array property is a sequence of “groups” of phandles followed by some number of cells:

```dts
node {
    phandle-array-prop = <&foo 1 2>, <&bar 3>;
};
```

The cells that follow each phandle are called a specifier. In this example, there are two specifiers:

1. 1 2: two cells
2. 3: one cell

Every phandle-array property has an associated specifier space. This sounds complex, but it’s really just a way to assign a meaning to the cells that follow each phandle in a hardware specific way. Every specifier space has a unique name. There are a few “standard” names for commonly used hardware, but you can create your own as well.

Dtc nodes encode the number of cells that must appear in a specifier, by name, using the #SPACE_NAME-cells property. For example, let's assume that phandle-array-prop's specifier space is named baz. Then we would need the foo and bar nodes to have the following #baz-cells properties:

```dts
foo: node@1000 {
    #baz-cells = <2>;
};
```

(continues on next page)
Without the \#baz-cells property, the devicetree tooling would not be able to validate the number of cells in each specifier in phandle-array-prop.

This flexibility allows you to write down an array of hardware resources in a single devicetree property, even though the amount of metadata you need to describe each resource might be different for different nodes.

A single node can also have different numbers of cells in different specifier spaces. For example, we might have:

```plaintext
foo: node@1000 {
    #baz-cells = <2>;
    #bob-cells = <1>;
};
```

With that, if phandle-array-prop-2 has specifier space bob, we could write:

```plaintext
node {
    phandle-array-prop = <&foo 1 2>, <&bar 3>;
    phandle-array-prop-2 = <&foo 4>;
};
```

This flexibility allows you to have a node that manages multiple different kinds of resources at the same time. The node describes the amount of metadata needed to describe each kind of resource (how many cells are needed in each case) using different \#SPACE_NAME-cells properties.

**Example specifier space: gpio** From the above example, you're already familiar with how one specifier space works: in the “gpio” space, specifiers almost always have two cells:

1. a pin number
2. a bit mask of flags related to the pin

Therefore, almost all GPIO controller nodes you will see in practice will look like this:

```plaintext
gpio: gpio-controller@deadbeef {
    gpio-controller;
    #gpio-cells = <2>;
};
```

**Associating properties with specifier spaces** Above, we have described that:

- each phandle-array property has an associated specifier space
- specifier spaces are identified by name
- devicetree nodes use \#SPECIFIER_NAME-cells properties to configure the number of cells which must appear in a specifier

In this section, we explain how phandle-array properties get their specifier spaces.

**High level description** In general, a phandle-array property named foos implicitly has specifier space foo. For example:
The \texttt{dmas} property's specifier space is "dma". The \texttt{pwms} property's specifier space is \texttt{pwm}.

**Special case: GPIO** \texttt{*-gpios} properties are special-cased so that e.g. \texttt{foo-gpios} resolves to \#gpio-cells rather than \#foo-gpio-cells.

**Manually specifying a space** You can manually specify the specifier space for any \texttt{phandle-array} property. See \texttt{specifier-space}.

**Naming the cells in a specifier** You should name the cells in each specifier space your hardware supports when writing bindings. For details on how to do this, see \texttt{Specifier cell names (*-cells)}.

This allows C code to query information about and retrieve the values of cells in a specifier by name using devicetree APIs like these:

- \texttt{DT_PHA_BY_IDX}
- \texttt{DT_PHA_BY_NAME}

This feature and these macros are used internally by numerous hardware-specific APIs. Here are a few examples:

- \texttt{DT_GPIO_PIN_BY_IDX}
- \texttt{DT_PWMS_CHANNEL_BY_IDX}
- \texttt{DT_DMAS_CELL_BY_NAME}
- \texttt{DT_IO_CHANNELS_INPUT_BY_IDX}
- \texttt{DT_CLOCKS_CELL_BY_NAME}

**See also**

- \texttt{Writing property values}: how to write phandles in devicetree properties
- \texttt{Properties}: how to write bindings for properties with phandle types (phandle, phandles, phandle-array)
- \texttt{specifier-space}: how to manually specify a phandle-array property's specifier space

**The \texttt{/zephyr, user node}**

Zephyr's devicetree scripts handle the \texttt{/zephyr, user node} as a special case: you can put essentially arbitrary properties inside it and retrieve their values without having to write a binding. It is meant as a convenient container when only a few simple properties are needed.

\textbf{Note}: This node is meant for sample code and user applications. It should not be used in the upstream Zephyr source code for device drivers, subsystems, etc.
Simple values  You can store numeric or array values in /zephyr/user if you want them to be configurable at build time via devicetree.

For example, with this devicetree overlay:

```
/ {
    zephyr, user {
        boolean;
        bytes = [81 82 83];
        number = <23>;
        numbers = <1>, <2>, <3>;
        string = "text";
        strings = "a", "b", "c",
    }
};
```

You can get the above property values in C/C++ code like this:

```
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

DT_PROP(ZEPHYR_USER_NODE, boolean) // 1
DT_PROP(ZEPHYR_USER_NODE, bytes) // {0x81, 0x82, 0x83}
DT_PROP(ZEPHYR_USER_NODE, number) // 23
DT_PROP(ZEPHYR_USER_NODE, numbers) // {1, 2, 3}
DT_PROP(ZEPHYR_USER_NODE, string) // "text"
DT_PROP(ZEPHYR_USER_NODE, strings) // {"a", "b", "c"}
```

Devices  You can store phandles in /zephyr/user if you want to be able to reconfigure which devices your application uses in simple cases using devicetree overlays.

For example, with this devicetree overlay:

```
/ {
    zephyr, user {
        handle = &gpio0;
        handles = &gpio0, &gpio1;
    }
};
```

You can convert the phandles in the handle and handles properties to device pointers like this:

```
/*
 * Same thing as:
 * ...
 * my_dev = DEVICE_DT_GET(DT_NODELABEL(gpio0));
 */
const struct device *my_device =
    DEVICE_DT_GET(DT_PROP(ZEPHYR_USER_NODE, handle));

#define PHANDLE_TO_DEVICE(node_id, prop, idx) DEVICE_DT_GET(DT_PHANDLE_BY_IDX(node_id, prop, idx)),

/*
 * Same thing as:
 * ...
 * *my_devices[] = {
 *     DEVICE_DT_GET(DT_NODELABEL(gpio0)),
 *     DEVICE_DT_GET(DT_NODELABEL(gpio1)),
 * }
 */
const struct device *my_devices[] = {
```
(continues on next page)
GPIOs  The /zephyr/user node is a convenient place to store application-specific GPIOs that you want to be able to reconfigure with a devicetree overlay.

For example, with this devicetree overlay:

```c
#include <zephyr/dt-bindings/gpio/gpio.h>
/
{  
    zephyr, user  
        signal-gpios = &gpio0 1 GPIO_ACTIVE_HIGH;  
};
```

You can convert the pin defined in `signal-gpios` to a struct `gpio_dt_spec` in your source code, then use it like this:

```c
#include <zephyr/drivers/gpio.h>
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)
const struct gpio_dt_spec signal = GPIO_DT_SPEC_GET(ZEPHYR_USER_NODE, signal_gpios);

/* Configure the pin */
gpio_pin_configure_dt(&signal, GPIO_OUTPUT_INACTIVE);

/* Set the pin to its active level */
gpio_pin_set_dt(&signal, 1);
```

(See `gpio_dt_spec`, `GPIO_DT_SPEC_GET`, and `gpio_pin_configure_dt()` for details on these APIs.)

Devicetree HOWTOs

This page has step-by-step advice for getting things done with devicetree.

Tip: See Troubleshooting devicetree for troubleshooting advice.

Get your devicetree and generated header  A board’s devicetree (BOARD.dts) pulls in common node definitions via `#include` preprocessor directives. This at least includes the SoC’s .dtsi. One way to figure out the devicetree’s contents is by opening these files, e.g. by looking in `dts/<ARCH>/<vendor>/<soc>.dtsi`, but this can be time consuming.

If you just want to see the “final” devicetree for your board, build an application and open the `zephyr.dts` file in the build directory.

Tip: You can build hello_world to see the “base” devicetree for your board without any additional changes from overlay files.

For example, using the qemu_cortex_m3 board to build hello_world:
You can change qemu_cortex_m3 to match your board.

CMake prints the input and output file locations like this:

```
-- Found BOARD.dts: .../zephyr/boards/arm/qemu_cortex_m3/qemu_cortex_m3.dts
-- Generated zephyr.dts: .../zephyr/build/zephyr/zephyr.dts
-- Generated devicetree_generated.h: .../zephyr/build/zephyr/include/generated/devicetree_generated.h
```

The zephyr.dts file is the final devicetree in DTS format.
The devicetree_generated.h file is the corresponding generated header.

See Input and output files for details about these files.

Get a struct device from a devicetree node When writing Zephyr applications, you’ll often want to get a driver-level struct device corresponding to a devicetree node.

For example, with this devicetree fragment, you might want the struct device for serial@40002000:

```
/ {
    soc {
        serial0: serial@40002000 {
            status = "okay";
            current-speed = <115200>;
            /* ... */
        };
    };
    aliases {
        my-serial = &serial0;
    };
    chosen {
        zephyr,console = &serial0;
    };
}
```

Start by making a node identifier for the device you are interested in. There are different ways to do this; pick whichever one works best for your requirements. Here are some examples:

```
/* Option 1: by node label */
#define MY_SERIAL DT_NODELABEL(serial0)
/* Option 2: by alias */
#define MY_SERIAL DT_ALIAS(my_serial)
/* Option 3: by chosen node */
#define MY_SERIAL DT_CHOSEN(zephyr_console)
/* Option 4: by path */
#define MY_SERIAL DT_PATH(soc, serial_40002000)
```

Once you have a node identifier there are two ways to proceed. One way to get a device is to use DEVICE_DT_GET():
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);

if (!device_is_ready(uart_dev)) {
    /* Not ready, do not use */
    return -ENODEV;
}

There are variants of DEVICE_DT_GET() such as DEVICE_DT_GET_OR_NULL(), DEVICE_DT_GET_ONE() or DEVICE_DT_GET_ANY(). This idiom fetches the device pointer at build-time, which means there is no runtime penalty. This method is useful if you want to store the device pointer as configuration data. But because the device may not be initialized, or may have failed to initialize, you must verify that the device is ready to be used before passing it to any API functions. (This check is done for you by device_get_binding().)

In some situations the device cannot be known at build-time, e.g., if it depends on user input like in a shell application. In this case you can get the struct device by combining device_get_binding() with the device name:

const char *const dev_name = /* TODO: insert device name from user */;
const struct device *uart_dev = device_get_binding(dev_name);

You can then use uart_dev with Universal Asynchronous Receiver-Transmitter (UART) API functions like uart_configure(). Similar code will work for other device types; just make sure you use the correct API for the device.

If you're having trouble, see Troubleshooting devicetree. The first thing to check is that the node has status = "okay", like this:

#define MY_SERIAL DT_NODELABEL(my_serial)
#if DT_NODE_HAS_STATUS(MY_SERIAL, okay)
    const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
#else
    #error "Node is disabled"
#endif

If you see the #error output, make sure to enable the node in your devicetree. In some situations your code will compile but it will fail to link with a message similar to:

...undefined reference to `__device_dts_ord_N'
collect2: error: ld returned 1 exit status

This likely means there's a Kconfig issue preventing the device driver from being built, resulting in a reference that does not exist. If your code compiles successfully, the last thing to check is if the device is ready, like this:

if (!device_is_ready(uart_dev)) {
    printk("Device not ready\n");
}

If you find that the device is not ready, it likely means that the device's initialization function failed. Enabling logging or debugging driver code may help in such situations. Note that you can also use device_get_binding() to obtain a reference at runtime. If it returns NULL it can either mean that device's driver failed to initialize or that it does not exist.

Find a devicetree binding Devicetree bindings are YAML files which declare what you can do with the nodes they describe, so it's critical to be able to find them for the nodes you are using.

If you don't have them already, Get your devicetree and generated header. To find a node's binding, open the generated header file, which starts with a list of nodes in a block comment:
Make note of the path to the node you want to find, like /flash@0. Search for the node’s output in the file, which starts with something like this if the node has a matching binding:

```
/*
 * Devicetree node:
 * /flash@0
 * Binding (compatible = soc-nv-flash):
 * $ZEPHYR_BASE/dts/bindings/mtd/soc-nv-flash.yaml
 * [...]
*/
```

See [Check for missing bindings](#) for troubleshooting.

**Set devicetree overlays.** Devicetree overlays are explained in *Introduction to devicetree*. The CMake variable `DTC_OVERLAY_FILE` contains a space- or semicolon-separated list of overlay files to use. If `DTC_OVERLAY_FILE` specifies multiple files, they are included in that order by the C preprocessor. A file in a Zephyr module can be referred to by escaping the Zephyr module dir variable like `${ZEPHYR_<module>_MODULE_DIR}/<path-to>/dts.overlay` when setting the `DTC_OVERLAY_FILE` variable.

You can set `DTC_OVERLAY_FILE` to contain exactly the files you want to use. Here is an example using `west build`.

If you don’t set `DTC_OVERLAY_FILE`, the build system will follow these steps, looking for files in your application configuration directory to use as devicetree overlays:

1. If the file `boards/<BOARD>.overlay` exists, it will be used.
2. If the current board has multiple revisions and `boards/<BOARD>_<revision>.overlay` exists, it will be used. This file will be used in addition to `boards/<BOARD>.overlay` if both exist.
3. If one or more files have been found in the previous steps, the build system stops looking and just uses those files.
4. Otherwise, if `<BOARD>.overlay` exists, it will be used, and the build system will stop looking for more files.
5. Otherwise, if `app.overlay` exists, it will be used.

Extra devicetree overlays may be provided using `EXTRA_DTC_OVERLAY_FILE` which will still allow the build system to automatically use devicetree overlays described in the above steps.

The build system appends overlays specified in `EXTRA_DTC_OVERLAY_FILE` to the overlays in `DTC_OVERLAY_FILE` when processing devicetree overlays. This means that changes made via `EXTRA_DTC_OVERLAY_FILE` have higher precedence than those made via `DTC_OVERLAY_FILE`.

All configuration files will be taken from the application’s configuration directory except for files with an absolute path that are given with the `DTC_OVERLAY_FILE` or `EXTRA_DTC_OVERLAY_FILE` argument.
See Application Configuration Directory on how the application configuration directory is defined.

Using Shields will also add devicetree overlay files.

The DTC_OVERLAY_FILE value is stored in the CMake cache and used in successive builds.

The build system prints all the devicetree overlays it finds in the configuration phase, like this:

```-- Found devicetree overlay: .../some/file.overlay```

Use devicetree overlays See Set devicetree overlays for how to add an overlay to the build.

Overlays can override node property values in multiple ways. For example, if your BOARD.dts contains this node:

```/
    soc {
        serial0: serial@40002000 {
            status = "okay";
            current-speed = <115200>;
        };
    };
```

These are equivalent ways to override the current-speed value in an overlay:

```/* Option 1 */
&serial0 {
    current-speed = <9600>;
};

/* Option 2 */
&{/soc/serial@40002000} {
    current-speed = <9600>;
};
```

We'll use the &serial0 style for the rest of these examples.

You can add aliases to your devicetree using overlays: an alias is just a property of the /aliases node. For example:

```/
    aliases {
        my-serial = &serial0;
    };
```

Chosen nodes work the same way. For example:

```/
    chosen {
        zephyr,console = &serial0;
    };
```

To delete a property (in addition to deleting properties in general, this is how to set a boolean property to false if it's true in BOARD.dts):

```&serial0 {
    /delete-property/ some-unwanted-property;
};```
You can add subnodes using overlays. For example, to configure a SPI or I2C child device on an existing bus node, do something like this:

```c
/* SPI device example */
&spi1 {
    my_spi_device: temp-sensor@0 {
        compatible = "temp-sensor";
        label = "TEMP_SENSOR_0";
        /* reg is the chip select number, if needed; *
        * If present, it must match the node's unit address. */
        reg = <0>;

        /* Configure other SPI device properties as needed. */
        spi-max-frequency = <4000000>;
    }
};

/* I2C device example */
&i2c2 {
    my_i2c_device: touchscreen@76 {
        compatible = "touchscreen";
        label = "TOUCHSCREEN";
        /* reg is the I2C device address. */
        * It must match the node's unit address. */
        reg = <76>;

        /* Configure other I2C device properties as needed. */
        i2c-max-frequency = <2000000>;
    }
};
```

Other bus devices can be configured similarly:

- create the device as a subnode of the parent bus
- set its properties according to its binding

Assuming you have a suitable device driver associated with the `my_spi_device` and `my_i2c_device` compatibles, you should now be able to enable the driver via Kconfig and get the struct device for your newly added bus node, then use it with that driver API.

**Write device drivers using devicetree APIs**  
“Devicetree-aware” device drivers should create a struct device for each status = “okay” devicetree node with a particular compatible (or related set of compatibles) supported by the driver.

Writing a devicetree-aware driver begins by defining a devicetree binding for the devices supported by the driver. Use existing bindings from similar drivers as a starting point. A skeletal binding to get started needs nothing more than this:

```yaml
description: <Human-readable description of your binding>
compatible: "foo-company,bar-device"
include: base.yaml
```

See [Find a devicetree binding](#) for more advice on locating existing bindings.

After writing your binding, your driver C file can then use the devicetree API to find status = “okay” nodes with the desired compatible, and instantiate a struct device for each one. There are two options for instantiating each struct device: using instance numbers, and using node labels.

In either case:
• Each struct device's name should be set to its devicetree node's label property. This allows the driver's users to Get a struct device from a devicetree node in the usual way.

• Each device's initial configuration should use values from devicetree properties whenever practical. This allows users to configure the driver using devicetree overlays.

Examples for how to do this follow. They assume you’ve already implemented the device-specific configuration and data structures and API functions, like this:

```c
/* my_driver.c */
#include <zephyr/drivers/some_api.h>

/* Define data (RAM) and configuration (ROM) structures: */
struct my_dev_data {
    /* per-device values to store in RAM */
};
struct my_dev_cfg {
    uint32_t freq; /* Just an example: initial clock frequency in Hz */
    /* other configuration to store in ROM */
};

/* Implement driver API functions (drivers/some_api.h callbacks): */
static int my_driver_api_func1(const struct device *dev, uint32_t *foo) { /* ... */ }
static int my_driver_api_func2(const struct device *dev, uint64_t bar) { /* ... */ }
static struct some_api my_api_funcs = {
    .func1 = my_driver_api_func1,
    .func2 = my_driver_api_func2,
};
```

**Option 1: create devices using instance numbers** Use this option, which uses Instance-based APIs, if possible. However, they only work when devicetree nodes for your driver's compatible are all equivalent, and you do not need to be able to distinguish between them.

To use instance-based APIs, begin by defining DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible that the device driver supports. For example, if your driver's compatible is "vnd,my-device" in devicetree, you would define DT_DRV_COMPAT to vnd_my_device in your driver C file:

```c
/* This instantiation macro is named "CREATE_MY_DEVICE".
   * Its "inst" argument is an arbitrary instance number.
   * * Put this near the end of the file, e.g. after defining "my_api_funcs".
   */
#define CREATE_MY_DEVICE(inst)
```

**Important:** As shown, the DT_DRV_COMPAT macro should have neither quotes nor special characters. Remove quotes and convert special characters to underscores when creating DT_DRV_COMPAT from the compatible property.

Finally, define an instantiation macro, which creates each struct device using instance numbers. Do this after defining my_api_funcs.

```c
/* This instantiation macro is named "CREATE_MY_DEVICE".
   * Its "inst" argument is an arbitrary instance number.
   * * Put this near the end of the file, e.g. after defining "my_api_funcs".
   */
#define CREATE_MY_DEVICE(inst)
```
static struct my_dev_data my_data_##inst = {
    /* initialize RAM values as needed, e.g.: */
    .freq = DT_INST_PROP(inst, clock_frequency),
};
static const struct my_dev_cfg my_cfg_##inst = {
    /* initialize ROM values as needed. */
};
DEVICE_DT_INST_DEFINE(inst, 
    my_dev_init_function, 
    NULL, 
    &my_data_##inst, 
    &my_cfg_##inst, 
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY, 
    &my_api_funcs);

Notice the use of APIs like `DT_INST_PROP()` and `DEVICE_DT_INST_DEFINE()` to access devicetree node data. These APIs retrieve data from the devicetree for instance number `inst` of the node with compatible determined by `DT_DRV_COMPAT`.

Finally, pass the instantiation macro to `DT_INST_FOREACH_STATUS_OKAY()`:

/* Call the device creation macro for each instance: */
DT_INST_FOREACH_STATUS_OKAY(CREATE_MY_DEVICE)

`DT_INST_FOREACH_STATUS_OKAY` expands to code which calls `CREATE_MY_DEVICE` once for each enabled node with the compatible determined by `DT_DRV_COMPAT`. It does not append a semicolon to the end of the expansion of `CREATE_MY_DEVICE`, so the macro's expansion must end in a semicolon or function definition to support multiple devices.

**Option 2: create devices using node labels**  Some device drivers cannot use instance numbers. One example is an SoC peripheral driver which relies on vendor HAL APIs specialized for individual IP blocks to implement Zephyr driver callbacks. Cases like this should use `DT_NODELABEL()` to refer to individual nodes in the devicetree representing the supported peripherals on the SoC. The devicetree.h `Generic APIs` can then be used to access node data.

For this to work, your SoC's `dtbfile` must define node labels like `mydevice0`, `mydevice1`, etc. appropriately for the IP blocks your driver supports. The resulting devicetree usually looks something like this:

```
/ {
    soc {
        mydevice0: dev0 {
            compatible = "vnd,my-device";
        }
        mydevice1: dev1 {
            compatible = "vnd,my-device";
        }
    }
}
```

The driver can use the `mydevice0` and `mydevice1` node labels in the devicetree to operate on specific device nodes:

```
/*
* This is a convenience macro for creating a node identifier for
* the relevant devices. An example use is MYDEV(0) to refer to
* the node with label "mydevice0".
*/
#define MYDEV(idx) DT_NODELABEL(mydevice ## idx)
```
Zephyr Project Documentation, Release 3.6.99

/*
  * Define your instantiation macro; "idx" is a number like 0 for mydevice0
  * or 1 for mydevice1. It uses MYDEV() to create the node label from the
  * index.
  */
#
#define CREATE_MY_DEVICE(idx)\
  static struct my_dev_data my_data_##idx = {\
    /* initialize RAM values as needed, e.g.: */\
    .freq = DT_PROP(MYDEV(idx), clock_frequency),\
  };
static const struct my_dev_cfg my_cfg_##idx = { /* ... */};
DEVICE_DT_DEFINE(MYDEV(idx),\
    my_dev_init_function,\
    NULL,\
    &my_data_##idx,\
    &my_cfg_##idx,\
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY,\
    &my_api_funcs)

Notice the use of APIs like `DT_PROP()` and `DEVICE_DT_DEFINE()` to access devicetree node data.

Finally, manually detect each enabled devicetree node and use CREATE_MY_DEVICE to instantiate each struct device:

```c
#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice0), okay)
CREATE_MY_DEVICE(0)
#endif

#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice1), okay)
CREATE_MY_DEVICE(1)
#endif
```

Since this style does not use `DT_INST_FOREACH_STATUS_OKAY()`, the driver author is responsible for calling `CREATE_MY_DEVICE()` for every possible node, e.g. using knowledge about the peripherals available on supported SoCs.

**Device drivers that depend on other devices**  At times, one struct device depends on another struct device and requires a pointer to it. For example, a sensor device might need a pointer to its SPI bus controller device. Some advice:

- Write your devicetree binding in a way that permits use of *Hardware specific APIs* from devicetree.h if possible.

- In particular, for bus devices, your driver's binding should include a file like `dts/bindings/spi/spi-device.yaml` which provides common definitions for devices addressable via a specific bus. This enables use of APIs like `DT_BUS()` to obtain a node identifier for the bus node. You can then *Get a struct device from a devicetree node* for the bus in the usual way.

Search existing bindings and device drivers for examples.

**Applications that depend on board-specific devices**  One way to allow application code to run unmodified on multiple boards is by supporting a devicetree alias to specify the hardware specific portions, as is done in the blinky sample. The application can then be configured in `BOARD.dts` files or via *devicetree overlays.*
Troubleshooting devicetree

Here are some tips for fixing misbehaving devicetree related code.
See Devicetree HOWTOs for other “HOWTO” style information.

Try again with a pristine build directory

Important: Try this first, before doing anything else.

See Pristine Builds for examples, or just delete the build directory completely and retry.
This is general advice which is especially applicable to debugging devicetree issues, because the outputs are created during the CMake configuration phase, and are not always regenerated when one of their inputs changes.

Make sure <devicetree.h> is included

Unlike Kconfig symbols, the devicetree.h header must be included explicitly.
Many Zephyr header files rely on information from devicetree, so including some other API may transitively include devicetree.h, but that's not guaranteed.

undefined reference to __device_dts_ord_<N>

This usually happens on a line like this:

```
const struct device *dev = DEVICE_DT_GET(NODE_ID);
```

where NODE_ID is a valid node identifier, but no device driver has allocated a struct device for this devicetree node. You thus get a linker error, because you're asking for a pointer to a device that isn't defined.

To fix it, you need to make sure that:

1. The node is enabled: the node must have status = "okay";
   (Recall that a missing status property means the same thing as status = "okay"; see Important properties for more information about status).
2. A device driver responsible for allocating the struct device is enabled. That is, the Kconfig option which makes the build system compile the driver sources into your application needs to be set to y.
   (See Setting Kconfig configuration values for more information on setting Kconfig options.)

Below, <build> means your build directory.

Making sure the node is enabled:

To find the devicetree node you need to check, use the number <N> from the linker error. Look for this number in the list of nodes at the top of <build>/zephyr/include/generated/devicetree_generated.h. For example, if <N> is 15, and your devicetree_generated.h file looks like this, the node you are interested in is /soc/i2c@deadbeef:

```
/*
   * Generated by gen_defines.py
   *
   * DTS input file:
   *     <build>/zephyr/zephyr.dts.pre
   *
   * Directories with bindings:
   *     $ZEPHYR_BASE/dts/bindings
   *
   * Node dependency ordering (ordinal and path):
   */
```
* 0 / 
* 1 /aliases 
[...]
* 15 /soc/i2c@deadbeef 
[...]

Now look for this node in `<build>/zephyr/zephyr.dts`, which is the final devicetree for your application build. (See Get your devicetree and generated header for information and examples.)

If the node has status = "disabled"; in zephyr.dts, then you need to enable it by setting status = "okay";, probably by using a devicetree overlay. For example, if zephyr.dts looks like this:

```c
i2c0:
    i2c@deadbeef {
        status = "disabled";
    };
```

Then you should put this into your devicetree overlay and Try again with a pristine build directory:

```c
@i2c0 {
    status = "okay";
};
```

Make sure that you see status = "okay"; in zephyr.dts after you rebuild.

**Making sure the device driver is enabled:**

The first step is to figure out which device driver is responsible for handling your devicetree node and allocating devices for it. To do this, you need to start with the compatible property in your devicetree node, and find the driver that allocates struct device instances for that compatible.

If you're not familiar with how devices are allocated from devicetree nodes based on compatible properties, the ZDS 2021 talk A deep dive into the Zephyr 2.5 device model may be a useful place to start, along with the Device Driver Model pages. See Important properties and the Devicetree specification for more information about compatible.

There is currently no documentation for what device drivers exist and which devicetree compatibles they are associated with. You will have to figure this out by reading the source code:

- Look in drivers for the appropriate subdirectory that corresponds to the API your device implements
- Look inside that directory for relevant files until you figure out what the driver is, or realize there is no such driver.

Often, but not always, you can find the driver by looking for a file that sets the DT_DRV_COMPAT macro to match your node's compatible property, except lowercased and with special characters converted to underscores. For example, if your node's compatible is vnd,foo-device, look for a file with this line:

```c
#define DT_DRV_COMPAT vnd_foo_device
```

**Important:** This does not always work since not all drivers use DT_DRV_COMPAT.

If you find a driver, you next need to make sure the Kconfig option that compiles it is enabled. (If you don’t find a driver, and you are sure the compatible property is correct, then you need to write a driver. Writing drivers is outside the scope of this documentation page.)

Continuing the above example, if your devicetree node looks like this now:

```
5.2. Devicetree
```
Then you would look inside of drivers/i2c for the driver file that handles the compatible nordic, nrf-twim. In this case, that is drivers/i2c/i2c_nrfx_twim.c. Notice how even in cases where DT_DRV_COMPAT is not set, you can use information like driver file names as clues.

Once you know the driver you want to enable, you need to make sure its Kconfig option is set to y. You can figure out which Kconfig option is needed by looking for a line similar to this one in the CMakeLists.txt file in the drivers subdirectory. Continuing the above example, drivers/i2c/CMakeLists.txt has a line that looks like this:

```
zephyr_library_sources_ifdef(CONFIG_NRFX_TWIM i2c_nrfx_twim.c)
```

This means that CONFIG_NRFX_TWIM must be set to y in <build>/zephyr/.config file.

If your driver's Kconfig is not set to y, you need to figure out what you need to do to make that happen. Often, this will happen automatically as soon as you enable the devicetree node. Otherwise, it is sometimes as simple as adding a line like this to your application's prj.conf file and then making sure to Try again with a pristine build directory:

```
CONFIG_FOO=y
```

where CONFIG_FOO is the option that CMakeLists.txt uses to decide whether or not to compile the driver.

However, there may be other problems in your way, such as unmet Kconfig dependencies that you also have to enable before you can enable your driver.

Consult the Kconfig file that defines CONFIG_FOO (for your value of FOO) for more information.

Make sure you're using the right names  Remember that:

- In C/C++, devicetree names must be lowercased and special characters must be converted to underscores. Zephyr's generated devicetree header has DTS names converted in this way into the C tokens used by the preprocessor-based <devicetree.h> API.

- In overlays, use devicetree node and property names the same way they would appear in any DTS file. Zephyr overlays are just DTS fragments.

For example, if you're trying to get the clock-frequency property of a node with path /soc/i2c@12340000 in a C++ file:

```
/*
 * foo.c: lowercase-and-underscores names
 */

/* Don't do this: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c@12340000), clock-frequency)
/*
 *                  @ should be _ - should be _ */

/* Do this instead: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c_1234000), clock_frequency)
/*
 */
```

And if you're trying to set that property in a devicetree overlay:

```
/*
 * foo.overlay: DTS names with special characters, etc.
 */
```

(continues on next page)
Look at the preprocessor output  To save preprocessor output files, enable the CONFIG_COMPILER_SAVE_TEMPS option. For example, to build hello_world with west with this option set, use:

```
west build -b BOARD samples/hello_world --DCONFIG_COMPILER_SAVE_TEMPS=y
```

This will create a preprocessor output file named foo.c.i in the build directory for each source file foo.c.

You can then search for the file in the build directory to see what your devicetree macros expanded to. For example, on macOS and Linux, using `find` to find main.c.i:

```
$ find build -name main.c.i
build/CMakeFiles/app.dir/src/main.c.i
```

It's usually easiest to run a style formatter on the results before opening them. For example, to use `clang-format` to reformat the file in place:

```
clang-format -i build/CMakeFiles/app.dir/src/main.c.i
```

You can then open the file in your favorite editor to view the final C results after preprocessing.

Do not track macro expansion  Compiler messages for devicetree errors can sometimes be very long. This typically happens when the compiler prints a message for every step of a complex macro expansion that has several intermediate expansion steps.

To prevent the compiler from doing this, you can disable the CONFIG_COMPILER_TRACK_MACRO_EXPANSION option. This typically reduces the output to one message per error.

For example, to build hello_world with west and this option disabled, use:

```
west build -b BOARD samples/hello_world --DCONFIG_COMPILER_TRACK_MACRO_EXPANSION=n
```

Validate properties  If you're getting a compile error reading a node property, check your node identifier and property. For example, if you get a build error on a line that looks like this:

```
int baud_rate = DT_PROP(DT_NODELABEL(my_serial), current_speed);
```

Try checking the node by adding this to the file and recompiling:

```
#if !DT_NODE_EXISTS(DT_NODELABEL(my_serial))
#error "whoops"
#endif
```
If you see the “whoops” error message when you rebuild, the node identifier isn’t referring to a valid node. Get your devicetree and generated header and debug from there.

Some hints for what to check next if you don’t see the “whoops” error message:

- did you Make sure you’re using the right names?
- does the property exist?
- does the node have a matching binding?
- does the binding define the property?

**Check for missing bindings**  See Devicetree bindings for information about bindings, and Bindings index for information on bindings built into Zephyr.

If the build fails to Find a devicetree binding for a node, then either the node’s compatible property is not defined, or its value has no matching binding. If the property is set, check for typos in its name. In a devicetree source file, compatible should look like "vnd,some-device" – Make sure you’re using the right names.

If your binding file is not under zephyr/dts, you may need to set DTS_ROOT; see Where bindings are located.

**Errors with DT_INST_() APIs**  If you’re using an API like DT_INST_PROP(), you must define DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible you are interested in. See Option 1: create devices using instance numbers.

**Devicetree versus Kconfig**

Along with devicetree, Zephyr also uses the Kconfig language to configure the source code. Whether to use devicetree or Kconfig for a particular purpose can sometimes be confusing. This section should help you decide which one to use.

In short:

- Use devicetree to describe hardware and its boot-time configuration. Examples include peripherals on a board, boot-time clock frequencies, interrupt lines, etc.
- Use Kconfig to configure software support to build into the final image. Examples include whether to add networking support, which drivers are needed by the application, etc.

In other words, devicetree mainly deals with hardware, and Kconfig with software.

For example, consider a board containing a SoC with 2 UART, or serial port, instances.

- The fact that the board has this UART hardware is described with two UART nodes in the devicetree. These provide the UART type (via the compatible property) and certain settings such as the address range of the hardware peripheral registers in memory (via the reg property).
- Additionally, the UART boot-time configuration is also described with devicetree. This could include configuration such as the RX IRQ line’s priority and the UART baud rate. These may be modifiable at runtime, but their boot-time configuration is described in devicetree.
- Whether or not to include software support for UART in the build is controlled via Kconfig. Applications which do not need to use the UARTs can remove the driver source code from the build using Kconfig, even though the board’s devicetree still includes UART nodes.

As another example, consider a device with a 2.4GHz, multi-protocol radio supporting both the Bluetooth Low Energy and 802.15.4 wireless technologies.

- Devicetree should be used to describe the presence of the radio hardware, what driver or drivers it’s compatible with, etc.
• **Boot-time configuration** for the radio, such as TX power in dBm, should also be specified using devicetree.

• Kconfig should determine which **software features** should be built for the radio, such as selecting a BLE or 802.15.4 protocol stack.

As another example, Kconfig options that formerly enabled a particular instance of a driver (that is itself enabled by Kconfig) have been removed. The devices are selected individually using devicetree's **status** keyword on the corresponding hardware instance.

There are **exceptions** to these rules:

• Because Kconfig is unable to flexibly control some instance-specific driver configuration parameters, such as the size of an internal buffer, these options may be defined in devicetree. However, to make clear that they are specific to Zephyr drivers and not hardware description or configuration these properties should be prefixed with **zephyr**, e.g. **zephyr, random-mac-address** in the common Ethernet devicetree properties.

• Devicetree's chosen keyword, which allows the user to select a specific instance of a hardware device to be used for a particular purpose. An example of this is selecting a particular UART for use as the system's console.

### 5.2.2 Devicetree Reference

These pages contain reference material for Zephyr’s devicetree APIs and built-in bindings. For the platform-independent details, see the Devicetree specification.

**Devicetree API**

This is a reference page for the `<zephyr/devicetree.h>` API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these – the ones beginning with **DT_INST_** – require a special macro named **DT_DRV_COMPAT** to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within **device drivers**, though they can be used outside of drivers with appropriate care.

**Contents**

- **Generic APIs**
  - Node identifiers and helpers
  - Property access
  - ranges property
  - reg property
  - interrupts property

- **Hardware specific APIs**
Generic APIs  The APIs in this section can be used anywhere and do not require DT_DRV_COMPAT to be defined.

Node identifiers and helpers  A node identifier is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the Property access API.

The root node / has node identifier DT_ROOT. You can create node identifiers for other devicetree nodes using DT_PATH(), DT_NODELABEL(), DT_ALIAS(), and DT_INST().

There are also DT_PARENT() and DT_CHILD() macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

Related code samples

GPIO with custom Devicetree binding

Use custom Devicetree binding to control a GPIO.

group devicetree-generic-id

Defines

DT_INVALID_NODE
Name for an invalid node identifier.

This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

DT_ROOT
Node identifier for the root node in the devicetree.
DT_PATH(...)  
Get a node identifier for a devicetree path.

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```
/ {
  soc {
    serial1: serial@40001000 {
      status = "okay";
      current-speed = <115200>;
      ...
    };
  };
};
```

You can use DT_PATH(soc, serial_40001000) to get a node identifier for the serial@40001000 node. Node labels like serial1 cannot be used as DT_PATH() arguments; use DT_NODELABEL() for those instead.

Example usage with DT_PROP() to get the current-speed property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The current-speed property is also in lowercase-and-underscores form when used with this API.)

When determining arguments to DT_PATH():

- the first argument corresponds to a child node of the root (soc above)
- a second argument corresponds to a child of the first argument (serial_40001000 above, from the node name serial@40001000 after lowercasing and changing @ to _)
- and so on for deeper nodes in the desired node's path

**Note:** This macro returns a node identifier from path components. To get a path string from a node identifier, use DT_NODE_PATH() instead.

**Parameters**

- ...–lowercase-and-underscores node names along the node's path, with each name given as a separate argument

**Returns**

node identifier for the node with that path

DT_NODELABEL(label)  
Get a node identifier for a node label.

Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

5.2. Devicetree
The only node label in this example is serial1. The string UART_0 is not a node label; it's the value of a property named label.

You can use \texttt{DT_NODELABEL(serial1)} to get a node identifier for the \texttt{serial@40001000} node. Example usage with \texttt{DT_PROP()} to get the current-speed property:

\begin{verbatim}
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
\end{verbatim}

Another example devicetree fragment:

\begin{verbatim}
cpu@0 {
  L2_0: l2-cache {
    cache-level = <2>;
    ... 
  };
};
\end{verbatim}

Example usage to get the cache-level property:

\begin{verbatim}
DT_PROP(DT_NODELABEL(L2_0), cache_level) // 2
\end{verbatim}

Notice how L2_0 in the devicetree is lowercased to \texttt{l2_0} in the \texttt{DT_NODELABEL()} argument.

\textbf{Parameters}

- \texttt{label} – lowercase-and-underscores node label name

\textbf{Returns}

node identifier for the node with that label

\texttt{DT_ALIAS(alias)}

Get a node identifier from /aliases.

This macro's argument is a property of the /aliases node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:

\begin{verbatim}
/ {
  aliases {
    my-serial = &serial1;
  };
  soc {
    serial1: serial@40001000 {
      status = "okay";
      current-speed = <115200>;
      ... 
    };
  };
};
\end{verbatim}

You can use \texttt{DT_ALIAS(my_serial)} to get a node identifier for the \texttt{serial@40001000} node. Notice how my-serial in the devicetree becomes my_serial in the \texttt{DT_ALIAS()} argument. Example usage with \texttt{DT_PROP()} to get the current-speed property:
Parameters

- alias – lowercase-and-underscores alias name.

Returns

node identifier for the node with that alias

```c
DT_PROP(DT_ALIAS(my_serial), current_speed)  // 115200
```

**DT_INST**(inst, compat)

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these nodes by passing **DT_INST** an instance number, inst, along with the lowercase-and-underscores version of the compatible, compat.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, **including disabled nodes**
- enabled nodes (status property is okay or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the /aliases node (use **DT_NODELABEL** or **DT_ALIAS** for those)
- there is **no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory

Example devicetree fragment:

```c
case1: serial@00001000 {
  compatible = "vnd,soc-serial";
  status = "disabled";
  current-speed = <9600>;
  ...
};

case2: serial@00002000 {
  compatible = "vnd,soc-serial";
  status = "okay";
  current-speed = <57600>;
  ...
};

case3: serial@00003000 {
  compatible = "vnd,soc-serial";
  current-speed = <115200>;
  ...
};
```

5.2. Devicetree
Assuming no other nodes in the devicetree have compatible "vnd,soc-serial", that compatible has nodes with instance numbers 0, 1, and 2.

The nodes serial@40002000 and serial@40003000 are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since serial@40001000 is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```c
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)
```

```c
// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)
```

```c
// 9600, because there is only one disabled node, and
// disabled nodes are "at the the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)
```

Notice how "vnd,soc-serial" in the devicetree becomes vnd_soc_serial (without quotes) in the `DT_INST()` arguments. (As usual, current-speed in the devicetree becomes current_speed as well.)

Nodes whose compatible property has multiple values are assigned independent instance numbers for each compatible.

**Parameters**
- `inst` – instance number for compatible `compat`
- `compat` – lowercase-and-underscores compatible, without quotes

**Returns**
node identifier for the node with that instance number and compatible

`DT_PARENT(node_id)`

Get a node identifier for a parent node.

Example devicetree fragment:

```c
collection: parent-node {
    child: child-node {
        ...
    };
}
```

The following are equivalent ways to get the same node identifier:

```c
DT_NODELABEL(parent)
DT_PARENT(DT_NODELABEL(child))
```

**Parameters**
- `node_id` – node identifier

**Returns**
a node identifier for the node's parent
DT_GPARENT(node_id)
Get a node identifier for a grandparent node.

Example devicetree fragment:

```c
grandparent-node {
  parent: parent-node {
    child: child-node { ... }
  };
};
```

The following are equivalent ways to get the same node identifier:

```c
dt_gparent(dt_nodelabel(child))
dt_parent(dt_parent(dt_nodelabel(child))
```

**Parameters**
- node_id – node identifier

**Returns**
a node identifier for the node's parent's parent

DT_CHILD(node_id, child)
Get a node identifier for a child node.

Example devicetree fragment:

```c
soc@soc-label:
  serial@40001000 {
    status = "okay";
    current-speed = <115200>;
    ...
  };
};
```

Example usage with `DT_PROP()` to get the status of the `serial@40001000` node:

```c
#define SOC_NODE DT_NODELABEL(soc_label)
prop(dt_child(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like `serial1` cannot be used as the child argument to this macro. Use `DT_NODELABEL()` for that instead.

You can also use `DT_FOREACH_CHILD()` to iterate over node identifiers for all of a node's children.

**Parameters**
- node_id – node identifier
- child – lowercase-and-underscores child node name

**Returns**
node identifier for the node with the name referred to by ‘child’

DT_COMPAT_GET_ANY_STATUS_OKAY(compat)
Get a node identifier for a status okay node with a compatible.

Use this if you want to get an arbitrary enabled node with a given compatible, and you do not care which one you get. If any enabled nodes with the given compatible exist, a node identifier for one of them is returned. Otherwise, `DT_INVALID_NODE` is returned.
Example devicetree fragment:

```devicetree
node-a {
    compatible = "vnd,device";
    status = "okay";
};

node-b {
    compatible = "vnd,device";
    status = "okay";
};

node-c {
    compatible = "vnd,device";
    status = "disabled";
};
```

Example usage:

```c
DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)
```

This expands to a node identifier for either node-a or node-b. It will not expand to a
node identifier for node-c, because that node does not have status okay.

**Parameters**

- compat – lowercase-and-underscores compatible, without quotes

**Returns**

- node identifier for a node with that compatible, or DT_INVALID_NODE

---

**DT_NODE_PATH(node_id)**

Get a devicetree node's full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from
path components instead, use DT_PATH().

Example devicetree fragment:

```devicetree
/ {
    soc {
        node: my-node@12345678 { ... };
    }
};
```

Example usage:

```c
DT_NODE_PATH(DT_NODELABEL(node)) // "/soc/my-node@12345678"
DT_NODE_PATH(DT_PATH(soc)) // "/soc"
DT_NODE_PATH(DT_ROOT) // "/
```

**Parameters**

- node_id – node identifier

**Returns**

- the node's full path in the devicetree

---

**DT_NODE_FULL_NAME(node_id)**

Get a devicetree node's name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:
/ {
    soc {
        node: my-node@12345678 { ... };
    }
};

Example usage:

DT_NODE_FULL_NAME(DT_NODELABEL(node))  // "my-node@12345678"

**Parameters**

- *node_id* – node identifier

**Returns**

the node's name with unit-address as a string in the devicetree

DT_NODE_CHILD_IDX(node_id)

Get a devicetree node's index into its parent's list of children.
Indexes are zero-based.
It is an error to use this macro with the root node.
Example devicetree fragment:

parent {
    c1: child-1 {};
    c2: child-2 {};
};

Example usage:

DT_NODE_CHILD_IDX(DT_NODELABEL(c1))  // 0
DT_NODE_CHILD_IDX(DT_NODELABEL(c2))  // 1

**Parameters**

- *node_id* – node identifier

**Returns**

the node's index in its parent node's list of children

DT_SAME_NODE(node_id1, node_id2)

Do node_id1 and node_id2 refer to the same node?
Both node_id1 and node_id2 must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with **DT_NODE_EXISTS()**).
The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

**Parameters**

- *node_id1* – first node identifier
- *node_id2* – second node identifier

**Returns**

an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

5.2. Devicetree
Property access The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the ranges property, reg property and interrupts property.

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.

group devicetree-generic-prop

Defines

DT_PROP(node_id, prop)
Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- string: a string literal
- boolean: 0 if the property is false, or 1 if it is true
- int: the property's value as an integer literal
- array, uint8-array, string-array: an initializer expression in braces, whose elements are integer or string literals (like {0, 1, 2},{"hello", "world"}, etc.)
- phandle: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: compatible has type string-array, status has type string, and interrupt-controller has type boolean.

For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see DT_PATH(), DT_ALIAS(), DT_NODELABEL(), and DT_INST() above.

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns

da representation of the property's value

DT_PROP_LEN(node_id, prop)
Get a property's logical length.

Here, “length” is a number of elements, which may differ from the property’s size in bytes.

The return value depends on the property's type:

- for types array, string-array, and uint8-array, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles
- for type phandle-array, this expands to the number of phandle and specifier blocks in the property
• for type phandle, this expands to 1 (so that a phandle can be treated as a degenerate
case of phandles with length 1)

• for type string, this expands to 1 (so that a string can be treated as a degenerate
case of string-array with length 1)

These properties are handled as special cases:

• reg property: use `DT_NUM_REGS(node_id)` instead

• interrupts property: use `DT_NUM_IRQS(node_id)` instead

It is an error to use this macro with the ranges, dma-ranges, reg or interrupts properties.

For other properties, behavior is undefined.

**Parameters**

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length

**Returns**

the property's length

```
DT_PROP_LEN_OR(node_id, prop, default_value)
```

Like `DT_PROP_LEN()`, but with a fallback to `default_value`.

If the property is defined (as determined by `DT_NODE_HAS_PROP()`), this expands to
`DT_PROP_LEN(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length
- `default_value` – a fallback value to expand to

**Returns**

the property's length or the given default value

```
DT_PROP_HAS_IDX(node_id, prop, idx)
```

Is index `idx` valid for an array type property?

If this returns 1, then `DT_PROP_BY_IDX(node_id, prop, idx)` or `DT_PHA_BY_IDX(node_id,
`prop, idx, ...)` are valid at index `idx`. If it returns 0, it is an error to use those macros
with that index.

These properties are handled as special cases:

• reg property: use `DT_REG_HAS_IDX(node_id, idx)` instead

• interrupts property: use `DT_IRQ_HAS_IDX(node_id, idx)` instead

It is an error to use this macro with the reg or interrupts properties.

**Parameters**

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length
- `idx` – index to check
Returns
An expression which evaluates to 1 if `idx` is a valid index into the given property, and 0 otherwise.

`DT_PROP_HAS_NAME(node_id, prop, name)`
Is name `name` available in a `foo-names` property?
This property is handled as special case:

- interrupts property: use `DT_IRQ_HAS_NAME(node_id, idx)` instead
It is an error to use this macro with the interrupts property.

Example devicetree fragment:
```device-tree
nx: node-x {
    foos = <&bar xx yy>, <&baz xx zz>;
    foo-names = "event", "error";
    status = "okay";
};
```
Example usage:
```c
DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, event) // 1
DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, failure) // 0
```

Parameters
- `node_id` – node identifier
- `prop` – a lowercase-and-underscores `prop-names` type property
- `name` – a lowercase-and-underscores name to check

Returns
An expression which evaluates to 1 if “name” is an available name into the given property, and 0 otherwise.

`DT_PROP_BY_IDX(node_id, prop, idx)`
Get the value at index `idx` in an array type property.
It might help to read the argument order as being similar to `node->property[index]`.
The return value depends on the property's type:

- for types array, string-array, uint8-array, and phandles, this expands to the `idx`-th array element as an integer, string literal, integer, and node identifier respectively
- for type phandle, `idx` must be 0 and the expansion is a node identifier (this treats phandle like a phandles of length 1)
- for type string, `idx` must be 0 and the expansion is the the entire string (this treats string like string-array of length 1)

These properties are handled as special cases:

- reg: use `DT_REG_ADDR_BY_IDX()` or `DT_REG_SIZE_BY_IDX()` instead
- interrupts: use `DT_IRQ_BY_IDX()`
- ranges: use `DT_NUM_RANGES()`
- dma-ranges: it is an error to use this property with `DT_PROP_BY_IDX()`
For properties of other types, behavior is undefined.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**
a representation of the idx-th element of the property

**`DT_PROP_OR(node_id, prop, default_value)`**
Like `DT_PROP()`, but with a fallback to `default_value`.
If the value exists, this expands to `DT_PROP(node_id, prop)`. The `default_value` parameter is not expanded in this case.
Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**
the property's value or `default_value`

**`DT_ENUM_IDX(node_id, prop)`**
Get a property value's index into its enumeration values.
The return values start at zero.

Example devicetree fragment:

```plaintext
usb1: usb@12340000 {
    maximum-speed = "full-speed";
};
usb2: usb@12341000 {
    maximum-speed = "super-speed";
};
```

Example bindings fragment:

```plaintext
properties:
    maximum-speed:
        type: string
        enum:
        - "low-speed"
        - "full-speed"
        - "high-speed"
        - "super-speed"
```

Example usage:

```plaintext
DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed) // 1
DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed) // 3
```

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
Returns
zero-based index of the property's value in its enum: list

**DT_ENUM_IDX_OR** (node_id, prop, default_idx_value)
Like **DT_ENUM_IDX()**, but with a fallback to a default enum index.
If the value exists, this expands to its zero based index value thanks to
**DT_ENUM_IDX(node_id, prop)**.
Otherwise, this expands to provided default index enum value.

Parameters
- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **default_idx_value** – a fallback index value to expand to

Returns
zero-based index of the property's value in its enum if present, default_idx_value otherwise

**DT_ENUM_HAS_VALUE** (node_id, prop, value)
Does a node enumeration property have a given value?

Parameters
- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **value** – lowercase-and-underscores enumeration value

Returns
1 if the node property has the value value, 0 otherwise.

**DT_STRING_TOKEN** (node_id, prop)
Get a string property's value as a token.
This removes “the quotes” from a string property's value, converting any non-alphanumeric characters to underscores. This can be useful, for example, when programatically using the value to form a C variable or code.

**DT_STRING_TOKEN()** can only be used for properties with string type.
It is an error to use **DT_STRING_TOKEN()** in other circumstances.

Example devicetree fragment:
```
  n1: node-1 {
    prop = "foo";
  };
  n2: node-2 {
    prop = "FOO";
  }
  n3: node-3 {
    prop = "123 foo";
  };
```

Example bindings fragment:
```
properties:
  prop:
    type: string
```

Example usage:
Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The uppercased "FOO" in the DTS remains FOO as a token. It is not converted to foo.
- The whitespace in the DTS "123 foo" string is converted to 123_foo as a token.

Parameters
- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns
the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

DT_STRING_TOKEN_OR(node_id, prop, default_value)
Like DT_STRING_TOKEN(), but with a fallback to default_value.
If the value exists, this expands to DT_STRING_TOKEN(node_id, prop). The default_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

Parameters
- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_value – a fallback value to expand to

Returns
the property's value as a token, or default_value

DT_STRING_UPPER_TOKEN(node_id, prop)
Like DT_STRING_TOKEN(), but uppercased.
This removes “the quotes” from a string property's value, converting any non-alphanumeric characters to underscores, and capitalizing the result. This can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_UPPER_TOKEN() can only be used for properties with string type.
It is an error to use DT_STRING_UPPER_TOKEN() in other circumstances.

Example devicetree fragment:

```c
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "123 foo";
};
```

Example bindings fragment:

5.2. Devicetree
**Properties**:  
```plaintext
  prop:
    type: string
```

Example usage:

```plaintext
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n1), prop) // FOO
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n2), prop) // 123_FOO
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes FOO as a token, i.e. it is uppercased.
- The whitespace in the DTS "123  foo" string is converted to 123_FOO as a token, i.e. it is uppercased and whitespace becomes an underscore.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns**

the value of `prop` as an uppercased token, i.e. without any quotes and with special characters converted to underscores

`DT_STRING_UPPER_TOKEN_OR(node_id, prop, default_value)`

Like `DT_STRING_UPPER_TOKEN()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_STRING_UPPER_TOKEN(node_id, prop)`.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**

the property's value as an uppercased token, or `default_value`

`DT_STRING_UNQUOTED(node_id, prop)`

Get a string property's value as an unquoted sequence of tokens.

This removes "the quotes" from string-valued properties. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

`DT_STRING_UNQUOTED()` can only be used for properties with string type.

It is an error to use `DT_STRING_UNQUOTED()` in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "12.7";
};
n2: node-2 {
```

(continues on next page)
Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_UNQUOTED(DT_NODELABEL(n1), prop)  // 12.7
DT_STRING_UNQUOTED(DT_NODELABEL(n2), prop)  // 0.5
DT_STRING_UNQUOTED(DT_NODELABEL(n3), prop)  // A B C
```

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns**
the property's value as a sequence of tokens, with no quotes

**DT_STRING_UNQUOTED_OR(node_id, prop, default_value)**

Like `DT_STRING_UNQUOTED()`, but with a fallback to `default_value`. If the value exists, this expands to `DT_STRING_UNQUOTED(node_id, prop)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**
the property's value as a sequence of tokens, with no quotes, or `default_value`

**DT_STRING_TOKEN_BY_IDX(node_id, prop, idx)**

Get an element out of a string-array property as a token. This removes “the quotes” from an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code. `DT_STRING_TOKEN_BY_IDX()` can only be used for properties with string-array type. It is an error to use `DT_STRING_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```
prop = "0.5";
}
```

```
prop = "A B C";
```

(continues from previous page)
Example bindings fragment:

```c
properties:
    prop:
        type: string-array
```

Example usage:

```c
DT_STRING_TOKEN_BY_IDX(DT_NODENAME(n1), prop, 0) // f1
DT_STRING_TOKEN_BY_IDX(DT_NODENAME(n1), prop, 1) // F2
DT_STRING_TOKEN_BY_IDX(DT_NODENAME(n2), prop, 0) // 123_foo
DT_STRING_TOKEN_BY_IDX(DT_NODENAME(n2), prop, 1) // 456_FOO
```

For more information, see `DT_STRING_TOKEN`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**

the element in `prop` at index `idx` as a token

`DT_STRING_UPPER_TOKEN_BY_IDX(node_id, prop, idx)`

Like `DT_STRING_TOKEN_BY_IDX()`, but uppercased.

This removes “the quotes” and capitalizes an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_UPPER_TOKEN_BY_IDX()` can only be used for properties with string-array type.

It is an error to use `DT_STRING_UPPER_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```c
n1: node-1 {
    prop = "f1", "F2";
};
n2: node-2 {
    prop = "123 foo", "456 FOO";
};
```

Example bindings fragment:

```c
properties:
    prop:
        type: string-array
```

Example usage:

```c
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODENAME(n1), prop, 0) // F1
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODENAME(n1), prop, 1) // F2
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODENAME(n2), prop, 0) // 123_FOO
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODENAME(n2), prop, 1) // 456_FOO
```

For more information, see `DT_STRING_UPPER_TOKEN`.
Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

Returns

the element in `prop` at index `idx` as an uppercased token

\texttt{DT\_STRING\_UNQUOTED\_BY\_IDX}(\texttt{node\_id, prop, idx})

Get a string array item value as an unquoted sequence of tokens.

This removes “the quotes” from string-valued item. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

\texttt{DT\_STRING\_UNQUOTED\_BY\_IDX()} can only be used for properties with string-array type.

It is an error to use \texttt{DT\_STRING\_UNQUOTED\_BY\_IDX()} in other circumstances.

Example devicetree fragment:

```
  n1: node-1 {
    prop = "12.7", "34.1";
  };
  n2: node-2 {
    prop = "A B", "C D";
  }
```

Example bindings fragment:

```
  properties:
    prop:
      type: string-array
```

Example usage:

```
  DT\_STRING\_UNQUOTED\_BY\_IDX(DT\_NODELABEL(n1), prop, 0) // 12.7
  DT\_STRING\_UNQUOTED\_BY\_IDX(DT\_NODELABEL(n1), prop, 1) // 34.1
  DT\_STRING\_UNQUOTED\_BY\_IDX(DT\_NODELABEL(n2), prop, 0) // A B
  DT\_STRING\_UNQUOTED\_BY\_IDX(DT\_NODELABEL(n2), prop, 1) // C D
```

Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

Returns

the property's value as a sequence of tokens, with no quotes

\texttt{DT\_PROP\_BY\_PHANDLE\_IDX}(\texttt{node\_id, phs, idx, prop})

Get a property value from a phandle in a property.

This is a shorthand for:

\texttt{DT\_PROP(DT\_PHANDLE\_BY\_IDX(node\_id, phs, idx), prop)}

That is, `prop` is a property of the phandle's node, not a property of `node_id`.

Example devicetree fragment:
### Example usage:

```c
#define N1 DT_NODELABEL(n1)
DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar)  // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz)  // 43
```

#### Parameters

- `node_id` – node identifier
- `phs` – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- `idx` – logical index into `phs`, which must be zero if `phs` has type phandle
- `prop` – lowercase-and-underscores property of the phandle's node

#### Returns

the property's value

`DT_PROP_BY_PHANDLE_IDX_OR(node_id, phs, idx, prop, default_value)`

Like `DT_PROP_BY_PHANDLE_IDX()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

#### Parameters

- `node_id` – node identifier
- `phs` – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- `idx` – logical index into `phs`, which must be zero if `phs` has type phandle
- `prop` – lowercase-and-underscores property of the phandle's node
- `default_value` – a fallback value to expand to

#### Returns

the property's value

`DT_PROP_BY_PHANDLE(node_id, ph, prop)`

Get a property value from a phandle's node.

This is equivalent to `DT_PROP_BY_PHANDLE_IDX(node_id, ph, 0, prop)`.

#### Parameters

- `node_id` – node identifier
- `ph` – lowercase-and-underscores property of `node_id` with type phandle
• prop – lowercase-and-underscores property of the phandle’s node

Returns
the property's value

DT_PHA_BY_IDX(node_id, pha, idx, cell)
Get a phandle-array specifier cell value at an index.
It might help to read the argument order as being similar to
node->phandle_array[index].cell. That is, the cell value is in the pha property
of node_id, inside the specifier at index idx.

Example devicetree fragment:

```plaintext
gpio0: gpio@abcd1234 {
    #gpio-cells = <2>;
};
gpio1: gpio@1234abcd {
    #gpio-cells = <2>;
};
led: led_0 {
    gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```

Bindings fragment for the gpio0 and gpio1 nodes:

```plaintext
gpio-cells:
- pin
- flags
```

Above, gpios has two elements:

• index 0 has specifier <17 0x1>, so its pin cell is 17, and its flags cell is 0x1
• index 1 has specifier <5 0x3>, so pin is 5 and flags is 0x3

Example usage:

```plaintext
#define LED DT_NODELABEL(led)
DT_PHA_BY_IDX(LED, gpios, 0, pin) // 17
DT_PHA_BY_IDX(LED, gpios, 1, flags) // 0x3
```

Parameters

• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• idx – logical index into pha
• cell – lowercase-and-underscores cell name within the specifier at pha
  index idx

Returns
the cell’s value

DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)
Like DT_PHA_BY_IDX(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA_BY_IDX(node_id, pha, idx, cell). The de-
fault_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

**Parameters**

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into **pha**
- **cell** – lowercase-and-underscores cell name within the specifier at **pha** index **idx**
- **default_value** – a fallback value to expand to

**Returns**
the cell's value or default_value

`DT_PHA(node_id, pha, cell)`

Equivalent to `DT_PHA_BY_IDX(node_id, pha, 0, cell)`

**Parameters**

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – lowercase-and-underscores cell name

**Returns**
the cell's value

`DT_PHA_OR(node_id, pha, cell, default_value)`

Like `DT_PHA()`, but with a fallback to default_value.

If the value exists, this expands to `DT_PHA(node_id, pha, cell)`. The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

**Parameters**

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – lowercase-and-underscores cell name
- **default_value** – a fallback value to expand to

**Returns**
the cell's value or default_value

`DT_PHA_BY_NAME(node_id, pha, name, cell)`

Get a value within a phandle-array specifier by name.

This is like `DT_PHA_BY_IDX()`, except it treats pha as a structure where each array element has a name.

It might help to read the argument order as being similar to `node->phandle_struct.name.cell`. That is, the cell value is in the pha property of **node_id**, treated as a data structure where each array element has a name.

Example devicetree fragment:

```plaintext
n: node {
    io-channels = <adc1 10>, <adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the “adc1” and “adc2” nodes:
io-channel-cells:
  - input

Example usage:

```c
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input) // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input) // 20
```

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of a specifier in `pha`
- `cell` – lowercase-and-underscores cell name in the named specifier

**Returns**

the cell's value

**DT_PHA_BY_NAME_OR**(`node_id`, `pha`, `name`, `cell`, `default_value`)

Like `DT_PHA_BY_NAME()`, but with a fallback to `default_value`. If the value exists, this expands to `DT_PHA_BY_NAME(`node_id`, `pha`, name`, `cell`)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of a specifier in `pha`
- `cell` – lowercase-and-underscores cell name in the named specifier
- `default_value` – a fallback value to expand to

**Returns**

the cell's value or `default_value`

**DT_PHANDLE_BY_NAME**(`node_id`, `pha`, `name`)

Get a phandle's node identifier from a phandle array by `name`. It might help to read the argument order as being similar to `node->phandle_struct. name.phandle`. That is, the phandle array is treated as a structure with named elements. The return value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

```c
adc1: adc@abcd1234 {
    foobar = "ADC_1";
};
adc2: adc@1234abcd {
    foobar = "ADC_2";
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>
    io-channel-names = "SENSOR", "BANDGAP"
};
```
Above, “io-channels” has two elements:

- the element named "SENSOR" has phandle &adc1
- the element named "BANDGAP" has phandle &adc2

Example usage:

```c
#define NODE DT_NODELABEL(n)

DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, sensor), foobar) // "ADC_1"
DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, bandgap), foobar) // "ADC_2"
```

Notice how devicetree properties and names are lowercased, and non-alphanumeric characters are converted to underscores.

**Parameters**

- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of an element in pha

**Returns**

a node identifier for the node with that phandle

```c
DT_PHANDLE_BY_IDX(node_id, prop, idx)
```

Get a node identifier for a phandle in a property.

When a node’s value at a logical index contains a phandle, this macro returns a node identifier for the node with that phandle.

Therefore, if prop has type phandle, idx must be zero. (A phandle type is treated as a phandles with a fixed length of 1).

Example devicetree fragment:

```c
n1: node-1 {
    foo = &n2 &n3;
};
n2: node-2 {
    ...
};
n3: node-3 {
    ...
};
```

Above, foo has type phandles and has two elements:

- index 0 has phandle &n2, which is node-2’s phandle
- index 1 has phandle &n3, which is node-3’s phandle

Example usage:

```c
#define N1 DT_NODELABEL(n1)

DT_PHANDLE_BY_IDX(N1, foo, 0) // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1) // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name in node_id with type phandle, phandles or phandle-array
• idx – index into prop

**Returns**
node identifier for the node with the phandle at that index

**DT_PHANDLE(node_id, prop)**
Get a node identifier for a phandle property's value.
This is equivalent to **DT_PHANDLE_BY_IDX(node_id, prop, 0)**. Its primary benefit is readability when prop has type phandle.

**Parameters**
• node_id – node identifier
• prop – lowercase-and-underscores property of node_id with type phandle

**Returns**
a node identifier for the node pointed to by “ph”

**ranges property** Use these APIs instead of Property access to access the ranges property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings. However, they take on special semantics when the node's binding indicates it is a PCIe bus node, as defined in the PCI Bus Binding to: IEEE Std 1275-1994 Standard for Boot (Initialization Configuration) Firmware

**group devicetree-ranges-prop**

**Defines**

**DT_NUM_RANGES(node_id)**
Get the number of range blocks in the ranges property.
Use this instead of **DT_PROP_LEN(node_id, ranges)**.
Example devicetree fragment:

```
 PCIe0: pcie0 @ {  
   compatible = "pcie-controller";
   reg = <0 1>;
   #address-cells = <3>;
   #size-cells = <2>;
   ranges = <0x1000000 0 0 0x3eff0000 0x10000>,
    <0x2000000 0x1000000 0x10000000 0 0x2eff0000>,
    <0x3000000 0x80 0x80 0x80 0x80 0x80>;
};

 other: other@1 {  
   reg = <1 1>;
   ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
    <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_NUM_RANGES(DT_NODELABEL(pcie0)) // 3
DT_NUM_RANGES(DT_NODELABEL(other)) // 2
```
Parameters

- node_id – node identifier

**DT_RANGES_HAS_IDX(node_id, idx)**

Is idx a valid range block index?

If this returns 1, then **DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)**, **DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)** or **DT_RANGES_LENGTH_BY_IDX(node_id, idx)** are valid. For **DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)** the return value of **DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)** will indicate validity. If it returns 0, it is an error to use those macros with index idx, including **DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)**.

Example devicetree fragment:

```
pcie0: pcie@0 {
    compatible = "pcie-controller";
    reg = <0 1>
    #address-cells = <3>
    #size-cells = <2>
    ranges = <0x1000000 0 0 0x3eff0000 0x10000>,
             <0x2000000 0x1000000 0x10000000 0x2eff0000>,
             <0x3000000 0x80 0x80 0x80 0x80>;
};
other: other@1 {
    reg = <1 1>
    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
             <0x0 0x1000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 3) // 0
```

Parameters

- node_id – node identifier
- idx – index to check

Returns

1 if idx is a valid register block index, 0 otherwise.

**DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)**

Does a ranges property have child bus flags at index?

If this returns 1, then **DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)** is valid. If it returns 0, it is an error to use this macro with index idx. This macro only returns 1 for PCIe buses (i.e. nodes whose bindings specify they are “pcie” bus nodes.)

Example devicetree fragment:
Example usage:

```c
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 1) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 3) // 0
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the ranges array

**Returns**

1 if `idx` is a valid child bus flags index, 0 otherwise.

**DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)**

Get the ranges property child bus flags at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is extracted from the Child Bus Address as Child Bus Flags field.

Example devicetree fragments:

```c
parent {
    #address-cells = <2>;

    pcie0: pcie0@0 {
        compatible = "pcie-controller";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
                 <0x2000000 0x10000000 0 0x10000000 0x2eff0000>,
                 <0x3000000 0x80 0 0x80 0 0x80 0>;
    }

    other: other01 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    }
};
```

(continues on next page)
Example usage:

```c
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x1000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x3000000
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the ranges array

**Returns**

range child bus flags field at idx

```
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)
```

Get the ranges property child bus address at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is removed from the Child Bus Address.

Example devicetree fragments:

```c
parent {
    #address-cells = <2>;
    
    pcie0: pcie0 {
        compatible = "pcie-controller";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
                <0x2000000 0x10000000 0x10000000 0x2eff0000>,
                <0x3000000 0x80 0x80 0x80 0x80>;
    };

    other: other01 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    };
};
```

Example usage:

```
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x1000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x800000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the ranges array
Returns

range child bus address field at idx

DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)
Get the ranges property parent bus address at index.

Similarly to DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(), this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "pcie-controller";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;
        ranges = <0x1000000 0 0x3eff0000 0x10000>,
                  <0x2000000 0x1000000 0x10000000 0x2eff0000>,
                  <0x3000000 0x80 0x80 0x80 0x80>;
    }

    other: other@1 {
        reg = <0 1 1>;
        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                  <0x0 0x1000000 0x0 0x1000000 0x2eff0000>;
    }
}
```

Example usage:

```
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x1000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x80000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x1000000
```

Parameters

- node_id – node identifier
- idx – logical index into the ranges array

Returns

range parent bus address field at idx

DT_RANGES_LENGTH_BY_IDX(node_id, idx)
Get the ranges property length at index.

Similarly to DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(), this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "pcie-controller";
```

(continues on next page)
reg = <0 0 1>;  
#address-cells = <3>;  
#size-cells = <2>;  
ranges = <0x1000000 0 0 0 0x3eff0000 0x10000>,  
<0x2000000 0x10000000 0 0x10000000 0x2eff0000>,  
<0x3000000 0x80 0 0x80 0 0x80>;  
};

other: other@1 {  
reg = <0 1 1>;  
ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,  
<0x0 0x10000000 0x0 0x10000000 0x2eff0000>;  
};

Example usage:

DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x10000  
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2eff0000  
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000  
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 0) // 0x10000  
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 1) // 0x2eff0000

Parameters

• node_id – node identifier
• idx – logical index into the ranges array

Returns

range length field at idx

DT_FOREACH_RANGE(node_id, fn)

Invokes fn for each entry of node_id ranges property.

The macro fn must take two parameters, node_id which will be the node identifier of
the node with the ranges property and idx the index of the ranges block.

Example devicetree fragment:

n: node@0 {  
  reg = <0 0 1>;  
  ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,  
<0x0 0x10000000 0x0 0x10000000 0x2eff0000>;  
};

Example usage:

#define RANGE_LENGTH(node_id, idx) DT_RANGES_LENGTH_BY_IDX(node_id, idx),  

const uint64_t *ranges_length[] = {  
  DT_FOREACH_RANGE(DT_NODELABEL(n), RANGE_LENGTH)  
};

This expands to:

const char *ranges_length[] = {  
0x10000, 0x2eff0000,  
};
Parameters

- node_id – node identifier
- fn – macro to invoke

**reg property**  Use these APIs instead of *Property access* to access the reg property. Because this property’s semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings.

**group devicetree-reg-prop**

**Defines**

**DT_NUM_REGS(node_id)**
Get the number of register blocks in the reg property.

Use this instead of *DT_PROP_LEN(node_id, reg)*.

**Parameters**

- node_id – node identifier

**Returns**

Number of register blocks in the node’s “reg” property.

**DT_REG_HAS_IDX(node_id, idx)**
Is idx a valid register block index?

If this returns 1, then *DT_REG_ADDR_BY_IDX(node_id, idx)* or *DT_REG_SIZE_BY_IDX(node_id, idx)* are valid. If it returns 0, it is an error to use those macros with index idx.

**Parameters**

- node_id – node identifier
- idx – index to check

**Returns**

1 if idx is a valid register block index, 0 otherwise.

**DT_REG_ADDR_BY_IDX(node_id, idx)**
Get the base address of the register block at index idx.

**Parameters**

- node_id – node identifier
- idx – index of the register whose address to return

**Returns**

address of the idx-th register block

**DT_REG_SIZE_BY_IDX(node_id, idx)**
Get the size of the register block at index idx.

This is the size of an individual register block, not the total number of register blocks in the property; use *DT_NUM_REGS()* for that.

**Parameters**

- node_id – node identifier
- idx – index of the register whose size to return
Returns

size of the idx-th register block

DT_REG_ADDR(node_id)
Get a node's (only) register block address.
Equivalent to DT_REG_ADDR_BY_IDX(node_id, 0).

Parameters
• node_id – node identifier

Returns
node's register block address

DT_REG_ADDR_U64(node_id)
64-bit version of DT_REG_ADDR()
This macro version adds the appropriate suffix for 64-bit unsigned integer literals.
Note that this macro is equivalent to DT_REG_ADDR() in linker/ASM context.

Parameters
• node_id – node identifier

Returns
node's register block address

DT_REG_SIZE(node_id)
Get a node's (only) register block size.
Equivalent to DT_REG_SIZE_BY_IDX(node_id, 0).

Parameters
• node_id – node identifier

Returns
node's only register block's size

DT_REG_ADDR_BY_NAME(node_id, name)
Get a register block's base address by name.

Parameters
• node_id – node identifier
• name – lowercase-and-underscores register specifier name

Returns
address of the register block specified by name

DT_REG_ADDR_BY_NAME_U64(node_id, name)
64-bit version of DT_REG_ADDR_BY_NAME()
This macro version adds the appropriate suffix for 64-bit unsigned integer literals.
Note that this macro is equivalent to DT_REG_ADDR_BY_NAME() in linker/ASM context.

Parameters
• node_id – node identifier
• name – lowercase-and-underscores register specifier name

Returns
address of the register block specified by name
DT_REG_SIZE_BY_NAME(node_id, name)
    Get a register block's size by name.

    Parameters
    • node_id – node identifier
    • name – lowercase-and-underscores register specifier name

    Returns
    size of the register block specified by name

interrupts property  Use these APIs instead of Property access to access the interrupts property.
Because this property's semantics are defined by the devicetree specification, some of these macros can be used even for nodes without matching bindings. This does not apply to macros which take cell names as arguments.

group devicetree-interrupts-prop

Defines

DT_NUM_IRQS(node_id)
    Get the number of interrupt sources for the node.
    Use this instead of DT_PROP_LEN(node_id, interrupts).
    Parameters
    • node_id – node identifier
    Returns
    Number of interrupt specifiers in the node's "interrupts" property.

DT_IRQ_LEVEL(node_id)
    Get the interrupt level for the node.
    Parameters
    • node_id – node identifier
    Returns
    interrupt level

DT_IRQ_HAS_IDX(node_id, idx)
    Is idx a valid interrupt index?
If this returns 1, then DT_IRQ_BY_IDX(node_id, idx) is valid. If it returns 0, it is an error to use that macro with this index.
    Parameters
    • node_id – node identifier
    • idx – index to check
    Returns
    1 if the idx is valid for the interrupt property 0 otherwise.

DT_IRQ_HAS_CELL_AT_IDX(node_id, idx, cell)
    Does an interrupts property have a named cell specifier at an index? If this returns 1, then DT_IRQ_BY_IDX(node_id, idx, cell) is valid.
If it returns 0, it is an error to use that macro.
Parameters

- `node_id` – node identifier
- `idx` – index to check
- `cell` – named cell value whose existence to check

Returns

1 if the named cell exists in the interrupt specifier at index `idx` 0 otherwise.

`DT_IRQ_HAS_CELL(node_id, cell)`

Equivalent to `DT_IRQ_HAS_CELL_AT_IDX(node_id, 0, cell)`

Parameters

- `node_id` – node identifier
- `cell` – named cell value whose existence to check

Returns

1 if the named cell exists in the interrupt specifier at index `0` 0 otherwise.

`DT_IRQ_HAS_NAME(node_id, name)`

Does an interrupts property have a named specifier value at an index? If this returns 1, then `DT_IRQ_BY_NAME(node_id, name, cell)` is valid.

If it returns 0, it is an error to use that macro.

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores interrupt specifier name

Returns

1 if “name” is a valid named specifier 0 otherwise.

`DT_IRQ_BY_IDX(node_id, idx, cell)`

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to “node->interrupts[index].cell”.

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```plaintext
my-serial: serial@abcd1234 {
    interrupts = <33 0>, <34 1>;
};
```

Assuming the node’s interrupt domain has “#interrupt-cells = <2>;” and the individual cells in each interrupt specifier are named “irq” and “priority” by the node’s binding, here are some examples:

```plaintext
#define SERIAL DT_NODELABEL(my_serial)
```

<table>
<thead>
<tr>
<th>Example usage</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 0, irq)</code></td>
<td>33</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 0, priority)</code></td>
<td>0</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 1, irq)</code></td>
<td>34</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 1, priority)</code></td>
<td>1</td>
</tr>
</tbody>
</table>

Parameters
• node_id – node identifier
• idx – logical index into the interrupt specifier array
• cell – cell name specifier

Returns
the named value at the specifier given by the index

**DT_IRQ_BY_NAME**(node_id, name, cell)
Get a value within an interrupt specifier by name.

It might help to read the argument order as being similar to node->interrupts.name.cell.

This can be used to get information about an individual interrupt when a device generates more than one, if the bindings give each interrupt specifier a name.

**Parameters**
• node_id – node identifier
• name – lowercase-and-underscores interrupt specifier name
• cell – cell name specifier

Returns
the named value at the specifier given by the index

**DT_IRQ**(node_id, cell)
Get an interrupt specifier's value Equivalent to **DT_IRQ_BY_IDX**(node_id, 0, cell).

**Parameters**
• node_id – node identifier
• cell – cell name specifier

Returns
the named value at that index

**DT_IRQ_INTC_BY_IDX**(node_id, idx)
Get an interrupt specifier's interrupt controller by index.

```
gpio0: gpio0 {
    interrupt-controller;
    #interrupt-cells = <2>;
};

foo: foo {
    interrupt-parent = <&gpio0>;
    interrupts = <1 1>, <2 2>;
};

bar: bar {
    interrupts-extended = <&gpio0 3 3>, <&pic0 4>;
};

pic0: pic0 {
    interrupt-controller;
    #interrupt-cells = <1>;
    qux: qux {
        interrupts = <5>, <6>;
        interrupt-names = "int1", "int2";
    }
};
```
Example usage:

```c
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(foo), 0) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(foo), 1) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(bar), 0) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(bar), 1) // &pic0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(qux), 0) // &pic0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(qux), 1) // &pic0
```

**Parameters**

- `node_id` – node identifier
- `idx` – interrupt specifier's index

**Returns**

node_id of interrupt specifier's interrupt controller

**Example usage:**

```c
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(foo), int1) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(foo), int2) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(bar), int1) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(bar), int2) // &pic0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(qux), int1) // &pic0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(qux), int2) // &pic0
```

**Parameters**

- `node_id` – node identifier
- `name` – interrupt specifier's name

**Returns**

node_id of interrupt specifier's interrupt controller
DT_IRQ_INTC(node_id)
Get an interrupt specifier's interrupt controller.

```c
gpio0: gpio0 {
    interrupt-controller;
    #interrupt-cells = <2>;
};
foo: foo {
    interrupt-parent = &gpio0;
    interrupts = <1 1>;
};
bar: bar {
    interrupts-extended = &gpio0 3 3;
};
pic0: pic0 {
    interrupt-controller;
    #interrupt-cells = <1>;
    qux: qux {
        interrupts = <5>;
    };
};
```

Example usage:

```
DT_IRQ_INTC(DT_NODELABEL(foo)) // &gpio0
DT_IRQ_INTC(DT_NODELABEL(bar)) // &gpio0
DT_IRQ_INTC(DT_NODELABEL(qux)) // &pic0
```

See also:

`DT_IRQ_INTC_BY_IDX()`

Note: Equivalent to `DT_IRQ_INTC_BY_IDX(node_id, 0)`

**Parameters**

- `node_id` – node identifier

**Returns**

node_id of interrupt specifier's interrupt controller

DT_IRQN_BY_IDX(node_id, idx)
Get the node's Zephyr interrupt number at index If `CONFIG_MULTI_LEVEL_INTERRUPTS` is enabled, the interrupt number at index will be multi-level encoded.

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the interrupt specifier array

**Returns**

the Zephyr interrupt number

DT_IRQN(node_id)
Get a node's (only) irq number.
Equivalent to `DT_IRQ(node_id, irq)`. This is provided as a convenience for the common case where a node generates exactly one interrupt, and the IRQ number is in a cell named irq.

**Parameters**

- `node_id` – node identifier

**Returns**

the interrupt number for the node's only interrupt

**For-each macros**

There is currently only one “generic” for-each macro, `DT_FOREACH_CHILD()`, which allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like `DT_INST_FOREACH_STATUS_OKAY()`, but these require `DT_DRV_COMPAT` to be defined before use.

`group devicetree-generic-foreach`

**Defines**

`DT_FOREACH_NODE(fn)`

Invokes `fn` for every node in the tree.

The macro `fn` must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

**Parameters**

- `fn` – macro to invoke

`DT_FOREACH_NODE_VARGS(fn, ...)`

Invokes `fn` for every node in the tree with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.

The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

**Parameters**

- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_STATUS_OKAY_NODE(fn)`

Invokes `fn` for every status okay node in the tree.

The macro `fn` must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

**Parameters**

- `fn` – macro to invoke

`DT_FOREACH_STATUS_OKAY_NODE_VARGS(fn, ...)`

Invokes `fn` for every status okay node in the tree with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.
The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

**Parameters**
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

**DT_FOREACH_CHILD**(node_id, fn)
Invokes `fn` for each child of `node_id`.

The macro `fn` must take one parameter, which will be the node identifier of a child node of `node_id`.

The children will be iterated over in the same order as they appear in the final device-tree.

Example devicetree fragment:

```
node {
    child-1 {
        foobar = "foo";
    };
    child-2 {
        foobar = "bar";
    };
}
```

Example usage:

```
#define FOOBAR_AND_COMMA(node_id) DT_PROP(node_id, foobar),
const char *child_foobars[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), FOOBAR_AND_COMMA)
};
```

This expands to:

```
const char *child_foobars[] = {
    "foo", "bar",
};
```

**Parameters**
- `node_id` – node identifier
- `fn` – macro to invoke

**DT_FOREACH_CHILD_SEP**(node_id, fn, sep)
Invokes `fn` for each child of `node_id` with a separator.

The macro `fn` must take one parameter, which will be the node identifier of a child node of `node_id`.

Example devicetree fragment:

```
node {
    child-1 {
        ...
    };
    child-2 {
        ...
```

(continues on next page)
Example usage:

```c
const char *child_names[] = {
    DT_FOREACH_CHILD_SEP(DT_NODELABEL(n), DT_NODE_FULL_NAME, (,))
};
```

This expands to:

```c
const char *child_names[] = {
    "child-1", "child-2"
};
```

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

**DT_FOREACH_CHILD_VARGS**

Invokes `fn` for each child of `node_id` with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final device-tree.

**See also:**

**DT_FOREACH_CHILD**

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

**DT_FOREACH_CHILD_SEP_VARGS**

Invokes `fn` for each child of `node_id` with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

**See also:**

**DT_FOREACH_CHILD_VARGS**

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
• `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_CHILD_STATUS_OKAY(node_id, fn)`
Call `fn` on the child nodes with status `okay`

The macro `fn` should take one argument, which is the node identifier for the child node. As usual, both a missing status and an `ok` status are treated as `okay`.
The children will be iterated over in the same order as they appear in the final device-tree.

**Parameters**
- `node_id` – node identifier
- `fn` – macro to invoke

`DT_FOREACH_CHILD_STATUS_OKAY_SEP(node_id, fn, sep)`
Call `fn` on the child nodes with status `okay` with separator.

The macro `fn` should take one argument, which is the node identifier for the child node. As usual, both a missing status and an `ok` status are treated as `okay`.

See also:
`DT_FOREACH_CHILD_STATUS_OKAY`

**Parameters**
- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

`DT_FOREACH_CHILD_STATUS_OKAY_VARGS(node_id, fn, ...)`
Call `fn` on the child nodes with status `okay` with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
As usual, both a missing status and an `ok` status are treated as `okay`.
The children will be iterated over in the same order as they appear in the final device-tree.

See also:
`DT_FOREACH_CHILD_STATUS_OKAY`

**Parameters**
- `node_id` – node identifier
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`
DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(node_id, fn, sep, ...)

Call fn on the child nodes with status okay with separator and multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

As usual, both a missing status and an ok status are treated as okay.

See also:

DT_FOREACH_CHILD_SEP_STATUS_OKAY

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator:
- ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM(node_id, prop, fn)

Invokes fn for each element in the value of property prop.

The macro fn must take three parameters: fn(node_id, prop, idx). node_id and prop are the same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the array. The idx values are integer literals starting from 0.

The prop argument must refer to a property that can be passed to DT_PROP_LEN().

Example devicetree fragment:

```
n: node {
    my-ints = <1 2 3>;
};
```

Example usage:

```
#define TIMES_TWO(node_id, prop, idx) \
    (2 * DT_PROP_BY_IDX(node_id, prop, idx)),
int array[] = {
    DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```

This expands to:

```
int array[] = {
    (2 * 1), (2 * 2), (2 * 3),
};
```

In general, this macro expands to:

```
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)
```

where n is the number of elements in prop, as it would be returned by DT_PROP_LEN(node_id, prop).

See also:

DT_PROP_LEN
Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke

**DT_FOREACH_PROP_ELEM_SEP(node_id, prop, fn, sep)**

Invokes `fn` for each element in the value of property `prop` with separator.

Example devicetree fragment:

```plaintext
n: node {
    my-gpios = <&gpioa 0 GPIO_ACTIVE_HIGH>,
              <&gpiob 1 GPIO_ACTIVE_HIGH>;
}
```

Example usage:

```c
struct gpio_dt_spec specs[] = {
    DT_FOREACH_PROP_ELEM_SEP(DT_NODELABEL(n),
        my_gpios,
        GPIO_DT_SPEC_GET_BY_IDX,
        ,)
};
```

This expands as a first step to:

```c
struct gpio_dt_spec specs[] = {
    GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 0),
    GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 1)
};
```

The `prop` parameter has the same restrictions as the same parameter given to `DT_FOREACH_PROP_ELEM()`.

See also:

**DT_FOREACH_PROP_ELEM**

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

**DT_FOREACH_PROP_ELEM_VARGS(node_id, prop, fn, ...)**

Invokes `fn` for each element in the value of property `prop` with multiple arguments.

The macro `fn` must take multiple parameters: `fn(node_id, prop, idx, ...)`. `node_id` and `prop` are the same as what is passed to `DT_FOREACH_PROP_ELEM()`, and `idx` is the current index into the array. The `idx` values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

The `prop` parameter has the same restrictions as the same parameter given to `DT_FOREACH_PROP_ELEM()`.

See also:

**DT_FOREACH_PROP_ELEM**
Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_PROP_ELEM_SEP_VARGS(node_id, prop, fn, sep, ...)`

Invokes `fn` for each element in the value of property `prop` with multiple arguments and a separator.

The `prop` parameter has the same restrictions as the same parameter given to `DT_FOREACH_PROP_ELEM()`.

See also:

`DT_FOREACH_PROP_ELEM_VARGS`

Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_STATUS_OKAY(compat, fn)`

Invokes `fn` for each status okay node of a compatible.

This macro expands to:

\[
\text{fn}(\text{node}_1) \; \text{fn}(\text{node}_2) \; \ldots \; \text{fn}(\text{node}_n)
\]

where each `\text{node}_i` is a node identifier for some node with compatible `compat` and status okay. Whitespace is added between expansions as shown above.

Example devicetree fragment:

```
/ {
  a {
    \text{compatible} = "foo";
    \text{status} = "okay";
  };
  b {
    \text{compatible} = "foo";
    \text{status} = "disabled";
  };
  c {
    \text{compatible} = "foo";
  };
};
```

Example usage:

`DT_FOREACH_STATUS_OKAY(foo, DT_NODE_PATH)`

This expands to one of the following:
"/a" "/c"
"/c" "/a"

“One of the following” is because no guarantees are made about the order that node identifiers are passed to fn in the expansion.

(The /c string literal is present because a missing status property is always treated as if the status were set to okay.)

Note also that fn is responsible for adding commas, semicolons, or other terminators as needed.

**Parameters**

- **compat** – lowercase-and-underscores devicetree compatible
- **fn** – Macro to call for each enabled node. Must accept a node_id as its only parameter.

**DT_FOREACH_STATUS_OKAY_VARGS** (compat, fn, ...)

Invokes fn for each status okay node of a compatible with multiple arguments.

This is like **DT_FOREACH_STATUS_OKAY()** except you can also pass additional arguments to fn.

Example devicetree fragment:

```
/ {
  a {
    compatible = "foo";
    val = <3>;
  };
  b {
    compatible = "foo";
    val = <4>;
  };
}
```

Example usage:

```
#define MY_FN(node_id, operator) DT_PROP(node_id, val) operator
x = DT_FOREACH_STATUS_OKAY_VARGS(foo, MY_FN, +) 0;
```

This expands to one of the following:

```
x = 3 + 4 + 0;
x = 4 + 3 + 0;
```

i.e. it sets x to 7. As with **DT_FOREACH_STATUS_OKAY()**, there are no guarantees about the order nodes appear in the expansion.

**Parameters**

- **compat** – lowercase-and-underscores devicetree compatible
- **fn** – Macro to call for each enabled node. Must accept a node_id as its only parameter.
- **...** – Additional arguments to pass to fn

**Existence checks** This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as **DT_IRQ_HAS_IDX()** and all macros which require **DT_DRV_COMPAT**) are documented elsewhere on this page.
Related code samples

**GPIO with custom Devicetree binding**

Use custom Devicetree binding to control a GPIO.

```plaintext
group devicetree-generic-exist
```

**Defines**

```plaintext
DT_NODE_EXISTS(node_id)

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree.

It doesn’t matter whether or not the node has a matching binding, or what the node’s status value is. This is purely a check of whether the node exists at all.

**Parameters**

- node_id – a node identifier

**Returns**

1 if the node identifier refers to a node, 0 otherwise.
```

```plaintext
DT_NODE_HAS_STATUS(node_id, status)

Does a node identifier refer to a node with a status?

Example uses:

```c
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), okay)
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), disabled)
```

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an ok status in the devicetree is treated as if it were okay instead)

**Parameters**

- node_id – a node identifier
- status – a status as one of the tokens okay or disabled, not a string

**Returns**

1 if the node has the given status, 0 otherwise.
```

```plaintext
DT_HAS_COMPAT_STATUS_OKAY(compat)

Does the devicetree have a status okay node with a compatible?

Test for whether the devicetree has any nodes with status okay and the given compatible. That is, this returns 1 if and only if there is at least one node_id for which both of these expressions return 1:

```c
DT_NODE_HAS_STATUS(node_id, okay)
DT_NODE_HAS_COMPAT(node_id, compat)
```

As usual, both a missing status and an ok status are treated as okay.
Parameters

- compat – lowercase-and-underscores compatible, without quotes

Returns

1 if both of the above conditions are met, 0 otherwise

DT_NUM_INST_STATUS_OKAY(compat)
Get the number of instances of a given compatible with status okay

Parameters

- compat – lowercase-and-underscores compatible, without quotes

Returns

Number of instances with status okay

DT_NODE_HAS_COMPAT(node_id, compat)
Does a devicetree node match a compatible?

Example devicetree fragment:

```plaintext
n: node {
    compatible = "vnd,specific-device", "generic-device";
}
```

Example usages which evaluate to 1:

- DT_NODE_HAS_COMPAT(DT_NODELABEL(n), vnd_specific_device)
- DT_NODE_HAS_COMPAT(DT_NODELABEL(n), generic_device)

This macro only uses the value of the compatible property. Whether or not a particular compatible has a matching binding has no effect on its value, nor does the node’s status.

Parameters

- node_id – node identifier
- compat – lowercase-and-underscores compatible, without quotes

Returns

1 if the node’s compatible property contains compat, 0 otherwise.

DT_NODE_HAS_COMPAT_STATUS(node_id, compat, status)
Does a devicetree node have a compatible and status?

This is equivalent to:

```plaintext
(DT_NODE_HAS_COMPAT(node_id, compat) &&
DT_NODE_HAS_STATUS(node_id, status))
```

Parameters

- node_id – node identifier
- compat – lowercase-and-underscores compatible, without quotes
- status – okay or disabled as a token, not a string

DT_NODE_HAS_PROP(node_id, prop)
Does a devicetree node have a property?

Tests whether a devicetree node has a property defined.

This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use DT_PROP(node_id, prop) instead.

Parameters

- node_id – node identifier
- prop – property name
- status – okay or disabled as a token, not a string
• `node_id` – node identifier
• `prop` – lowercase-and-underscores property name

**Returns**
1 if the node has the property, 0 otherwise.

`DT_PHA_HAS_CELL_AT_IDX(node_id, pha, idx, cell)`

Does a phandle array have a named cell specifier at an index?

If this returns 1, then the phandle-array property `pha` has a cell named `cell` at index `idx`, and therefore `DT_PHA_BY_IDX(node_id, pha, idx, cell)` is valid. If it returns 0, it’s an error to use `DT_PHA_BY_IDX()` with the same arguments.

**Parameters**
• `node_id` – node identifier
• `pha` – lowercase-and-underscores property with type phandle-array
• `idx` – index to check within `pha`
• `cell` – lowercase-and-underscores cell name whose existence to check at index `idx`

**Returns**
1 if the named cell exists in the specifier at index `idx`, 0 otherwise.

`DT_PHA_HAS_CELL(node_id, pha, cell)`

Equivalent to `DT_PHA_HAS_CELL_AT_IDX(node_id, pha, 0, cell)`

**Parameters**
• `node_id` – node identifier
• `pha` – lowercase-and-underscores property with type phandle-array
• `cell` – lowercase-and-underscores cell name whose existence to check at index `idx`

**Returns**
1 if the named cell exists in the specifier at index 0, 0 otherwise.

**Inter-node dependencies**
The `devicetree.h` API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary “depends on” relation between devicetree nodes, which is defined as the transitive closure of the following “directly depends on” relation:

• every non-root node directly depends on its parent node
• a node directly depends on any nodes its properties refer to by phandle
• a node directly depends on its `interrupt-parent` if it has an `interrupts` property
• a parent node inherits all dependencies from its child nodes

A **dependency ordering** of a devicetree is a list of its nodes, where each node `n` appears earlier in the list than any nodes that depend on `n`. A node’s dependency ordinal is then its zero-based index in that list. Thus, for two distinct devicetree nodes `n1` and `n2` with dependency ordinals `d1` and `d2`, we have:

• `d1` != `d2`
• if `n1` depends on `n2`, then `d1` > `d2`
• `d1` > `d2` does **not** necessarily imply that `n1` depends on `n2`
The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see \texttt{DT\_INST\_DEP\_ORD()} and subsequent documentation.

\textit{group devicetree-dep-ord}

\textbf{Defines}

\texttt{DT\_DEP\_ORD(node_id)}

Get a node's dependency ordinal.

\textbf{Parameters}

- \texttt{node_id} – Node identifier

\textbf{Returns}

the node's dependency ordinal as an integer literal

\texttt{DT\_DEP\_ORD\_STR\_SORTABLE(node_id)}

Get a node's dependency ordinal in string sortable form.

\textbf{Parameters}

- \texttt{node_id} – Node identifier

\textbf{Returns}

the node's dependency ordinal as a zero-padded integer literal

\texttt{DT\_REQUIRES\_DEP\_ORDS(node_id)}

Get a list of dependency ordinals of a node's direct dependencies.

There is a comma after each ordinal in the expansion, \textbf{including} the last one:

\texttt{DT\_REQUIRES\_DEP\_ORDS(my_node) // required_ord_1, ..., required_ord_n,}

The one case \texttt{DT\_REQUIRES\_DEP\_ORDS()} expands to nothing is when given the root node identifier \texttt{DT\_ROOT} as argument. The root has no direct dependencies; every other node at least depends on its parent.

\textbf{Parameters}

- \texttt{node_id} – Node identifier

\textbf{Returns}

a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

\texttt{DT\_SUPPORTS\_DEP\_ORDS(node_id)}

Get a list of dependency ordinals of what depends directly on a node.

There is a comma after each ordinal in the expansion, \textbf{including} the last one:

\texttt{DT\_SUPPORTS\_DEP\_ORDS(my_node) // supported_ord_1, ..., supported_ord_n,}

\texttt{DT\_SUPPORTS\_DEP\_ORDS()} may expand to nothing. This happens when \texttt{node_id} refers to a leaf node that nothing else depends on.

\textbf{Parameters}

- \texttt{node_id} – Node identifier
Returns
a list of dependency ordinals, with each ordinal followed by a comma (,),
or an empty expansion

DT_INST_DEP_ORD(inst)
Get a DT_DRV_COMPAT instance's dependency ordinal.
Equivalent to DT_DEP_ORD(DT_DRV_INST(inst)).

Parameters
• inst – instance number

Returns
The instance's dependency ordinal

DT_INSTQUIRES_DEP_ORDS(inst)
Get a list of dependency ordinals of a DT_DRV_COMPAT instance's direct dependencies.
Equivalent to DT_REQUIRES_DEP_ORDS(DT_DRV_INST(inst)).

Parameters
• inst – instance number

Returns
a list of dependency ordinals for the nodes the instance depends on directly

DT_INST_SUPPORTS_DEP_ORDS(inst)
Get a list of dependency ordinals of what depends directly on a DT_DRV_COMPAT instance.
Equivalent to DT_SUPPORTS_DEP_ORDS(DT_DRV_INST(inst)).

Parameters
• inst – instance number

Returns
a list of node identifiers for the nodes that depend directly on the instance

Bus helpers Zephyr's devicetree bindings language supports a bus: key which allows bindings
to declare that nodes with a given compatible describe system buses. In this case, child nodes
are considered to be on a bus of the given type, and the following APIs may be used.

group devicetree-generic-bus

Defines

DT_BUS(node_id)
Node's bus controller.
Get the node identifier of the node's bus controller. This can be used with DT_PROP() to get properties of the bus controller.
It is an error to use this with nodes which do not have bus controllers.

Example devicetree fragment:

```
i2c@deadbeef {
  status = "okay";
  clock-frequency = < 100000 >;
```

(continues on next page)
### i2c_device

```c
accelerometer@12 {
    ...,
};
```

Example usage:

```c
DT_PROP(DT_BUS(DT_NODELABEL(i2c_device)), clock_frequency) // 100000
```

**Parameters**

- `node_id` - node identifier

**Returns**

A node identifier for the node's bus controller

#### DT_ON_BUS(node_id, bus)

Is a node on a bus of a given type?

Example devicetree overlay:

```c
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming i2c0 is an I2C bus controller node, and therefore temp is on an I2C bus:

```c
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```

**Parameters**

- `node_id` - node identifier
- `bus` - lowercase-and-underscores bus type as a C token (i.e. without quotes)

**Returns**

1 if the node is on a bus of the given type, 0 otherwise

### Instance-based APIs

These are recommended for use within device drivers. To use them, define `DT_DRV_COMPAT` to the lowercase-and-underscores compatible the device driver implements support for. Here is an example devicetree fragment:

```c
serial@40001000 {
    compatible = "vnd,serial";
    status = "okay";
    current-speed = <115200>;
};
```

Example usage, assuming serial@40001000 is the only enabled node with compatible vnd, serial:

```c
#define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0) // node identifier for serial@40001000
DT_INST_PROP(0, current_speed) // 115200
```

## 5.2. Devicetree
Warning: Be careful making assumptions about instance numbers. See DT_INST() for the API guarantees.

As shown above, the DT_INST_* APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the Generic APIs. The equivalent generic API can be found by removing INST_ from the macro name. For example, DT_INST_PROP(inst, prop) is equivalent to DT_PROP(DT_DRV_INST(inst), prop). Similarly, DT_INST_REG_ADDR(inst) is equivalent to DT_REG_ADDR(DT_DRV_INST(inst)), and so on. There are some exceptions: DT_ANY_INST_ON_BUS_STATUS_OKAY() and DT_INST_FOREACH_STATUS_OKAY() are special-purpose helpers without straightforward generic equivalents.

Since DT_DRV_INST() requires DT_DRV_COMPAT to be defined, it’s an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in Hardware specific APIs.

group devicetree-inst

Defines

DT_DRV_INST(inst)
Node identifier for an instance of a DT_DRV_COMPAT compatible.

Parameters

• inst – instance number

Returns

a node identifier for the node with DT_DRV_COMPAT compatible and instance number inst

DT_INST_PARENT(inst)
Get a DT_DRV_COMPAT parent’s node identifier.

See also:

DT_PARENT

Parameters

• inst – instance number

Returns

a node identifier for the instance’s parent

DT_INST_GPARENT(inst)
Get a DT_DRV_COMPAT grandparent’s node identifier.

See also:

DT_GPARENT

Parameters

• inst – instance number
Returns
a node identifier for the instance’s grandparent

DT_INST_CHILD(inst, child)
Get a node identifier for a child node of DT_DRV_INST(inst)

See also:
DT_CHILD

Parameters
• inst – instance number
• child – lowercase-and-underscores child node name

Returns
node identifier for the node with the name referred to by ‘child’

DT_INST_FOREACH_CHILD(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst).
The macro fn should take one argument, which is the node identifier for the child node.
The children will be iterated over in the same order as they appear in the final device-tree.

See also:
DT_FOREACH_CHILD

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier

DT_INST_FOREACH_CHILD_SEP(inst, fn, sep)
Call fn on all child nodes of DT_DRV_INST(inst) with a separator.
The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_SEP

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_VARGS(inst, fn, ...)
Call fn on all child nodes of DT_DRV_INST(inst).
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
The children will be iterated over in the same order as they appear in the final device-tree.

See also:

*DT_FOREACH_CHILD*

**Parameters**

- inst – instance number
- fn – macro to invoke on each child node identifier
- ... – variable number of arguments to pass to fn

**DT_INST_FOREACH_CHILD_SEP_VARGS**(inst, fn, sep, ...)

Call fn on all child nodes of *DT_DRV_INST(inst)* with separator.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:

*DT_FOREACH_CHILD_SEP_VARGS*

**Parameters**

- inst – instance number
- fn – macro to invoke on each child node identifier
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

**DT_INST_FOREACH_CHILD_STATUS_OKAY**(inst, fn)

Call fn on all child nodes of *DT_DRV_INST(inst)* with status okay.

The macro fn should take one argument, which is the node identifier for the child node.

See also:

*DT_FOREACH_CHILD_STATUS_OKAY*

**Parameters**

- inst – instance number
- fn – macro to invoke on each child node identifier

**DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP**(inst, fn, sep)

Call fn on all child nodes of *DT_DRV_INST(inst)* with status okay and with separator.

The macro fn should take one argument, which is the node identifier for the child node.

See also:

*DT_FOREACH_CHILD_STATUS_OKAY_SEP*
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

\texttt{DT_INST_FOREACH_CHILD_STATUS_OKAY_VARGS}(\texttt{inst}, \texttt{fn}, \ldots)

Call \texttt{fn} on all child nodes of \texttt{DT_DRV_INST(\texttt{inst})} with status okay and multiple arguments.

The macro \texttt{fn} takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
\texttt{DT_FOREACH_CHILD_STATUS_OKAY_VARGS}

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• ... – variable number of arguments to pass to \texttt{fn}

\texttt{DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS}(\texttt{inst}, \texttt{fn}, \texttt{sep}, \ldots)

Call \texttt{fn} on all child nodes of \texttt{DT_DRV_INST(\texttt{inst})} with status okay and with separator and multiple arguments.

The macro \texttt{fn} takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
\texttt{DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS}

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• ... – variable number of arguments to pass to \texttt{fn}

\texttt{DT_INST_ENUM_IDX}(\texttt{inst}, \texttt{prop})

Get a \texttt{DT_DRV_COMPAT} value's index into its enumeration values.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name

Returns
zero-based index of the property's value in its enum: list

\texttt{DT_INST_ENUM_IDX_OR}(\texttt{inst}, \texttt{prop}, \texttt{default_idx_value})

Like \texttt{DT_INST_ENUM_IDX()}, but with a fallback to a default enum index.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• default_idx_value – a fallback index value to expand to

Returns
zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_INST_ENUM_HAS_VALUE(inst, prop, value)
Does a DT_DRV_COMPAT enumeration property have a given value?

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• value – lowercase-and-underscores enumeration value

Returns
1 if the node property has the value value, 0 otherwise.

DT_INST_PROP(inst, prop)
Get a DT_DRV_COMPAT instance property.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name

Returns
a representation of the property's value

DT_INST_PROP_LEN(inst, prop)
Get a DT_DRV_COMPAT property length.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name

Returns
logical length of the property

DT_INST_PROP_HAS_IDX(inst, prop, idx)
Is index idx valid for an array type property on a DT_DRV_COMPAT instance?

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• idx – index to check

Returns
1 if idx is a valid index into the given property, 0 otherwise.

DT_INST_PROP_HAS_NAME(inst, prop, name)
Is name name available in a foo-names property?

Parameters
• inst – instance number
• prop – a lowercase-and-underscores prop-names type property
• name – a lowercase-and-underscores name to check
Returns
An expression which evaluates to 1 if name is an available name into the given property, and 0 otherwise.

`DT_INST_PROP_BY_IDX(inst, prop, idx)`
Get a `DT_DRV_COMPAT` element value in an array property.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

Returns
a representation of the idx-th element of the property

`DT_INST_PROP_OR(inst, prop, default_value)`
Like `DT_INST_PROP()`, but with a fallback to default_value.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

Returns
`DT_INST_PROP(inst, prop)` or `default_value`

`DT_INST_PROP_LEN_OR(inst, prop, default_value)`
Like `DT_INST_PROP_LEN()`, but with a fallback to default_value.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

Returns
`DT_INST_PROP_LEN(inst, prop)` or `default_value`

`DT_INST_STRING_TOKEN(inst, prop)`
Get a `DT_DRV_COMPAT` instance's string property's value as a token.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

Returns
the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_UPPER_TOKEN(inst, prop)`
Like `DT_INST_STRING_TOKEN()`, but uppercased.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

Returns
the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores
DT_INST_STRING_UNQUOTED(inst, prop)
Get a DT_DRV_COMPAT instance's string property's value as an unquoted sequence of tokens.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
the value of prop as a sequence of tokens, with no quotes

DT_INST_STRING_TOKEN_BY_IDX(inst, prop, idx)
Get an element out of string-array property as a token.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as a token

DT_INST_STRING_UPPER_TOKEN_BY_IDX(inst, prop, idx)
Like DT_INST_STRING_TOKEN_BY_IDX(), but upcased.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as an upcased token

DT_INST_STRING_UNQUOTED_BY_IDX(inst, prop, idx)
Get an element out of string-array property as an unquoted sequence of tokens.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the value of prop at index idx as a sequence of tokens, with no quotes

DT_INST_PROP_BY_PHANDLE(inst, ph, prop)
Get a DT_DRV_COMPAT instance's property value from a phandle's node.

**Parameters**
- inst – instance number
- ph – lowercase-and-underscores property of inst with type phandle
- prop – lowercase-and-underscores property of the phandle's node

**Returns**
the value of prop as described in the DT_PROP() documentation
DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)
Get a DT_DRV_COMPAT instance's property value from a phandle in a property.

Parameters

- **inst** – instance number
- **phs** – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- **idx** – logical index into “phs”, which must be zero if “phs” has type phandle
- **prop** – lowercase-and-underscores property of the phandle's node

Returns

the value of prop as described in the DT_PROP documentation

DT_INST_PHA_BY_IDX(inst, pha, idx, cell)
Get a DT_DRV_COMPAT instance's phandle-array specifier value at an index.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into the property pha
- **cell** – binding's cell name within the specifier at index idx

Returns

the value of the cell inside the specifier at index idx

DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)
Like DT_INST_PHA_BY_IDX(), but with a fallback to default_value.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into the property pha
- **cell** – binding's cell name within the specifier at index idx
- **default_value** – a fallback value to expand to

Returns

DT_INST_PHA_BY_IDX(inst, pha, idx, cell) or default_value

DT_INST_PHA(inst, pha, cell)
Get a DT_DRV_COMPAT instance's phandle-array specifier value Equivalent to

DT_INST_PHA_BY_IDX(inst, pha, 0, cell)

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – binding's cell name for the specifier at pha index 0

Returns

the cell value

DT_INST_PHA_OR(inst, pha, cell, default_value)
Like DT_INST_PHA(), but with a fallback to default_value.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• cell – binding's cell name for the specifier at pha index 0
• default_value – a fallback value to expand to

Returns
\texttt{DT\_INST\_PHA(inst, pha, cell)} or default_value

\texttt{DT\_INST\_PHA\_BY\_NAME}(inst, pha, name, cell)
Get a \texttt{DT\_DRV\_COMPAT} instance's value within a phandle-array specifier by name.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• name – lowercase-and-underscores name of a specifier in pha
• cell – binding's cell name for the named specifier

Returns
the cell value

\texttt{DT\_INST\_PHA\_BY\_NAME\_OR}(inst, pha, name, cell, default_value)
Like \texttt{DT\_INST\_PHA\_BY\_NAME()}, but with a fallback to default_value.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• name – lowercase-and-underscores name of a specifier in pha
• cell – binding's cell name for the named specifier
• default_value – a fallback value to expand to

Returns
\texttt{DT\_INST\_PHA\_BY\_NAME(inst, pha, name, cell)} or default_value

\texttt{DT\_INST\_PHANDLE\_BY\_NAME}(inst, pha, name)
Get a \texttt{DT\_DRV\_COMPAT} instance's phandle node identifier from a phandle array by name.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• name – lowercase-and-underscores name of an element in pha

Returns
node identifier for the phandle at the element named “name”

\texttt{DT\_INST\_PHANDLE\_BY\_IDX}(inst, prop, idx)
Get a \texttt{DT\_DRV\_COMPAT} instance's node identifier for a phandle in a property.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name in inst with type phandle, phandles or phandle-array
• idx – index into prop

Returns
a node identifier for the phandle at index idx in prop
DT_INST_PHANDLE(inst, prop)
Get a DT_DRV_COMPAT instance's node identifier for a phandle property's value.

Parameters
- `inst` – instance number
- `prop` – lowercase-and-underscores property of `inst` with type phandle

Returns
a node identifier for the node pointed to by “ph”

DT_INST_REG_HAS_IDX(inst, idx)
is `idx` a valid register block index on a DT_DRV_COMPAT instance?

Parameters
- `inst` – instance number
- `idx` – index to check

Returns
1 if `idx` is a valid register block index, 0 otherwise.

DT_INST_REG_ADDR_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance's idx-th register block's address.

Parameters
- `inst` – instance number
- `idx` – index of the register whose address to return

Returns
address of the instance's idx-th register block

DT_INST_REG_SIZE_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance's idx-th register block's size.

Parameters
- `inst` – instance number
- `idx` – index of the register whose size to return

Returns
size of the instance's idx-th register block

DT_INST_REG_ADDR_BY_NAME(inst, name)
Get a DT_DRV_COMPAT's register block address by name.

Parameters
- `inst` – instance number
- `name` – lowercase-and-underscores register specifier name

Returns
address of the register block with the given name

DT_INST_REG_ADDR_BY_NAME_U64(inst, name)
64-bit version of `DT_INST_REG_ADDR_BY_NAME()`
This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to `DT_INST_REG_ADDR_BY_NAME()` in linker/ASM context.

Parameters
- `inst` – instance number
DT_INST_REG_SIZE_BY_NAME(inst, name)
Get a DT_DRV_COMPAT's register block size by name.

Parameters
• inst – instance number
• name – lowercase-and-underscores register specifier name

Returns
address of the register block with the given name

DT_INST_REG_ADDR(inst)
Get a DT_DRV_COMPAT's (only) register block address.

Parameters
• inst – instance number

Returns
instance's register block address

DT_INST_REG_ADDR_U64(inst)
64-bit version of DT_INST_REG_ADDR()

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to DT_INST_REG_ADDR() in linker/ASM context.

Parameters
• inst – instance number

Returns
instance's register block address

DT_INST_REG_SIZE(inst)
Get a DT_DRV_COMPAT's (only) register block size.

Parameters
• inst – instance number

Returns
instance's register block size

DT_INST_IRQ_LEVEL(inst)
Get a DT_DRV_COMPAT interrupt level.

Parameters
• inst – instance number

Returns
interrupt level

DT_INST_IRQ_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT interrupt specifier value at an index.

Parameters
• inst – instance number
• idx – logical index into the interrupt specifier array
• cell – cell name specifier
**Returns**
the named value at the specifier given by the index

\texttt{DT_INST_IRQ_INTC\_BY\_IDX}(inst, idx)
Get a DT\_DRV\_COMPAT interrupt specifier's interrupt controller by index.

**Parameters**
- \texttt{inst} – instance number
- \texttt{idx} – interrupt specifier’s index

**Returns**
node\_id of interrupt specifier's interrupt controller

\texttt{DT\_INST\_IRQ\_INTC\_BY\_NAME}(inst, name)
Get a DT\_DRV\_COMPAT interrupt specifier's interrupt controller by name.

**Parameters**
- \texttt{inst} – instance number
- \texttt{name} – interrupt specifier’s name

**Returns**
node\_id of interrupt specifier's interrupt controller

\texttt{DT\_INST\_IRQ\_INTC}(inst)
Get a DT\_DRV\_COMPAT interrupt specifier's interrupt controller.

**See also:**
\texttt{DT\_INST\_IRQ\_INTC\_BY\_IDX()}

**Note:** Equivalent to \texttt{DT\_INST\_IRQ\_INTC\_BY\_IDX(node\_id, 0)}

**Parameters**
- \texttt{inst} – instance number

**Returns**
node\_id of interrupt specifier's interrupt controller

\texttt{DT\_INST\_IRQ\_BY\_NAME}(inst, name, cell)
Get a DT\_DRV\_COMPAT interrupt specifier value by name.

**Parameters**
- \texttt{inst} – instance number
- \texttt{name} – lowercase-and-underscores interrupt specifier name
- \texttt{cell} – cell name specifier

**Returns**
the named value at the specifier given by the index

\texttt{DT\_INST\_IRQ}(inst, cell)
Get a DT\_DRV\_COMPAT interrupt specifier's value.

**Parameters**
- \texttt{inst} – instance number
- \texttt{cell} – cell name specifier
Returns
the named value at that index.

DT_INST_IRQN(inst)
Get a DT_DRV_COMPAT's (only) irq number.

Parameters
- inst – instance number

Returns
the interrupt number for the node's only interrupt

DT_INST_IRQN_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT's irq number at index.

Parameters
- inst – instance number
- idx – logical index into the interrupt specifier array

Returns
the interrupt number for the node's idx-th interrupt

DT_INST_BUS(inst)
Get a DT_DRV_COMPAT's bus node identifier.

Parameters
- inst – instance number

Returns
node identifier for the instance's bus node

DT_INST_ON_BUS(inst, bus)
Test if a DT_DRV_COMPAT's bus type is a given type.

Parameters
- inst – instance number
- bus – a binding's bus type as a C token, lowercased and without quotes

Returns
1 if the given instance is on a bus of the given type, 0 otherwise

DT_INST_STRING_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_TOKEN(), but with a fallback to default_value.

Parameters
- inst – instance number
- name – lowercase-and-underscores property name
- default_value – a fallback value to expand to

Returns
if prop exists, its value as a token, i.e. without any quotes and with special characters converted to underscores. Otherwise default_value

DT_INST_STRING_UPPER_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_UPPER_TOKEN(), but with a fallback to default_value.

Parameters
- inst – instance number
- name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

**Returns**
the property's value as an uppercased token, or default_value

`DT_INST_STRING_UNQUOTED_OR(inst, name, default_value)`
Like `DT_INST_STRING_UNQUOTED()`, but with a fallback to default_value.

**Parameters**
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

**Returns**
the property's value as a sequence of tokens, with no quotes, or default_value

`DT_HAS_COMPAT_ON_BUS_STATUS_OKAY(compat, bus)`

`DT_ANY_INST_ON_BUS_STATUS_OKAY(bus)`
Test if any DT_DRV_COMPAT node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:

```plaintext
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming i2c0 is an I2C bus controller node, and therefore temp is on an I2C bus:

```plaintext
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
```

**Parameters**
• bus – a binding's bus type as a C token, lowercased and without quotes

**Returns**
1 if any enabled node with that compatible is on that bus type, 0 otherwise

`DT_ANY_INST_HAS_PROP_STATUS_OKAY(prop)`
Check if any DT_DRV_COMPAT node with status okay has a given property.

Example devicetree overlay:

```plaintext
&i2c0 {
    sensor0: sensor@0 {
        compatible = "vnd,some-sensor";
        status = "okay";
        reg = <0>;
        foo = <1>;
    };
};
```
bar = <2>;
};

sensor1: sensor@1 {
    compatible = "vnd,some-sensor";
    status = "okay";
    reg = <1>;
    foo = <2>;
};

sensor2: sensor@2 {
    compatible = "vnd,some-sensor";
    status = "disabled";
    reg = <2>;
    baz = <1>;
};

Example usage:

#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_HAS_PROP_STATUS_OKAY(foo) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(bar) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(baz) // 0

Parameters

• prop – lowercase-and-underscores property name

DT_INST_FOREACH_STATUS_OKAY(fn)

Call fn on all nodes with compatible DT_DRV_COMPAT and status okay

This macro calls fn(inst) on each inst number that refers to a node with status okay. Whitespace is added between invocations.

Example devicetree fragment:

a {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_A";
};

b {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_B";
};

c {
    compatible = "vnd,device";
    status = "disabled";
    foobar = "DEV_C";
};

Example usage:

#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_PROP(inst, foobar),
DT_INST_FOREACH_STATUS_OKAY(MY_FN)
This expands to:

```
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```
"DEV_A", "DEV_B",
```

or this:

```
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that `fn` is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver's compatible `DT_DRV_COMPAT`.

**Parameters**

- `fn` – Macro to call for each enabled node. Must accept an instance number as its only parameter.

```
DT_INST_FOREACH_STATUS_OKAY_VARGS(fn, ...)
```

Call `fn` on all nodes with compatible `DT_DRV_COMPAT` and status okay with multiple arguments.

**See also:**

`DT_INST_FOREACH_STATUS_OKAY`  

**Parameters**

- `fn` – Macro to call for each enabled node. Must accept an instance number as its only parameter.  
- `...` – variable number of arguments to pass to `fn`

```
DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)
```

Invokes `fn` for each element of property `prop` for a `DT_DRV_COMPAT` instance.

Equivalent to `DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn)`.

**Parameters**

- `inst` – instance number  
- `prop` – lowercase-and-underscores property name  
- `fn` – macro to invoke

```
DT_INST_FOREACH_PROP_ELEM_SEP(inst, prop, fn, sep)
```

Invokes `fn` for each element of property `prop` for a `DT_DRV_COMPAT` instance with a separator.

Equivalent to `DT_FOREACH_PROP_ELEM_SEP(DT_DRV_INST(inst), prop, fn, sep)`.

**Parameters**

- `inst` – instance number  
- `prop` – lowercase-and-underscores property name  
- `fn` – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

```c
DT_INST_FOREACH_PROP_ELEM_VARGS(inst, prop, fn, ...)
```
Invokes `fn` for each element of property `prop` for a `DT_DRV_COMPAT` instance with multiple arguments.

Equivalent to `DT_FOREACH_PROP_ELEM_VARGS(DT_DRV_INST(inst), prop, fn, VA_ARGS)`

See also:

```c
DT_INST_FOREACH_PROP_ELEM
```

Parameters
- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

```c
DT_INST_FOREACH_PROP_ELEM_SEP_VARGS(inst, prop, fn, sep, ...)
```
Invokes `fn` for each element of property `prop` for a `DT_DRV_COMPAT` instance with multiple arguments and a separator.

Equivalent to `DT_FOREACH_PROP_ELEM_SEP_VARGS(DT_DRV_INST(inst), prop, fn, sep, VA_ARGS)`

See also:

```c
DT_INST_FOREACH_PROP_ELEM
```

Parameters
- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator:
- `...` – variable number of arguments to pass to `fn`

```c
DT_INST_NODE_HAS_PROP(inst, prop)
```
Does a `DT_DRV_COMPAT` instance have a property?

Parameters
- `inst` – instance number
- `prop` – lowercase-and-underscores property name

Returns
1 if the instance has the property, 0 otherwise.

```c
DT_INST_PHA_HAS_CELL_AT_IDX(inst, pha, idx, cell)
```
Does a phandle array have a named cell specifier at an index for a `DT_DRV_COMPAT` instance?

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• idx – index to check
• cell – named cell value whose existence to check

Returns
1 if the named cell exists in the specifier at index idx, 0 otherwise.

**DT_INST_PHA_HAS_CELL** (inst, pha, cell)

Does a phandle array have a named cell specifier at index 0 for a DT_DRV_COMPAT instance?

**Parameters**
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the specifier at index 0, 0 otherwise.

**DT_INST_IRQ_HAS_IDX** (inst, idx)

is index valid for interrupt property on a DT_DRV_COMPAT instance?

**Parameters**
- inst – instance number
- idx – logical index into the interrupt specifier array

**Returns**
1 if the idx is valid for the interrupt property 0 otherwise.

**DT_INST_IRQ_HAS_CELL_AT_IDX** (inst, idx, cell)

Does a DT_DRV_COMPAT instance have an interrupt named cell specifier?

**Parameters**
- inst – instance number
- idx – index to check
- cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

**DT_INST_IRQ_HAS_CELL** (inst, cell)

Does a DT_DRV_COMPAT instance have an interrupt value?

**Parameters**
- inst – instance number
- cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

**DT_INST_IRQ_HAS_NAME** (inst, name)

Does a DT_DRV_COMPAT instance have an interrupt value?

**Parameters**
- inst – instance number
- name – lowercase-and-underscores interrupt specifier name
Returns
1 if name is a valid named specifier

Hardware specific APIs  The following APIs can also be used by including <devicetree.h>; no additional include is needed.

CAN  These conveniences may be used for nodes which describe CAN controllers/transceivers, and properties related to them.

group devicetree-can

Defines

DT_CAN_TRANSCEIVER_MAX_BITRATE(node_id, max)
Get the maximum transceiver bitrate for a CAN controller.
The bitrate will be limited to the maximum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the maximum bitrate will be that of the CAN controller.

Example devicetree fragment:

```
transceiver0: can-phy0 {
    compatible = "vnd,can-transceiver";
    max-bitrate = <1000000>;
    #phy-cells = <0>;
};

can0: can@... {
    compatible = "vnd,can-controller";
    phys = <&transceiver0>;
};

can1: can@... {
    compatible = "vnd,can-controller";
    can-transceiver {
        max-bitrate = <2000000>;
    };
};
```

Example usage:

```
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can0), 5000000) // 1000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 5000000) // 2000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 1000000) // 1000000
```

Parameters
- **node_id** – node identifier
- **max** – maximum bitrate supported by the CAN controller

Returns
the maximum bitrate supported by the CAN controller/transceiver combination
**DT_INST_CAN_TRANSCEIVER_MAX_BITRATE** (inst, max)

Get the maximum transceiver bitrate for a DT_DRV_COMPAT CAN controller.

**See also:**

**DT_CAN_TRANSCEIVER_MAX_BITRATE()**

**Parameters**

- **inst** – DT_DRV_COMPAT instance number
- **max** – maximum bitrate supported by the CAN controller

**Returns**

the maximum bitrate supported by the CAN controller/transceiver combination

**Clocks**  These conveniences may be used for nodes which describe clock sources, and properties related to them.

**group devicetree-clocks**

**Defines**

**DT_CLOCKS_HAS_IDX** (node_id, idx)

Test if a node has a clocks phandle-array property at a given index.

This expands to 1 if the given index is valid clocks property phandle-array index. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
    clocks = <...>, <...>;
};
n2: node-2 {
    clocks = <...>;
};
```

Example usage:

```plaintext
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n2), 1) // 0
```

**Parameters**

- **node_id** – node identifier; may or may not have any clocks property
- **idx** – index of a clocks property phandle-array whose existence to check

**Returns**

1 if the index exists, 0 otherwise
**DT_CLOCKS_HAS_NAME**(*node_id, name*)

Test if a node has a clock-names array property holds a given name.

This expands to 1 if the name is available as clocks-name array property cell. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
    clocks = <...>, <...>;
    clock-names = "alpha", "beta";
};

n2: node-2 {
    clocks = <...>;
    clock-names = "alpha";
};
```

Example usage:

```plaintext
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), alpha) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), beta) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n2), beta) // 0
```

**Parameters**

- **node_id** – node identifier; may or may not have any clock-names property.
- **name** – lowercase-and-underscores clock-names cell value name to check

**Returns**

1 if the clock name exists, 0 otherwise

**DT_NUM_CLOCKS**(*node_id*)

Get the number of elements in a clocks property.

Example devicetree fragment:

```plaintext
n1: node-1 {
    clocks = <&foo>, <&bar>;
};

n2: node-2 {
    clocks = <&foo>;
};
```

Example usage:

```plaintext
DT_NUM_CLOCKS(DT_NODELABEL(n1)) // 2
DT_NUM_CLOCKS(DT_NODELABEL(n2)) // 1
```

**Parameters**

- **node_id** – node identifier with a clocks property

**Returns**

number of elements in the property

**DT_CLOCKS_CTLR_BY_IDX**(*node_id, idx*)

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:
clk1: clock-controller@... { ...; 
clk2: clock-controller@... { ...; 
n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>; 
};

Example usage:
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)

See also:
DT_PHANDLE_BY_IDX()

Parameters
  • node_id – node identifier
  • idx – logical index into “clocks”

Returns
  the node identifier for the clock controller referenced at index “idx”

DT_CLOCKS_CTLR(node_id)
Equivalent to DT_CLOCKS_CTLR_BY_IDX(node_id, 0)

See also:
DT_CLOCKS_CTLR_BY_IDX()

Parameters
  • node_id – node identifier

Returns
  a node identifier for the clocks controller at index 0 in “clocks”

DT_CLOCKS_CTLR_BY_NAME(node_id, name)
Get the node identifier for the controller phandle from a clocks phandle-array property by name.
Example devicetree fragment:
clk1: clock-controller@... { ...; 
clk2: clock-controller@... { ...; 
n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>; 
    clock-names = "alpha", "beta";
};

Example usage:
DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)

See also:
DT_PHANDLE_BY_NAME()
Parameters

- **node_id** – node identifier
- **name** – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

Returns

the node identifier for the clock controller referenced by name

**DT_CLOCKS_CELL_BY_IDX(node_id, idx, cell)**

Get a clock specifier's cell value at an index.

Example devicetree fragment:

```
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};
```

Bindings fragment for the vnd,clock compatible:

```
clock-cells:
- bus
- bits
```

Example usage:

```
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 0, bus) // 10
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 1, bits) // 40
```

See also:

**DT_PHA_BY_IDX()**

Parameters

- **node_id** – node identifier for a node with a clocks property
- **idx** – logical index into clocks property
- **cell** – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

**DT_CLOCKS_CELL_BY_NAME(node_id, name, cell)**

Get a clock specifier's cell value by name.

Example devicetree fragment:

```
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
    clock-names = "alpha", "beta";
};
```

Bindings fragment for the vnd,clock compatible:
clock-cells:
- bus
- bits

Example usage:
```
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus) // 10
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40
```

See also:

**DT_PHA_BY_NAME()**

Parameters

- **node_id** – node identifier for a node with a clocks property
- **name** – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property
- **cell** – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

```
DT_CLOCKS_CELL(node_id, cell)
```

Equivalent to **DT_CLOCKS_CELL_BY_IDX(node_id, 0, cell)**

See also:

**DT_CLOCKS_CELL_BY_IDX()**

Parameters

- **node_id** – node identifier for a node with a clocks property
- **cell** – lowercase-and-underscores cell name

Returns

the cell value at index 0

```
DT_INST_CLOCKS_HAS_IDX(inst, idx)
```

Equivalent to **DT_CLOCKS_HAS_IDX(DT_DRV_INST(inst), idx)**

Parameters

- **inst** – DT_DRV_COMPAT instance number; may or may not have any clocks property
- **idx** – index of a clocks property phandle-array whose existence to check

Returns

1 if the index exists, 0 otherwise

```
DT_INST_CLOCKS_HAS_NAME(inst, name)
```

Equivalent to **DT_CLOCK_HAS_NAME(DT_DRV_INST(inst), name)**

Parameters

- **inst** – DT_DRV_COMPAT instance number; may or may not have any clock-names property.
- **name** – lowercase-and-underscores clock-names cell value name to check

Returns

1 if the clock name exists, 0 otherwise
DT_INST_NUM_CLOCKS(inst)
   Equivalent to DT_NUM_CLOCKS(DT_DRV_INST(inst))

   Parameters
   • inst – instance number

   Returns
   number of elements in the clocks property

DT_INST_CLOCKS_CTLR_BY_IDX(inst, idx)
   Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

   See also:
   DT_CLOCKS_CTLR_BY_IDX()

   Parameters
   • inst – instance number
   • idx – logical index into “clocks”

   Returns
   the node identifier for the clock controller referenced at index “idx”

DT_INST_CLOCKS_CTLR(inst)
   Equivalent to DT_INST_CLOCKS_CTLR_BY_IDX(inst, 0)

   See also:
   DT_CLOCKS_CTLR()

   Parameters
   • inst – instance number

   Returns
   a node identifier for the clocks controller at index 0 in “clocks”

DT_INST_CLOCKS_CTLR_BY_NAME(inst, name)
   Get the node identifier for the controller phandle from a clocks phandle-array property by name.

   See also:
   DT_CLOCKS_CTLR_BY_NAME()

   Parameters
   • inst – instance number
   • name – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

   Returns
   the node identifier for the clock controller referenced by the named element
DT_INST_CLOCKS_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value at an index.

See also:
DT_CLOCKS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value by name.

See also:
DT_CLOCKS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_CLOCKS_CELL (inst, cell)
Equivalent to DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)

Parameters
• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

Returns
the value of the cell inside the specifier at index 0

DMA These conveniences may be used for nodes which describe direct memory access controllers or channels, and properties related to them.

5.2. Devicetree

Defines
DT_DMAS_CTLR_BY_IDX(node_id, idx)
Get the node identifier for the DMA controller from a dmas property at an index.
Example devicetree fragment:

```
dma1: dma@... { ... };
dma2: dma@... { ... };
n: node {
  dmas = <&dma1 1 2 0x400 0x3>,
      <&dma2 6 3 0x404 0x5>;
};
```

Example usage:

```
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(dma2)
```

See also:

DT_PROP_BY_PHANDLE_IDX()

Parameters
- node_id – node identifier for a node with a dmas property
- idx – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

DT_DMAS_CTLR_BY_NAME(node_id, name)
Get the node identifier for the DMA controller from a dmas property by name.
Example devicetree fragment:

```
dma1: dma@... { ... };
dma2: dma@... { ... };
n: node {
  dmas = <&dma1 1 2 0x400 0x3>,
      <&dma2 6 3 0x404 0x5>;
  dma-names = "tx", "rx";
};
```

Example usage:

```
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)
```

See also:

DT_PHANDLE_BY_NAME()

Parameters
- node_id – node identifier for a node with a dmas property
- name – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns
the node identifier for the DMA controller in the named element

DT_DMAS_CTLR(node_id)
Equivalent to DT_DMAS_CTLR_BY_IDX(node_id, 0)

See also:
DT_DMAS_CTLR_BY_IDX()

Parameters
• node_id – node identifier for a node with a dmas property

Returns
the node identifier for the DMA controller at index 0 in the node’s “dmas” property

DT_INST_DMAS_CTLR_BY_IDX(inst, idx)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance’s dmas property at an index.

See also:
DT_DMAS_CTLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

DT_INST_DMAS_CTLR_BY_NAME(inst, name)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance’s dmas property by name.

See also:
DT_DMAS_CTLR_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns
the node identifier for the DMA controller in the named element

DT_INST_DMAS_CTLR(inst)
Equivalent to DT_INST_DMAS_CTLR_BY_IDX(inst, 0)

See also:
DT_DMAS_CTLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

5.2. Devicetree

1361
Returns
the node identifier for the DMA controller at index 0 in the instance's "dmas" property

DT_DMAS_CELL_BY_IDX(node_id, idx, cell)
Get a DMA specifier's cell value at an index.

Example devicetree fragment:

dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};
dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};
n: node {
    dmas = <&dma1 1 0x400>,
         <&dma2 6 0x404>;
}

Bindings fragment for the vnd,dma compatible:

dma-cells:
- channel
- config

Example usage:

DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 6
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, config) // 0x400
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, config) // 0x404

See also:
DT_PHA_BY_IDX()

Parameters
- node_id – node identifier for a node with a dmas property
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_INST_DMAS_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance's DMA specifier's cell value at an index.

See also:
DT_DMAS_CELL_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into dmas property
• **cell** – lowercase-and-underscores cell name

**Returns**
the cell value at index “idx”

**DT_DMAS_CELL_BY_NAME**(node_id, name, cell)
Get a DMA specifier's cell value by name.

Example devicetree fragment:

```plaintext
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
             <&dma2 6 0x404>;
    dma-names = "tx", "rx";
};
```

Bindings fragment for the vnd,dma compatible:

```plaintext
dma-cells:
    - channel
    - config
```

Example usage:

```plaintext
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

**See also:**

**DT_PHA_BY_NAME()**

**Parameters**

• **node_id** – node identifier for a node with a dmas property

• **name** – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

• **cell** – lowercase-and-underscores cell name

**Returns**
the cell value in the specifier at the named element

**DT_INST_DMAS_CELL_BY_NAME**(inst, name, cell)
Get a DT_DRV_COMPAT instance's DMA specifier's cell value by name.

**See also:**

**DT_DMAS_CELL_BY_NAME()**

**Parameters**
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

\textbf{DT\_DMAS\_HAS\_IDX}(\text{node}\_id, idx)
Is index “idx” valid for a dmas property?

Parameters
• node\_id – node identifier for a node with a dmas property
• idx – logical index into dmas property

Returns
1 if the “dmas” property has index “idx”, 0 otherwise

\textbf{DT\_INST\_DMAS\_HAS\_IDX}(\text{inst}, idx)
Is index “idx” valid for a DT_DRV_COMPAT instance's dmas property?

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into dmas property

Returns
1 if the “dmas” property has a specifier at index “idx”, 0 otherwise

\textbf{DT\_DMAS\_HAS\_NAME}(\text{node}\_id, name)
Does a dmas property have a named element?

Parameters
• node\_id – node identifier for a node with a dmas property
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

\textbf{DT\_INST\_DMAS\_HAS\_NAME}(\text{inst}, name)
Does a DT_DRV_COMPAT instance's dmas property have a named element?

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

\textbf{Fixed flash partitions} These conveniences may be used for the special-purpose fixed-partitions compatible used to encode information about flash memory partitions in the device tree. See \texttt{fixed-partition} for more details.
Defines

DT_NODE_BY_FIXED_PARTITION_LABEL(label)
Get a node identifier for a fixed partition with a given label property.
Example devicetree fragment:

```
flash@... {
    partitions {
        compatible = "fixed-partitions";
        boot_partition: partition@0 {
            label = "mcuboot";
        };
        slot0_partition: partition@c000 {
            label = "image-0";
        };
        ...
    }
};
```

Example usage:

```
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_partition
```

Parameters

- label – lowercase-and-underscores label property value

Returns

da node identifier for the partition with that label property

DT_HAS_FIXED_PARTITION_LABEL(label)
Test if a fixed partition with a given label property exists.

Parameters

- label – lowercase-and-underscores label property value

Returns

1 if any “fixed-partitions” child node has the given label, 0 otherwise.

DT_FIXED_PARTITION_EXISTS(node_id)
Test if fixed-partition compatible node exists.

Parameters

- node_id – DTS node to test

Returns

1 if node exists and is fixed-partition compatible, 0 otherwise.

DT_FIXED_PARTITION_ID(node_id)
Get a numeric identifier for a fixed partition.

Parameters

- node_id – node identifier for a fixed-partitions child node

Returns

the partition’s ID, a unique zero-based index number

DT_MEM_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash memory for a partition.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the internal memory that contains the fixed-partitions node, or DT_INVALID_NODE if it doesn't exist.

DT_MTD_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash controller for a partition.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the memory technology device that contains the fixed-partitions node.

DT_FIXED_PARTITION_ADDR(node_id)
Get the absolute address of a fixed partition.

Example devicetree fragment:

```
&flash_controller {
    flash@1000000 {
        compatible = "soc-nv-flash";
        partitions {
            compatible = "fixed-partitions";
            storage_partition: partition@3a000 {
                label = "storage";
            };
        };
    };
};
```

Here, the “storage” partition is seen to belong to flash memory starting at address 0x1000000. The partition’s unit address of 0x3a000 represents an offset inside that flash memory.

Example usage:

```
DT_FIXED_PARTITION_ADDR(DT_NODELABEL(storage_partition)) // 0x103a000
```

This macro can only be used with partitions of internal memory addressable by the CPU. Otherwise, it may produce a compile-time error, such as: __REG_IDX_0_VAL_ADDRESS’ undeclared’.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the partition’s offset plus the base address of the flash node containing it.

GPIO These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

```
group devicetree-gpio
```

Defines
### DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, idx)

Get the node identifier for the controller phandle from a gpio phandle-array property at an index.

Example devicetree fragment:

```plaintext
gpio1: gpio@... { }
gpio2: gpio@... { }

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
             <&gpio2 30 GPIO_ACTIVE_HIGH>;
}
```

Example usage:

```
DT_GPIO_CTLR_BY_IDX(DT_NODELABEL(n), gpios, 1) // DT_NODELABEL(gpio2)
```

**See also:**
- `DT_PHANDLE_BY_IDX()`

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio_pha”

**Returns**

the node identifier for the gpio controller referenced at index “idx”

### DT_GPIO_CTLR(node_id, gpio_pha)

Equivalent to `DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, 0)`

**See also:**
- `DT_GPIO_CTLR_BY_IDX()`

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**

a node identifier for the gpio controller at index 0 in “gpio_pha”

### DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)

Get a GPIO specifier's pin cell at an index.

This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
}
```
gpio2: gpio@... {
   compatible = "vnd,gpio";
   #gpio-cells = <2>;
};

n: node {
   gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
         <&gpio2 30 GPIO_ACTIVE_HIGH>;
};

Bindings fragment for the vnd,gpio compatible:

gpio-cells:
  - pin
  - flags

Example usage:

```
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30
```

See also:

`DT_PHA_BY_IDX()`

Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio_pha”

Returns

the pin cell value at index “idx”

```
DT_GPIO_PIN(node_id, gpio_pha)
```
Equivalent to `DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, 0)`

See also:

`DT_GPIO_PIN_BY_IDX()`

Parameters

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

Returns

the pin cell value at index 0

```
DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, idx)
```
Get a GPIO specifier's flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.
Example devicetree fragment:

```c
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
          <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```c
gpio-cells:
    - pin
    - flags
```

Example usage:

```c
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 0) // GPIO_ACTIVE_LOW
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 1) // GPIO_ACTIVE_HIGH
```

See also:

`DT_PHA_BY_IDX()`

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio_pha”

**Returns**

the flags cell value at index “idx”, or zero if there is none

`DT_GPIO_FLAGS(node_id, gpio_pha)`

Equivalent to `DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, 0)`

See also:

`DT_GPIO_FLAGS_BY_IDX()`

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**

the flags cell value at index 0, or zero if there is none
DT_NUM_GPIO_HOGS(node_id)
Get the number of GPIO hogs in a node.
This expands to the number of hogged GPIOs, or zero if there are none.
Example devicetree fragment:

```dtb
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;

    n1: node-1 {
        gpio-hog;
        gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
        output-high;
    }

    n2: node-2 {
        gpio-hog;
        gpios = <3 GPIO_ACTIVE_HIGH>;
        output-low;
    }
};
```

Bindings fragment for the vnd,gpio compatible:

```dtb
gpio-cells:
- pin
- flags
```

Example usage:

```c
DT_NUM_GPIO_HOGS(DT_NODELABEL(n1)) // 2
DT_NUM_GPIO_HOGS(DT_NODELABEL(n2)) // 1
```

**Parameters**
- node_id – node identifier; may or may not be a GPIO hog node.

**Returns**
number of hogged GPIOs in the node

DT_GPIO_HOG_PIN_BY_IDX(node_id, idx)
Get a GPIO hog specifier's pin cell at an index.
This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding to check if necessary.
Example devicetree fragment:

```dtb
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;

    n1: node-1 {
        gpio-hog;
        gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
        output-high;
    }

    n2: node-2 {
        gpio-hog;
        gpios = <3 GPIO_ACTIVE_HIGH>;
    }
};
```

(continues on next page)
Bindings fragment for the vnd,gpio compatible:

gpio-cells:
- pin
- flags

Example usage:

```
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 0) // 0
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 1) // 1
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n2), 0) // 3
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into “gpios”

**Returns**

the pin cell value at index “idx”

**DT_GPIO_HOG_FLAGS_BY_IDX(node_id, idx)**

Get a GPIO hog specifier's flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;

    n1: node-1 {
        gpio-hog;
        gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
        output-high;
    };

    n2: node-2 {
        gpio-hog;
        gpios = <3 GPIO_ACTIVE_HIGH>;
        output-low;
    };
}
```

Bindings fragment for the vnd,gpio compatible:

gpio-cells:
- pin
- flags

Example usage:

```
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 0) // GPIO_ACTIVE_HIGH
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 1) // GPIO_ACTIVE_LOW
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n2), 0) // GPIO_ACTIVE_HIGH
```
Parameters
• node_id – node identifier
• idx – logical index into “gpios”

Returns
the flags cell value at index “idx”, or zero if there is none

DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance's GPIO specifier's pin cell value at an index.

See also:
DT_GPIO_PIN_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the pin cell value at index “idx”

DT_INST_GPIO_PIN(inst, gpio_pha)
Equivalent to DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, 0)

See also:
DT_INST_GPIO_PIN_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance’s GPIO specifier’s flags cell at an index.

See also:
DT_GPIO_FLAGS_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the flags cell value at index “idx”, or zero if there is none
DT_INST_GPIO_FLAGS(inst, gpio_pha)
   Equivalent to DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, 0)

See also:
   DT_INST_GPIO_FLAGS_BY_IDX()

Parameters
   - inst – DT_DRV_COMPAT instance number
   - gpio_pha – lowercase-and-underscores GPIO property with type
     “phandle-array”

Returns
   the flags cell value at index 0, or zero if there is none

IO channels
These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

group devicetree-io-channels

Defines

DT_IO_CHANNELS_CTLR_BY_IDX(node_id, idx)
   Get the node identifier for the node referenced by an io-channels property at an index.
   Example devicetree fragment:

   adc1: adc@... { ... };
   adc2: adc@... { ... };
   n: node {
       io-channels =<&adc1 10>,<&adc2 20>;
   };

   Example usage:
   DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
   DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)

See also:
   DT_PROP_BY_PHANDLE_IDXX()
adc1: adc@... { ... };
adc2: adc@... { ... };

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};

Example usage:

```c
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), sensor)  // DT_NODELABEL(adc1)  DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), bandgap) // DT_NODELABEL(adc2)
```

See also:

`DT_PHANDLE_BY_NAME()`

**Parameters**

- `node_id` – node identifier for a node with an io-channels property
- `name` – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

**Returns**

the node identifier for the node referenced at the named element

**DT_IO_CHANNELS_CTLR**(`node_id`)

Equivalent to `DT_IO_CHANNELS_CTLR_BY_IDX(node_id, 0)`

See also:

`DT_IO_CHANNELS_CTLR_BY_IDX()`

**Parameters**

- `node_id` – node identifier for a node with an io-channels property

**Returns**

the node identifier for the node referenced at index 0 in the node's “io-channels” property

**DT_INST_IO_CHANNELS_CTLR_BY_IDX**(`inst`, `idx`)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property at an index.

See also:

`DT_IO_CHANNELS_CTLR_BY_IDX()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into io-channels property

**Returns**

the node identifier for the node referenced at index “idx”
DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)
Get the node identifier from a DT_DRV_COMPAT instance's io-channels property by name.

See also:
DT_IO_CHANNELS_CTLR_BY_NAME()

Parameters
- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

Returns
the node identifier for the node referenced at the named element

DT_INST_IO_CHANNELS_CTLR(inst)
Equivalent to DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, 0)

See also:
DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number

Returns
the node identifier for the node referenced at index 0 in the node's “io-channels” property

DT_IO_CHANNELS_INPUT_BY_IDX(node_id, idx)
Get an io-channels specifier input cell at an index.
This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
adc1: adc0... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
adc2: adc0... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Bindings fragment for the vnd,adc compatible:
io-channel-cells:
- input

Example usage:
See also:

$DT\_PHA\_BY\_IDX()$

**Parameters**
- $node\_id$ – node identifier for a node with an io-channels property
- $idx$ – logical index into io-channels property

**Returns**
the input cell in the specifier at index “idx”

$DT\_IO\_CHANNELS\_INPUT\_BY\_NAME($node\_id, name$)$

Get an io-channels specifier input cell by name.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node's binding to check if necessary.

Example devicetree fragment:

```plaintext
adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
n: node {
    io-channels = <adc1 10>, <adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:
- input

Example usage:

```plaintext
DT\_IO\_CHANNELS\_INPUT\_BY\_NAME($DT\_NODELABEL(n)$, sensor) // 10
DT\_IO\_CHANNELS\_INPUT\_BY\_NAME($DT\_NODELABEL(n)$, bandgap) // 20
```

See also:

$DT\_PHA\_BY\_NAME()$

**Parameters**
- $node\_id$ – node identifier for a node with an io-channels property
- $name$ – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

**Returns**
the input cell in the specifier at the named element
DT_IO_CHANNELS_INPUT(node_id)
   Equivalent to DT_IO_CHANNELS_INPUT_BY IDX(node_id, 0)

See also:
DT_IO_CHANNELS_INPUT_BY IDX()  

Parameters
   • node_id – node identifier for a node with an io-channels property

Returns
   the input cell in the specifier at index 0

DT_INST_IO_CHANNELS_INPUT_BY IDX(inst, idx)
   Get an input cell from the “DT_DRV_INST(inst)” io-channels property at an index.

See also:
DT_IO_CHANNELS_INPUT_BY IDX()  

Parameters
   • inst – DT_DRV_COMPAT instance number
   • idx – logical index into io-channels property

Returns
   the input cell in the specifier at index “idx”

DT_INST_IO_CHANNELS_INPUT_BY NAME(inst, name)
   Get an input cell from the “DT_DRV_INST(inst)” io-channels property by name.

See also:
DT_IO_CHANNELS_INPUT_BY NAME()  

Parameters
   • inst – DT_DRV_COMPAT instance number
   • name – lowercase-and-underscores name of an io-channels element as defined by the instance’s io-channel-names property

Returns
   the input cell in the specifier at the named element

DT_INST_IO_CHANNELS_INPUT(inst)
   Equivalent to DT_INST_IO_CHANNELS_INPUT_BY IDX(inst, 0)

Parameters
   • inst – DT_DRV_COMPAT instance number

Returns
   the input cell in the specifier at index 0
MBOX These conveniences may be used for nodes which describe MBOX controllers/users, and properties related to them.

group devicetree-mbox

Defines

**DT_MBOX_CTLR_BY_NAME**(node_id, name)
Get the node identifier for the MBOX controller from a mboxes property by name.

Example devicetree fragment:

```plaintext
mbox1: mbox-controller@... { ... };

n: node {
   mboxes = <&mbox1 8>,
            <&mbox1 9>;
   mbox-names = "tx", "rx";
};
```

Example usage:

```plaintext
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(mbox1)
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(mbox1)
```

See also:

**DT_PHANDLE_BY_NAME()**

Parameters

- **node_id** – node identifier for a node with a mboxes property
- **name** – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

Returns
the node identifier for the MBOX controller in the named element

**DT_MBOX_CHANNEL_BY_NAME**(node_id, name)
Get a MBOX channel value by name.

Example devicetree fragment:

```plaintext
mbox1: mbox@... { 
   #mbox-cells = <1>;
};

n: node {
   mboxes = <&mbox1 1>,
            <&mbox1 6>;
   mbox-names = "tx", "rx";
};
```

Bindings fragment for the mbox compatible:

```plaintext
mbox-cells:
   - channel
```

Example usage:
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), tx) // 1
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), rx) // 6

See also:
DT_PHA_BY_NAME_OR()

Parameters
- `node_id` – node identifier for a node with a mbox property
- `name` – lowercase-and-underscores name of a mbox element as defined
  by the node's mbox-names property

Returns
the channel value in the specifier at the named element or 0 if no channels
are supported

Pinctrl (pin control) These are used to access pin control properties by name or index.
Devicetree nodes may have properties which specify pin control (sometimes known as pin mux)
settings. These are expressed using pinctrl-<index> properties within the node, where the
<index> values are contiguous integers starting from 0. These may also be named using the
pinctrl-names property.
Here is an example:

```plaintext
node {
  ...
  pinctrl-0 = &foo &bar ...;
  pinctrl-1 = &baz ...;
  pinctrl-names = "default", "sleep";
}
```

Above, pinctrl-0 has name "default", and pinctrl-1 has name "sleep". The pinctrl-<index>
property values contain phandles. The &foo, &bar, etc. phandles within the properties point to
nodes whose contents vary by platform, and which describe a pin configuration for the node.

group devicetree-pinctrl

Defines

DT_PINCTRL_BY_IDX(node_id, pc_idx, idx)
Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```plaintext
n: node {
  pinctrl-0 = &foo &bar;
  pinctrl-1 = &baz &blub;
}
```

Example usage:

```
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

Parameters
- `node_id` – node with a pinctrl-'pc_idx' property
• `pc_idx` – index of the `pinctrl` property itself
• `idx` – index into the value of the `pinctrl` property

**Returns**
node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx’’

`DT_PINCTRL_0(node_id, idx)`
Get a node identifier from a `pinctrl-0` property.
This is equivalent to:

```
DT_PINCTRL_BY_IDX(node_id, 0, idx)
```

It is provided for convenience since `pinctrl-0` is commonly used.

**Parameters**
• `node_id` – node with a `pinctrl-0` property
• `idx` – index into the `pinctrl-0` property

**Returns**
node identifier for the phandle at index `idx` in the `pinctrl-0` property of that node

`DT_PINCTRL_BY_NAME(node_id, name, idx)`
Get a node identifier for a phandle inside a `pinctrl` node by name.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0) // DT_NODELABEL(baz)
```

**Parameters**
• `node_id` – node with a named `pinctrl` property
• `name` – lowercase-and-underscores `pinctrl` property name
• `idx` – index into the value of the named `pinctrl` property

**Returns**
node identifier for the phandle at that index in the `pinctrl` property

`DT_PINCTRL_NAME_TO_IDX(node_id, name)`
Convert a `pinctrl` name to its corresponding index.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:
parameters

- **node_id** – node identifier with a named pinctrl property
- **name** – lowercase-and-underscores name of the pinctrl whose index to get

returns

integer literal for the index of the pinctrl property with that name

**dt_pinctrl_idx_to_name_token(node_id, pc_idx)**

Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property’s name, and “remove the quotes” from it.

**dt_pinctrl_idx_to_name_token()** can only be used if the node has a pinctrl-‘pc_idx’ property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

example devicetree fragment:

```devicetree
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

example usage:

```dtc
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0)  // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1)  // f_o_o2
```

the same caveats and restrictions that apply to **dt_string_token()’s** return value also apply here.

parameters

- **node_id** – node identifier
- **pc_idx** – index of a pinctrl property in that node

returns

name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

**dt_pinctrl_idx_to_name_upper_token(node_id, pc_idx)**

like **dt_pinctrl_idx_to_name_token()**, but with an uppercased result.

this does the a similar conversion as **dt_pinctrl_idx_to_name_token(node_id, pc_idx)**. the only difference is that alphabetical characters in the result are uppercased.

example devicetree fragment:

```devicetree
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```
Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_O_O2
```

The same caveats and restrictions that apply to `DT_STRING_UPPER_TOKEN()`’s return value also apply here.

### DT_NUM_PINCTRLS_BY_IDX(node_id, pc_idx)

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <&foo &bar>;
};
n2: node-2 {
    pinctrl-0 = <&baz>;
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `pc_idx` – index of the pinctrl property itself

**Returns**

number of phandles in the property with that index

### DT_NUM_PINCTRLS_BY_NAME(node_id, name)

Like `DT_NUM_PINCTRLS_BY_IDX()`, but by name instead.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz>
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl property

**Returns**

number of phandles in the property with that name

### DT_NUM_PINCTRL_STATES(node_id)

Get the number of pinctrl properties in a node.
This expands to 0 if there are no pinctrl-i properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

```plaintext
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```plaintext
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n2)) // 0
```

**Parameters**
- `node_id` – node identifier; may or may not have any pinctrl properties

**Returns**
- number of pinctrl properties in the node

**DT_PINCTRL_HAS_IDX(node_id, pc_idx)**
Test if a node has a pinctrl property with an index.
This expands to 1 if the pinctrl-'idx' property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```plaintext
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0
```

**Parameters**
- `node_id` – node identifier; may or may not have any pinctrl properties
- `pc_idx` – index of a pinctrl property whose existence to check

**Returns**
- 1 if the property exists, 0 otherwise

**DT_PINCTRL_HAS_NAME(node_id, name)**
Test if a node has a pinctrl property with a name.
This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.

Example devicetree fragment:
Example usage:

```c
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep) // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

**Parameters**

- `node_id` – node identifier; may or may not have any pinctrl properties
- `name` – lowercase-and-underscores pinctrl property name to check

**Returns**

1 if the property exists, 0 otherwise

```
DT_INST_PINCTRL_BY_IDX(inst, pc_idx, idx)
```

Get a node identifier for a phandle in a pinctrl property by index for a DT_DRV_COMPAT instance.

This is equivalent to `DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx)`.

**Parameters**

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself
- `idx` – index into the value of the pinctrl property

**Returns**

node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx”

```
DT_INST_PINCTRL_0(inst, idx)
```

Get a node identifier from a pinctrl-0 property for a DT_DRV_COMPAT instance.

This is equivalent to:

```
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

**Parameters**

- `inst` – instance number
- `idx` – index into the pinctrl-0 property

**Returns**

node identifier for the phandle at index idx in the pinctrl-0 property of that instance

```
DT_INST_PINCTRL_BY_NAME(inst, name, idx)
```

Get a node identifier for a phandle inside a pinctrl node for a DT_DRV_COMPAT instance.

This is equivalent to `DT_PINCTRL_BY_NAME(DT_DRV_INST(inst), name, idx)`.

**Parameters**
• inst – instance number
• name – lowercase-and-underscores pinctrl property name
• idx – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

`DT_INST_PINCTRL_NAME_TO_IDX`(inst, name)
Convert a pinctrl name to its corresponding index for a DT_DRV_COMPAT instance.
This is equivalent to `DT_PINCTRL_NAME_TO_IDX(DT_DRV_INST(inst), name)`.

Parameters
• inst – instance number
• name – lowercase-and-underscores name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

`DT_INST_PINCTRL_IDX_TO_NAME_TOKEN`(inst, pc_idx)
Convert a pinctrl index to its name as an uppercased token.
This is equivalent to `DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_DRV_INST(inst), pc_idx)`.

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as a token

`DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN`(inst, pc_idx)
Convert a pinctrl index to its name as an uppercased token.
This is equivalent to `DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(DT_DRV_INST(inst), idx)`.

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as an uppercase token

`DT_INST_NUM_PINCTRLS_BY_IDX`(inst, pc_idx)
Get the number of phandles in a pinctrl property for a DT_DRV_COMPAT instance.
This is equivalent to `DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst), pc_idx)`.

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
number of phandles in the property with that index

`DT_INST_NUM_PINCTRLS_BY_NAME`(inst, name)
Like `DT_INST_NUM_PINCTRLS_BY_IDX()`, but by name instead.
This is equivalent to `DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst), name)`.

Parameters
• \texttt{inst} – instance number
• \texttt{name} – lowercase-and-underscores name of the pinctrl property

\textbf{Returns}
number of phandles in the property with that name

\texttt{DT_INST_NUM_PINCTRL_STATES(inst)}
Get the number of pinctrl properties in a DT_DRV_COMPAT instance.
This is equivalent to \texttt{DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst))}.

\textbf{Parameters}
• \texttt{inst} – instance number

\textbf{Returns}
number of pinctrl properties in the instance

\texttt{DT_INST_PINCTRL_HAS_IDX(inst, pc_idx)}
Test if a DT_DRV_COMPAT instance has a pinctrl property with an index.
This is equivalent to \texttt{DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx)}.

\textbf{Parameters}
• \texttt{inst} – instance number
• \texttt{pc_idx} – index of a pinctrl property whose existence to check

\textbf{Returns}
1 if the property exists, 0 otherwise

\texttt{DT_INST_PINCTRL_HAS_NAME(inst, name)}
Test if a DT_DRV_COMPAT instance has a pinctrl property with a name.
This is equivalent to \texttt{DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name)}.

\textbf{Parameters}
• \texttt{inst} – instance number
• \texttt{name} – lowercase-and-underscores pinctrl property name to check

\textbf{Returns}
1 if the property exists, 0 otherwise

\textbf{PWM}
These conveniences may be used for nodes which describe PWM controllers and properties related to them.

\textit{group devicetree-pwms}

\textbf{Defines}

\texttt{DT_PWMS_CTLR_BY_IDX(node_id, idx)}
Get the node identifier for the PWM controller from a pwms property at an index.

Example devicetree fragment:

\begin{verbatim}
pwm1: pwm-controller@... { ... };  
pwm2: pwm-controller@... { ... };  
\end{verbatim}

(continues on next page)
Example usage:

```c
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)
```

See also:

`DT_PROP_BY_PHANDLE_IDX()`

**Parameters**
- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns**
the node identifier for the PWM controller referenced at index “idx”

### `DT_PWMS_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:

```c
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller... { ... };
n: node { pwms = <&pwm1 1 PWM_POLARITY_NORMAL>, <&pwm2 3 PWM_POLARITY_INVERTED>; pwm-names = “alpha”, “beta”; };
```

Example usage:

```c
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(pwm2)
```

See also:

`DT_PHANDLE_BY_NAME()`

**Parameters**
- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

**Returns**
the node identifier for the PWM controller in the named element

### `DT_PWMS_CTLR(node_id)`

Equivalent to `DT_PWMS_CTLR_BY_IDX(node_id, 0)`

See also:

`DT_PWMS_CTLR_BY_IDX()`

**Parameters**
- `node_id` – node identifier for a node with a pwms property
Returns
the node identifier for the PWM controller at index 0 in the node's “pwms”
property

DT_PWMS_CELL_BY_IDX(node_id, idx, cell)
Get PWM specifier's cell value at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
};
```

Bindings fragment for the “vnd,pwm” compatible:

```
pwm-cells:
    - channel
    - period
    - flags
```

Example usage:

```
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period) // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period) // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags) // PWM_POLARITY_INVERTED
```

See also:

`DT_PHA_BY_IDX()`

Parameters

- **node_id** – node identifier for a node with a pwms property
- **idx** – logical index into pwms property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_PWMS_CELL_BY_NAME(node_id, name, cell)
Get a PWM specifier's cell value by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};
```
pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};

Bindings fragment for the “vnd,pwm” compatible:

- channel
- period
- flags

Example usage:

DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel) // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period) // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period) // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, flags) // PWM_POLARITY_INVERTED

See also:

DT_PHA_BY_NAME()

Parameters

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined
  by the node’s pwm-names property
- cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_PWMS_CELL(node_id, cell)
Equivalent to DT_PWMS_CELL_BY_IDX(node_id, 0, cell)

See also:

DT_PWMS_CELL_BY_IDX()

Parameters

- node_id – node identifier for a node with a pwms property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index 0
DT_PWMS_CHANNEL_BY_IDX(node_id, idx)
Get a PWM specifier's channel cell value at an index.
This macro only works for PWM specifiers with cells named “channel”. Refer to the
node's binding to check if necessary.
This is equivalent to \texttt{DT_PWMS_CELL_BY_IDX(node_id, idx, channel)}.

See also: \texttt{DT_PWMS_CELL_BY_IDX()}

Parameters
\begin{itemize}
  \item node_id – node identifier for a node with a pwms property
  \item idx – logical index into pwms property
\end{itemize}

Returns
the channel cell value at index “idx”

DT_PWMS_CHANNEL_BY_NAME(node_id, name)
Get a PWM specifier’s channel cell value by name.
This macro only works for PWM specifiers with cells named “channel”. Refer to the
node's binding to check if necessary.
This is equivalent to \texttt{DT_PWMS_CELL_BY_NAME(node_id, name, channel)}.

See also: \texttt{DT_PWMS_CELL_BY_NAME()}

Parameters
\begin{itemize}
  \item node_id – node identifier for a node with a pwms property
  \item name – lowercase-and-underscores name of a pwms element as defined
           by the node's pwm-names property
\end{itemize}

Returns
the channel cell value in the specifier at the named element

DT_PWMS_CHANNEL(node_id)
Equivalent to \texttt{DT_PWMS_CHANNEL_BY_IDX(node_id, 0)}

See also: \texttt{DT_PWMS_CHANNEL_BY_IDX()}

Parameters
\begin{itemize}
  \item node_id – node identifier for a node with a pwms property
\end{itemize}

Returns
the channel cell value at index 0
**DT_PWMS_PERIOD_BY_IDX(node_id, idx)**

Get PWM specifier's period cell value at an index.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_IDX(node_id, idx, period)`.

**See also:**

`DT_PWMS_CELL_BY_IDX()`

**Parameters**

- **node_id** – node identifier for a node with a pwms property
- **idx** – logical index into pwms property

**Returns**

the period cell value at index “idx”

**DT_PWMS_PERIOD_BY_NAME(node_id, name)**

Get a PWM specifier's period cell value by name.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_NAME(node_id, name, period)`.

**See also:**

`DT_PWMS_CELL_BY_NAME()`

**Parameters**

- **node_id** – node identifier for a node with a pwms property
- **name** – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

**Returns**

the period cell value in the specifier at the named element

**DT_PWMS_PERIOD(node_id)**

Equivalent to `DT_PWMS_PERIOD_BY_IDX(node_id, 0)`

**See also:**

`DT_PWMS_PERIOD_BY_IDX()`

**Parameters**

- **node_id** – node identifier for a node with a pwms property

**Returns**

the period cell value at index 0
DT_PWMS_FLAGS_BY_IDX(node_id, idx)
Get a PWM specifier’s flags cell value at an index.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the PWM specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, flags).

See also:
DT_PWMS_CELL_BY_IDX()

Parameters
- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property

Returns
the flags cell value at index “idx”, or zero if there is none

DT_PWMS_FLAGS_BY_NAME(node_id, name)
Get a PWM specifier’s flags cell value by name.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the PWM specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, flags) if there is a flags cell, but expands to zero if there is none.

See also:
DT_PWMS_CELL_BY_NAME()

Parameters
- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

DT_PWMS_FLAGS(node_id)
Equivalent to DT_PWMS_FLAGS_BY_IDX(node_id, 0)

See also:
DT_PWMS_FLAGS_BY_IDX()

**DT_INST_PWMS_CTLR_BY_IDX(inst, idx)**

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s `pwms` property at an index.

**See also:**

`DT_PWMS_CTLR_BY_IDX()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into `pwms` property

**Returns**

the node identifier for the PWM controller referenced at index “idx”

**DT_INST_PWMS_CTLR_BY_NAME(inst, name)**

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s `pwms` property by name.

**See also:**

`DT_PWMS_CTLR_BY_NAME()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a `pwms` element as defined by the node’s `pwm-names` property

**Returns**

the node identifier for the PWM controller in the named element

**DT_INST_PWMS_CTLR(inst)**

Equivalent to `DT_INST_PWMS_CTLR_BY_IDX(inst, 0)`

**See also:**

`DT_PWMS_CTLR_BY_IDX()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number

**Returns**

the node identifier for the PWM controller at index 0 in the instance’s “pwms” property

**DT_INST_PWMS_CELL_BY_IDX(inst, idx, cell)**

Get a DT_DRV_COMPAT instance’s PWM specifier’s cell value at an index.

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into `pwms` property
- `cell` – lowercase-and-underscores cell name
Returns
the cell value at index “idx”

DT_INST_PWMS_CELL_BY_NAME
(inst, name, cell)
Get a DT_DRV_COMPAT instance’s PWM specifier’s cell value by name.

See also:
DT_PWMS_CELL_BY_NAME()

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
- cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_PWMS_CELL
(inst, cell)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, 0, cell)

Parameters

- inst – DT_DRV_COMPAT instance number
- cell – lowercase-and-underscores cell name

Returns
the cell value at index 0

DT_INST_PWMS_CHANNEL_BY_IDX
(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, channel)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters

- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property

Returns
the channel cell value at index “idx”

DT_INST_PWMS_CHANNEL_BY_NAME
(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, channel)

See also:
DT_INST_PWMS_CELL_BY_NAME()}

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
Returns
the channel cell value in the specifier at the named element

DT_INST_PWMS_CHANNEL(inst)
Equivalent to DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_CHANNEL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the channel cell value at index 0

DT_INST_PWMS_PERIOD_BY_IDX(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns
the period cell value at index “idx”

DT_INST_PWMS_PERIOD_BY_NAME(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, period)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the period cell value in the specifier at the named element

DT_INST_PWMS_PERIOD(inst)
Equivalent to DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_PERIOD_BY_IDX()
Returns
the period cell value at index 0

DT_INST_PWMS_FLAGS_BY_IDX(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, flags)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns
the flags cell value at index “idx”, or zero if there is none

DT_INST_PWMS_FLAGS_BY_NAME(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, flags)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

DT_INST_PWMS_FLAGS(inst)
Equivalent to DT_INST_PWMS_FLAGS_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_FLAGS_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the flags cell value at index 0, or zero if there is none

Reset Controller
These conveniences may be used for nodes which describe reset controllers and properties related to them.

group devicetree-reset-controller
Defines

**DT_RESET_CTLR_BY_IDX(node_id, idx)**

Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.

Example devicetree fragment:

```
reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;
 n: node {
   resets = <&reset1 10>, <&reset2 20>;
 }
```

Example usage:

```
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 0))  // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 1))  // DT_NODELABEL(reset2)
```

See also:

**DT_PHANDLE_BY_IDX()**

Parameters

- **node_id** – node identifier
- **idx** – logical index into “resets”

Returns

the node identifier for the reset controller referenced at index “idx”

**DT_RESET_CTLR(node_id)**

Equivalent to **DT_RESET_CTLR_BY_IDX(node_id, 0)**

See also:

**DT_RESET_CTLR_BY_IDX()**

Parameters

- **node_id** – node identifier

Returns

a node identifier for the reset controller at index 0 in “resets”

**DT_RESET_CTLR_BY_NAME(node_id, name)**

Get the node identifier for the controller phandle from a resets phandle-array property by name.

Example devicetree fragment:

```
reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;
 n: node {
   resets = <&reset1 10>, <&reset2 20>;
   reset-names = "alpha", "beta";
 }
```
Example usage:

```
DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(reset2)
```

See also:

`DT_PHANDLE_BY_NAME()`

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

Returns

the node identifier for the reset controller referenced by name

`DT_RESET_CELL_BY_IDX(node_id, idx, cell)`

Get a reset specifier’s cell value at an index.

Example devicetree fragment:

```
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```
reset-cells:
    - id
```

Example usage:

```
DT_RESET_CELL_BY_IDX(DT_NODELABEL(n), 0, id) // 10
```

See also:

`DT_PHA_BY_IDX()`

Parameters

- `node_id` – node identifier for a node with a resets property
- `idx` – logical index into resets property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

`DT_RESET_CELL_BY_NAME(node_id, name, cell)`

Get a reset specifier’s cell value by name.

Example devicetree fragment:
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
    reset-names = "alpha";
};

Bindings fragment for the vnd,reset compatible:

reset-cells:
    - id

Example usage:

DT_RESET_CELL_BY_NAME(DT_NODELABEL(n), alpha, id) // 10

See also:

DT_PHA_BY_NAME()

Parameters

- node_id – node identifier for a node with a resets property
- name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
- cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_RESET_CELL(node_id, cell)

Equivalent to DT_RESET_CELL_BY_IDX(node_id, 0, cell)

See also:

DT_RESET_CELL_BY_IDX()

Parameters

- node_id – node identifier for a node with a resets property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index 0

DT_INST_RESET_CTLR_BY_IDX(inst, idx)

Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.

See also:

DT_RESET_CTLR_BY_IDX()

Parameters

- inst – instance number

5.2. Devicetree
• idx – logical index into “resets”

**Returns**
the node identifier for the reset controller referenced at index “idx”

`DT_INST_RESET_CTLR(inst)`
Equivalent to `DT_INST_RESET_CTLR_BY_IDX(inst, 0)`

**See also:**
`DT_RESET_CTLR()`

**Parameters**
• inst – instance number

**Returns**
a node identifier for the reset controller at index 0 in “resets”

`DT_INST_RESET_CTLR_BY_NAME(inst, name)`
Get the node identifier for the controller phandle from a resets phandle-array property by name.

**See also:**
`DT_RESET_CTLR_BY_NAME()`

**Parameters**
• inst – instance number
  • name – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

**Returns**
the node identifier for the reset controller referenced by the named element

`DT_INST_RESET_CELL_BY_IDX(inst, idx, cell)`
Get a DT_DRV_COMPAT instance’s reset specifier’s cell value at an index.

**See also:**
`DT_RESET_CELL_BY_IDX()`

**Parameters**
• inst – DT_DRV_COMPAT instance number
  • idx – logical index into resets property
  • cell – lowercase-and-underscores cell name

**Returns**
the cell value at index “idx”
**DT_INST_RESET_CELL_BY_NAME**(inst, name, cell)

Get a DT_DRV_COMPAT instance's reset specifier's cell value by name.

**See also:**

**DT_RESET_CELL_BY_NAME()**

**Parameters**

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
• cell – lowercase-and-underscores cell name

**Returns**

the cell value in the specifier at the named element

**DT_INST_RESET_CELL**(inst, cell)

Equivalent to **DT_INST_RESET_CELL_BY_IDX**(inst, 0, cell)

**Parameters**

• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

**Returns**

the value of the cell inside the specifier at index 0

**DT_RESET_ID_BY_IDX**(node_id, idx)

Get a Reset Controller specifier's id cell at an index.

This macro only works for Reset Controller specifiers with cells named “id”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```
reset-cells:
    - id
```

Example usage:

```
DT_RESET_ID_BY_IDX(DT_NODELABEL(n), 0) // 10
```

**See also:**

**DT_PHA_BY_IDX()**

**Parameters**

• node_id – node identifier
• idx – logical index into “resets”
Returns
the id cell value at index “idx”

`DT_RESET_ID(node_id)`
Equivalent to `DT_RESET_ID_BY_IDX(node_id, 0)`

See also:
`DT_RESET_ID_BY_IDX()`

Parameters
• `node_id` – node identifier

Returns
the id cell value at index 0

`DT_INST_RESET_ID_BY_IDX(inst, idx)`
Get a DT_DRV_COMPAT instance's Reset Controller specifier's id cell value at an index.

See also:
`DT_RESET_ID_BY_IDX()`

Parameters
• `inst` – DT_DRV_COMPAT instance number
• `idx` – logical index into “resets”

Returns
the id cell value at index “idx”

`DT_INST_RESET_ID(inst)`
Equivalent to `DT_INST_RESET_ID_BY_IDX(inst, 0)`

See also:
`DT_INST_RESET_ID_BY_IDX()`

Parameters
• `inst` – DT_DRV_COMPAT instance number

Returns
the id cell value at index 0

**SPI** These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

`group devicetree-spi`
Defines

**DT_SPI_HAS_CS_GPIOS(spi)**

Does a SPI controller node have chip select GPIOs configured?

SPI bus controllers use the “cs-gpios” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```plaintext
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {  
    compatible = "vnd,spi";
};
```

Example usage:

```plaintext
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

**Parameters**

• *spi* – a SPI bus controller node identifier

**Returns**

1 if “spi” has a cs-gpios property, 0 otherwise

**DT_SPI_NUM_CS_GPIOS(spi)**

Number of chip select GPIOs in a SPI controller's cs-gpios property.

Example devicetree fragment:

```plaintext
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {  
    compatible = "vnd,spi";
};
```

Example usage:

```plaintext
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

**Parameters**

• *spi* – a SPI bus controller node identifier

**Returns**

Logical length of *spi*'s cs-gpios property, or 0 if “spi” doesn’t have a cs-gpios property
**DT_SPI_DEV_HAS_CS_GPIOS(spi_dev)**

Does a SPI device have a chip select line configured? Example devicetree fragment:

```plaintext
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
    a: spi-dev-a@0 {
        reg = <0>;
    };
    b: spi-dev-b@1 {
        reg = <1>;
    };
};
spi2: spi@... {
    compatible = "vnd,spi";
    c: spi-dev-c@0 {
        reg = <0>;
    };
};
```

Example usage:

```plaintext
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0
```

**Parameters**

- **spi_dev** – a SPI device node identifier

**Returns**

1 if `spi_dev`'s bus node `DT_BUS(spi_dev)` has a chip select pin at index `DT_REG_ADDR(spi_dev)`, 0 otherwise

**DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)**

Get a SPI device's chip select GPIO controller's node identifier.

Example devicetree fragment:

```plaintext
gpio1: gpio@... { ... };
gpio2: gpio@... { ... };
spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
    a: spi-dev-a@0 {
        reg = <0>;
    };
    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```
Example usage:

```
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

node identifier for `spi_dev`'s chip select GPIO controller

`DT_SPI_DEV_CS_GPIOS_PIN(spi_dev)`

Get a SPI device's chip select GPIO pin number.

It's an error if the GPIO specifier for `spi_dev`'s entry in its bus node's `cs-gpios` property has no pin cell.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>, <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(b)) // 20
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

pin number of `spi_dev`'s chip select GPIO

`DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)`

Get a SPI device's chip select GPIO flags.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };
};
```

Example usage:
If the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no flags cell, this expands to zero.

**Parameters**
- spi_dev – a SPI device node identifier

**Returns**
- flags value of spi_dev's chip select GPIO specifier, or zero if there is none

**DT_INST_SPI_DEV_HAS_CS_GPIOS**

Equivalent to `DT_SPI_DEV_HAS_CS_GPIOS(DT_DRV_INST(inst))`.

**See also:**
- `DT_SPI_DEV_HAS_CS_GPIOS()`

**Parameters**
- inst – DT_DRV_COMPAT instance number

**Returns**
- 1 if the instance's bus has a CS pin at index `DT_INST_REG_ADDR(inst)`, 0 otherwise

**DT_INST_SPI_DEV_CS_GPIOS_CTLR**

Get GPIO controller node identifier for a SPI device instance. This is equivalent to `DT_SPI_DEV_CS_GPIOS_CTLR(DT_DRV_INST(inst))`.

**See also:**
- `DT_SPI_DEV_CS_GPIOS_CTLR()`

**Parameters**
- inst – DT_DRV_COMPAT instance number

**Returns**
- node identifier for instance's chip select GPIO controller

**DT_INST_SPI_DEV_CS_GPIOS_PIN**

Equivalent to `DT_SPI_DEV_CS_GPIOS_PIN(DT_DRV_INST(inst))`.

**See also:**
- `DT_SPI_DEV_CS_GPIOS_PIN()`

**Parameters**
- inst – DT_DRV_COMPAT instance number

**Returns**
- pin number of the instance's chip select GPIO
DT_INST_SPI_DEV_CS_GPIOS_FLAGS(inst)

DT_SPI_DEV_CS_GPIOS_FLAGS(DT_DRV_INST(inst)).

See also:

DT_SPI_DEV_CS_GPIOS_FLAGS()

Parameters

• inst – DT_DRV_COMPAT instance number

Returns

flags value of the instance's chip select GPIO specifier, or zero if there is none

Chosen nodes  The special /chosen node contains properties whose values describe system-wide settings. The DT_CHOSEN() macro can be used to get a node identifier for a chosen node.

Defines

DT_CHOSEN(prop)

Get a node identifier for a /chosen node property.

This is only valid to call if DT_HAS_CHOSEN(prop) is 1.

Parameters

• prop – lowercase-and-underscores property name for the /chosen node

Returns

a node identifier for the chosen node property

DT_HAS_CHOSEN(prop)

Test if the devicetree has a /chosen node.

Parameters

• prop – lowercase-and-underscores devicetree property

Returns

1 if the chosen property exists and refers to a node, 0 otherwise

Zephyr-specific chosen nodes  The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node's label property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.

<table>
<thead>

<tr>
<td>zephyr,uart-pipe</td>
<td>Sets UART device used by serial pipe driver</td>
</tr>
<tr>
<td>zephyr,usb-device</td>
<td>USB device node. If defined and has a vbus–gpios property, these will be used by the USB subsystem to enable/disable VBUS</td>
</tr>
</tbody>
</table>

**Bindings index**

This page documents the available devicetree bindings. See Devicetree bindings for an introduction to the Zephyr bindings file format.

**Vendor index** This section contains an index of hardware vendors. Click on a vendor’s name to go to the list of bindings for that vendor.

- **Generic or vendor-independent**
- **Advanced Micro Devices (AMD), Inc. (amd)**
• Altera Corp. (altr)
• Ambiq Micro, Inc. (ambiq)
• AMS AG (ams)
• Analog Devices, Inc. (adi)

• RISC-V Foundation (riscv)
• ROCKTECH DISPLAYS LIMITED (rocktech)
• ROHM Semiconductor Co., Ltd (rohm)
• Sciosense B.V. (sciosense)
• Seeed Technology Co., Ltd (seeed)
• SEGGER Microcontroller GmbH (segger)
• Semtech Corporation (semtech)
• Sensirion AG (sensirion)
• Sequans Communications (sqn)
• Sharp Corporation (sharp)
• Shenzhen Huiding Technology Co., Ltd. (goodix)
• Shenzhen Jinghua Displays Electronics Co., Ltd. (jhd)
• Shenzhen Xptek Technology Co., Ltd (xptek)
• Siemens AG (siemens)
• Sierra Wireless (swir)
• SiFive, Inc. (sifive)
• Silicon Laboratories (silabs)
• SIMCom Wireless Solutions Co., LTD (simcom)
• Sino Wealth Electronic Ltd (sinowealth)
• Sitronix Technology Corporation (sitronix)
• Skyworks Solutions, Inc. (skyworks)
• Smart Battery System (sbs)
• Solomon Systech Limited (solomon)
• SparkFun Electronics (sparkfun)
• Standard Microsystems Corporation (smsc)
• StarFive Technology Co. Ltd. (starfive)
• STMicroelectronics (st)
• Synopsys, Inc. (snps)
• Synopsys, Inc. (formerly ARC International PLC) (arc)
• TDK Corporation. (tdk)
• Telink Semiconductor (telink)
• Telit Cinterion (telit)
• Texas Instruments (ti)
• u-blox (u-blox)
• UltraChip Inc. (ultrachip)
• Vishay Intertechnology, Inc (vishay)
• Wistron NeWeb Corporation (wnc)
• WIZnet Co., Ltd. (wiznet)
• Worldsemi Co., Limited (worldsemi)
• Würth Elektronik GmbH. (we)
• X-Powers (x-powers)
• Xen Hypervisor (xen)
• Xilinx (xlnx)
• Zephyr-specific binding (zephyr)
• Zhengzhou Winsen Electronics Technology Co., Ltd. (wisen)
• Unknown vendor

**Bindings by vendor**  This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the “compatible” property they apply to, like this:

**Vendor name (vendor prefix)**

• <compatible-A>
• <compatible-B> (on <bus-name> bus)
• <compatible-C>
• ...

The text “(on <bus-name> bus)” appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

5.3 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called symbols) are defined in Kconfig files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.

The output from Kconfig is a header file autoconf.h with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing Kconfig files.

5.3.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: menuconfig and guiconfig. menuconfig is a curses-based interface that runs in the terminal, while guiconfig is a graphical configuration interface.

**Note:** The configuration can also be changed by editing zephyr/.config in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in zephyr/.config, the assignment will be ignored and overwritten when re-configuring.

To make a setting permanent, you should set it in a *.conf file, as described in Setting Kconfig configuration values.

**Tip:** Saving a minimal configuration file (with e.g. D in menuconfig) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their default value.

To run one of the configuration interfaces, do this:

1. Build your application as usual using either west or cmake:

   Using west:
   ```bash
   west build -b <board>
   ```

   Using CMake and ninja:
   ```bash
   mkdir build && cd build
cmake -GNinja -DBOARD=<board> ..
ninja
   ```

2. To run the terminal-based menuconfig interface, use either of these commands:
To run the graphical `guiconfig`, use either of these commands:

```
west build -t guiconfig
ninja guiconfig
```

**Note:** If you get an import error for `tkinter` when trying to run `guiconfig`, you are missing required packages. See *Install Linux Host Dependencies*. The package you need is usually called something like `python3-tk/python3-tkinter`.

`tkinter` is not included by default in many Python installations, despite being part of the standard library.

The two interfaces are shown below:

```
 guarconfig always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press `?` to view the same information.

**Note:** If you prefer to work in the `guiconfig` interface, then it's a good idea to check any changes to Kconfig files you make in *single-menu mode*, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

3. Change configuration values in the `menuconfig` interface as follows:

   - Navigate the menu with the arrow keys. Common Vim key bindings are supported as well.
   - Use Space and Enter to enter menus and toggle values. Menus appear with `--->` next to them. Press ESC to return to the parent menu.
Boolean configuration options are shown with \[ ] brackets, while numeric and string-valued configuration symbols are shown with ( ) brackets. Symbol values that can't be changed are shown as -- or --*--.

**Note:** You can also press Y or N to set a boolean configuration symbol to the corresponding value.

- Press ? to display information about the currently selected symbol, including its help text. Press ESC or Q to return from the information display to the menu.

In the guiconfig interface, either click on the image next to the symbol to change its value, or double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).

guiconfig also supports keyboard controls, which are similar to menuconfig.

4. Pressing Q in the menuconfig interface will bring up the save-and-quit dialog (if there are changes to save):

   Press Y to save the kernel configuration options to the default filename (zephyr/.config).
   You will typically save to the default filename unless you are experimenting with different configurations.

   The guiconfig interface will also prompt for saving the configuration on exit if it has been modified.

**Note:** The configuration file used during the build is always zephyr/.config. If you have another saved configuration that you want to build with, copy it to zephyr/.config. Make
Be sure to back up your original configuration file.

Also note that filenames starting with . are not listed by ls by default on Linux and macOS. Use the -a flag to see them.

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the / key (this also works in guiconfig). This brings up the following dialog, where you can search for symbols by name and jump to them. In guiconfig, you can also change symbol values directly within the dialog.

If you jump to a symbol that isn’t currently visible (e.g., due to having unsatisfied dependencies), then show-all mode will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press A in menuconfig or Ctrl-A in guiconfig.
Note: Show-all mode can’t be turned off if there are no visible items in the current menu.

To figure out why a symbol you jumped to isn’t visible, inspect its dependencies, either by pressing ? in menuconfig or in the information pane at the bottom in guiconfig. If you discover that the symbol depends on another symbol that isn’t enabled, you can jump to that symbol in turn to see if it can be enabled.

Note: In menuconfig, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

For more information on menuconfig and guiconfig, see the Python docstrings at the top of menuconfig.py and guiconfig.py.

### 5.3.2 Setting Kconfig configuration values

The menuconfig and guiconfig interfaces can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

Note: Before making changes to Kconfig files, it’s a good idea to also go through the Kconfig - Tips and Best Practices page.

**Visible and invisible Kconfig symbols**

When making Kconfig changes, it's important to understand the difference between visible and invisible symbols.

- A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence visible), and can be set in configuration files.

Here's an example of a visible symbol:

```plaintext
config FPU
bool "Support floating point operations"
depends on HAS_FPU
```

The symbol is shown like this in menuconfig, where it can be toggled:
• An **invisible** symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

Here's an example of an invisible symbol:

```plaintext
config CPU_HAS_FPU
bool
help
   This symbol is **y** if the CPU has a hardware floating point unit.
```

In this case, CPU_HAS_FPU is enabled through other symbols having select CPU_HAS_FPU.

### Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a \*.*.defconfig file for the board with application settings, usually from prj.conf. See [The Initial Configuration](#) below for more details.

Assignments in configuration files use this syntax:

```plaintext
CONFIG_<symbol name >= <value>
```

There should be no spaces around the equals sign.

bool symbols can be enabled or disabled by setting them to **y** or **n**, respectively. The FPU symbol from the example above could be enabled like this:

```plaintext
CONFIG_FPU=y
```

**Note:** A boolean symbol can also be set to **n** with a comment formatted like this:

```plaintext
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in zephyr/.config.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn't use this). Having **n**-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```plaintext
CONFIG_SOME_STRING=”cool value”
CONFIG_SOME_INT=123
```

Comments use a `#`:

```plaintext
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the interactive configuration interfaces (you can jump directly to a symbol with `/`), or look up the symbol in the Kconfig search page.
The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:

1. A BOARD-specific configuration file stored in boards/<architecture>/<BOARD>/
   <BOARD>_defconfig
2. Any CMake cache entries prefix with CONFIG_
3. The application configuration

The application configuration can come from the sources below (each file is known as a Kconfig fragment, which are then merged to get the final configuration used for a particular build). By default, prj.conf is used.

1. If CONF_FILE is set, the configuration file(s) specified in it are merged and used as the application configuration. CONF_FILE can be set in various ways:
   1. In CMakeLists.txt, before calling find_package(Zephyr)
   2. By passing -DCONF_FILE=<conf file(s)>, either directly or via west
   3. From the CMake variable cache
   Furthermore if CONF_FILE is set as single configuration file of the form prj_<build>.conf and if file boards/<BOARD>_<build>.conf exists in same folder as file prj_<build>.conf, the result of merging prj_<build>.conf and boards/<BOARD>_<build>.conf is used.
2. Otherwise, prj_<BOARD>.conf is used if it exists in the application configuration directory.
3. Otherwise, if boards/<BOARD>.conf exists in the application configuration directory, the result of merging it with prj.conf is used.
4. Otherwise, if board revisions are used and boards/<BOARD>_<revision>.conf exists in the application configuration directory, the result of merging it with prj.conf and boards/<BOARD>.conf is used.
5. Otherwise, prj.conf is used from the application configuration directory. If it does not exist then a fatal error will be emitted.

All configuration files will be taken from the application’s configuration directory except for files with an absolute path that are given with the CONF_FILE, EXTRA_CONF_FILE, DTC_OVERLAY_FILE, and EXTRA_DTC_OVERLAY_FILE arguments. For these, a file in a Zephyr module can be referred by escaping the Zephyr module dir variable like this \${ZEPHYR_<module>_MODULE_DIR}/<path-to>/<file> when setting any of said variables in the application’s CMakeLists.txt.

See Application Configuration Directory on how the application configuration directory is defined.

If a symbol is assigned both in <BOARD>_defconfig and in the application configuration, the value set in the application configuration takes precedence.

The merged configuration is saved to zephyr/.config in the build directory.

As long as zephyr/.config exists and is up-to-date (is newer than any BOARD and application configuration files), it will be used in preference to producing a new merged configuration. zephyr/.config is also the configuration that gets modified when making changes in the interactive configuration interfaces.

Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible symbols. This is done in boards/<architecture>/<BOARD>/Kconfig.defconfig, which is a regular Kconfig file.
Note: Assignments in .config files have no effect on invisible symbols, so this scheme is not just an organizational issue.

Assigning values in Kconfig.defconfig relies on defining a Kconfig symbol in multiple locations. As an example, say we want to set FOO_WIDTH below to 32:

```
config FOO_WIDTH
  int
```

To do this, we extend the definition of FOO_WIDTH as follows, in Kconfig.defconfig:

```
if BOARD_MY_BOARD
  config FOO_WIDTH
    default 32
endif
```

Note: Since the type of the symbol (int) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the “base” definition of the symbol is a good idea for reasons explained in Common Kconfig shorthands.

Default values in Kconfig.defconfig files have priority over default values given on the “base” definition of a symbol. Internally, this is implemented by including the Kconfig.defconfig files first. Kconfig uses the first default with a satisfied condition, where an empty condition corresponds to if y (is always satisfied).

Note that conditions from surrounding top-level ifs are propagated to symbol properties, so the above default is equivalent to default 32 if BOARD_MY_BOARD.

**Multiple symbol definitions** When a symbol is defined in multiple locations, each definition acts as an independent symbol that happens to share the same name. This means that properties are not appended to previous definitions. If the conditions for ANY definition result in the symbol resolving to y, the symbol will be y. It is therefore not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the dependencies of the symbol FOO below are satisfied if either DEP1 OR DEP2 are true, it does not require both:

```
config FOO
  ...
  depends on DEP1
config FOO
  ...
  depends on DEP2
```

Warning: Symbols without explicit dependencies still follow the above rule. A symbol without any dependencies will result in the symbol always being assignable. The definition below will result in FOO always being enabled by default, regardless of the value of DEP1.

```
config FOO
  bool "FOO"
    depends on DEP1
config FOO
  default y
```
This dependency weakening can be avoided with the `configdefault` extension if the desire is only to add a new default without modifying any other behaviour of the symbol.

**Note:** When making changes to `Kconfig.defconfig` files, always check the symbol’s direct dependencies in one of the interactive configuration interfaces afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol’s dependencies.

**Motivation for `Kconfig.defconfig` files** One motivation for this configuration scheme is to avoid making fixed board-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via `<BOARD>_defconfig`, all symbols would have to be visible, as values given in `<BOARD>_defconfig` have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via `devicetree` instead.

**Configuring choices** There are two ways to configure a `Kconfig` choice:

1. **By setting one of the choice symbols to `y` in a configuration file.**
   
   Setting one choice symbol to `y` automatically gives all other choice symbols the value `n`.
   
   If multiple choice symbols are set to `y`, only the last one set to `y` will be honored (the rest will get the value `n`). This allows a choice selection from a board defconfig file to be overridden from an application `prj.conf` file.

2. **By changing the default of the choice in `Kconfig.defconfig`.**
   
   As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

   As an example, assume that a choice has the following base definition (here, the name of the choice is `FOO`):

   ```
   choice FOO
     bool "Foo choice"
     default B
   config A
     bool "A"
   config B
     bool "B"
   endchoice
   ```

   To change the default symbol of `FOO` to `A`, you would add the following definition to `Kconfig.defconfig`:

   ```
   choice FOO
     default A
   endchoice
   ```

5.3. Configuration System (Kconfig)
The Kconfig.defconfig method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

**More Kconfig resources**  The *Kconfig - Tips and Best Practices* page has some tips for writing Kconfig files.

The *kconfiglib.py* docstring (at the top of the file) goes over how symbol values are calculated in detail.

### 5.3.3 Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

**Note:** The official Kconfig documentation is *kconfig-language.rst* and *kconfig-macro-language.rst*.

What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don’t.

If a symbol has a prompt (e.g. `bool “Enable foo”), then the user can change the symbol’s value in the menuconfig or guiconfig interface (see Interactive Kconfig interfaces), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called hidden or invisible symbols, because they don’t show up in menuconfig and guiconfig. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can’t be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the optional prompts section for a way to deal with settings that are fixed on some machines and configurable on other machines.

What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via devicetree instead.

In particular, avoid adding new Kconfig options of the following types:

Options that specify a device in the system by name  For example, if you are writing an I2C device driver, avoid creating an option named `MY_DEVICE_I2C_BUS_NAME` for specifying the bus node your device is controlled by. See Device drivers that depend on other devices for alternatives.

Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like `MY_PWM_DEVICE_NAME`. See Applications that depend on board-specific devices for alternatives.

Options that specify fixed hardware configuration  For example, avoid Kconfig options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type phandle-array in the device binding, and using the GPIO devicetree API from C. Similar advice applies to other cases where devicetree.h provides Hardware specific APIs for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree binding to identify board specific properties may be appropriate. See tests/drivers/gpio/gpio_basic_api for an example.
For applications, see blinky for a devicetree-based alternative.

**select statements**

The select statement is used to force one symbol to y whenever another symbol is y. For example, the following code forces CONSOLE to y whenever USB_CONSOLE is y:

```plaintext
config CONSOLE
    bool "Console support"
...
config USB_CONSOLE
    bool "USB console support"
    select CONSOLE
```

This section covers some pitfalls and good uses for select.

**select pitfalls**  select might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the CONSOLE symbol above, by a developer who is unaware of the USB_CONSOLE symbol (or simply forgot about it):

```plaintext
config CONSOLE
    bool "Console support"
    depends on STRING_ROUTINES
```

Enabling USB_CONSOLE now forces CONSOLE to y, even if STRING_ROUTINES is n.

To fix the problem, the STRING_ROUTINES dependency needs to be added to USB_CONSOLE as well:

```plaintext
config USB_CONSOLE
    bool "USB console support"
    select CONSOLE
    depends on STRING_ROUTINES
...
config STRING_ROUTINES
    bool "Include string routines"
```

More insidious cases with dependencies inherited from if and menu statements are common.

An alternative attempt to solve the issue might be to turn the depends on into another select:

```plaintext
config CONSOLE
    bool "Console support"
    select STRING_ROUTINES
...
config USB_CONSOLE
    bool "USB console support"
    select CONSOLE
```

In practice, this often amplifies the problem, because any dependencies added to STRING_ROUTINES now need to be copied to both CONSOLE and USB_CONSOLE.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.
Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in *Using select for helper symbols*.

Liberal use of select also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of select, which hides ways in which a symbol might get enabled.

**Alternatives to select** For the example in the previous section, a better solution is usually to turn the select into a depends on:

```
config CONSOLE
  bool "Console support"
...
config USB_CONSOLE
  bool "USB console support"
  depends on CONSOLE
```

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using depends on here might be that configuration files that enable USB_CONSOLE now also need to enable CONSOLE:

```
CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y
```

This comes down to a trade-off, but if enabling CONSOLE is the norm, then a mitigation is to make CONSOLE default to y:

```
config CONSOLE
  bool "Console support"
  default y
```

This gives just a single assignment in configuration files:

```
CONFIG_USB_CONSOLE=y
```

Note that configuration files that do not want CONSOLE enabled now have to explicitly disable it:

```
CONFIG_CONSOLE=n
```

**Using select for helper symbols** A good and safe use of select is for setting “helper” symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

```
config CPU_HAS_FPU
  bool
  help If y, the CPU has an FPU
...
config SOC_FOO
  bool "FOO SoC"
  select CPU_HAS_FPU
```
This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

```c
config FPU
  bool "Support floating point operations"
  depends on CPU_HAS_FPU
```

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

```c
config FPU
  bool "Support floating point operations"
  depends on SOC_FOO || SOC_BAR || ...
```

Invisible helper symbols can also be useful without `select`. For example, the following code defines a helper symbol that has the value `y` if the machine has some arbitrarily-defined “large” amount of memory:

```c
config LARGE_MEM
  def_bool MEM_SIZE >= 64
```

**Note:** This is short for the following:

```c
config LARGE_MEM
  bool
  default MEM_SIZE >= 64
```

**select recommendations**  In summary, here are some recommended practices for `select`:

- Avoid selecting symbols with prompts or dependencies. Prefer `depends on`. If `depends on` causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

  Rare exceptions might include cases where you're sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same `if`.

  Common sense applies, but be aware that `select` often causes issues in practice. `depends on` is usually a cleaner and safer solution.

- Select simple helper symbols without prompts and dependencies however much you like. They're a great tool for simplifying Kconfig files.

- An exemption are busses like I2C and SPI, and following the same thought process things like MFD as well. Drivers on these busses should use `select` to allow the automatic activation of the necessary bus drivers when devices on the bus are enabled in the devicetree.

```c
config ADC_FOO
  bool "external SPI ADC foo driver"
  select SPI
```
(Lack of) conditional includes

If blocks add dependencies to each item within the if, as if depends on was used.

A common misunderstanding related to if is to think that the following code conditionally includes the file Kconfig.other:

```c
if DEP
    source "Kconfig.other"
endif
```

In reality, there are no conditional includes in Kconfig. if has no special meaning around a source.

Note: Conditional includes would be impossible to implement, because if conditions may contain (either directly or indirectly) forward references to symbols that haven’t been defined yet.

Say that Kconfig.other above contains this definition:

```c
config FOO
    bool "Support foo"
```

In this case, FOO will end up with this definition:

```c
config FOO
    bool "Support foo"
    depends on DEP
```

Note that it is redundant to add depends on DEP to the definition of FOO in Kconfig.other, because the DEP dependency has already been added by if DEP.

In general, try to avoid adding redundant dependencies. They can make the structure of the Kconfig files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

“Stuck” symbols in menuconfig and guiconfig

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:

```c
config FOO
    bool "Foo"
config STACK_SIZE
    hex "Stack size"
    default @x200 if FOO
    default @x100
```

Assume that the intention here is to use a larger stack whenever FOO is enabled, and that the configuration initially has FOO disabled. Also, remember that Zephyr creates an initial configuration in zephyr/.config in the build directory by merging configuration files (including e.g. prj.conf). This configuration file exists before menuconfig or guiconfig is run.

When first entering the configuration interface, the value of STACK_SIZE is 0x100, as expected. After enabling FOO, you might reasonably expect the value of STACK_SIZE to change to 0x200, but it stays as 0x100.

To understand what’s going on, remember that STACK_SIZE has a prompt, meaning it is user-configurable, and consider that all Kconfig has to go on from the initial configuration is this:
CONFIG_STACK_SIZE=0x100

Since Kconfig can't know if the 0x100 value came from a default or was typed in by the user, it has to assume that it came from the user. Since STACK_SIZE is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of STACK_SIZE appears to be “frozen” at 0x100 when toggling FOO.

The right fix depends on what the intention is. Here's some different scenarios with suggestions:

- If STACK_SIZE can always be derived automatically and does not need to be user-configurable, then just remove the prompt:

```
config STACK_SIZE
    hex
    default 0x200 if FOO
    default 0x100
```

Symbols without prompts ignore any value from the saved configuration.

- If STACK_SIZE should usually be user-configurable, but needs to be set to 0x200 when FOO is enabled, then disable its prompt when FOO is enabled, as described in optional prompts:

```
config STACK_SIZE
    hex "Stack size" if !FOO
    default 0x200 if FOO
    default 0x100
```

- If STACK_SIZE should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making STACK_SIZE user-configurable:

```
config CUSTOM_STACK_SIZE
    bool "Use a custom stack size"
    help
        Enable this if you need to use a custom stack size. When disabled, a suitable stack size is calculated automatically.

config STACK_SIZE
    hex "Stack size" if CUSTOM_STACK_SIZE
    default 0x200 if FOO
    default 0x100
```

As long as CUSTOM_STACK_SIZE is disabled, STACK_SIZE will ignore the value from the saved configuration.

It is a good idea to try out changes in the menuconfig or guiconfig interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.

**Assignments to promptless symbols in configuration files**

Assignments to hidden (promptless, also called invisible) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. default and select.

A common source of confusion is opening the output configuration file (zephyr/.config), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in zephyr/.config are ignored by Kconfig, like for other configuration files.

To understand why zephyr/.config still includes assignments to hidden symbols, it helps to realize that zephyr/.config serves two separate purposes:
1. It holds the saved configuration, and
2. it holds configuration output. `zephyr/.config` is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in `zephyr/.config` are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

**Note:** A minimal configuration, which can be generated from within the `menuconfig` and `guiconfig` interfaces, could be considered closer to just a saved configuration, without the full configuration output.

**depends on and string/int/hex symbols**

*depends on* works not just for *bool* symbols, but also for *string*, *int*, and *hex* symbols (and for *choices*).

The Kconfig definitions below will hide the `FOO_DEVICE_FREQUENCY` symbol and disable any configuration output for it when `FOO_DEVICE` is disabled.

```
config FOO_DEVICE
  bool "Foo device"

config FOO_DEVICE_FREQUENCY
  int "Foo device frequency"
  depends on FOO_DEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the `menuconfig`/`guiconfig` interface. Having `FOO_DEVICE_FREQUENCY` show up when `FOO_DEVICE` is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at `FOO_DEVICE_FREQUENCY` when `FOO_DEVICE` is disabled.

**menuconfig symbols**

If the definition of a symbol `FOO` is immediately followed by other symbols that depend on `FOO`, then those symbols become children of `FOO`. If `FOO` is defined with `config FOO`, then the children are shown indented relative to `FOO`. Defining `FOO` with `menuconfig FOO` instead puts the children in a separate menu rooted at `FOO`.

`menuconfig` has no effect on evaluation. It's just a display option.

`menuconfig` can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```
menu "Foo subsystem"

config FOO_SUBSYSTEM
  bool "Foo subsystem"

if FOO_SUBSYSTEM

  config FOO_FEATURE_1
    bool "Foo feature 1"

  config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
```

(continues on next page)
int "Foo frequency"
... lots of other FOO-related symbols
endif # FOO_SUBSYSTEM
endmenu

In this case, it’s probably better to get rid of the menu and turn FOO_SUBSYSTEM into a menuconfig symbol:

```
menuconfig FOO_SUBSYSTEM
  bool "Foo subsystem"
if FOO_SUBSYSTEM
  config FOO_FEATURE_1
    bool "Foo feature 1"
  config FOO_FEATURE_2
    bool "Foo feature 2"
  config FOO_FREQUENCY
    int "Foo frequency"
... lots of other FOO-related symbols
endif # FOO_SUBSYSTEM
```

In the menuconfig interface, this will be displayed as follows:

```
[*] Foo subsystem --->
```

Note that making a symbol without children a menuconfig is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

```
[*] I have no children ----
[*] All my children are invisible ----
```

**Commas in macro arguments**

Kconfig uses commas to separate macro arguments. This means a construct like this will fail:

```
config FOO
  bool default y if $(dt_chosen_enabled,"zephyr,bar")
```

To solve this problem, create a variable with the text and use this variable as argument, as follows:

```
DT_CHOSEN_ZEPHYR_BAR := zephyr,bar
config FOO
  bool default y if $(dt_chosen_enabled,$(DT_CHOSEN_ZEPHYR_BAR))
```
Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in menuconfig or guiconfig afterwards. To get to a symbol quickly, use the jump-to feature (press /).

Here are some things to check:

- Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.
  
  If one symbol depends on another, then it's often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the menuconfig interface, and in a separate menu rooted at the symbol in guiconfig. This also works if several symbols are placed after the symbol they depend on.

- Is it easy to guess what the symbols do from their prompts?

- If many symbols are added, do all combinations of values they can be set to make sense?
  
  For example, if two symbols FOO_SUPPORT and NO_FOO_SUPPORT are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it's probably better to have a single FOO_SUPPORT symbol.

- Are there any duplicated dependencies?
  
  This can be checked by selecting a symbol and pressing ? to view the symbol information. If there are duplicated dependencies, then use the Included via ... path shown in the symbol information to figure out where they come from.

Checking changes with scripts/kconfig/lint.py

After you make Kconfig changes, you can use the scripts/kconfig/lint.py script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use --help to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there's a problem. If a check returns a false positive e.g. due to token pasting in C (CONFIG_FOO_##index##_BAR), just ignore it.

When investigating an unknown symbol FOO_BAR, it is a good idea to run git grep FOO_BAR to look for references. It is also a good idea to search for some components of the symbol name with e.g. git grep FOO and git grep BAR, as it can help uncover token pasting.

Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.

Factoring out common dependencies

If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an if.

As an example, consider the following code:

```c
config FOO
  bool "Foo"
  depends on DEP

config BAR
  bool "Bar"
  depends on DEP
```

(continues on next page)
Here, the \texttt{DEP} dependency can be factored out like this:

\begin{verbatim}
if \texttt{DEP}
  config \texttt{FOO}
    bool "Foo"
  config \texttt{BAR}
    bool "Bar"
  choice
    prompt "Choice"
    config \texttt{BAZ}
      bool "Baz"
    config \texttt{QAZ}
      bool "Qaz"
  endchoice
endif  # DEP
\end{verbatim}

\textbf{Note:} Internally, the second version of the code is transformed into the first.

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

\begin{verbatim}
menu "Foo features"
  depends on \texttt{FOO_SUPPORT}
  config \texttt{FOO_FEATURE_1}
    bool "Foo feature 1"
  config \texttt{FOO_FEATURE_2}
    bool "Foo feature 2"
endmenu
\end{verbatim}

If \texttt{FOO_SUPPORT} is \texttt{n}, the entire menu disappears.

\textbf{Redundant defaults} bool symbols implicitly default to \texttt{n}, and string symbols implicitly default to the empty string. Therefore, \texttt{default n} and \texttt{default "} are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for bool and string symbols. That also generates clearer documentation: (\textit{Implicitly defaults to} \texttt{n} instead of \texttt{n if <dependencies,}
possibly inherited>.

Defaults should always be given for int and hex symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit 0 default might be less likely to be what was intended compared to other symbol types as well.

The one case where default n/default "" is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a default y on a later definition. Note that a default n does not override a previously defined default y.

That is, FOO will be set to n in the example below. If the default n was omitted in the first definition, FOO would have been set to y.

```c
config FOO
    bool "foo"
    default n
config FOO
    bool "foo"
    default y
```

In the following example FOO will get the value y.

```c
config FOO
    bool "foo"
    default y
config FOO
    bool "foo"
    default n
```

Common Kconfig shorthands  Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```c
config FOO
    bool "foo"
```

```c
config FOO
    bool
    prompt "foo"
```

The first style, with the shorthand, is preferred in Zephyr.

- `def_<type> <value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```c
config FOO
    def_bool BAR && BAZ
```

```c
config FOO
    bool
    default BAR && BAZ
```

Using both the `<type> "prompt"` and the `def_<type> <value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type> <value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.
**Note:** For a symbol defined in multiple locations (e.g., in a `Kconfig.defconfig` file in Zephyr), it is best to only give the symbol type for the “base” definition of the symbol, and to use `default` (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

**Prompt strings** For a `Kconfig` symbol that enables a driver/subsystem FOO, consider having just “Foo” as the prompt, instead of “Enable Foo support” or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

**Header comments and other nits** A few formatting nits, to help keep things consistent:

- Use this format for any header comments at the top of `Kconfig` files:

  ```
  # <Overview of symbols defined in the file, preferably in plain English>
  (Blank line)
  # Copyright (c) 2019 ...
  # SPDX-License-Identifier: <License>
  (Blank line)
  (Kconfig definitions)
  ```

- Format comments as `# Comment` rather than `#Comment`
- Put a blank line before/after each top-level `if` and `endif`
- Use a single tab for each indentation
- Indent help text with two extra spaces

**Lesser-known/used `Kconfig` features**

This section lists some more obscure `Kconfig` behaviors and features that might still come in handy.

**The `imply` statement** The `imply` statement is similar to `select`, but respects dependencies and doesn't force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:

```
config SOC_FOO
  bool "FOO SoC"
  imply USB_KEYBOARD

... 

config USB_KEYBOARD
  bool "USB keyboard support"
```

`imply` acts like a suggestion, whereas `select` forces a value.

**Optional prompts** A condition can be put on a symbol’s prompt to make it optionally configurable by the user. For example, a value `MASK` that's hardcoded to `0xFF` on some boards and configurable on others could be expressed as follows:
**Zephyr Project Documentation, Release 3.6.99**

```c
config MASK
  hex "Bitmask" if HAS_CONFIGURABLE_MASK
  default 0xFF
```

**Note:** This is short for the following:

```c
config MASK
  hex prompt "Bitmask" if HAS_CONFIGURABLE_MASK
  default 0xFF
```

The `HAS_CONFIGURABLE_MASK` helper symbol would get selected by boards to indicate that `MASK` is configurable. When `MASK` is configurable, it will also default to `0xFF`.

**Optional choices**  Defining a choice with the `optional` keyword allows the whole choice to be toggled off to select none of the symbols:

```c
choice
  prompt "Use legacy protocol"
  optional

config LEGACY_PROTOCOL_1
  bool "Legacy protocol 1"

config LEGACY_PROTOCOL_2
  bool "Legacy protocol 2"
endchoice
```

In the `menuconfig` interface, this will be displayed e.g. as [*] Use legacy protocol (Legacy protocol 1) -->, where the choice can be toggled off to enable neither of the symbols.

**visible if conditions**  Putting a `visible if` condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

```c
menu "Foo subsystem"
  depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
  int "Foo setting 1"
  default 1

config FOO_SETTING_2
  int "Foo setting 2"
  default 2
endmenu
```

When `HAS_CONFIGURABLE_FOO` is n, no configuration output is generated for `FOO_SETTING_1` and `FOO_SETTING_2`, as the code above is logically equivalent to the following code:

```c
config FOO_SETTING_1
  int "Foo setting 1"
  default 1
  depends on HAS_CONFIGURABLE_FOO
```

(continues on next page)
If we want the symbols to still get their default values even when HAS_CONFIGURABLE_FOO is n, but not be configurable by the user, then we can use `visible if` instead:

```c
menu "Foo subsystem"
  visible if HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
  int "Foo setting 1"
  default 1

config FOO_SETTING_2
  int "Foo setting 2"
  default 2

endmenu
```

This is logically equivalent to the following:

```c
config FOO_SETTING_1
  int "Foo setting 1" if HAS_CONFIGURABLE_FOO
  default 1

config FOO_SETTING_2
  int "Foo setting 2" if HAS_CONFIGURABLE_FOO
  default 2
```

**Note:** See the `optional prompts` section for the meaning of the conditions on the prompts.

When HAS_CONFIGURABLE is n, we now get the following configuration output for the symbols, instead of no output:

```bash
... CONFIG_FOO_SETTING_1=1 CONFIG_FOO_SETTING_2=2 ...
```

**Other resources**

The `Intro to symbol values` section in the Kconfiglib docstring goes over how symbols values are calculated in more detail.

### 5.3.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in `scripts/kconfig/kconfigfunctions.py`.

**Note:** The official Kconfig preprocessor documentation can be found here.
Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree reg property.

**Devicetree-related Functions**

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in `scripts/kconfig/kconfigfunctions.py` for detailed documentation.

The *\_int* version of each function returns the value as a decimal integer, while the *\_hex* version returns a hexadecimal value starting with 0x.

```markdown
$(dt_alias_enabled,<node alias>)
$(dt_chosen_bool_prop, <property in /chosen>, <prop>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_chosen_has_compat,<property in /chosen>)
$(dt_chosen_label,<property in /chosen>)
$(dt_chosen_path,<property in /chosen>)
$(dt_chosen_reg_addr_hex,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_addr_int,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_size_hex,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_size_int,<property in /chosen>[<index>,<unit>])

$(dt_compat_on_bus,<compatible string>,<bus>)
$(dt_gpio_hogs_enabled)
$(dt_has_compat,<compatible string>)
$(dt_node_bool_prop,<node path>,<prop>)
$(dt_node_has_compat,<node path>,<compatible string>)
$(dt_node_has_prop,<node path>,<prop>)
$(dt_node_int_prop_hex,<node path>,<prop>[<unit>])
$(dt_node_int_prop_int,<node path>,<prop>[<unit>])
$(dt_node_parent,<node path>)
$(dt_node_reg_addr_hex,<node path>[<index>,<unit>])
$(dt_node_reg_addr_int,<node path>[<index>,<unit>])
$(dt_node_reg_size_hex,<node path>[<index>,<unit>])
$(dt_node_reg_size_int,<node path>[<index>,<unit>])
$(dt_node_str_prop_equals,<node path>,<prop>,<value>)
$(dt_nodelabel_array_prop_has_val, <node label>, <prop>, <value>)
$(dt_nodelabel_bool_prop,<node label>,<prop>)
$(dt_nodelabel_enabled,<node label>)
$(dt_nodelabel_enabled_with_compat,<node label>,<compatible string>)
$(dt_nodelabel_has_compat,<node label>,<compatible string>)
$(dt_nodelabel_has_prop,<node label>,<prop>)
$(dt_nodelabel_path,<node label>)
$(dt_nodelabel_reg_addr_hex,<node label>[<index>,<unit>])
$(dt_nodelabel_reg_addr_int,<node label>[<index>,<unit>])
$(dt_nodelabel_reg_size_hex,<node label>[<index>,<unit>])
$(dt_nodelabel_reg_size_int,<node label>[<index>,<unit>])
$(dt_path_enabled,<node path>)
$(shields_list_contains,<shield name>)
```

**Example Usage**

Assume that the devicetree for some board looks like this:

```markdown
{  
  soc {  
    #address-cells = <1>;  
    #size-cells = <1>;  
    spi0: spi@0014000 {  
      compatible = "sifive_spi0";  
      reg = <0x10014000 0x1000 0x20010000 0x3c0900>;  
  }
}
```

(continues on next page)
The second entry in `reg` in `spi@1001400` (<0x20010000 0x3c0900>) corresponds to `mem`, and has the address 0x20010000. This address can be inserted into Kconfig as follows:

```
config FLASH_BASE_ADDRESS
default $(dt_node_reg_addr_hex,/soc/spi@1001400,1)
```

After preprocessor expansion, this turns into the definition below:

```
config FLASH_BASE_ADDRESS
default 0x20010000
```

### 5.3.5 Kconfig extensions

Zephyr uses the Kconfiglib implementation of Kconfig, which includes some Kconfig extensions:

- Default values can be applied to existing symbols without weakening the symbols dependencies through the use of `configdefault`.

```
config FOO
  bool "FOO"
  depends on BAR
configdefault FOO
default y if FIZZ
```

The statement above is equivalent to:

```
config FOO
  bool "Foo"
  default y if FIZZ
  depends on BAR
```

`configdefault` symbols cannot contain any fields other than `default`, however they can be wrapped in `if` statements. The two statements below are equivalent:

```
configdefault FOO
default y if BAR
if BAR
  configdefault FOO
  default y
endif # BAR
```

- Environment variables in source statements are expanded directly, meaning no “bounce” symbols with option `env="ENV_VAR"` need to be defined.

**Note:** option `env` has been removed from the C tools as of Linux 4.18 as well.

The recommended syntax for referencing environment variables is `$F00` rather than `$FOO`. This uses the new Kconfig preprocessor. The `$F00` syntax for expanding environment variables is only supported for backwards compatibility.

- The source statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.
Consider the following example:

```
source "foo/bar/*/Kconfig"
```

If the pattern `foo/bar/*/Kconfig` matches the files `foo/bar/baz/Kconfig` and `foo/bar/qaz/Kconfig`, the statement above is equivalent to the following two `source` statements:

```
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

If no files match the pattern, an error is generated.

The wildcard patterns accepted are the same as for the Python `glob` module.

For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate `osource` (optional `source`) statement is available. `osource` is a no-op if no file matches.

**Note:** `source` and `osource` are analogous to `include` and `-include` in Make.

- An `rsource` statement is available for including files specified with a relative path. The path is relative to the directory of the `Kconfig` file that contains the `rsource` statement.

  As an example, assume that `foo/Kconfig` is the top-level `Kconfig` file, and that `foo/bar/Kconfig` has the following statements:

  ```
  source "qaz/Kconfig1"
  rsource "qaz/Kconfig2"
  ```

  This will include the two files `foo/qaz/Kconfig1` and `foo/bar/qaz/Kconfig2`.

  `rsource` can be used to create `Kconfig` “subtrees” that can be moved around freely.

  `rsource` also supports glob patterns.

  A drawback of `rsource` is that it can make it harder to figure out where a file gets included, so only use it if you need it.

- An `orsource` statement is available that combines `osource` and `rsource`.

  For example, the following statement will include `Kconfig1` and `Kconfig2` from the current directory (if they exist):

  ```
  orsource "Kconfig[12]"
  ```

- `def_int`, `def_hex`, and `def_string` keywords are available, analogous to `def_bool`. These set the type and add a default at the same time.

Users interested in optimizing their configuration for security should refer to the Zephyr Security Guide's section on the Hardening Tool.

### 5.4 Snippets

Snippets are a way to save build system settings in one place, and then use those settings when you build any Zephyr application. This lets you save common configuration separately when it applies to multiple different applications.

Some example use cases for snippets are:

- changing your board's console backend from a “real” UART to a USB CDC-ACM UART
- enabling frequently-used debugging options
• applying interrelated configuration settings to your “main” CPU and a co-processor core on an AMP SoC

The following pages document this feature.

## 5.4.1 Using Snippets

**Tip:** See [Built-in snippets](#) for a list of snippets that are provided by Zephyr.

Snippets have names. You use snippets by giving their names to the build system.

### With west build

To use a snippet named foo when building an application app:

```
west build -S foo app
```

To use multiple snippets:

```
west build -S snippet1 -S snippet2 [...] app
```

### With cmake

If you are running CMake directly instead of using `west build`, use the `SNIPPET` variable. This is a whitespace- or semicolon-separated list of snippet names you want to use. For example:

```
cmake -Sapp -Bbuild -DSNIPPET="snippet1;snippet2" [...] cmake --build build
```

### Application required snippets

If an application should always be compiled with a given snippet, it can be added to that application's `CMakeLists.txt` file. For example:

```
if(NOT snippet1 IN_LIST SNIPPET)
  set(SNIPPET snippet1 ${{SNIPPET}} CACHE STRING "" FORCE)
endif()

find_package(Zephyr ....)
```

## 5.4.2 Built-in snippets

### CDC-ACM Console Snippet (cdc-acm-console)

```
west build -S cdc-acm-console [...] 
```

**Overview** This snippet redirects serial console output to a CDC ACM UART. The USB device which should be used is configured using [Devicetree](#).
Requirements  Hardware support for:

- CONFIG_USB_DEVICE_STACK
- CONFIG_SERIAL
- CONFIG_CONSOLE
- CONFIG_UART_CONSOLE
- CONFIG_UART_LINE_CTRL

A devicetree node with node label zephyr_udc0 that points to an enabled USB device node with driver support. This should look roughly like this in your devicetree:

```c
zephyr_udc0: usbd@deadbeef {
    compatible = "vnd,usb-device";
    /* ... */
};
```

Nordic boot PPR snippet with execution from RAM (nordic-ppr-ram)

Overview  This snippet allows users to build Zephyr with the capability to boot Nordic PPR (Peripheral Processor) from another core. PPR code is executed from RAM. Note that PPR image must be built with CONFIG_XIP disabled.

Nordic PPR snippet (nordic-ppr)

Overview  This snippet allows users to build Zephyr with the capability to boot Nordic PPR (Peripheral Processor) from another core.

Xen Dom0: universal snippet for XEN control domain

Overview  This snippet allows user to build Zephyr as a Xen initial domain (Dom0). The feature is implemented as configuration snippet to allow support for any compatible platform.

How to add support of a new board

- add board dts overlay to this snippet which deletes/adds memory and deletes UART nodes;
- add correct memory and hypervisor nodes, based on regions Xen picked for Domain-0 on your setup.

Programming  Correct snippet designation for Xen must be entered when you invoke west build. For example:

```
west build -b qemu_cortex_a53 -S xen_dom0 samples/synchronization
```

QEMU example with Xen  Overlay for qemu_cortex_a53 board, that is present in board/ directory of this snippet is QEMU Xen control domain example. To run such setup, you need to:

- fetch and build Xen (e.g. RELEASE-4.17.0) for arm64 platform
- take and compile sample device tree from example/ directory
- build your Zephyr sample/application with xen_dom0 snippet and start it as Xen control domain
For starting you can use QEMU from Zephyr SDK by following command:

```bash
<path to Zephyr SDK>/sysroots/x86_64-pokysdk-linux/usr/bin/qemu-system-aarch64 -cpu cortex-a53 -m 6G -nographic -machine virt,gic-version=3,virtualization=true -chardev stdio,id=con,mux=on -serial chardev:con -mon chardev=con,mode=readline -pidfile qemu.pid -device loader,file=<path to Zephyr app build>/zephyr.bin,addr=0x40600000 -dtb <path to DTB>/xen.dtb -kernel <path to Xen build>/xen
```

This will start you a Xen hypervisor with your application as Xen control domain. To make it usable, you can add `zephyr-xenlib` by Xen-troops library to your project. It'll provide basic domain management functionalities - domain creation and configuration.

### 5.4.3 Writing Snippets

- **Basics**
- **Namespacing**
- **Where snippets are located**
- **Processing order**
- **Devicetree overlays (.overlay)**
- **.conf files**
- **DTS_EXTRA_CPPFLAGS**
- **Board-specific settings**
  - By name
  - By regular expression

#### Basics

Snippets are defined using YAML files named `snippet.yml`. A `snippet.yml` file contains the name of the snippet, along with additional build system settings, like this:

```yaml
name: snippet-name
# ... build system settings go here ...
```

Build system settings go in other keys in the file as described later on in this page.

You can combine settings whenever they appear under the same keys. For example, you can combine a snippet-specific devicetree overlay and a `.conf` file like this:

```yaml
name: foo
append:
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
  EXTRA_CONF_FILE: foo.conf
```

#### Namespacing

When writing devicetree overlays in a snippet, use `snippet_<name>` or `snippet-<name>` as a namespace prefix when choosing names for node labels, node names, etc. This avoids names-
pace conflicts.

For example, if your snippet is named foo-bar, write your devicetree overlays like this:

```c
chosen {
    zephyr,baz = &snippet_foo_bar_dev;
};

snippet_foo_bar_dev: device@12345678 {
    /* ... */
};
```

### Where snippets are located

The build system looks for snippets in these places:

1. In directories configured by the `SNIPPET_ROOT` CMake variable. This always includes the zephyr repository (so `snippets/` is always a source of snippets) and the application source directory (so `<app>/snippets` is also).

   Additional directories can be added manually at CMake time.

   The variable is a whitespace- or semicolon-separated list of directories which may contain snippet definitions.

   For each directory in the list, the build system looks for `snippet.yml` files underneath a subdirectory named `snippets/`, if one exists.

   For example, if `SNIPPET_ROOT` is set to `/foo;/bar`, the build system will look for `snippet.yml` files underneath the following subdirectories:
   - `/foo/snippets/`
   - `/bar/snippets/`

   The `snippet.yml` files can be nested anywhere underneath these locations.

2. In any module whose `module.yml` file provides a `snippet_root` setting.

   For example, in a zephyr module named `baz`, you can add this to your `module.yml` file:

   ```yaml
   settings:
     snippet_root: .
   ```

   And then any `snippet.yml` files in `baz/snippets` will automatically be discovered by the build system, just as if the path to `baz` had appeared in `SNIPPET_ROOT`.

### Processing order

Snippets are processed in the order they are listed in the `SNIPPET` variable, or in the order of the `-S` arguments if using west.

To apply `bar` after `foo`:

```sh
cmake -Sapp -Bbuild -DSNIPPET="foo;bar" [...]  
cmake --build build
```

The same can be achieved with west as follows:

```sh
west build -S foo -S bar [...] app
```
When multiple snippets set the same configuration, the configuration value set by the last processed snippet ends up in the final configurations. For instance, if foo sets CONFIG_FOO=1 and bar sets CONFIG_FOO=2 in the above example, the resulting final configuration will be CONFIG_FOO=2 because bar is processed after foo.

This principle applies to both Kconfig fragments (.conf files) and devicetree overlays (.overlay files).

**Devicetree overlays (.overlay)**

This snippet.yml adds foo.overlay to the build:

```yaml
name: foo
append: 
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
```

The path to foo.overlay is relative to the directory containing snippet.yml.

**.conf files**

This snippet.yml adds foo.conf to the build:

```yaml
name: foo
append: 
  EXTRA_CONF_FILE: foo.conf
```

The path to foo.conf is relative to the directory containing snippet.yml.

**DTS_EXTRA_CPPFLAGS**

This snippet.yml adds DTS_EXTRA_CPPFLAGS CMake Cache variables to the build:

```yaml
name: foo
append: 
  DTS_EXTRA_CPPFLAGS: -DMY_DTS_CONFIGURE
```

Adding these flags enables control over the content of a devicetree file.

**Board-specific settings**

You can write settings that only apply to some boards.

The settings described here are applied in addition to snippet settings that apply to all boards. (This is similar, for example, to the way that an application with both prj.conf and boards/foo.conf files will use both .conf files in the build when building for board foo, instead of just boards/foo.conf)

**By name**

```yaml
name: ...
boards:
  bar: # settings for board "bar" go here
    append: 
      EXTRA_DTC_OVERLAY_FILE: bar.overlay
  baz: # settings for board "baz" go here
```

(continues on next page)
EXTRA_DTC_OVERLAY_FILE: baz.overlay

The above example uses bar.overlay when building for board bar, and baz.overlay when building for baz.

By regular expression You can enclose the board name in slashes (/) to match the name against a regular expression in the CMake syntax. The regular expression must match the entire board name.
For example:

name: foo
boards:
  /my_vendor_.*/:
append:
  EXTRA_DTC_OVERLAY_FILE: my_vendor.overlay

The above example uses devicetree overlay my_vendor.overlay when building for either board my_vendor_board1 or my_vendor_board2. It would not use the overlay when building for either another_vendor_board or x_my_vendor_board.

5.4.4 Snippets Design

This page documents design goals for the snippets feature. Further information can be found in Issue #51834.

- extensible: for example, it is possible to add board support for an existing built-in snippet without modifying the zephyr repository
- composable: it is possible to use multiple snippets at once, for example using:

west build -S <snippet1> -S <snippet2> ...

- able to combine multiple types of configuration: snippets make it possible to store multiple different types of build system settings in one place, and apply them all together
- specializable: for example, it is possible to customize a snippet's behavior for a particular board, or board revision
- future-proof and backwards-compatible: arbitrary future changes to the snippets feature will be possible without breaking backwards compatibility for older snippets
- applicable to purely “software” changes: unlike the shields feature, snippets do not assume the presence of a “daughterboard”, “shield”, “hat”, or any other type of external assembly which is connected to the main board
- DRY (don’t repeat yourself): snippets allow you to skip unnecessary repetition; for example, you can apply the same board-specific configuration to boards foo and bar by specifying /(/foo|bar)/ as a regular expression for the settings, which will then apply to both boards

5.5 Zephyr CMake Package

The Zephyr CMake package is a convenient way to create a Zephyr-based application.
The Zephyr CMake package ensures that CMake can automatically select a Zephyr installation to use for building the application, whether it is a Zephyr repository application, a Zephyr workspace application, or a Zephyr freestanding application.

When developing a Zephyr-based application, then a developer simply needs to write `find_package(Zephyr)` in the beginning of the application `CMakeLists.txt` file.

To use the Zephyr CMake package it must first be exported to the CMake user package registry. This is means creating a reference to the current Zephyr installation inside the CMake user package registry.

Ubuntu

In Linux, the CMake user package registry is found in:
`~/.cmake/packages/Zephyr`

macOS

In macOS, the CMake user package registry is found in:
`~/.cmake/packages/Zephyr`

Windows

In Windows, the CMake user package registry is found in:
`HKEY_CURRENT_USER\Software\Kitware\CMake\Packages\Zephyr`

The Zephyr CMake package allows CMake to automatically find a Zephyr base. One or more Zephyr installations must be exported. Exporting multiple Zephyr installations may be useful when developing or testing Zephyr freestanding applications, Zephyr workspace application with vendor forks, etc..

5.5.1 Zephyr CMake package export (west)

When installing Zephyr using `west` then it is recommended to export Zephyr using `west zephyr-export`.

5.5.2 Zephyr CMake package export (without west)

Zephyr CMake package is exported to the CMake user package registry using the following commands:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyr-package/cmake/zephyr_export.cmake
```

This will export the current Zephyr to the CMake user package registry.

To also export the Zephyr Unittest CMake package, run the following command in addition:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyrunittest-package/cmake/zephyr_export.cmake
```

5.5.3 Zephyr Base Environment Setting

The Zephyr CMake package search functionality allows for explicitly specifying a Zephyr base using an environment variable.

To do this, use the following `find_package()` syntax:
This syntax instructs CMake to first search for Zephyr using the Zephyr base environment setting `ZEPHYR_BASE` and then use the normal search paths.

### 5.5.4 Zephyr CMake Package Search Order

When Zephyr base environment setting is not used for searching, the Zephyr installation matching the following criteria will be used:

- A Zephyr repository application will use the Zephyr in which it is located. For example:

  ```
  <projects>/zephyr-workspace/zephyr
  ├── samples
  │   └── hello_world
  ```

  in this example, `hello_world` will use `<projects>/zephyr-workspace/zephyr`.

- Zephyr workspace application will use the Zephyr that share the same workspace. For example:

  ```
  <projects>/zephyr-workspace
  ├── zephyr
  │   ├── ...
  │   └── my_applications
  │        └── my_first_app
  ```

  in this example, `my_first_app` will use `<projects>/zephyr-workspace/zephyr` as this Zephyr is located in the same workspace as the Zephyr workspace application.

**Note:** The root of a Zephyr workspace is identical to `west topdir` if the workspace was installed using `west`.

- Zephyr freestanding application will use the Zephyr registered in the CMake user package registry. For example:

  ```
  <projects>/zephyr-workspace-1
  ├── zephyr
  <projects>/zephyr-workspace-2
  │   └── zephyr
  │       (Not exported to CMake)
  │
  <home>/app
  ├── CMakeLists.txt
  │   ├── prj.conf
  │   └── src
  │       └── main.c
  ```

  in this example, only `<projects>/zephyr-workspace-2/zephyr` is exported to the CMake package registry and therefore this Zephyr will be used by the Zephyr freestanding application `<home>/app`.

  If user wants to test the application with `<projects>/zephyr-workspace-1/zephyr`, this can be done by using the Zephyr Base environment setting, meaning set `ZEPHYR_BASE=<$projects>/zephyr-workspace-1/zephyr`, before running CMake.

**Note:** The Zephyr package selected on the first CMake invocation will be used for all subsequent builds. To change the Zephyr package, for example to test the application using...
Zephyr base environment setting, then it is necessary to do a pristine build first (See Re-
building an Application).

### 5.5.5 Zephyr CMake Package Version

When writing an application then it is possible to specify a Zephyr version number x.y.z that
must be used in order to build the application.

Specifying a version is especially useful for a Zephyr freestanding application as it ensures the
application is built with a minimal Zephyr version.

It also helps CMake to select the correct Zephyr to use for building, when there are multiple
Zephyr installations in the system.

For example:

```cmake
find_package(Zephyr 2.2.0)
project(app)
```

will require app to be built with Zephyr 2.2.0 as minimum. CMake will search all exported can-
didates to find a Zephyr installation which matches this version criteria.

Thus it is possible to have multiple Zephyr installations and have CMake automatically select
between them based on the version number provided, see CMake package version for details.

For example:

```
<projects>/zephyr-workspace-2.a
   └── zephyr (Exported to CMake)

<projects>/zephyr-workspace-2.b
   └── zephyr (Exported to CMake)

<home>/app
   ├── CMakeLists.txt
   │    └── prj.conf
   │         └── src
   │             └── main.c
```

In this case, there are two released versions of Zephyr installed at their own workspaces. Workspace 2.a and 2.b, corresponding to the Zephyr version.

To ensure app is built with minimum version 2.a the following find_package syntax may be
used:

```cmake
find_package(Zephyr 2.a)
project(app)
```

Note that both 2.a and 2.b fulfill this requirement.

CMake also supports the keyword EXACT, to ensure an exact version is used, if that is required. In this case, the application CMakeLists.txt could be written as:

```cmake
find_package(Zephyr 2.a EXACT)
project(app)
```

In case no Zephyr is found which satisfies the version required, as example, the application specifies

```cmake
find_package(Zephyr 2.z)
project(app)
```
then an error similar to below will be printed:

```
Could not find a configuration file for package "Zephyr" that is compatible with requested version "2.z".

The following configuration files were considered but not accepted:
<projects>/zephyr-workspace-2.a/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake,
  version: 2.a.0
<projects>/zephyr-workspace-2.b/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake,
  version: 2.b.0
```

**Note:** It can also be beneficial to specify a version number for Zephyr repository applications and Zephyr workspace applications. Specifying a version in those cases ensures the application will only build if the Zephyr repository or workspace is matching. This can be useful to avoid accidental builds when only part of a workspace has been updated.

### 5.5.6 Multiple Zephyr Installations (Zephyr workspace)

Testing out a new Zephyr version, while at the same time keeping the existing Zephyr in the workspace untouched is sometimes beneficial.

Or having both an upstream Zephyr, Vendor specific, and a custom Zephyr in same workspace. For example:

```
<projects>/zephyr-workspace
  ├── zephyr
  │   └── my_applications
  │       └── my_first_app
  └── zephyr-vendor
  └── zephyr-custom
      └── my_applications
          └── my_first_app
```

in this setup, `find_package(Zephyr)` has the following order of precedence for selecting which Zephyr to use:

- Project name: zephyr
- First project, when Zephyr projects are ordered lexicographical, in this case.
  - zephyr-custom
  - zephyr-vendor

This means that `my_first_app` will use `<projects>/zephyr-workspace/zephyr`.

It is possible to specify a Zephyr preference list in the application.

A Zephyr preference list can be specified as:

```cmake
set(ZEPHYR_PREFER "zephyr-custom" "zephyr-vendor")
find_package(Zephyr)
project(my_first_app)
```

the ZEPHYR_PREFER is a list, allowing for multiple Zephyrs. If a Zephyr is specified in the list, but not found in the system, it is simply ignored and `find_package(Zephyr)` will continue to the next candidate.

This allows for temporary creation of a new Zephyr release to be tested, without touching current Zephyr. When testing is done, the zephyr-test folder can simply be removed. Such a CMake-Lists.txt could look as:
There are two Zephyr Build configuration packages which provide control over the build settings in Zephyr in a more generic way. These packages are:

- **ZephyrBuildConfiguration**: Applies to all Zephyr applications in the workspace
- **ZephyrAppConfiguration**: Applies only to the application you are currently building

They are similar to the per-user .zephyr.rc file that can be used to set Environment Variables, but they set CMake variables instead. They also allow you to automatically share the build configuration among all users through the project repository. They also allow more advanced use cases, such as loading of additional CMake boilerplate code.

The Zephyr Build Configuration CMake packages will be loaded in the Zephyr boilerplate code after initial properties and ZEPHYR_BASE has been defined, but before CMake code execution. The ZephyrBuildConfiguration is included first and ZephyrAppConfiguration afterwards. That means the application-specific package could override the workspace settings, if needed. This allows the Zephyr Build Configuration CMake packages to setup or extend properties such as: DTS_ROOT, BOARD_ROOT, TOOLCHAIN_ROOT / other toolchain setup, fixed overlays, and any other property that can be controlled. It also allows inclusion of additional boilerplate code.

To provide a ZephyrBuildConfiguration or ZephyrAppConfiguration, create ZephyrBuildConfig.cmake and/or ZephyrAppConfig.cmake respectively and place them in the appropriate location. The CMake find_package mechanism will search for these files with the steps below. Other default CMake package search paths and hints are disabled and there is no version checking implemented for these packages. This also means that these packages cannot be installed in the CMake package registry. The search steps are:

1. If ZephyrBuildConfiguration_ROOT, or ZephyrAppConfiguration_ROOT respectively, is set, search within this prefix path. If a matching file is found, execute this file. If no matching file is found, go to step 2.
2. Search within ${ZEPHYR_BASE}/../*, or ${APPLICATION_SOURCE_DIR} respectively. If a matching file is found, execute this file. If no matching file is found, abort the search.

It is recommended to place the files in the default paths from step 2, but with the <PackageName>_ROOT variables you have the flexibility to place them anywhere. This is especially necessary for freestanding applications, for which the default path to ZephyrBuildConfiguration usually does not work. In this case the <PackageName>_ROOT variables can be set on the CMake command line, before find_package(Zephyr ...), as environment variable or from a CMake cache initialization file with the -C command line option.

**Note:** The <PackageName>_ROOT variables, as well as the default paths, are just the prefixes to the search path. These prefixes get combined with additional path suffixes, which together form the actual search path. Any combination that honors the CMake package search procedure is valid and will work.

If you want to completely disable the search for these packages, you can use the special CMake CMAKE_DISABLE_FIND_PACKAGE_<PackageName> variable for that. Just set CMAKE_DISABLE_FIND_PACKAGE_ZephyrBuildConfiguration or CMAKE_DISABLE_FIND_PACKAGE_ZephyrAppConfiguration to TRUE to disable the package.

An example folder structure could look like this:
A sample `ZephyrBuildConfig.cmake` can be seen below.

```cmake
# ZephyrBuildConfig.cmake sample code
get_filename_component(APPLICATION_PROJECT_DIR
  ${CMAKE_CURRENT_LIST_DIR}/../../..
  ABSOLUTE)

# Add this project to list of board roots
list(APPEND BOARD_ROOT
  ${APPLICATION_PROJECT_DIR})

# Default to GNU Arm Embedded toolchain if no toolchain is set
if(NOT ENV{ZEPHYR_TOOLCHAIN_VARIANT})
  set(ZEPHYR_TOOLCHAIN_VARIANT gnuarmemb)
  find_program(GNU_ARM_GCC arm-none-eabi-gcc)
  if(NOT $(GNU_ARM_GCC) STREQUAL GNU_ARM_GCC-NOTFOUND)
    # The toolchain root is located above the path to the compiler.
    get_filename_component(GNUARMEMB_TOOLCHAIN_PATH
      $(GNU_ARM_GCC)/../../..
      ABSOLUTE)
  endif()
endif()
```

### 5.5.8 Zephyr CMake package source code

The Zephyr CMake package source code in `share/zephyr-package/cmake` and
`share/zephyrunittest-package/cmake` contains the CMake config package which is used by
the CMake `find_package` function.

It also contains code for exporting Zephyr as a CMake config package.

The following is an overview of the files in these directories:

- **ZephyrConfigVersion.cmake**
  The Zephyr package version file. This file is called by CMake to determine if this installation
  fulfills the requirements specified by user when calling `find_package(Zephyr ...)`. It is also
  responsible for detection of Zephyr repository or workspace only installations.

- **ZephyrUnittestConfigVersion.cmake**
  Same responsibility as `ZephyrConfigVersion.cmake`, but for unit tests. Includes
  `ZephyrConfigConfigVersion.cmake`.

- **ZephyrConfig.cmake**
  The Zephyr package file. This file is called by CMake to for the package meeting which
  fulfills the requirements specified by user when calling `find_package(Zephyr ...)`. This
  file is responsible for sourcing of boilerplate code.

- **ZephyrUnittestConfig.cmake**
  Same responsibility as `ZephyrConfig.cmake`, but for unit tests. Includes `ZephyrConfigConfig.cmake`.

- **zephyr_package_search.cmake**
  Common file used for detection of Zephyr repository and workspace candidates. Used by
Zephyr ConfigVersion.cmake and ZephyrConfig.cmake for common code.  

zephyr_export.cmake  
See Zephyr CMake package export (without west).

5.6 Sysbuild (System build)

Sysbuild is a higher-level build system that can be used to combine multiple other build systems together. It is a higher-level layer that combines one or more Zephyr build systems and optional additional build systems into a hierarchical build system.

For example, you can use sysbuild to build a Zephyr application together with the MCUboot bootloader, flash them both onto your device, and debug the results.

Sysbuild works by configuring and building at least a Zephyr application and, optionally, as many additional projects as you want. The additional projects can be either Zephyr applications or other types of builds you want to run.

Like Zephyr's build system, sysbuild is written in CMake and uses Kconfig.

5.6.1 Definitions

The following are some key concepts used in this document:

**Single-image build**  
When sysbuild is used to create and manage just one Zephyr application's build system.

**Multi-image build**  
When sysbuild is used to manage multiple build systems. The word “image” is used because your main goal is usually to generate the binaries of the firmware application images from each build system.

**Domain**  
Every Zephyr CMake build system managed by sysbuild.

**Multi-domain**  
When more than one Zephyr CMake build system (domain) is managed by sysbuild.

5.6.2 Architectural Overview

This figure is an overview of sysbuild's inputs, outputs, and user interfaces:

The following are some key sysbuild features indicated in this figure:

- You can run sysbuild either with west build or directly via cmake.
- You can use sysbuild to generate application images from each build system, shown above as ELF, BIN, and HEX files.
- You can configure sysbuild or any of the build systems it manages using various configuration variables. These variables are namedpaced so that sysbuild can direct them to the right build system. In some cases, such as the BOARD variable, these are shared among multiple build systems.
- Sysbuild itself is also configured using Kconfig. For example, you can instruct sysbuild to build the MCUboot bootloader, as well as to build and link your main Zephyr application as an MCUboot-bootable image, using sysbuild's Kconfig files.
• Sysbuild integrates with west’s Building, Flashing and Debugging commands. It does this by managing the Flash and debug runners, and specifically the runners.yaml files that each Zephyr build system will contain. These are packaged into a global view of how to flash and debug each build system in a domains.yaml file generated and managed by sysbuild.

• Build names are prefixed with the target name and an underscore, for example the sysbuild target is prefixed with sysbuild_ and if MCUboot is enabled as part of sysbuild, it will be prefixed with mcuboot_. This also allows for running things like menuconfig with the prefix, for example (if using ninja) ninja sysbuild_menuconfig to configure sysbuild or (if using make) make mcuboot_menuconfig.

5.6.3 Building with sysbuild

As mentioned above, you can run sysbuild via west build or cmake.

west build

Here is an example. For details, see Sysbuild (multi-domain builds) in the west build documentation.

```
west build -b reel_board --sysbuild samples/hello_world
```

**Tip:** To configure west build to use --sysbuild by default from now on, run:

```
west config build.sysbuild True
```

Since sysbuild supports both single- and multi-image builds, this lets you use sysbuild all the time, without worrying about what type of build you are running.

To turn this off, run this before generating your build system:

```
setenv CCACHE_DISABLE 1
```
To turn this off for just one `west build` command, run:

```
w west build --no-sysbuild ...
```

---

This is an example using CMake and Ninja.

```
cmake -B build -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild
ninja -C build
```

To use sysbuild directly with CMake, you must specify the sysbuild project as the source folder, and give `-DAPP_DIR=<path-to-sample>` as an extra CMake argument. APP_DIR is the path to the main Zephyr application managed by sysbuild.

### 5.6.4 Configuration namespaces

When building a single Zephyr application without sysbuild, all CMake cache settings and Kconfig build options given on the command line as `-D<var>=<value>` or `-DCONFIG_<var>=<value>` are handled by the Zephyr build system.

However, when sysbuild combines multiple Zephyr build systems, there could be Kconfig settings exclusive to sysbuild (and not used by any of the applications). To handle this, sysbuild has namespaces for configuration variables. You can use these namespaces to direct settings either to sysbuild itself or to a specific Zephyr application managed by sysbuild using the information in these sections.

The following example shows how to build hello_world with MCUboot enabled, applying to both images debug optimizations:

```
w west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y
```

```
cmake
```

```
cmake -B build -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild
-DBOARD_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y share/sysbuild
ninja -C build
```

See the following subsections for more information.

---

**CMake variable namespaces**

CMake variable settings can be passed to CMake using `-D<var>=<value>` on the command line. You can also set Kconfig options via CMake as `-DCONFIG_<var>=<value>` or `-D<namespace>_CONFIG_<var>=<value>`.

Since sysbuild is the entry point for the build system, and sysbuild is written in CMake, all CMake variables are first processed by sysbuild.

Sysbuild creates a namespace for each domain. The namespace prefix is the domain’s application name. See *Adding Zephyr applications to sysbuild* for more information.

To set the variable `<var>` in the namespace `<namespace>`, use this syntax:
For example, to set the CMake variable `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```
west build
west build --sysbuild ... -- -Dmy_sample_FOO=BAR
cmake
cmake -Dmy_sample_FOO=BAR ...
```

**Kconfig namespaces**

To set the sysbuild Kconfig option `<var>` to the value `<value>`, use this syntax:

```
-D<namespace>_<var>=<value>
```

In the previous example, `SB_CONFIG` is the namespace prefix for sysbuild's Kconfig options.

To set a Zephyr application's Kconfig option instead, use this syntax:

```
-D<namespace>_CONFIG_<var>=<value>
```

In the previous example, `<namespace>` is the application name discussed above in *CMake variable namespaces*.

For example, to set the Kconfig option `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```
west build
west build --sysbuild ... -- -Dmy_sample_CONFIG_FOO=BAR
cmake
cmake -Dmy_sample_CONFIG_FOO=BAR ...
```

**Tip:** When no `<namespace>` is used, the Kconfig setting is passed to the main Zephyr application `my_sample`.

This means that passing `-DCONFIG_<var>=<value>` and `-Dmy_sample_CONFIG_<var>=<value>` are equivalent.

This allows you to build the same application with or without sysbuild using the same syntax for setting Kconfig values at CMake time. For example, the following commands will work in the same way:

```
west build -b <board> my_sample -- -DCONFIG_FOO=BAR
west build -b <board> --sysbuild my_sample -- -DCONFIG_FOO=BAR
```

### 5.6.5 Sysbuild flashing using west flash

You can use `west flash` to flash applications with sysbuild.
When invoking `west flash` on a build consisting of multiple images, each image is flashed in sequence. Extra arguments such as `--runner jlink` are passed to each invocation. For more details, see *Multi-domain flashing*.

### 5.6.6 Sysbuild debugging using `west debug`

You can use `west debug` to debug the main application, whether you are using sysbuild or not. Just follow the existing `west debug` guide to debug the main sample.

To debug a different domain (Zephyr application), such as `mcuboot`, use the `--domain` argument, as follows:

```
w west debug --domain mcuboot
```

For more details, see *Multi-domain debugging*.

### 5.6.7 Building a sample with MCUboot

Sysbuild supports MCUboot natively.

To build a sample like `hello_world` with MCUboot, enable MCUboot and build and flash the sample as follows:

```
w west build
```

```
w west build -b reel_board --sysbuild samples/hello_world --DSB_CONFIG_BOOTLOADER_MCUBOOT=y
```

```
w cmake
```

```
w cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y share/sysbuild
```

```
w ninja -Cbuild
```

This builds `hello_world` and `mcuboot` for the `reel_board`, and then flashes both the `mcuboot` and `hello_world` application images to the board.

More detailed information regarding the use of MCUboot with Zephyr can be found in the *MCUboot with Zephyr* documentation page on the MCUboot website.

**Note:** The deprecated MCUBoot Kconfig option `CONFIG_ZEPHYR_TRY_MASS_ERASE` will perform a full chip erase when flashed. If this option is enabled, then flashing only MCUBoot, for example using `west flash --domain mcuboot`, may erase the entire flash, including the main application image.

### 5.6.8 Sysbuild Kconfig file

You can set sysbuild's Kconfig options for a single application using configuration files. By default, sysbuild looks for a configuration file named `sysbuild.conf` in the application top-level directory.

In the following example, there is a `sysbuild.conf` file that enables building and flashing with MCUboot whenever sysbuild is used:
SB_CONFIG_BOOTLOADER_MCUBOOT=y

You can set a configuration file to use with the -DSB_CONF_FILE=<sysbuild-conf-file> CMake build setting.

For example, you can create `sysbuild-mcuboot.conf` and then specify this file when building with `sysbuild`, as follows:

```bash
west build
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONF_FILE=sysbuild-mcuboot.conf
```

```
cmake
make -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONF_FILE=sysbuild-mcuboot.conf share/sysbuild
```

5.6.9 Sysbuild targets

Sysbuild creates build targets for each image (including sysbuild itself) for the following modes:

- menuconfig
- hardenedconfig
- guiconfig

For the main application (as is the same without using sysbuild) these can be ran normally without any prefix. For other images (including sysbuild), these are ran with a prefix of the image name and an underscore e.g. sysbuild_ or mcuboot_, using `ninja` or `make` - for details on how to run image build targets that do not have mapped build targets in sysbuild, see the Dedicated image build targets section.

5.6.10 Dedicated image build targets

Not all build targets for images are given equivalent prefixed build targets when sysbuild is used, for example build targets like `ram_report`, `rom_report`, footprint, puncover and pahole are not exposed. When using Trusted Firmware, this includes build targets prefix with `tfm_` and `b12_`, for example: `tfm_rom_report` and `b12_ram_report`. To run these build targets, the build directory of the image can be provided to `west/ninja/make` along with the name of the build target to execute and it will run.

```
west
Assuming that a project has been configured and built using `west` using sysbuild with mcuboot enabled in the default build folder location, the `rom_report` build target for `mcuboot` can be ran with:

```bash
west build -d build/mcuboot -t rom_report
```

```
ninja
Assuming that a project has been configured using `cmake` and built using `ninja` using sysbuild with mcuboot enabled, the `rom_report` build target for `mcuboot` can be ran with:

```bash
```
Assuming that a project has been configured using cmake and built using make using sysbuild with mcuboot enabled, the `rom_report` build target for mcuboot can be run with:

```
make -C mcuboot rom_report
```

### 5.6.11 Adding Zephyr applications to sysbuild

You can use the `ExternalZephyrProject_Add()` function to add Zephyr applications as sysbuild domains. Call this CMake function from your application's `sysbuild.cmake` file, or any other CMake file you know will run as part sysbuild CMake invocation.

#### Targeting the same board

To include `my_sample` as another sysbuild domain, targeting the same board as the main image, use this example:

```cmake
ExternalZephyrProject_Add(  APPLICATION my_sample  SOURCE_DIR <path-to>/my_sample)
```

This could be useful, for example, if your board requires you to build and flash an SoC-specific bootloader along with your main application.

#### Targeting a different board

In sysbuild and Zephyr CMake build system a board may refer to:

- A physical board with a single core SoC.
- A specific core on a physical board with a multi-core SoC, such as nrf5340dk_nrf5340.
- A specific SoC on a physical board with multiple SoCs, such as nrf9160dk_nrf9160 and nrf9160dk_nrf52840.

If your main application, for example, is built for `mps2_an521`, and your helper application must target the `mps2_an521_remote` board (`cpu1`), add a CMake function call that is structured as follows:

```cmake
ExternalZephyrProject_Add(  APPLICATION my_sample  SOURCE_DIR <path-to>/my_sample  BOARD mps2_an521_remote)
```

This could be useful, for example, if your main application requires another helper Zephyr application to be built and flashed alongside it, but the helper runs on another core in your SoC.

#### Targeting conditionally using Kconfig

You can control whether extra applications are included as sysbuild domains using Kconfig.
If the extra application image is specific to the board or an application, you can create two additional files: `sysbuild.cmake` and `Kconfig.sysbuild`.

For an application, this would look like this:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
├── Kconfig.sysbuild
└── sysbuild.cmake
```

In the previous example, `sysbuild.cmake` would be structured as follows:

```
if(SB_CONFIG_SECOND_SAMPLE)
    ExternalZephyrProject_Add(
        APPLICATION second_sample
        SOURCE_DIR <path-to>/second_sample
    )
endif()
```

`Kconfig.sysbuild` would be structured as follows:

```
source "sysbuild/Kconfig"
config SECOND_SAMPLE
    bool "Second sample"
    default y
```

This will include `second_sample` by default, while still allowing you to disable it using the Kconfig option `SECOND_SAMPLE`.

For more information on setting sysbuild Kconfig options, see `Kconfig namespacing`.

### Building without flashing

You can mark `my_sample` as a build-only application in this manner:

```
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
    BUILD_ONLY TRUE
)
```

As a result, `my_sample` will be built as part of the sysbuild build invocation, but it will be excluded from the default image sequence used by `west flash`. Instead, you may use the outputs of this domain for other purposes - for example, to produce a secondary image for DFU, or to merge multiple images together.

You can also replace `TRUE` with another boolean constant in CMake, such as a Kconfig option, which would make `my_sample` conditionally build-only.

**Note:** Applications marked as build-only can still be flashed manually, using `west flash --domain my_sample`. As such, the `BUILD_ONLY` option only controls the default behavior of `west flash`.

### Zephyr application configuration

When adding a Zephyr application to sysbuild, such as MCUboot, then the configuration files from the application (MCUboot) itself will be used.
When integrating multiple applications with each other, then it is often necessary to make adjustments to the configuration of extra images.

Sysbuild gives users the ability of creating Kconfig fragments or devicetree overlays that will be used together with the application’s default configuration. Sysbuild also allows users to change the Application Configuration Directory in order to give users full control of an image’s configuration.

**Zephyr application Kconfig fragment and devicetree overlay**  In the folder of the main application, create a Kconfig fragment or a devicetree overlay under a sysbuild folder, where the name of the file is `<image>.conf` or `<image>.overlay`, for example if your main application includes `my_sample` then create a `sysbuild/my_sample.conf` file or a devicetree overlay `sysbuild/my_sample.overlay`.

A Kconfig fragment could look as:

```
# sysbuild/my_sample.conf
CONFIG_FOO=n
```

**Zephyr application configuration directory**  In the folder of the main application, create a new folder under `sysbuild/<image>/`. This folder will then be used as `APPLICATION_CONFIG_DIR` when building `<image>`. As an example, if your main application includes `my_sample` then create a `sysbuild/my_sample/` folder and place any configuration files in there as you would normally do:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
├── sysbuild
│   └── my_sample
│       ├── prj.conf
│       └── app.overlay
│           └── boards
│               └── <board_A>.conf
│                   └── <board_A>.overlay
│                       └── <board_B>.conf
│                                           └── <board_B>.overlay
```

All configuration files under the `sysbuild/my_sample/` folder will now be used when `my_sample` is included in the build, and the default configuration files for `my_sample` will be ignored.

This give you full control on how images are configured when integrating those with application.

**Sysbuild file suffix support**  File suffix support through the makevar: `FILE_SUFFIX` is supported in sysbuild (see [File Suffixes](#) for details on this feature in applications). For sysbuild, a globally provided option will be passed down to all images. In addition, the image configuration file will have this value applied and used (instead of the build type) if the file exists.

Given the example project:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
├── sysbuild.conf
├── sysbuild_test_key.conf
├── sysbuild
│   └── mcuboot.conf
│       └── mcuboot_max_log.conf
│                       └── my_sample.conf
```

Chapter 5. Build and Configuration Systems
• If FILE_SUFFIX is not defined and both mcuboot and my_sample images are included, mcuboot will use the mcuboot.conf Kconfig fragment file and my_sample will use the my_sample.conf Kconfig fragment file. Sysbuild itself will use the sysbuild.conf Kconfig fragment file.

• If FILE_SUFFIX is set to max_log and both mcuboot and my_sample images are included, mcuboot will use the mcuboot_max_log.conf Kconfig fragment file and my_sample will use the my_sample.conf Kconfig fragment file (as it will fallback to the file without the suffix). Sysbuild itself will use the sysbuild.conf Kconfig fragment file (as it will fallback to the file without the suffix).

• If FILE_SUFFIX is set to test_key and both mcuboot and my_sample images are included, mcuboot will use the mcuboot.conf Kconfig fragment file and my_sample will use the my_sample.conf Kconfig fragment file (as it will fallback to the file without the suffix). Sysbuild itself will use the sysbuild_test_key.conf Kconfig fragment file. This can be used to apply a different sysbuild configuration, for example to use a different signing key in MCUboot and when signing the main application.

The FILE_SUFFIX can also be applied only to single images by prefixing the variable with the image name:

west build

west build -b reel_board --sysbuild file_suffix_example -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y
              --Dmcuboot_FILE_SUFFIX="max_log"

cmake

make -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=<app_dir> -DSB_CONFIG_BOOTLOADER_
              -DMCUBOOT=y -Dmcuboot_FILE_SUFFIX="max_log" share/sysbuild

ninja -Cbuild

5.6. Sysbuild (System build)

Adding dependencies among Zephyr applications

Sometimes, in a multi-image build, you may want certain Zephyr applications to be configured or flashed in a specific order. For example, if you need some information from one application's build system to be available to another's, then the first thing to do is to add a configuration dependency between them. Separately, you can also add flashing dependencies to control the sequence of images used by west flash; this could be used if a specific flashing order is required by an SoC, a runner, or something else.

By default, sysbuild will configure and flash applications in the order that they are added, as ExternalZephyrProject_Add() calls are processed by CMake. You can use the sysbuild_add_dependencies() function to make adjustments to this order, according to your needs. Its usage is similar to the standard add_dependencies() function in CMake.

Here is an example of adding configuration dependencies for my_sample:

```c
sysbuild_add_dependencies(IMAGE CONFIGURE my_sample sample_a sample_b)
```

This will ensure that sysbuild will run CMake for sample_a and sample_b (in some order) before doing the same for my_sample, when building these domains in a single invocation.

If you want to add flashing dependencies instead, then do it like this:

```c
sysbuild_add_dependencies(IMAGE FLASH my_sample sample_a sample_b)
```

As a result, my_sample will be flashed after sample_a and sample_b (in some order), when flashing these domains in a single invocation.

Note: Adding flashing dependencies is not allowed for build-only applications. If my_sample had been created with BUILD_ONLY TRUE, then the above call to sysbuild_add_dependencies()
would have produced an error.

5.6.12 Adding non-Zephyr applications to sysbuild

You can include non-Zephyr applications in a multi-image build using the standard CMake module `ExternalProject`. Please refer to the CMake documentation for usage details.

When using `ExternalProject`, the non-Zephyr application will be built as part of the sysbuild build invocation, but `west flash` or `west debug` will not be aware of the application. Instead, you must manually flash and debug the application.

5.6.13 Extending sysbuild

Sysbuild can be extended by other modules to give it additional functionality or include other configuration or images, an example could be to add support for another bootloader or external signing method.

Modules can be extended by adding custom CMake or Kconfig files as normal `modules` do, this will cause the files to be included in each image that is part of a project. Alternatively, there are `sysbuild-specific module extension` files which can be used to include CMake and Kconfig files for the overall sysbuild image itself, this is where e.g. a custom image for a particular board or SoC can be added.

5.7 Application version management

Zephyr supports an application version management system for applications which is built around the system that Zephyr uses for its own version system management. This allows applications to define a version file and have application (or module) code include the auto-generated file and be able to access it, just as they can with the kernel version. This version information is available from multiple scopes, including:

- Code (C/C++)
- Kconfig
- CMake

which makes it a very versatile system for lifecycle management of applications. In addition, it can be used when building applications which target supported bootloaders (e.g. MCUBoot) allowing images to be signed with correct version of the application automatically - no manual signing steps are required.

5.7.1 VERSION file

Application version information is set on a per-application basis in a file named `VERSION`, which must be placed at the base directory of the application, where the `CMakeLists.txt` file is located. This is a simple text file which contains the various version information fields, each on a newline. The basic `VERSION` file has the following structure:

```
VERSION_MAJOR =
VERSION_MINOR =
PATCHLEVEL =
VERSION_TWEAK =
EXTRAVERSION =
```
Each field and the values it supports is described below (note that there may be further restrictions depending upon what the version is used for, e.g. bootloaders might only support some of these fields or might place limits on the maximum values of fields):

<table>
<thead>
<tr>
<th>Field</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VERSION_MAJOR</td>
<td>Numerical</td>
</tr>
<tr>
<td>VERSION_MINOR</td>
<td>Numerical</td>
</tr>
<tr>
<td>PATCHLEVEL</td>
<td>Numerical</td>
</tr>
<tr>
<td>VERSION_TWEAK</td>
<td>Numerical</td>
</tr>
<tr>
<td>EXTRAVERSION</td>
<td>Alphanumerical (Lowercase a-z and 0-9)</td>
</tr>
</tbody>
</table>

When an application is configured using CMake, the version file will be automatically processed, and will be checked automatically each time the version is changed, so CMake does not need to be manually re-ran for changes to this file.

For the sections below, examples are provided for the following VERSION file:

```
VERSION_MAJOR = 1
VERSION_MINOR = 2
PATCHLEVEL = 3
VERSION_TWEAK = 4
EXTRAVERSION = unstable
```

### 5.7.2 Use in code

To use the version information in application code, the version file must be included, then the fields can be freely used. The include file name is `app_version.h` (no path is needed), the following defines are available:
<table>
<thead>
<tr>
<th>Define</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPVERSION</td>
<td>Numerical</td>
<td>VERSION_MAJOR (left shifted by 24 bits), VERSION_MINOR (left shifted by 16 bits), PATCHLEVEL (left shifted by 8 bits), VERSION_TWEAK</td>
<td>0x1020304</td>
</tr>
<tr>
<td>APP_VERSION_3</td>
<td>Numerical</td>
<td>VERSION_MAJOR (left shifted by 16 bits), VERSION_MINOR (left shifted by 8 bits), PATCHLEVEL</td>
<td>0x10203</td>
</tr>
<tr>
<td>APP_VERSION_2</td>
<td>Numerical</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>APP_VERSION_1</td>
<td>Numerical</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>APP_PATCHLEVEL</td>
<td>Numerical</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>APP_VERSION_1</td>
<td>Numerical</td>
<td>VERSION_MAJOR</td>
<td>4</td>
</tr>
<tr>
<td>APP_VERSION_4</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>&quot;1.2.3-unstable&quot;</td>
</tr>
<tr>
<td>APP_VERSION_3</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>&quot;1.2.3-unstable+4&quot;</td>
</tr>
<tr>
<td>APP_VERSION_2</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, VERSION_TWEAK</td>
<td>&quot;1.2.3+4&quot;</td>
</tr>
<tr>
<td>APP_BUILD_VERI</td>
<td>String</td>
<td>None (value of git describe --abbrev=12 --always from application repository)</td>
<td>v3.3.0-18-g2c85d9224fca</td>
</tr>
</tbody>
</table>

### 5.7.3 Use in Kconfig

The following variables are available for usage in Kconfig files:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(VERSION_MAJOR)</td>
<td>Numerical</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>$(VERSION_MINOR)</td>
<td>Numerical</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>$(PATCHLEVEL)</td>
<td>Numerical</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>$(VERSION_TWEAK)</td>
<td>Numerical</td>
<td>VERSION_TWEAK</td>
<td>4</td>
</tr>
<tr>
<td>$(APPVERSION)</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>1.2.3-unstable</td>
</tr>
<tr>
<td>$(APP_VERSION_EXTEN)</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION, VERSION_TWEAK</td>
<td>1.2.3-unstable+4</td>
</tr>
<tr>
<td>$(APP_VERSION_TWEAK)</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, VERSION_TWEAK</td>
<td>1.2.3+4</td>
</tr>
</tbody>
</table>
5.7.4 Use in CMake

The following variables are available for usage in CMake files:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPVERSION</td>
<td>Numerical</td>
<td>VERSION_MAJOR (left shifted by 24 bits), VERSION_MINOR (left shifted by 16 bits), PATCHLEVEL (left shifted by 8 bits), VERSION_TWEAK</td>
<td>0x1020304</td>
</tr>
<tr>
<td>APP_VERSION_N</td>
<td>Numerical (hex)</td>
<td>VERSION_MAJOR (left shifted by 16 bits), VERSION_MINOR (left shifted by 8 bits), PATCHLEVEL</td>
<td>0x10203</td>
</tr>
<tr>
<td>APP_VERSION_M</td>
<td>Numerical</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>APP_VERSION_M</td>
<td>Numerical</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>APP_PATCHLEVEL</td>
<td>Numerical</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>APP_VERSION_T</td>
<td>Numerical</td>
<td>VERSION_TWEAK</td>
<td>4</td>
</tr>
<tr>
<td>APP_VERSION_STRING</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>1.2.3-unstable</td>
</tr>
<tr>
<td>APP_VERSION_EXTENDED_STRING</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION, VERSION_TWEAK</td>
<td>1.2.3-unstable+4</td>
</tr>
<tr>
<td>APP_VERSION_TWEAK_STRING</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, VERSION_TWEAK</td>
<td>1.2.3+4</td>
</tr>
</tbody>
</table>

5.7.5 Use in MCUboot-supported applications

No additional configuration needs to be done to the target application so long as it is configured to support MCUboot and a signed image is generated, the version information will be automatically included in the image data.
Chapter 6

Connectivity

6.1 Bluetooth

This section contains information regarding the Bluetooth stack of the Zephyr OS. You can use this information to understand the principles behind the operation of the layers and how they were implemented.

Zephyr includes a complete Bluetooth Low Energy stack from application to radio hardware, as well as portions of a Classical Bluetooth (BR/EDR) Host layer.

6.1.1 Overview

- **Supported Features**

Since its inception, Zephyr has had a strong focus on Bluetooth and, in particular, on Bluetooth Low Energy (BLE). Through the contributions of several companies and individuals involved in existing open source implementations of the Bluetooth specification (Linux’s BlueZ) as well as the design and development of BLE radio hardware, the protocol stack in Zephyr has grown to be mature and feature-rich, as can be seen in the section below.

**Supported Features**

Zephyr comes integrated with a feature-rich and highly configurable Bluetooth stack.

- Bluetooth v5.3 compliant
  - Highly configurable
    - Features, buffer sizes/counts, stack sizes, etc.
  - Portable to all architectures supported by Zephyr (including big and little endian, alignment flavors and more)
  - Support for all combinations of Host and Controller builds:
    - Controller-only (HCI) over UART, SPI, USB and IPC physical transports
    - Host-only over UART, SPI, and IPC (shared memory)
    - Combined (Host + Controller)
  - Bluetooth-SIG qualified
Controller on Nordic Semiconductor hardware

Conformance tests run regularly on all layers

**Bluetooth Low Energy Controller support (LE Link Layer)**

- Unlimited role and connection count, all roles supported
- All v5.3 specification features supported (except a few minor items)
- Concurrent multi-protocol support ready
- Intelligent scheduling of roles to minimize overlap
- Portable design to any open BLE radio, currently supports Nordic Semiconductor nRF51 and nRF52, as well as proprietary radios
- Supports little and big endian architectures, and abstracts the hard real-time specifics so that they can be encapsulated in a hardware-specific module
- Support for Controller (HCI) builds over different physical transports

**Bluetooth Host support**

- Generic Access Profile (GAP) with all possible LE roles
  - Peripheral & Central
  - Observer & Broadcaster
  - Multiple PHY support (2Mbit/s, Coded)
  - Extended Advertising
  - Periodic Advertising (including Sync Transfer)
- GATT (Generic Attribute Profile)
  - Server (to be a sensor)
  - Client (to connect to sensors)
  - Enhanced ATT (EATT)
  - GATT Database Hash
  - GATT Multiple Notifications
- Pairing support, including the Secure Connections feature from Bluetooth 4.2
- Non-volatile storage support for permanent storage of Bluetooth-specific settings and data
- Bluetooth Mesh support
  - Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
  - Both Provisioning roles and bearers supported (PB-ADV & PB-GATT)
  - Foundation Models included
  - Highly configurable, fits as small as 16k RAM devices
- IPSP/6LoWPAN for IPv6 connectivity over Bluetooth LE
  - IPSP node sample application
- Basic Bluetooth BR/EDR (Classic) support
  - Generic Access Profile (GAP)
  - Logical Link Control and Adaptation Protocol (L2CAP)
  - Serial Port emulation (RFCOMM protocol)
  - Service Discovery Protocol (SDP)
– Clean HCI driver abstraction
  * 3-Wire (H:5) & 5-Wire (H:4) UART
  * SPI
  * Local controller support as a virtual HCI driver
– Verified with multiple popular controllers

• LE Audio in Host and Controller
  – Isochronous channels
    * Full Host support
    * Initial Controller support
  – Generic Audio Framework
    * Basic Audio Profile
      · Unicast server and client
      · Broadcast source and sink
      · Broadcast assistant
      · Scan delegator
    * Common Audio Profile
      · Acceptor
    * Volume Control Profile, Microphone Control Profile
    * Call Control Profile, Media Control Profile
    * Coordinated Set Identification Profile

6.1.2 Bluetooth Stack Architecture

Overview

This page describes the software architecture of Zephyr’s Bluetooth protocol stack.

**Note:** Zephyr supports mainly Bluetooth Low Energy (BLE), the low-power version of the Bluetooth specification. Zephyr also has limited support for portions of the BR/EDR Host. Throughout this architecture document we use BLE interchangeably for Bluetooth except when noted.

**BLE Layers** There are 3 main layers that together constitute a full Bluetooth Low Energy protocol stack:

• **Host:** This layer sits right below the application, and is comprised of multiple (non real-time) network and transport protocols enabling applications to communicate with peer devices in a standard and interoperable way.

• **Controller:** The Controller implements the Link Layer (LE LL), the low-level, real-time protocol which provides, in conjunction with the Radio Hardware, standard-interoperable over-the-air communication. The LL schedules packet reception and transmission, guarantees the delivery of data, and handles all the LL control procedures.

• **Radio Hardware:** Hardware implements the required analog and digital baseband functional blocks that permit the Link Layer firmware to send and receive in the 2.4GHz band of the spectrum.
The **Host Controller Interface** describes the format in which a Host must communicate with a Controller. This is called the Host Controller Interface (HCI) protocol. HCI can be implemented over a range of different physical transports like UART, SPI, or USB. This protocol defines the commands that a Host can send to a Controller and the events that it can expect in return, and also the format for user and protocol data that needs to go over the air. The HCI ensures that different Host and Controller implementations can communicate in a standard way making it possible to combine Hosts and Controllers from different vendors.

The three separate layers of the protocol and the standardized interface make it possible to implement the Host and Controller on different platforms. The two following configurations are commonly used:

- **Single-chip configuration**: In this configuration, a single microcontroller implements all three layers and the application itself. This can also be called a system-on-chip (SoC) implementation. In this case the BLE Host and the BLE Controller communicate directly through function calls and queues in RAM. The Bluetooth specification does not specify how HCI is implemented in this single-chip configuration and so how HCI commands, events, and data flows between the two can be implementation-specific. This configuration is well suited for those applications and designs that require a small footprint and the lowest possible power consumption, since everything runs on a single IC.

- **Dual-chip configuration**: This configuration uses two separate ICs, one running the Application and the Host, and a second one with the Controller and the Radio Hardware. This is sometimes also called a connectivity-chip configuration. This configuration allows for a wider variety of combinations of Hosts when using the Zephyr OS as a Controller. Since HCI ensures interoperability among Host and Controller implementations, including of course Zephyr’s very own BLE Host and Controller, users of the Zephyr Controller can choose to use whatever Host running on any platform they prefer. For example, the host can be the Linux BLE Host stack (BlueZ) running on any processor capable of supporting Linux. The Host processor may of course also run Zephyr and the Zephyr OS BLE Host. Conversely, combining an IC running the Zephyr Host with an external Controller that does not run Zephyr is also supported.

The Zephyr software stack as an RTOS is highly configurable, and in particular, the BLE subsystem can be configured in multiple ways during the build process to include only the features and layers that are required to reduce RAM and ROM footprint as well as power consumption. Here’s a short list of the different BLE-enabled builds that can be produced from the Zephyr project codebase:

- **Controller-only build**: When built as a BLE Controller, Zephyr includes the Link Layer and a special application. This application is different depending on the physical transport chosen for HCI:
  - hci_uart
  - hci_usb
  - hci_spi

  This application acts as a bridge between the UART, SPI or USB peripherals and the Controller subsystem, listening for HCI commands, sending application data and responding with events and received data. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_HCI_RAW =y
  - CONFIG_BT_CTLR =y
  - CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)
• **Host-only build:** A Zephyr OS Host build will contain the Application and the BLE Host, along with an HCI driver (UART or SPI) to interface with an external Controller chip. A build of this type sets the following Kconfig option values:
  - `CONFIG_BT =y`
  - `CONFIG_BT_HCI =y`
  - `CONFIG_BT_CTLR =n`

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Host-only

• **Combined build:** This includes the Application, the Host and the Controller, and it is used exclusively for single-chip (SoC) configurations. A build of this type sets the following Kconfig option values:
  - `CONFIG_BT =y`
  - `CONFIG_BT_HCI =y`
  - `CONFIG_BT_CTLR =y`
  - `CONFIG_BT_LL_SW_SPLIT =y` (if using the open source Link Layer)

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Combined

The picture below shows the SoC or single-chip configuration when using a Zephyr combined build (a build that includes both a BLE Host and a Controller in the same firmware image that is programmed onto the chip):

When using connectivity or dual-chip configurations, several Host and Controller combinations are possible, some of which are depicted below:

When using a Zephyr Host (left side of image), two instances of Zephyr OS must be built with different configurations, yielding two separate images that must be programmed into each of the chips respectively. The Host build image contains the application, the BLE Host and the selected HCI driver (UART or SPI), while the Controller build runs either the `hci_uart`, or the `hci_spi` app to provide an interface to the BLE Controller.

This configuration is not limited to using a Zephyr OS Host, as the right side of the image shows. One can indeed take one of the many existing GNU/Linux distributions, most of which include Linux's own BLE Host (BlueZ), to connect it via UART or USB to one or more instances of the Zephyr OS Controller build. BlueZ as a Host supports multiple Controllers simultaneously for applications that require more than one BLE radio operating at the same time but sharing the same Host stack.

**Source tree layout**

The stack is split up as follows in the source tree:

**subsys/bluetooth/host**
  The host stack. This is where the HCI command and event handling as well as connection tracking happens. The implementation of the core protocols such as L2CAP, ATT, and SMP is also here.

**subsys/bluetooth/controller**
  Bluetooth Controller implementation. Implements the controller-side of HCI, the Link Layer as well as access to the radio transceiver.

**include/bluetooth/**
  Public API header files. These are the header files applications need to include in order to use Bluetooth functionality.
Fig. 1: A Combined build on a Single-Chip configuration
drivers/bluetooth/

HCI transport drivers. Every HCI transport needs its own driver. For example, the two common types of UART transport protocols (3-Wire and 5-Wire) have their own drivers.

samples/bluetooth/

Sample Bluetooth code. This is a good reference to get started with Bluetooth application development.

tests/bluetooth/

Test applications. These applications are used to verify the functionality of the Bluetooth stack, but are not necessary the best source for sample code (see samples/bluetooth instead).

doc/guides/bluetooth/

Extra documentation, such as PICS documents.

**Host**

The Bluetooth Host implements all the higher-level protocols and profiles, and most importantly, provides a high-level API for applications. The following diagram depicts the main protocol & profile layers of the host.

Lowest down in the host stack sits a so-called HCI driver, which is responsible for abstracting away the details of the HCI transport. It provides a basic API for delivering data from the controller to the host, and vice-versa.

Perhaps the most important block above the HCI handling is the Generic Access Profile (GAP). GAP simplifies Bluetooth LE access by defining four distinct roles of BLE usage:

- Connection-oriented roles
Peripheral role Most Zephyr-based BLE devices will most likely be peripheral-role devices. This means that they perform connectable advertising and expose one or more GATT services. After registering services using the `bt_gatt_service_register()` API the application will typically start connectable advertising using the `bt_le_adv_start()` API.

There are several peripheral sample applications available in the tree, such as `samples/bluetooth/peripheral_hr`.

Central role Central role may not be as common for Zephyr-based devices as peripheral role, but it is still a plausible one and equally well supported in Zephyr. Rather than accepting connections from other devices a central role device will scan for available peripheral device and choose one to connect to. Once connected, a central will typically act as a GATT client, first performing discovery of available services and then accessing one or more supported services. To initially discover a device to connect to the application will likely use the `bt_le_scan_start()` API, wait for an appropriate device to be found (using the scan callback), stop scanning using `bt_le_scan_stop()` and then connect to the device using `bt_conn_le_create()`. If the central wants to keep automatically reconnecting to the peripheral it should use the `bt_le_set_auto_conn()` API.

There are some sample applications for the central role available in the tree, such as `samples/bluetooth/central_hr`.
Observer role  An observer role device will use the `bt_le_scan_start()` API to scan for devices, but it will not connect to any of them. Instead it will simply utilize the advertising data of found devices, combining it optionally with the received signal strength (RSSI).

Broadcaster role  A broadcaster role device will use the `bt_le_adv_start()` API to advertise specific advertising data, but the type of advertising will be non-connectable, i.e. other device will not be able to connect to it.

Connections  Connection handling and the related APIs can be found in the *Connection Management* section.

Security  To achieve a secure relationship between two Bluetooth devices a process called pairing is used. This process can either be triggered implicitly through the security properties of GATT services, or explicitly using the `bt_conn_security()` API on a connection object.

To achieve a higher security level, and protect against Man-In-The-Middle (MITM) attacks, it is recommended to use some out-of-band channel during the pairing. If the devices have a sufficient user interface this “channel” is the user itself. The capabilities of the device are registered using the `bt_conn_auth_cb_register()` API. The `bt_conn_auth_cb` struct that's passed to this API has a set of optional callbacks that can be used during the pairing - if the device lacks some feature the corresponding callback may be set to NULL. For example, if the device does not have an input method but does have a display, the `passkey_entry` and `passkey_confirm` callbacks would be set to NULL, but the `passkey_display` would be set to a callback capable of displaying a passkey to the user.

Depending on the local and remote security requirements & capabilities, there are four possible security levels that can be reached:

- **BT_SECURITY_L1**  No encryption and no authentication.
- **BT_SECURITY_L2**  Encryption but no authentication (no MITM protection).
- **BT_SECURITY_L3**  Encryption and authentication using the legacy pairing method from Bluetooth 4.0 and 4.1.
- **BT_SECURITY_L4**  Encryption and authentication using the LE Secure Connections feature available since Bluetooth 4.2.

**Note:**  Mesh has its own security solution through a process called provisioning. It follows a similar procedure as pairing, but is done using separate mesh-specific APIs.

**L2CAP**  L2CAP stands for the Logical Link Control and Adaptation Protocol. It is a common layer for all communication over Bluetooth connections, however an application comes in direct contact with it only when using it in the so-called Connection-oriented Channels (CoC) mode. More information on this can be found in the *L2CAP API section*.

**GATT**  The Generic Attribute Profile is the most common means of communication over LE connections. A more detailed description of this layer and the API reference can be found in the *GATT API reference section*.
Mesh  Mesh is a little bit special when it comes to the needed GAP roles. By default, mesh requires both observer and broadcaster role to be enabled. If the optional GATT Proxy feature is desired, then peripheral role should also be enabled.

The API reference for mesh can be found in the Mesh API reference section.

LE Audio  The LE audio is a set of profiles and services that utilizes GATT and Isochronous Channel to provide audio over Bluetooth Low Energy. The architecture and API references can be found in Bluetooth Audio Architecture.

Persistent storage  The Bluetooth host stack uses the settings subsystem to implement persistent storage to flash. This requires the presence of a flash driver and a designated “storage” partition on flash. A typical set of configuration options needed will look something like the following:

```
CONFIG_BT_SETTINGS=y
CONFIG_FLASH=y
CONFIG_FLASH_PAGE_LAYOUT=y
CONFIG_FLASH_MAP=y
CONFIG_NVS=y
CONFIG_SETTINGS=y
```

Once enabled, it is the responsibility of the application to call settings_load() after having initialized Bluetooth (using the bt_enable() API).

6.1.3  Bluetooth Low Energy Controller
Overview

1. HCI
   - Host Controller Interface, Bluetooth standard
   - Provides Zephyr Bluetooth HCI Driver

2. HAL
   - Hardware Abstraction Layer
   - Vendor Specific, and Zephyr Driver usage

3. Ticker
   - Soft real time radio/resource scheduling

4. LL_SW
   - Software-based Link Layer implementation
   - States and roles, control procedures, packet controller

5. Util
   - Bare metal memory pool management
   - Queues of variable count, lockless usage
   - FIFO of fixed count, lockless usage
   - Mayfly concept based deferred ISR executions

6.1. Bluetooth
## Architecture Overview

The architecture overview illustrates the execution contexts and the interaction between the kernel side and the bare-metal side. The execution contexts include:

- **Kernel**
- **Interrupt manager**

The diagram shows the flow of execution through different threads and contexts, including:

- **App thread(s)**
- **Host thread(s)**
- **ULL (tasklet)**
- **LLL (tasklet)**
- **HW timers/radio**

The execution flow is depicted with arrows indicating the priorities and the split between the controller and the interrupt manager.

### Execution Overview

The execution overview provides a detailed view of the execution flow, including:

- **RTC**
- **Baseband time(s)-Lo-HW**

The diagram includes various components such as:

- **HCI driver**
- **LL if**
- **Scheduler**
- **Event handler**
- **Packet Controller**

These components interact with each other through events and threads, as shown in the diagram.
6.1. Bluetooth
Upper Link Layer and Lower Link Layer

Slot reservation protects full event (event execution fully resolved by ULL scheduling)

Slot reservation partly protects event (occasional part of event execution is resolved by LLL)

Several slot reservations protects event (occasional part of event execution is fully resolved by ULL scheduling)

Scheduling Variants

ULL and LLL Timing

Start timing computed by ULL (air reference)

Start timing handled by LLL (radio reference)
Event Handling

The ULL is unaware of the offset time domain and delayed execution in LLL:
1. The ULL can only queue prepare/abort commands.
2. The LLL returns event done for executed commands.
3. The ULL cannot peek into the LLL activity.

ULL Scheduling

LLL Event Handling

6.1. Bluetooth
Scheduling Closely Spaced Events

Abortng Active Event
Cancelling Pending Event

Top-half of LLL event preparation sets preempt tick.
Bottom-half of LLL event preparation cancels the event and peaks into FIFO if an entry is found. This half of the event preparation is done and a preempt tick is set (in this case FIFO is empty).

Pre-emption of Active Event

Top-half of LLL event preparation sets preempt tick.
Bottom-half of LLL event preparation peaks into FIFO if an entry is found. This half of the event preparation is done, and a preempt tick is set (in this case FIFO is empty).
Data Flow

Transmit Data Flow
Receive Data Flow
Execution Priorities

- Event handle (0, 1) < Event preparation (2, 3) < Event/Rx done (4) < Tx request (5) < Role management (6) < Host (7).
- LLL is vendor ISR, ULL is Mayfly ISR concept, Host is kernel thread.

Lower Link Layer

LLL Execution
### LLL Resume

- Preempted event is resumed after the last event in the event queue (in this case after the current event).
- New event reservation overlap with resumed event reservation.
  - Resumed event is moved to be after the new event.

### Bare metal utilities

- Memory FIFO and Memory Queue

### Mayfly

- Mayfly are multi-instance scalable ISR execution contexts

#### 6.1. Bluetooth
• What a Work is to a Thread, Mayfly is to an ISR
• List of functions executing in ISRs
• Execution priorities map to IRQ priorities
• Facilitate cross execution context scheduling
• Race-to-idle execution
• Lock-less, bare metal

Legacy Controller

Bluetooth Low Energy Controller - Vendor Specific Details

Hardware Requirements

Nordic Semiconductor  The Nordic Semiconductor Bluetooth Low Energy Controller implementation requires the following hardware peripherals.
<table>
<thead>
<tr>
<th>Resource</th>
<th>nRFPeripheral</th>
<th># instances</th>
<th>ZephyrDriver Accessible</th>
<th>Description</th>
</tr>
</thead>
</table>
| Clock    | NRF_CLOCK    | 1           | Yes                     | • A Low Frequency Clock (LFCLOCK) or sleep clock, for low power consumption between Bluetooth radio events  
• A High Frequency Clock (HFCLOCK) or active clock, for high precision packet timing and software based transceiver state switching with inter-frame space (tIFS) timing inside Bluetooth radio events |
| RTC [a]  | NRF_RTC0     | 1           | No                      | • Uses 2 capture/compare registers |
| Timer    | NRF_TIMER0   | 2 or 1 Page 1542 | No                      | • 2 instances, one each for packet timing and tIFS software switching, respectively  
• 7 capture/compare registers (3 mandatory, 1 optional for ISR profiling, 4 for single timer tIFS switching) on first instance  
• 4 capture/compare registers for second instance, if single tIFS timer is not used. |
| PPI [b]  | NRF_PPI      | 21 channels (20²), and 2 channel groups³ | Yes⁴ | • Used for radio mode switching to achieve tIFS timings, for PA/LNA control |
| DPPI [c] | NRF_DPPI     | 20 channels, and 2 channel groups Page 15 | Yes | • Used for radio mode switching to achieve tIFS timings, for PA/LNA control |
| SWI [d]  | NRF_SWI4 and NRF_SWI5, or NRF_SWI2 and NRF_SWI3⁵ | 2 | No | • 2 instances, for Lower Link Layer and Upper Link Layer Low priority execution context |
| Radio    | NRF_RADIO    | 1           | No                      | • 2.4 GHz radio transceiver with multiple radio standards such as 1 Mbps, 2 Mbps and Coded PHY S2/S8 Long Range Bluetooth Low Energy technology |
| RNG [e]  | NRF_RNG      | 1           | Yes                     | |
| ECB [f]  | NRF_ECB      | 1           | No                      | |
| CBC-CCM [g] | NRF_CCM   | 1           | No                      | |
| AAR [h]  | NRF_AAR      | 1           | No                      | |
| GPIOTE [i] | NRF_GPIO    | 1           | Yes                     | • Additionally, 10 Debug GPIO pins (optional) |

6.1. Bluetooth
6.1.4 Bluetooth Audio Architecture

---

**Generic Audio Framework (GAF)**

The Generic Audio Framework (GAF) is considered the middleware of the Bluetooth LE Audio architecture. The GAF contains the profiles and services that allows higher layer applications and profiles to set up streams, change volume, control media and telephony and more. The GAF builds on GATT, GAP and isochronous channels (ISO).

GAF uses GAP to connect, advertise and synchronize to other devices. GAF uses GATT to configure streams, associate streams with content (e.g. media or telephony), control volume and more. GAF uses ISO for the audio streams themselves, both as unicast (connected) audio streams or broadcast (unconnected) audio streams.

GAF mandates the use of the LC3 codec, but also supports other codecs.

The top-level profiles TMAP and HAP are not part of the GAF, but rather provide top-level requirements for how to use the GAF.

GAF has been implemented in Zephyr with the following structure.

---

**Bluetooth Audio Stack Status**  The following table shows the current status and support of the profiles in the Bluetooth Audio Stack.

---

1. CONFIG_BT_CTLR_SW_SWITCH_SINGLE_TIMER = y
2. CONFIG_BT_CTLR_TIFS_HW = n
3. When not using pre-defined PPI channels
4. For software-based tIFS switching
5. For nRF53x Series

Using the Bluetooth Audio Stack  To use any of the profiles in the Bluetooth Audio Stack, including the top-level profiles outside of GAF, `CONFIG_BT_AUDIO` shall be enabled. This Kconfig option allows the enabling of the individual profiles inside of the Bluetooth Audio Stack. Each profile can generally be enabled on its own, but enabling higher-layer profiles (such as CAP, TMAP and HAP) will typically require enabling some of the lower layer profiles.

It is, however, possible to create a device that uses e.g. only Stream Control (with just the BAP), without using any of the content control or rendering/capture control profiles, or vice versa. Using the higher layer profiles will however typically provide a better user experience and better interoperability with other devices.

Common Audio Profile (CAP)  The Common Audio Profile introduces restrictions and requirements on the lower layer profiles. The procedures in CAP works on one or more streams for one or more devices. Is it thus possible via CAP to do a single function call to setup multiple streams across multiple devices.

The figure below shows a complete structure of the procedures in CAP and how they correspond to procedures from the other profiles. The circles with I, A and C show whether the procedure has active involvement or requirements from the CAP Initiator, CAP Accept and CAP Commander roles respectively.

The API reference for CAP can be found in Common Audio Profile.

Stream Control (BAP)  Stream control is implemented by the Basic Audio Profile. This profile defines multiple roles:

- Unicast Client
- Unicast Server
- Broadcast Source
- Broadcast Sink
- Scan Delegator (not yet implemented)
- Broadcast assistant (not yet implemented)
Fig. 7: Common Audio Profile Procedures
Each role can be enabled individually, and it is possible to support more than one role.
The API reference for stream control can be found in Bluetooth Audio.

**Rendering and Capture Control**  Rendering and capture control is implemented by the Volume Control Profile (VCP) and Microphone Control Profile (MICP).
The VCP implementation supports the following roles
- Volume Control Service (VCS) Server
- Volume Control Service (VCS) Client
The MICP implementation supports the following roles
- Microphone Control Profile (MICP) Microphone Device (server)
- Microphone Control Profile (MICP) Microphone Controller (client)
The API reference for volume control can be found in Bluetooth Volume Control.
The API reference for Microphone Control can be found in Bluetooth Microphone Control.

**Content Control**  Content control is implemented by the Call Control Profile (CCP) and Media Control Profile (MCP).
The CCP implementation is not yet implemented in Zephyr.
The MCP implementation supports the following roles
- Media Control Service (MCS) Server via the Media Proxy module
- Media Control Client (MCC)
The API reference for media control can be found in Bluetooth Media Control.

**Coordinated Sets**  Coordinated Sets is implemented by the Coordinated Sets Identification Profile (CSIP).
The CSIP implementation supports the following roles
- Coordinated Set Identification Service (CSIP) Set Member
- Coordinated Set Identification Service (CSIP) Set Coordinator
The API reference for media control can be found in Bluetooth Coordinated Sets.

### 6.1.5  Bluetooth Qualification

**Qualification Listings**
The Zephyr BLE stack has obtained qualification listings for both the Host and the Controller. See the tables below for a list of qualification listings

6.1.6 Bluetooth tools

This page lists and describes tools that can be used to assist during Bluetooth stack or application development in order to help, simplify and speed up the development process.

Mobile applications

It is often useful to make use of existing mobile applications to interact with hardware running Zephyr, to test functionality without having to write any additional code or requiring extra hardware.

The recommended mobile applications for interacting with Zephyr are:

- **Android:**
  - nRF Connect for Android
  - nRF Mesh for Android
  - LightBlue for Android

- **iOS:**
  - nRF Connect for iOS
  - nRF Mesh for iOS
  - LightBlue for iOS
Using BlueZ with Zephyr

The Linux Bluetooth Protocol Stack, BlueZ, comes with a very useful set of tools that can be used to debug and interact with Zephyr's BLE Host and Controller. In order to benefit from these tools you will need to make sure that you are running a recent version of the Linux Kernel and BlueZ:

- Linux Kernel 4.10+
- BlueZ 4.45+

Additionally, some of the BlueZ tools might not be bundled by default by your Linux distribution. If you need to build BlueZ from scratch to update to a recent version or to obtain all of its tools you can follow the steps below:

```
git clone git://git.kernel.org/pub/scm/bluetooth/bluez.git
cd bluez
./bootstrap-configure --disable-android --disable-midi
make
```

You can then find `btattach`, `btmgt` and `btproxy` in the `tools/` folder and `btmon` in the `monitor/` folder.

You'll need to enable BlueZ's experimental features so you can access its most recent BLE functionality. Do this by editing the file `/lib/systemd/system/bluetooth.service` and making sure to include the `-E` option in the daemon's execution start line:

```
ExecStart=/usr/libexec/bluetooth/bluetoothd -E
```

Finally, reload and restart the daemon:

```
sudo systemctl daemon-reload
sudo systemctl restart bluetooth
```

Running on QEMU or native_sim

It's possible to run Bluetooth applications using either the QEMU emulator or native_sim. In either case, a Bluetooth controller needs to be exported from the host OS (Linux) to the emulator. For this purpose you will need some tools described in the Using BlueZ with Zephyr section.

Using the Host System Bluetooth Controller  The host OS's Bluetooth controller is connected in the following manner:

- To the second QEMU serial line using a UNIX socket. This socket gets used with the help of the QEMU option `-serial unix:/tmp/bt-server-bredr`. This option gets passed to QEMU through `QEMU_EXTRA_FLAGS` automatically whenever an application has enabled Bluetooth support.
- To native_sim's BT User Channel driver through the use of a command-line option passed to the `native_sim` executable: `--bt-dev=hci0`

On the host side, BlueZ allows you to export its Bluetooth controller through a so-called user channel for QEMU and native_sim to use.

**Note:** You only need to run `btproxy` when using QEMU. native_sim handles the UNIX socket proxying automatically.

If you are using QEMU, in order to make the Controller available you will need one additional step using `btproxy`:

1. Make sure that the Bluetooth controller is down
2. Use the btproxy tool to open the listening UNIX socket, type:

```
sudo tools/btproxy -u -i 0
Listening on /tmp/bt-server-bredr
```

You might need to replace `-i 0` with the index of the Controller you wish to proxy.

If you see `Received unknown host packet type 0x00` when running QEMU, then add `-z` to the `btproxy` command line to ignore any null bytes transmitted at startup.

Once the hardware is connected and ready to use, you can then proceed to building and running a sample:

- Choose one of the Bluetooth sample applications located in `samples/bluetooth`.
- To run a Bluetooth application in QEMU, type:

```
west build -b qemu_x86 samples/bluetooth/<sample>
w west build -t run
```

Running QEMU now results in a connection with the second serial line to the `bt-server-bredr` UNIX socket, letting the application access the Bluetooth controller.

- To run a Bluetooth application in native_sim, first build it:

```
w west build -b native_sim samples/bluetooth/<sample>
```

And then run it with:

```
$ sudo ./build/zephyr/zephyr.exe --bt-dev=hci0
```

**Using a Zephyr-based BLE Controller**  Depending on which hardware you have available, you can choose between two transports when building a single-mode, Zephyr-based BLE Controller:

- UART: Use the `hci_uart` sample and follow the instructions in `bluetooth-hci-uart-qemu-posix`.
- USB: Use the `hci_usb` sample and then treat it as a Host System Bluetooth Controller (see previous section)

**HCI Tracing**  When running the Host on a computer connected to an external Controller, it is very useful to be able to see the full log of exchanges between the two, in the format of a Host Controller Interface log. In order to see those logs, you can use the built-in `btmon` tool from BlueZ:

```
$ btmon
```

**Running on a Virtual Controller and native_sim**

An alternative to a Bluetooth physical controller is the use of a virtual controller. This controller can be connected over an HCI TCP server. This TCP server must support the HCI H4 protocol. In comparison to the physical controller variant, the virtual controller allows to test a Zephyr application running on the native boards without a physical Bluetooth controller.

The main use case for a virtual controller is to do Bluetooth connectivity tests without the need of Bluetooth hardware. This allows to automate Bluetooth integration tests with external applications such as a Bluetooth gateway or a mobile application.

To demonstrate this functionality an example is given to interact with a virtual controller. For this purpose, the experimental python module Bumble from Google is used as it allows to create a TCP Bluetooth virtual controller and connect with the Zephyr Bluetooth host. To install bumble follow the Bumble Getting Started Guide.
Note: If your Zephyr application requires the use of the HCI LE Set extended commands, install the branch controller-extended-advertising from Bumble.

**Android Emulator**  You can test the virtual controller by connecting a Bluetooth Zephyr application to the Android Emulator.

To connect your application to the Android Emulator follow the next steps:

1. Build your Zephyr application and disable the HCI ACL flow control (i.e. `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n`) as the virtual controller from android does not support it at the moment.

2. Install Android Emulator version >= 33.1.4.0. The easiest way to do this is by installing the latest Android Studio Preview version.

3. Create a new Android Virtual Device (AVD) with the Android Device Manager. The AVD should use at least SDK API 34.

4. Run the Android Emulator via terminal as follows:
   
   ```
   emulator avd YOUR_AVD -packet-streamer-endpoint default
   ```

5. Create a Bluetooth bridge between the Zephyr application and the virtual controller from Android Emulator with the Bumble utility hci-bridge.
   
   ```
   bumble-hci-bridge tcp-server:_:1234 android-netsim
   ```
   
   This command will create a TCP server bridge on the local host IP address 127.0.0.1 and port number 1234.

6. Run the Zephyr application and connect to the TCP server created in the last step.
   
   ```
   ./zephyr.exe --bt-dev=127.0.0.1:1234
   ```

After following these steps the Zephyr application will be available to the Android Emulator over the virtual Bluetooth controller that was bridged with Bumble. You can verify that the Zephyr application can communicate over Bluetooth by opening the Bluetooth settings in your AVD and scanning for your Zephyr application device. To test this you can build the Bluetooth peripheral samples such as Peripheral HR or Peripheral DIS

**Using Zephyr-based Controllers with BlueZ**

If you want to test a Zephyr-powered BLE Controller using BlueZ's Bluetooth Host, you will need a few tools described in the Using BlueZ with Zephyr section. Once you have installed the tools you can then use them to interact with your Zephyr-based controller:

```
sudo tools/btmgmt --index 0
[hci0]# auto-power
[hci0]# find -l
```

You might need to replace `--index 0` with the index of the Controller you wish to manage. Additional information about btmgmt can be found in its manual pages.

**6.1.7 Developing Bluetooth Applications**

Bluetooth applications are developed using the common infrastructure and approach that is described in the Application Development section of the documentation.

Additional information that is only relevant to Bluetooth applications can be found in this page.
Thread safety

Calling into the Bluetooth API is intended to be thread safe, unless otherwise noted in the documentation of the API function. The effort to ensure that this is the case for all API calls is an ongoing one, but the overall goal is formally stated in this paragraph. Bug reports and Pull Requests that move the subsystem in the direction of such goal are welcome.

Hardware setup

This section describes the options you have when building and debugging Bluetooth applications with Zephyr. Depending on the hardware that is available to you, the requirements you have and the type of development you prefer you may pick one or another setup to match your needs.

There are 4 possible hardware setups to use with Zephyr and Bluetooth:

1. Embedded
2. QEMU with an external Controller
3. native_sim with an external Controller
4. Simulated nRF5x with BabbleSim

**Embedded** This setup relies on all software running directly on the embedded platform(s) that the application is targeting. All the Configurations and Build Types are supported but you might need to build Zephyr more than once if you are using a dual-chip configuration or if you have multiple cores in your SoC each running a different build type (e.g., one running the Host, the other the Controller).

To start developing using this setup follow the Getting Started Guide, choose one (or more if you are using a dual-chip solution) boards that support Bluetooth and then run the application.

**Embedded HCI tracing** When running both Host and Controller in actual Integrated Circuits, you will only see normal log messages on the console by default, without any way of accessing the HCI traffic between the Host and the Controller. However, there is a special Bluetooth logging mode that converts the console to use a binary protocol that interleaves both normal log messages as well as the HCI traffic. Set the following Kconfig options to enable this protocol before building your application:

```
CONFIG_BT_DEBUG_MONITOR_UART=y
CONFIG_UART_CONSOLE=n
```

Setting `CONFIG_BT_DEBUG_MONITOR_UART` to y replaces the `CONFIG_BT_DEBUG_LOG` option, and setting `CONFIG_UART_CONSOLE` to n disables the default printk/printf hooks.

To decode the binary protocol that will now be sent to the console UART you need to use the btmon tool from BlueZ:

```
$ btmon --tty <console TTY> --tty-speed 115200
```

**Host on Linux with an external Controller**

*Note:* This is currently only available on GNU/Linux

This setup relies on a “dual-chip” configuration which is comprised of the following devices:

1. A Host-only application running in the QEMU emulator or the native_sim native port of Zephyr
2. A Controller, which can be one of the following types:
   - A commercially available Controller
   - A Controller-only build of Zephyr
   - A Virtual controller

   **Warning:** Certain external Controllers are either unable to accept the Host to Controller flow control parameters that Zephyr sets by default (Qualcomm), or do not transmit any data from the Controller to the Host (Realtek). If you see a message similar to:

   `<wrn> bt_hci_core: opcode 0x0c33 status 0x12`

   when booting your sample of choice (make sure you have enabled CONFIG_LOG in your `prj.conf` before running the sample), or if there is no data flowing from the Controller to the Host, then you need to disable Host to Controller flow control. To do so, set `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n` in your `prj.conf`.

**QEMU** You can run the Zephyr Host on the QEMU emulator and have it interact with a physical external Bluetooth Controller. Refer to Running on QEMU or native_sim for full instructions on how to build and run an application in this setup.

**native_sim**

   **Note:** This is currently only available on GNU/Linux

   The native_sim target builds your Zephyr application with the Zephyr kernel, and some minimal HW emulation as a native Linux executable. This executable is a normal Linux program, which can be debugged and instrumented like any other, and it communicates with a physical or virtual external Controller.

   Refer to Running on QEMU or native_sim for full instructions on how to build and run an application with a physical controller. For the virtual controller refer to Running on a Virtual Controller and native_sim.

**Simulated nRF5x with BabbleSim**

   **Note:** This is currently only available on GNU/Linux

   The nrf52_bsim and nrf5340bsim boards, are simulated target boards which emulate the necessary peripherals of a nRF52/53 SOC to be able to develop and test BLE applications. These boards, use:

   - BabbleSim to simulate the nRF5x modem and the radio environment.
   - The POSIX arch and native simulator to emulate the processor, and run natively on your host.
   - Models of the nrf5x HW

   Just like with the native_sim target, the build result is a normal Linux executable. You can find more information on how to run simulations with one or several devices in either of these boards's documentation.

   With the nrf52_bsim, typically you do Combined builds, but it is also possible to build the controller with one of the HCI UART samples in one simulated device, and the host with the H4 driver instead of the integrated controller in another simulated device.
With the nrf5340bsim, you can build with either, both controller and host on its network core, or, with the network core running only the controller, the application core running the host and your application, and the HCI transport over IPC.

**Initialization**

The Bluetooth subsystem is initialized using the `bt_enable()` function. The caller should ensure that function succeeds by checking the return code for errors. If a function pointer is passed to `bt_enable()`, the initialization happens asynchronously, and the completion is notified through the given function.

**Bluetooth Application Example**

A simple Bluetooth beacon application is shown below. The application initializes the Bluetooth Subsystem and enables non-connectable advertising, effectively acting as a Bluetooth Low Energy broadcaster.

```c
/*
 * Set Advertisement data. Based on the Eddystone specification:
 * https://github.com/google/eddystone/blob/master/protocol-specification.md
 * https://github.com/google/eddystone/tree/master/eddystone-url
 */
static const struct bt_data ad[] = {
    BT_DATA_BYTES(BT_DATA_FLAGS, BT_LE_AD_NO_BREDR),
    BT_DATA_BYTES(BT_DATA_UUID16_ALL, 0xaa, 0xfe),
    BT_DATA_BYTES(BT_DATA_SVC_DATA16, 0xaa, 0xfe, /* Eddystone UUID */
                 0x10, /* Eddystone-URL frame type */
                 0x00, /* Calibrated Tx power at 0m */
                 0x00, /* URL Scheme Prefix http://www. */
                 'z', 'e', 'p', 'h', 'y', 'r',
                 'p', 'r', 'o', 'j', 'e', 'c', 't',
                 0x08) /* .org */};

/* Set Scan Response data */
static const struct bt_data sd[] = {
    BT_DATA(BT_DATA_NAME_COMPLETE, DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
    char addr_s[BT_ADDR_LE_STR_LEN];
    bt_addr_le_t addr = {0};
    size_t count = 1;

    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
        return;
    }

    printk("Bluetooth initialized\n");

    /* Start advertising */
    err = bt_le_adv_start(BT_LEADV_NCONN.IDENTITY, ad, ARRAY_SIZE(ad),
                           sd, ARRAY_SIZE(sd));
    if (err) {
        printk("Advertising failed to start (err %d)\n", err);
    }
} (continues on next page)```
return;
}
/* For connectable advertising you would use
* bt_le_oob_get_local(). For non-connectable non-identity
* advertising an non-resolvable private address is used;
* there is no API to retrieve that. */
btd_id_get(&addr, &count);
btd_addr_le_to_str(&addr, addr_s, sizeof(addr_s));
printk("Beacon started, advertising as %s\n", addr_s);
}
int main(void)
{
    int err;
    printk("Starting Beacon Demo\n");
    /* Initialize the Bluetooth Subsystem */
    err = bt_enable(bt_ready);
    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
    }
    return 0;
}
The key APIs employed by the beacon sample are bt_enable() that’s used to initialize Bluetooth and then bt_le_adv_start() that’s used to start advertising a specific combination of advertising and scan response data.

6.1.8 AutoPTS on Windows 10 with nRF52 board

Overview

This tutorial shows how to setup AutoPTS client and server to run both on Windows 10. We use WSL1 with Ubuntu only to build a Zephyr project to an elf file, because Zephyr SDK is not available on Windows yet. Tutorial covers only nrf52840dk.

Update Windows and drivers

Update Windows in:
Start -> Settings -> Update & Security -> Windows Update
Update drivers, following the instructions from your hardware vendor.

Install Python 3

Download and install Python 3. Setup was tested with versions >=3.8. Let the installer add the Python installation directory to the PATH and disable the path length limitation.
Install Git

Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8

Install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

**Note:** Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

**Setup Zephyr project for Windows**

Perform Windows setup from Getting Started Guide.

**Install nrftools**

Connect devices
Flash board

In Device Manager find COM port of your nrf board. In my case it is COM3.
In Git Bash, go to `zephyrproject`

```bash
cd ~/zephyrproject
```

**Build the auto-pts tester app**

```bash
west build -p auto -b nrf52840dk/nrf52840 zephyr/tests/bluetooth/tester/
```

You can display flashing options with:

```bash
west flash --help
```

and flash board with built earlier elf file:

```bash
west flash --skip-rebuild --board-dir /dev/ttyS2 --elf-file ~/zephyrproject/build/zephyr/zephyr.elf
```

Note that west does not accept COMs, so use /dev/ttyS2 as the COM3 equivalent, /dev/ttyS2 as the COM3 equivalent, etc./dev/ttyS + decremented COM number).

**Setup auto-pts project**

In Git Bash, clone project repo:

```bash
git clone https://github.com/intel/auto-pts.git
```

Go into the project folder:

```bash
cd auto-pts
```

Install required python modules:
Zephyr Project Documentation, Release 3.6.99

```
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
pip3 install --user -r autoptsclient_requirements.txt
```

Install socat.exe

Download and extract socat.exe from [https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/](https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/) into folder `~/socat-1.7.3.2-1-x86_64/`.

![Download Latest Version](https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/)

<table>
<thead>
<tr>
<th>Name</th>
<th>Modified</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>socat-1.7.3.2-1-x64.zip</td>
<td>2018-07-23</td>
<td>2.6 MB</td>
</tr>
<tr>
<td>socat-1.7.3.2-1-x64.tar.gz</td>
<td>2018-07-23</td>
<td>2.0 MB</td>
</tr>
<tr>
<td><code>socat-1.7.3.2-1-x86_64.zip</code></td>
<td>2018-07-23</td>
<td>2.9 MB</td>
</tr>
<tr>
<td>socat-1.7.3.2-1-x64.tar.gz</td>
<td>2018-07-23</td>
<td>2.3 MB</td>
</tr>
</tbody>
</table>

Add path to directory of socat.exe to PATH:

6.1. Bluetooth
Running AutoPTS

Server and client by default will run on localhost address. Run server:

```bash
python ./autoptsserver.py -S 65000
```

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```bash
pip install --upgrade --force-reinstall pywin32
```

Run client:

```bash
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t -COM3 -b nrf52 -S 65000 -C 65001
```
At the first run, when Windows asks, enable connection through firewall:

Troubleshooting

- “When running actual hardware test mode, I have only BTP TIMEOUTs.”

This is a problem with connection between auto-pts client and board. There are many possible causes. Try:

- Clean your auto-pts and zephyr repos with

  Warning: This command will force the irreversible removal of all uncommitted files in the repo.

  `git clean -fdx`

  then build and flash tester elf again.
If you have set up Windows on virtual machine, check if guest extensions are installed properly or change USB compatibility mode in VM settings to USB 2.0.

- Check if firewall is not blocking python.exe or socat.exe.
- Check if board sends ready event after restart (hex 00 00 80 ff 00 00). Open serial connection to board with e.g. PuTTY with proper COM and baud rate. After board reset you should see some strings in console.
- Check if socat.exe creates tunnel to board. Run in console

```
socat.exe -x -v tcp-listen:65123 /dev/ttyS2,raw,b115200
```

where /dev/ttyS2 is the COM3 equivalent. Open PuTTY, set connection type to Raw, IP to 127.0.0.1, port to 65123. After board reset you should see some strings in console.

### 6.1.9 AutoPTS on Linux

#### Overview

This tutorial shows how to setup AutoPTS client on Linux with AutoPTS server running on Windows 10 virtual machine. Tested with Ubuntu 20.4 and Linux Mint 20.4.

You must have a Zephyr development environment set up. See [Getting Started Guide](#) for details.

Supported methods to test zephyr bluetooth host:

- Testing Zephyr Host Stack on QEMU
- Testing Zephyr Host Stack on native_sim
- Testing Zephyr combined (controller + host) build on Real hardware (such as nRF52)

For running with QEMU or native_sim, see [Running on QEMU or native_sim](#).

#### Setup Linux

**Install nrftools (only required in the actual hardware test mode)**

After you extract archive, you will see 2 .deb files, e.g.:

- JLink_Linux_V688a_x86_64.deb
- nRF-Command-Line-Tools_10_12_1_Linux-amd64.deb

and README.md. To install the tools, double click on each .deb file or follow instructions from README.md.

**Setup Windows 10 virtual machine**

Choose and install your hypervisor like VMWare Workstation (preferred) or VirtualBox. On VirtualBox could be some issues, if your host has fewer than 6 CPU.

Create Windows virtual machine instance. Make sure it has at least 2 cores and installed guest extensions.

Setup tested with VirtualBox 6.1.18 and VMWare Workstation 16.1.1 Pro.

**Update Windows**  Update Windows in:
Start -> Settings -> Update & Security -> Windows Update

**Setup static IP**

**VMWare Works**  On Linux, open Virtual Network Editor app and create network:
Open virtual machine network settings. Add custom adapter:

If you type ‘ifconfig’ in terminal, you should be able to find your host IP:
VirtualBox  Go to:
File -> Host Network Manager
and create network:

Open virtual machine network settings. On adapter 1 you will have created by default NAT. Add adapter 2:

6.1. Bluetooth
**Windows**  Setup static IP on Windows virtual machine. Go to Settings -> Network & Internet -> Ethernet -> Unidentified network -> Edit and set:
Install Python 3  Download and install latest Python 3 on Windows. Let the installer add the Python installation directory to the PATH and disable the path length limitation.

Install Git  Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8  On Windows virtual machine, install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

\[\text{\textbf{Note:} Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.}\]

Connect PTS dongle  With VirtualBox there should be no problem. Just find dongle in Devices -> USB and connect.

With VMWare you might need to use some trick, if you cannot find dongle in VM -> Removable Devices. Type in Linux terminal:

```
usb-devices
```

and find in output your PTS Bluetooth USB dongle
Note Vendor and ProdID number. Close VMWare Workstation and open .vmx of your virtual machine (path similar to /home/codecoup/vmware/Windows 10/Windows 10.vmx) in text editor. Write anywhere in the file following line:

```
usb.autoConnect.device0 = "0x0a12:0x0001"
```

just replace 0x0a12 with Vendor number and 0x0001 with ProdID number you found earlier.

**Connect devices (only required in the actual hardware test mode)**
Flash board (only required in the actual hardware test mode)

On Linux, go to ~/zephyrproject. There should be already ~/zephyrproject/build directory. Flash board:

```
west flash
```

Setup auto-pts project

**AutoPTS client on Linux**  
Clone auto-pts project:
Install socat, that is used to transfer BTP data stream from UART's tty file:

```
sudo apt-get install python-setuptools socat
```

Install required python modules:

```
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsclient_requirements.txt
```

**Autopts server on Windows virtual machine**

In Git Bash, clone auto-pts project repo:

```
git clone https://github.com/intel/auto-pts.git
```

Install required python modules:

```
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
```

Restart virtual machine.

## Running AutoPTS

Server and client by default will run on localhost address. Run server:

```
python ./autoptsserver.py
```

```
$ python ./autoptsserver.py
Local IP address: ('10.0.0.15', 'fe80::ccbb:6cal:6368:342a') DNS 'home'  
Local IP address: ('192.168.2.2', 'fe80::did2:15d5:26db:9147') DNS None 
Starting PTS    ... OK 
Serving on port 65000 ...
```

Testing Zephyr Host Stack on QEMU:

```
# A Bluetooth controller needs to be mounted.  
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/samples/ 
# bluetooth/hci_uart/README.html#bluetooth-hci_uart  
python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_PROJECT\PTS_PROJECT.pqw6" \
~/zephyrproject/build/zephyr/zephyr.elf -i SERVER_IP -l LOCAL_IP
```

Testing Zephyr Host Stack on native_sim:

```
# A Bluetooth controller needs to be mounted.  
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/samples/ 
# bluetooth/hci_uart/README.html#bluetooth-hci_uart  
wst build -b native_sim zephyr/tests/bluetooth/tester/ -DEXTRA_CONF_FILE=overlay-native. 
conf

sudo python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_PROJECT\PTS_PROJECT.pqw6" \
~/zephyrproject/build/zephyr/zephyr.exe -i SERVER_IP -l LOCAL_IP --hci 0
```

### 6.1. Bluetooth
Testing Zephyr combined (controller + host) build on nRF52:

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```
pip install --upgrade --force-reinstall pywin32
```

Run client:

```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t /dev/ACM0 -b nrf52 -l 192.168.2.1 -i 192.168.2.2
```

At the first run, when Windows asks, enable connection through firewall:

Troubleshooting

- “After running one test, I need to restart my Windows virtual machine to run another, because of fail verdict from APICOM in PTS logs.”

It means your virtual machine has not enough processor cores or memory. Try to add more in settings. Note that a host with 4 CPUs could be not enough with VirtualBox as hypervisor. In this case, choose rather VMWare Workstation.
"I cannot start autoptsserver-zephyr.py. I always got error:"

One or more of the following steps should help:
- Close all PTS Windows.
- Replug PTS bluetooth dongle.
- Delete temporary workspace. You will find it in auto-pts-code/workspaces/zephyr/zephyr-master/ as temp_zephyr-master. Be careful, do not remove the original one zephyr-master.pqw6.
- Restart Windows virtual machine.

### 6.1.10 Bluetooth APIs

**Attribute Protocol (ATT)**

**API Reference**

```c
bt_att
```

**Attributes Protocol (ATT)**

**Defines**

- **BT_ATT_ERR_SUCCESS**
  - The ATT operation was successful.

- **BT_ATT_ERR_INVALID_HANDLE**
  - The attribute handle given was not valid on the server.

- **BT_ATT_ERR_READ_NOT_PERMITTED**
  - The attribute cannot be read.

- **BT_ATT_ERR_WRITE_NOT_PERMITTED**
  - The attribute cannot be written.
The attribute PDU was invalid.

The attribute requires authentication before it can be read or written.

The ATT Server does not support the request received from the client.

Offset specified was past the end of the attribute.

The attribute requires authorization before it can be read or written.

Too many prepare writes have been queued.

No attribute found within the given attribute handle range.

The attribute cannot be read using the ATT_READ_BLOB_REQ PDU.

The Encryption Key Size used for encrypting this link is too short.

The attribute value length is invalid for the operation.

The attribute request that was requested has encountered an error that was unlikely.

The attribute request could therefore not be completed as requested.

The attribute requires encryption before it can be read or written.

The attribute type is not a supported grouping attribute.

The attribute type is not a supported grouping attribute as defined by a higher layer specification.

Insufficient Resources to complete the request.

The server requests the client to rediscover the database.

BT_ATT_ERR_VALUE_NOT_ALLOWED
   The attribute parameter value was not allowed.

BT_ATT_ERR_WRITE_REQ_REJECTED
   Write Request Rejected.

BT_ATT_ERR CCC_IMPROPER_CONF
   Client Characteristic Configuration Descriptor Improperly Configured.

BT_ATT_ERR_PROCEDURE_IN_PROGRESS
   Procedure Already in Progress.

BT_ATT_ERR_OUT_OF_RANGE
   Out of Range.

BT_ATT_MAX_ATTRIBUTE_LEN

BT_ATT_FIRST_ATTRIBUTE_HANDLE

BT_ATT_FIRSTATTRIBUTE_HANDLE

BT_ATT_LAST_ATTRIBUTE_HANDLE

BT_ATT_LASTATTRIBUTE_HANDLE

Enums

denum bt_att_chan_opt
   ATT channel option bit field values.

   Note:  BT_ATT_CHAN_OPT_UNENHANCED ONLY and
          BT_ATT_CHAN_OPT_ENHANCED ONLY are mutually exclusive and both bits may
          not be set.

   Values:

   enumerator BT_ATT_CHAN_OPT_NONE = 0x0
      Both Enhanced and Unenhanced channels can be used

   enumerator BT_ATT_CHAN_OPT_UNENHANCED ONLY = BIT(0)
      Only Unenhanced channels will be used

   enumerator BT_ATT_CHAN_OPT_ENHANCED ONLY = BIT(1)
      Only Enhanced channels will be used

6.1. Bluetooth
Functions

int bt_eatt_connect(struct bt_conn *conn, size_t num_channels)

Connect Enhanced ATT channels.
Sends a series of Credit Based Connection Requests to connect num_channels Enhanced
ATT channels. The peer may have limited resources and fewer channels may be cre-
ated.

Parameters
• conn – The connection to send the request on
• num_channels – The number of Enhanced ATT beares to request. Must be
  in the range 1 - CONFIG_BT_EATT_MAX , inclusive.

Return values
• -EINVAL – if num_channels is not in the allowed range or conn is NULL.
• -ENOMEM – if less than num_channels are allocated.
• 0 – in case of success

Returns
0 in case of success or negative value in case of error.

size_t bt_eatt_count(struct bt_conn *conn)
Get number of EATT channels connected.

Parameters
• conn – The connection to get the number of EATT channels for.

Returns
The number of EATT channels connected. Returns 0 if conn is NULL or not
connected.

Bluetooth Audio

API Reference

group bt_audio
  Bluetooth Audio.

Defines

BT_AUDIO_BROADCAST_ID_SIZE

BT_AUDIO_BROADCAST_ID_MAX
  Maximum broadcast ID value.

BT_AUDIO_PD_PREF_NONE
  Indicates that the server have no preference for the presentation delay.

BT_AUDIO_PD_MAX
  Maximum presentation delay in microseconds.
BT_AUDIO_BROADCAST_CODE_SIZE

BT_AUDIO_CODEC_CAP_CHAN_COUNT_MIN
    Minimum supported channel counts.

BT_AUDIO_CODEC_CAP_CHAN_COUNT_MAX
    Maximum supported channel counts.

BT_AUDIO_CODEC_CAP_CHAN_COUNT_SUPPORT(...)
    Channel count support capability.
    Macro accepts variable number of channel counts. The allowed channel counts are defined by specification and have to be in range from \textit{BT_AUDIO_CODEC_CAP_CHAN_COUNT_MIN} to \textit{BT_AUDIO_CODEC_CAP_CHAN_COUNT_MAX} inclusive.
    Example to support 1 and 3 channels: \textit{BT_AUDIO_CODEC_CAP_CHAN_COUNT_SUPPORT(1, 3)}

BT_AUDIO_CONTEXT_TYPE_ANY
    Any known context.

BT_AUDIO_METADATA_TYPE_IS_KNOWN(_type)
    Helper to check whether metadata type is known by the stack.

\underbar{Note:} _type is evaluated thrice.

BT_AUDIO_UNICAST_ANNOUNCEMENT_GENERAL

BT_AUDIO_UNICAST_ANNOUNCEMENT_TARGETED

BT_AUDIO_CODEC_DATA(_type, _bytes...)
    Helper to declare elements of \textit{bt_audio_codec_cap} arrays.
    This macro is mainly for creating an array of struct \textit{bt_audio_codec_cap} data arrays.

\textbf{Parameters}

\begin{itemize}
    \item _type – Type of advertising data field
    \item _bytes – Variable number of single-byte parameters
\end{itemize}

BT_AUDIO_CODEC_CFG(_id, _cid, _vid, _data, _meta)
    Helper to declare \textit{Codec config parsing APIs}.

\textbf{Parameters}

\begin{itemize}
    \item _id – Codec ID
    \item _cid – Company ID
    \item _vid – Vendor ID
    \item _data – Codec Specific Data in LVT format
    \item _meta – Codec Specific Metadata in LVT format
\end{itemize}
BT_AUDIO_CODEC_CAP(_id, _cid, _vid, _data, _meta)
Helper to declare Codec capability parsing APIs structure.

Parameters
• _id – Codec ID
• _cid – Company ID
• _vid – Vendor ID
• _data – Codec Specific Data in LVT format
• _meta – Codec Specific Metadata in LVT format

BT_AUDIO_LOCATION_ANY
Any known location.

BT_AUDIO_CODEC_QOS(_interval, _framing, _phy, _sdu, _rtn, _latency, _pd)
Helper to declare elements of bt_audio_codec_qos.

Parameters
• _interval – SDU interval (usec)
• _framing – Framing
• _phy – Target PHY
• _sdu – Maximum SDU Size
• _rtn – Retransmission number
• _latency – Maximum Transport Latency (msec)
• _pd – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_UNFRAMED(_interval, _sdu, _rtn, _latency, _pd)
Helper to declare Input Unframed bt_audio_codec_qos.

Parameters
• _interval – SDU interval (usec)
• _sdu – Maximum SDU Size
• _rtn – Retransmission number
• _latency – Maximum Transport Latency (msec)
• _pd – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_FRAMED(_interval, _sdu, _rtn, _latency, _pd)
Helper to declare Input Framed bt_audio_codec_qos.

Parameters
• _interval – SDU interval (usec)
• _sdu – Maximum SDU Size
• _rtn – Retransmission number
• _latency – Maximum Transport Latency (msec)
• _pd – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_PREF(_unframed_supported, _phy, _rtn, _latency, _pd_min, _pd_max, _pref_pd_min, _pref_pd_max)
Helper to declare elements of bt_audio_codec_qos_pref.

Parameters
• _unframed_supported – Unframed PDUs supported
• _phy – Preferred Target PHY
• _rtn – Preferred Retransmission number
• _latency – Preferred Maximum Transport Latency (msec)
• _pd_min – Minimum Presentation Delay (usec)
• _pd_max – Maximum Presentation Delay (usec)
• _pref_pd_min – Preferred Minimum Presentation Delay (usec)
• _pref_pd_max – Preferred Maximum Presentation Delay (usec)

Enums

e num bt_audio_codec_cap_type
  Codec capability types.
  Used to build and parse codec capabilities as specified in the PAC specification. Source
  is assigned numbers for Generic Audio, bluetooth.com.
  Values:

  enumerator BT_AUDIO_CODEC_CAP_TYPE_FREQ = 0x01
    Supported sampling frequencies.

e num bt_audio_codec_cap_freq
  Supported frequencies bitfield.
  Values:

  enumerator BT_AUDIO_CODEC_CAP_FREQ_8KHZ = BIT(0)
    8 Khz sampling frequency

e num bt_audio_codec_cap_freq
  11.025 Khz sampling frequency

e num bt_audio_codec_cap_freq
  16 Khz sampling frequency
enumerator BT_AUDIO_CODEC_CAP_FREQ_22KHZ = \textit{BIT}(3)
22.05 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_24KHZ = \textit{BIT}(4)
24 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_32KHZ = \textit{BIT}(5)
32 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_44KHZ = \textit{BIT}(6)
44.1 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_48KHZ = \textit{BIT}(7)
48 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_88KHZ = \textit{BIT}(8)
88.2 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_96KHZ = \textit{BIT}(9)
96 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_176KHZ = \textit{BIT}(10)
176.4 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_192KHZ = \textit{BIT}(11)
192 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_384KHZ = \textit{BIT}(12)
384 Khz sampling frequency

enumerator BT_AUDIO_CODEC_CAP_FREQ_ANY = \textit{(BIT AUDIO_CODEC_CAP_FREQ_8KHZ | BIT AUDIO_CODEC_CAP_FREQ_11KHZ | BIT AUDIO_CODEC_CAP_FREQ_16KHZ | BIT AUDIO_CODEC_CAP_FREQ_22KHZ | BIT AUDIO_CODEC_CAP_FREQ_24KHZ | BIT AUDIO_CODEC_CAP_FREQ_32KHZ | BIT AUDIO_CODEC_CAP_FREQ_44KHZ | BIT AUDIO_CODEC_CAP_FREQ_48KHZ | BIT AUDIO_CODEC_CAP_FREQ_88KHZ | BIT AUDIO_CODEC_CAP_FREQ_96KHZ | BIT AUDIO_CODEC_CAP_FREQ_176KHZ | BIT AUDIO_CODEC_CAP_FREQ_192KHZ | BIT AUDIO_CODEC_CAP_FREQ_384KHZ)}
Any frequency capability.

enum bt_audio_codec_cap_frame_dur
Supported frame durations bitfield.
\textbf{Values:}

enumerator BT_AUDIO_CODEC_CAP_DURATION_7_5 = \textit{BIT}(0)
7.5 msec frame duration capability

enumerator BT_AUDIO_CODEC_CAP_DURATION_10 = \textit{BIT}(1)
10 msec frame duration capability
enumerator BT_AUDIO_CODEC_CAP_DURATION_ANY =
(BT_AUDIO_CODEC_CAP_DURATION_7_5 | BT_AUDIO_CODEC_CAP_DURATION_10)
Any frame duration capability.

enumerator BT_AUDIO_CODEC_CAP_DURATION_PREFER_7_5 = BIT(4)
7.5 msec preferred frame duration capability.
This shall only be set if BT_AUDIO_CODEC_CAP_DURATION_7_5 is also set, and if
BT_AUDIO_CODEC_CAP_DURATION_PREFER_10 is not set.

enumerator BT_AUDIO_CODEC_CAP_DURATION_PREFER_10 = BIT(5)
10 msec preferred frame duration capability
This shall only be set if BT_AUDIO_CODEC_CAP_DURATION_10 is also set, and if
BT_AUDIO_CODEC_CAP_DURATION_PREFER_7_5 is not set.

enum bt_audio_codec_cap_chan_count

Values:

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_1 = BIT(0)
Supporting 1 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_2 = BIT(1)
Supporting 2 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_3 = BIT(2)
Supporting 3 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_4 = BIT(3)
Supporting 4 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_5 = BIT(4)
Supporting 5 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_6 = BIT(5)
Supporting 6 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_7 = BIT(6)
Supporting 7 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_8 = BIT(7)
Supporting 8 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_ANY =
(BT_AUDIO_CODEC_CAP_CHAN_COUNT_1 | BT_AUDIO_CODEC_CAP_CHAN_COUNT_2 |
BT_AUDIO_CODEC_CAP_CHAN_COUNT_3 |
BT_AUDIO_CODEC_CAP_CHAN_COUNT_4 | BT_AUDIO_CODEC_CAP_CHAN_COUNT_5 |
BT_AUDIO_CODEC_CAP_CHAN_COUNT_6 |
BT_AUDIO_CODEC_CAP_CHAN_COUNT_7 | BT_AUDIO_CODEC_CAP_CHAN_COUNT_8)
Supporting all channels.
enum bt_audio_codec_cfg_type
   Codec configuration types.
   Used to build and parse codec configurations as specified in the ASCS and BAP specifications. Source is assigned numbers for Generic Audio, bluetooth.com.

Values:

enumerator BT_AUDIO_CODEC_CFG_FREQ = 0x01
   Sampling frequency.

enumerator BT_AUDIO_CODEC_CFG_DURATION = 0x02
   Frame duration.

enumerator BT_AUDIO_CODEC_CFG_CHAN_ALLOC = 0x03
   Audio channel allocation.

enumerator BT_AUDIO_CODEC_CFG_FRAME_LEN = 0x04
   Octets per codec frame.

enumerator BT_AUDIO_CODEC_CFG_FRAME_BLKS_PER SDU = 0x05
   Codec frame blocks per SDU.

enum bt_audio_codec_cfg_freq
Values:

enumerator BT_AUDIO_CODEC_CFG_FREQ_8KHZ = 0x01
   8 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_11KHZ = 0x02
   11.025 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_16KHZ = 0x03
   16 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_22KHZ = 0x04
   22.05 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_24KHZ = 0x05
   24 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_32KHZ = 0x06
   32 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_44KHZ = 0x07
   44.1 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_48KHZ = 0x08
   48 Khz codec sampling frequency
enumerator BT_AUDIO_CODEC_CFG_FREQ_88KHZ = 0x09
  88.2 Khz codec sampling frequency
enumerator BT_AUDIO_CODEC_CFG_FREQ_96KHZ = 0x0a
  96 Khz codec sampling frequency
enumerator BT_AUDIO_CODEC_CFG_FREQ_176KHZ = 0x0b
  176.4 Khz codec sampling frequency
enumerator BT_AUDIO_CODEC_CFG_FREQ_192KHZ = 0x0c
  192 Khz codec sampling frequency
enumerator BT_AUDIO_CODEC_CFG_FREQ_384KHZ = 0x0d
  384 Khz codec sampling frequency

enum bt_audio_codec_cfg_frame_dur
  Values:
  enumerator BT_AUDIO_CODEC_CFG_DURATION_7_5 = 0x00
    7.5 msec Frame Duration configuration
  enumerator BT_AUDIO_CODEC_CFG_DURATION_10 = 0x01
    10 msec Frame Duration configuration

enum bt_audio_context
  Audio Context Type for Generic Audio.
  These values are defined by the Generic Audio Assigned Numbers, bluetooth.com
  Values:
  enumerator BT_AUDIO_CONTEXT_TYPE_PROHIBITED = 0
  enumerator BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED = BIT(0)
  enumerator BT_AUDIO_CONTEXT_TYPE_CONVERSATIONAL = BIT(1)
  enumerator BT_AUDIO_CONTEXT_TYPE_MEDIA = BIT(2)
  enumerator BT_AUDIO_CONTEXT_TYPE_GAME = BIT(3)
  enumerator BT_AUDIO_CONTEXT_TYPE_INSTRUCTIONAL = BIT(4)
  enumerator BT_AUDIO_CONTEXT_TYPE_VOICE_ASSISTANTS = BIT(5)
  enumerator BT_AUDIO_CONTEXT_TYPE_LIVE = BIT(6)
  enumerator BT_AUDIO_CONTEXT_TYPE_SOUND_EFFECTS = BIT(7)
enumerator BT_AUDIO_CONTEXT_TYPE_NOTIFICATIONS = BIT(8)

enumerator BT_AUDIO_CONTEXT_TYPE_RINGTONE = BIT(9)

enumerator BT_AUDIO_CONTEXT_TYPE_ALERTS = BIT(10)

enumerator BT_AUDIO_CONTEXT_TYPE_EMERGENCY_ALARM = BIT(11)

enum bt_audio_parental_rating
Parental rating defined by the Generic Audio assigned numbers (bluetooth.com).
The numbering scheme is aligned with Annex F of EN 300 707 v1.2.1 which defined
parental rating for viewing.

Values:

enumerator BT_AUDIO_PARENTAL_RATING_NO_RATING = 0x00
enumerator BT_AUDIO_PARENTAL_RATING_AGE_ANY = 0x01
enumerator BT_AUDIO_PARENTAL_RATING_AGE_5_OR_ABOVE = 0x02
enumerator BT_AUDIO_PARENTAL_RATING_AGE_6_OR_ABOVE = 0x03
enumerator BT_AUDIO_PARENTAL_RATING_AGE_7_OR_ABOVE = 0x04
enumerator BT_AUDIO_PARENTAL_RATING_AGE_8_OR_ABOVE = 0x05
enumerator BT_AUDIO_PARENTAL_RATING_AGE_9_OR_ABOVE = 0x06
enumerator BT_AUDIO_PARENTAL_RATING_AGE_10_OR_ABOVE = 0x07
enumerator BT_AUDIO_PARENTAL_RATING_AGE_11_OR_ABOVE = 0x08
enumerator BT_AUDIO_PARENTAL_RATING_AGE_12_OR_ABOVE = 0x09
enumerator BT_AUDIO_PARENTAL_RATING_AGE_13_OR_ABOVE = 0x0A
enumerator BT_AUDIO_PARENTAL_RATING_AGE_14_OR_ABOVE = 0x0B
enumerator BT_AUDIO_PARENTAL_RATING_AGE_15_OR_ABOVE = 0x0C
enumerator BT_AUDIO_PARENTAL_RATING_AGE_16_OR_ABOVE = 0x0D
enumerator BT_AUDIO_PARENTAL_RATING_AGE_17_OR_ABOVE = 0x0E
enumerator BT_AUDIO_PARENTAL_RATING_AGE_18_OR_ABOVE = 0x0F
enum bt_audio_active_state
Audio Active State defined by the Generic Audio assigned numbers (bluetooth.com).
Values:

enumerator BT_AUDIO_ACTIVE_STATE_DISABLED = 0x00
enumerator BT_AUDIO_ACTIVE_STATE_ENABLED = 0x01

enum bt_audio_metadata_type
Codec metadata type IDs.
Metadata types defined by the Generic Audio assigned numbers (bluetooth.com).
Values:

enumerator BT_AUDIO_METADATA_TYPE_PREF_CONTEXT = 0x01
Preferred audio context.

Bitfield of preferred audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the BT_AUDIO_CONTEXT_* for valid values.

enumerator BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT = 0x02
Streaming audio context.

Bitfield of streaming audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the BT_AUDIO_CONTEXT_* for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO = 0x03
UTF-8 encoded title or summary of stream content.

enumerator BT_AUDIO_METADATA_TYPE_STREAM_LANG = 0x04
Stream language.

3 octet lower case language code defined by ISO 639-3

enumerator BT_AUDIO_METADATA_TYPE_CCID_LIST = 0x05
Array of 8-bit CCID values.

enumerator BT_AUDIO_METADATA_TYPE_PARENTAL_RATING = 0x06
Parental rating.
See @ref bt_audio_parental_rating for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI = 0x07
UTF-8 encoded URI for additional Program information.
enumerator BT_AUDIO_METADATA_TYPE_AUDIO_STATE = 0x08
Audio active state.
See @ref bt_audio_active_state for valid values.

enumerator BT_AUDIO_METADATA_TYPE_BROADCAST_IMMEDIATE = 0x09
Broadcast Audio Immediate Rendering flag

enumerator BT_AUDIO_METADATA_TYPE_EXTENDED = 0xFE
Extended metadata.

enumerator BT_AUDIO_METADATA_TYPE_VENDOR = 0xFF
Vendor specific metadata.

enum bt_audio_location
Location values for BT Audio.
These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

Values:

enumerator BT_AUDIO_LOCATION_MONO_AUDIO = 0

enumerator BT_AUDIO_LOCATION_FRONT_LEFT = BIT(0)

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT = BIT(1)

enumerator BT_AUDIO_LOCATION_FRONT_CENTER = BIT(2)

enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_1 = BIT(3)

enumerator BT_AUDIO_LOCATION_BACK_LEFT = BIT(4)

enumerator BT_AUDIO_LOCATION_BACK_RIGHT = BIT(5)

enumerator BT_AUDIO_LOCATION_FRONT_LEFT_OF_CENTER = BIT(6)

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_OF_CENTER = BIT(7)

enumerator BT_AUDIO_LOCATION_BACK_CENTER = BIT(8)

enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_2 = BIT(9)

enumerator BT_AUDIO_LOCATION_SIDE_LEFT = BIT(10)

enumerator BT_AUDIO_LOCATION_SIDE_RIGHT = BIT(11)

enumerator BT_AUDIO_LOCATION_TOP_FRONT_LEFT = BIT(12)

enumerator BT_AUDIO_LOCATION_RIGHT_SURROUND = BIT(27)

enum bt_audio_dir
    Audio Capability type.
    Values:

    enumerator BT_AUDIO_DIR_SINK = 0x01
    enumerator BT_AUDIO_DIR_SOURCE = 0x02

enum bt_audio_codec_qos_framing
    Codec QoS Framing.
    Values:

    enumerator BT_AUDIO_CODEC_QOS_FRAMING_UNFRAMED = 0x00
    enumerator BT_AUDIO_CODEC_QOS_FRAMING_FRAMED = 0x01
Codec QoS Preferred PHY.

Values:

enumerator BT_AUDIO_CODEC_QOS_1M = BIT(0)
enumerator BT_AUDIO_CODEC_QOS_2M = BIT(1)
enumerator BT_AUDIO_CODEC_QOS_CODED = BIT(2)

Functions

int bt_audio_data_parse(const uint8_t ltv[], size_t size, bool (*func)(struct bt_data *data, void *user_data), void *user_data)

Helper for parsing length-type-value data.

Parameters

• ltv – Length-type-value (LTV) encoded data.
• size – Size of the ltv data.
• func – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.
• user_data – User data to be passed to the callback.

Return values

• 0 – if all entries were parsed.
• -EINVAL – if the data is incorrectly encoded
• -ECANCELED – if parsing was prematurely cancelled by the callback

struct bt_audio_codec_octets_per_codec_frame
#include <audio.h>

Public Members

uint16_t min
Minimum number of octets supported per codec frame.

uint16_t max
Maximum number of octets supported per codec frame.

struct bt_audio_codec_cap
#include <audio.h> Codec capability structure.
Public Members

uint8_t path_id
   Data path ID.
   BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.

bool ctrlr_transcode
   Whether or not the local controller should transcode.
   This effectively sets the coding format for the ISO data path to
   BT_HCI_CODING_FORMAT_TRANSPARENT if false, else uses the
   bt_audio_codec_cfg::id.

uint8_t id
   Codec ID.

uint16_t cid
   Codec Company ID.

uint16_t vid
   Codec Company Vendor ID.

struct bt_audio_codec_cfg
   #include <audio.h> Codec specific configuration structure.

6.1. Bluetooth
Public Members

uint8_t phy
  QoS PHY.

enum bt_audio_codec_qos_framing framing
  QoS Framing.

uint8_t rtn
  QoS Retransmission Number.

uint16_t sdu
  QoS SDU.

uint32_t interval
  QoS Frame Interval.

uint32_t pd
  QoS Presentation Delay in microseconds.
  Value range 0 to BT_AUDIO_PD_MAX.

struct bt_audio_codec_qos_pref
  #include <audio.h> Audio Stream Quality of Service Preference structure.

Public Members

bool unframed_supported
  Unframed PDUs supported.
  Unlike the other fields, this is not a preference but whether the codec supports
  unframed ISOAL PDUs.

uint8_t phy
  Preferred PHY.

uint8_t rtn
  Preferred Retransmission Number.

uint16_t latency
  Preferred Transport Latency.

uint32_t pd_min
  Minimum Presentation Delay in microseconds.
  Unlike the other fields, this is not a preference but a minimum requirement.
  Value range 0 to BT_AUDIO_PD_MAX, or BT_AUDIO_PD_PREF_NONE to indicate no
  preference.
uint32_t pd_max
Maximum Presentation Delay.
Unlike the other fields, this is not a preference but a maximum requirement.
Value range 0 to BT_AUDIO_PD_MAX, or BT_AUDIO_PD_PREF_NONE to indicate no preference.

uint32_t pref_pd_min
Preferred minimum Presentation Delay.
Value range 0 to BT_AUDIO_PD_MAX.

uint32_t pref_pd_max
Preferred maximum Presentation Delay.
Value range 0 to BT_AUDIO_PD_MAX.

**group bt_audio_codec_cfg**
Audio codec Config APIs.
Functions to parse codec config data when formatted as LTV wrapped into Codec config parsing APIs.

**Functions**

int bt_audio_codec_cfg_freq_to_freq_hz(enum bt_audio_codec_cfg_freq freq)
Convert assigned numbers frequency to frequency value.

**Parameters**
- freq – The assigned numbers frequency to convert.

**Return values**
- EINVAL – if arguments are invalid.
- The – converted frequency value in Hz.

int bt_audio_codec_cfg_freq_hz_to_freq(uint32_t freq_hz)
Convert frequency value to assigned numbers frequency.

**Parameters**
- freq_hz – The frequency value to convert.

**Return values**
- EINVAL – if arguments are invalid.
- The – assigned numbers frequency (bt_audio_codec_cfg_freq).

int bt_audio_codec_cfg_get_freq(const struct bt_audio_codec_cfg *codec_cfg)
Extract the frequency from a codec configuration.

**Parameters**
- codec_cfg – The codec configuration to extract data from.

**Return values**
- A – bt_audio_codec_cfg_freq value
- EINVAL – if arguments are invalid
int bt_audio_codec_cfg_set_freq(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_codec_cfg_freq freq)

Set the frequency of a codec configuration.

Parameters
- `codec_cfg` – The codec configuration to set data for.
- `freq` – The assigned numbers frequency to set.

Return values
- The `data_len` of `codec_cfg` on success
- -EINVAL – if arguments are invalid
- -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_frame_dur_to_frame_dur_us(enum bt_audio_codec_cfg_frame_dur frame_dur)

Convert assigned numbers frame duration to duration in microseconds.

Parameters
- `frame_dur` – The assigned numbers frame duration to convert.

Return values
- -EINVAL – if arguments are invalid.
- The converted frame duration value in microseconds.

int bt_audio_codec_cfg_frame_dur_us_to_frame_dur(uint32_t frame_dur_us)

Convert frame duration in microseconds to assigned numbers frame duration.

Parameters
- `frame_dur_us` – The frame duration in microseconds to convert.

Return values
- -EINVAL – if arguments are invalid.
- The assigned numbers frame duration (`bt_audio_codec_cfg_frame_dur`).

int bt_audio_codec_cfg_get_frame_dur(const struct bt_audio_codec_cfg *codec_cfg)

Extract frame duration from BT codec config.

Parameters
- `codec_cfg` – The codec configuration to extract data from.

Return values
- A `bt_audio_codec_cfg_frame_dur` value
- -EINVAL – if arguments are invalid
- -ENODATA – if not found
- -EBADMSG – if found value has invalid size or value

int bt_audio_codec_cfg_set_frame_dur(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_codec_cfg_frame_dur frame_dur)

Set the frame duration of a codec configuration.

Parameters
• codec_cfg – The codec configuration to set data for.
• frame_dur – The assigned numbers frame duration to set.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

```
int bt_audio_codec_cfg_get_chan_allocation(const struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_location *chan_allocation)
```

Extract channel allocation from BT codec config.
The value returned is a bit field representing one or more audio locations
as specified by bt_audio_location. Shall match one or more of the bits set in
BT_PAC_SNK_LOC/BT_PAC_SRC_LOC.

Up to the configured BT_AUDIO_CODEC_CAP_TYPE_CHAN_COUNT number of channels can be present.

Parameters
• codec_cfg – The codec configuration to extract data from.
• chan_allocation – Pointer to the variable to store the extracted value in.

Return values
• 0 – if value is found and stored in the pointer provided
• -EINVAL – if arguments are invalid
• -ENODATA – if not found
• -EBADMSG – if found value has invalid size or value

```
int bt_audio_codec_cfg_set_chan_allocation(struct.bt_audio_codec_cfg *codec_cfg, enum bt_audio_location chan_allocation)
```

Set the channel allocation of a codec configuration.

Parameters
• codec_cfg – The codec configuration to set data for.
• chan_allocation – The channel allocation to set.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

```
int bt_audio_codec_cfg_get_octets_per_frame(const struct bt_audio_codec_cfg *codec_cfg)
```

Extract frame size in octets from BT codec config.
The overall SDU size will be octets_per_frame * blocks_per_sdu.

The Bluetooth specification are not clear about this value - it does not state that the codec shall use this SDU size only. A codec like LC3 supports variable bit-rate (per SDU) hence it might be allowed for an encoder to reduce the frame size below this value. Hence it is recommended to use the received SDU size and divide by blocks_per_sdu rather than relying on this octets_per_sdu value to be fixed.

Parameters
• codec_cfg – The codec configuration to extract data from.

Return values
• Frame – length in octets
• -EINVAL – if arguments are invalid
• -ENODATA – if not found
• -EBADMSG – if found value has invalid size or value

```c
int bt_audio_codec_cfg_set_octets_per_frame(struct bt_audio_codec_cfg *codec_cfg, uint16_t octets_per_frame)
```

Set the octets per codec frame of a codec configuration.

Parameters
• codec_cfg – The codec configuration to set data for.
• octets_per_frame – The octets per codec frame to set.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

```c
int bt_audio_codec_cfg_get_frame_blocks_per_sdu(const struct bt_audio_codec_cfg *codec_cfg, bool fallback_to_default)
```

Extract number of audio frame blockss in each SDU from BT codec config.

The overall SDU size will be octets_per_frame * frame_blocks_per_sdu * number-of-channels.

If this value is not present a default value of 1 shall be used.

A frame block is one or more frames that represents data for the same period of time but for different channels. If the stream have two audio channels and this value is two there will be four frames in the SDU.

Parameters
• codec_cfg – The codec configuration to extract data from.
• fallback_to_default – If true this function will return the default value of 1 if the type is not found. In this case the function will only fail if a NULL pointer is provided.

Return values
• The – count of codec frames in each SDU if value is found else of fallback_to_default is true then the value 1 is returned if frames per sdu is not found.
• -EINVAL – if arguments are invalid
• -ENODATA – if not found
• -EBADMSG – if found value has invalid size or value

```c
int bt_audio_codec_cfg_set_frame_blocks_per_sdu(struct bt_audio_codec_cfg *codec_cfg, uint8_t frame_blocks)
```

Set the frame blocks per SDU of a codec configuration.

Parameters
• codec_cfg – The codec configuration to set data for.
• frame_blocks – The frame blocks per SDU to set.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_get_val(const struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_codec_cfg_type type, const uint8_t **data)

Lookup a specific codec configuration value.

Parameters
• codec_cfg – [in] The codec data to search in.
• type – [in] The type id to look for
• data – [out] Pointer to the data-pointer to update when item is found

Return values
• Length – of found data (may be 0)
• -EINVAL – if arguments are invalid
• -ENODATA – if not found

int bt_audio_codec_cfg_set_val(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_codec_cfg_type type, const uint8_t *data, size_t data_len)

Set or add a specific codec configuration value.

Parameters
• codec_cfg – The codec data to set the value in.
• type – The type id to set
• data – Pointer to the data-pointer to set
• data_len – Length of data

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_unset_val(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_codec_cfg_type type)

Unset a specific codec configuration value.

The type and the value will be removed from the codec configuration.

Parameters
• codec_cfg – The codec data to set the value in.
• type – The type id to unset.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
int bt_audio_codec_cfg_meta_get_val(const struct bt_audio_codec_cfg *codec_cfg, 
uint8_t type, const uint8_t **data)

Lookup a specific metadata value based on type.

Parameters
- type – [in] The type id to look for
- data – [out] Pointer to the data-pointer to update when item is found

Return values
- Length – of found data (may be 0)
- -EINVAL – if arguments are invalid
- -ENODATA – if not found

int bt_audio_codec_cfg_meta_set_val(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_metadata_type type, const uint8_t *data, size_t data_len)

Set or add a specific codec configuration metadata value.

Parameters
- codec_cfg – The codec configuration to set the value in.
- type – The type id to set.
- data – Pointer to the data-pointer to set.
- data_len – Length of data.

Return values
- The – meta_len of codec_cfg on success
- -EINVAL – if arguments are invalid
- -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_meta_unset_val(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_metadata_type type)

Unset a specific codec configuration metadata value.
The type and the value will be removed from the codec configuration metadata.

Parameters
- codec_cfg – The codec data to set the value in.
- type – The type id to unset.

Return values
- The – meta_len of codec_cfg on success
- -EINVAL – if arguments are invalid

int bt_audio_codec_cfg_meta_get_pref_context(const struct bt_audio_codec_cfg *codec_cfg)

Extract preferred contexts.
See BT_AUDIO_METADATA_TYPE_PREF_CONTEXT for more information about this value.

Parameters
- codec_cfg – The codec data to search in.
Return values

- The – preferred context type if positive or 0
- EINVAL – if arguments are invalid
- ENODATA – if not found
- EBADMSG – if found value has invalid size

```c
int bt_audio_codec_cfg_meta_set_pref_context(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_context ctx)
```

Set the preferred context of a codec configuration metadata.

**Parameters**

- `codec_cfg` – The codec configuration to set data for.
- `ctx` – The preferred context to set.

**Return values**

- The – data_len of `codec_cfg` on success
- EINVAL – if arguments are invalid
- ENOMEM – if the new value could not set or added due to memory

```c
int bt_audio_codec_cfg_meta_get_stream_context(const struct bt_audio_codec_cfg *codec_cfg)
```

Extract stream contexts.

See `BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT` for more information about this value.

**Parameters**

- `codec_cfg` – The codec data to search in.

**Return values**

- The – stream context type if positive or 0
- EINVAL – if arguments are invalid
- ENODATA – if not found
- EBADMSG – if found value has invalid size

```c
int bt_audio_codec_cfg_meta_set_stream_context(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_context ctx)
```

Set the stream context of a codec configuration metadata.

**Parameters**

- `codec_cfg` – The codec configuration to set data for.
- `ctx` – The stream context to set.

**Return values**

- The – data_len of `codec_cfg` on success
- EINVAL – if arguments are invalid
- ENOMEM – if the new value could not set or added due to memory

```c
int bt_audio_codec_cfg_meta_get_program_info(const struct bt_audio_codec_cfg *codec_cfg, const uint8_t **program_info)
```
Extract program info.

See `BT_AUDIO_METADATA_TYPE_PROGRAM_INFO` for more information about this value.

**Parameters**

- `program_info` – [out] Pointer to the UTF-8 formatted program info.

**Return values**

- The length of the `program_info` (may be 0)
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if not found

```c
int bt_audio_codec_cfg_meta_set_program_info(struct bt_audio_codec_cfg *codec_cfg, const uint8_t *program_info, size_t program_info_len)
```

Set the program info of a codec configuration metadata.

**Parameters**

- `codec_cfg` – The codec configuration to set data for.
- `program_info` – The program info to set.
- `program_info_len` – The length of `program_info`.

**Return values**

- The data_len of `codec_cfg` on success
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if the new value could not be set or added due to memory

```c
int bt_audio_codec_cfg_meta_get_stream_lang(const struct bt_audio_codec_cfg *codec_cfg)
```

Extract stream language.

See `BT_AUDIO_METADATA_TYPE_STREAM_LANG` for more information about this value.

**Parameters**

- `codec_cfg` – The codec data to search in.

**Return values**

- The stream language if positive or 0
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if not found
- `-EBADMSG` – if found value has invalid size

```c
int bt_audio_codec_cfg_meta_set_stream_lang(struct bt_audio_codec_cfg *codec_cfg, uint32_t stream_lang)
```

Set the stream language of a codec configuration metadata.

**Parameters**

- `codec_cfg` – The codec configuration to set data for.
- `stream_lang` – The 24-bit stream language to set.

**Return values**
Extract CCID list.

See `BT_AUDIO_METADATA_TYPE_CCID_LIST` for more information about this value.

**Parameters**
- `ccid_list` – [out] Pointer to the array containing 8-bit CCIDs.

**Return values**
- The – length of the `ccid_list` (may be 0)
- -EINVAL – if arguments are invalid
- -ENOMEM – if not found

Set the CCID list of a codec configuration metadata.

**Parameters**
- `codec_cfg` – The codec configuration to set data for.
- `ccid_list` – The program info to set.
- `ccid_list_len` – The length of `ccid_list`.

**Return values**
- The – `data_len` of `codec_cfg` on success
- -EINVAL – if arguments are invalid
- -ENOMEM – if the new value could not set or added due to memory

Extract parental rating.

See `BT_AUDIO_METADATA_TYPE_PARENTAL_RATING` for more information about this value.

**Parameters**
- `codec_cfg` – The codec data to search in.

**Return values**
- The – parental rating if positive or 0
- -EINVAL – if arguments are invalid
- -ENODATA – if not found
- -EBADMSG – if found value has invalid size

Set the parental rating of a codec configuration metadata.

**Parameters**
- `codec_cfg` – The codec configuration to set data for.
- `parental_rating` – The parental rating to set.
Parameters

- `codec_cfg` – The codec configuration to set data for.
- `parental_rating` – The parental rating to set.

Return values

- The – data_len of `codec_cfg` on success
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if the new value could not set or added due to memory

```
int bt_audio_codec_cfg_meta_get_program_info_uri(const struct bt_audio_codec_cfg *codec_cfg, const uint8_t **program_info_uri)
```

Extract program info URI.

See `BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI` for more information about this value.

Parameters

- `program_info_uri` – [out] Pointer to the UTF-8 formatted program info URI.

Return values

- The – length of the `ccid_list` (may be 0)
- `-EINVAL` – if arguments are invalid
- `-ENODATA` – if not found

```
int bt_audio_codec_cfg_meta_set_program_info_uri(struct bt_audio_codec_cfg *codec_cfg, const uint8_t *program_info_uri, size_t program_info_uri_len)
```

Set the program info URI of a codec configuration metadata.

Parameters

- `codec_cfg` – The codec configuration to set data for.
- `program_info_uri` – The program info URI to set.
- `program_info_uri_len` – The length of `program_info_uri`.

Return values

- The – data_len of `codec_cfg` on success
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if the new value could not set or added due to memory

```
int bt_audio_codec_cfg_meta_get_audio_active_state(const struct bt_audio_codec_cfg *codec_cfg)
```

Extract audio active state.

See `BT_AUDIO_METADATA_TYPE_AUDIO STATE` for more information about this value.

Parameters

- `codec_cfg` – The codec data to search in.

Return values
• The – preferred context type if positive or 0
• -EINVAL – if arguments are invalid
• -ENODATA – if not found
• -EBADMSG – if found value has invalid size

int bt_audio_codec_cfg_meta_set_audio_active_state(struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_active_state state)

Set the audio active state of a codec configuration metadata.

Parameters
  • codec_cfg – The codec configuration to set data for.
  • state – The audio active state to set.

Return values
  • The – data_len of codec_cfg on success
  • -EINVAL – if arguments are invalid
  • -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_meta_get_bcast_audio_immediate_rend_flag(const struct bt_audio_codec_cfg *codec_cfg)

Extract broadcast audio immediate rendering flag.
See BT_AUDIO_METADATA_TYPE_BROADCAST_IMMEDIATE for more information about this value.

Parameters
  • codec_cfg – The codec data to search in.

Return values
  • 0 – if the flag was found
  • -EINVAL – if arguments are invalid
  • -ENODATA – if not the flag was not found

int bt_audio_codec_cfg_meta_set_bcast_audio_immediate_rend_flag(struct bt_audio_codec_cfg *codec_cfg)

Set the broadcast audio immediate rendering flag of a codec configuration metadata.

Parameters
  • codec_cfg – The codec configuration to set data for.

Return values
  • The – data_len of codec_cfg on success
  • -EINVAL – if arguments are invalid
  • -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_meta_get_extended(const struct bt_audio_codec_cfg *codec_cfg, const uint8_t **extended_meta)

Extract extended metadata.
See BT_AUDIO_METADATA_TYPE_EXTENDED for more information about this value.

Parameters

• codec_cfg – [in] The codec data to search in.
• extended_meta – [out] Pointer to the extended metadata.

Return values
• The – length of the ccid_list (may be 0)
• -EINVAL – if arguments are invalid
• -ENODATA – if not found

int bt_audio_codec_cfg_meta_set_extended(struct bt_audio_codec_cfg *codec_cfg, const uint8_t *extended_meta, size_t extended_meta_len)

Set the extended metadata of a codec configuration metadata.

Parameters
• codec_cfg – The codec configuration to set data for.
• extended_meta – The extended metadata to set.
• extended_meta_len – The length of extended_meta.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_meta_get_vendor(const struct bt_audio_codec_cfg *codec_cfg, const uint8_t **vendor_meta)

Extract vendor specific metadata.
See BT_AUDIO_METADATA_TYPE_VENDOR for more information about this value.

Parameters
• codec_cfg – [in] The codec data to search in.
• vendor_meta – [out] Pointer to the vendor specific metadata.

Return values
• The – length of the ccid_list (may be 0)
• -EINVAL – if arguments are invalid
• -ENODATA – if not found

int bt_audio_codec_cfg_meta_set_vendor(struct bt_audio_codec_cfg *codec_cfg, const uint8_t *vendor_meta, size_t vendor_meta_len)

Set the vendor specific metadata of a codec configuration metadata.

Parameters
• codec_cfg – The codec configuration to set data for.
• vendor_meta – The vendor specific metadata to set.
• vendor_meta_len – The length of vendor_meta.

Return values
• The – data_len of codec_cfg on success
• -EINVAL – if arguments are invalid
• -ENOMEM – if the new value could not set or added due to memory

Basic Audio Profile

API Reference

Related code samples

Bluetooth: Broadcast Audio Assistant
Use LE Audio Broadcast Assistant functionality

```c
typedef bool (*bt_bap_scan_delegator_state_func_t)(const struct bt_bap_scan_delegator_recv_state *recv_state, void *user_data)
```

Callback function for Scan Delegator receive state search functions.

**Param** recv_state
The receive state.

**Param** user_data
User data.

**Retval**
- **true** to stop iterating. If this is used in the context of `bt_bap_scan_delegator_find_state()`, the recv_state will be returned by `bt_bap_scan_delegator_find_state()`.
- **false** to continue iterating.

```c
typedef void (*bt_bap_broadcast_assistant_write_cb)(struct bt_conn *conn, int err)
```

Callback function for writes.

**Param** conn
The connection to the peer device.

---

6.1. Bluetooth
Error value. 0 on success, GATT error on fail.

Enums

eNum bt_bap_pa_state

Periodic advertising state reported by the Scan Delegator.

Values:

enumerator BT_BAP_PA_STATE_NOT_SYNCED = 0x00
   The periodic advertising has not been synchronized.

enumerator BT_BAP_PA_STATE_INFO_REQ = 0x01
   Waiting for SyncInfo from Broadcast Assistant.

enumerator BT_BAP_PA_STATE_SYNCED = 0x02
   Synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_FAILED = 0x03
   Failed to synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_NO_PAST = 0x04
   No periodic advertising sync transfer receiver from Broadcast Assistant.

eNum bt_bap_big_enc_state

Broadcast Isochronous Group encryption state reported by the Scan Delegator.

Values:

enumerator BT_BAP_BIG_ENC_STATE_NO_ENC = 0x00
   The Broadcast Isochronous Group not encrypted.

enumerator BT_BAP_BIG_ENC_STATE_BCODE_REQ = 0x01
   The Broadcast Isochronous Group broadcast code requested.

enumerator BT_BAP_BIG_ENC_STATE_DEC = 0x02
   The Broadcast Isochronous Group decrypted.

enumerator BT_BAP_BIG_ENC_STATE_BAD_CODE = 0x03
   The Broadcast Isochronous Group bad broadcast code.

eNum bt_bap_bass_att_err

Broadcast Audio Scan Service (BASS) specific ATT error codes.

Values:

enumerator BT_BAP_BASS_ERR_OPCODE_NOT_SUPPORTED = 0x80
   Opcode not supported.
enumerator BT_BAP_BASS_ERR_INVALID_SRC_ID = 0x81
Invalid source ID supplied.

definitions

enum bt_bap_ep_state
Endpoint states.

Values:

enumerator BT_BAP_EP_STATE_IDLE = 0x00
Audio Stream Endpoint Idle state.

enumerator BT_BAP_EP_STATE_CODEC_CONFIGURED = 0x01
Audio Stream Endpoint Codec Configured state.

enumerator BT_BAP_EP_STATE_QOS_CONFIGURED = 0x02
Audio Stream Endpoint QoS Configured state.

enumerator BT_BAP_EP_STATE_ENABLING = 0x03
Audio Stream Endpoint Enabling state.

enumerator BT_BAP_EP_STATE_STREAMING = 0x04
Audio Stream Endpoint Streaming state.

enumerator BT_BAP_EP_STATE_DISABLING = 0x05
Audio Stream Endpoint Disabling state.

enumerator BT_BAP_EP_STATE_RELEASING = 0x06
Audio Stream Endpoint Streaming state.

enum bt_bap_ascs_rsp_code
Response Status Code.
These are sent by the server to the client when a stream operation is requested.

Values:

enumerator BT_BAP_ASCS_RSP_CODE_SUCCESS = 0x00
Server completed operation successfully.

enumerator BT_BAP_ASCS_RSP_CODE_NOT_SUPPORTED = 0x01
Server did not support operation by client.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_LENGTH = 0x02
Server rejected due to invalid operation length.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE = 0x03
Invalid ASE ID.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE_STATE = 0x04
Invalid ASE state.

6.1. Bluetooth
enumerator BT_BAP_ASCS_RSP_CODE_INVALID_DIR = 0x05
    Invalid operation for direction.

enumerator BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED = 0x06
    Capabilities not supported by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED = 0x07
    Configuration parameters not supported by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_REJECTED = 0x08
    Configuration parameters rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_INVALID = 0x09
    Invalid Configuration parameters.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED = 0x0a
    Unsupported metadata.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED = 0x0b
    Metadata rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_INVALID = 0x0c
    Invalid metadata.

enumerator BT_BAP_ASCS_RSP_CODE_NO_MEM = 0x0d
    Server has insufficient resources.

enumerator BT_BAP_ASCS_RSP_CODE_UNSPECIFIED = 0x0e
    Unspecified error.

eenum bt_bap_ascs_reason
    Response Reasons.
    These are used if the \texttt{bt_bap_ascs_rsp_code} value is
    \texttt{BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED}, \texttt{BT_BAP_ASCS_RSP_CODE_CONF_REJECTED}
    or \texttt{BT_BAP_ASCS_RSP_CODE_CONF_INVALID}.

    Values:

enumerator BT_BAP_ASCS_REASON_NONE = 0x00
    No reason.

enumerator BT_BAP_ASCS_REASON_CODEC = 0x01
    Codec ID.

enumerator BT_BAP_ASCS_REASON_CODEC_DATA = 0x02
    Codec configuration.

enumerator BT_BAP_ASCS_REASON_INTERVAL = 0x03
    SDU interval.
enumerator BT_BAP_ASCS_REASON_FRAMING = 0x04
    Framing.

enumerator BT_BAP_ASCS_REASON_PHY = 0x05
    PHY.

enumerator BT_BAP_ASCS_REASON_SDU = 0x06
    Maximum SDU size.

enumerator BT_BAP_ASCS_REASON_RTN = 0x07
    RTN.

enumerator BT_BAP_ASCS_REASON_LATENCY = 0x08
    Max transport latency.

enumerator BT_BAP_ASCS_REASON_PD = 0x09
    Presentation delay.

enumerator BT_BAP_ASCS_REASON_CIS = 0x0a
    Invalid CIS mapping.

Functions

int bt_bap_ep_get_info(const struct bt_bap_ep *ep, struct bt_bap_ep_info *info)
Return structure holding information of audio stream endpoint.

Parameters

• ep – The audio stream endpoint object.
• info – The structure object to be filled with the info.

Returns

0 in case of success or negative value in case of error.

void bt_bap_stream_cb_register(struct bt_bap_stream *stream, struct bt_bap_stream_ops *ops)
Register Audio callbacks for a stream.

Parameters

• stream – Stream object.
• ops – Stream operations structure.

int bt_bap_stream_config(struct bt_conn *conn, struct bt_bap_stream *stream, struct bt_bap_ep *ep, struct bt_audio_codec_cfg *codec_cfg)
Configure Audio Stream.

This procedure is used by a client to configure a new stream using the remote endpoint, local capability and codec configuration.

Parameters

• conn – Connection object
• stream – Stream object being configured
• ep – Remote Audio Endpoint being configured
• codec_cfg – Codec configuration

Returns
Allocated Audio Stream object or NULL in case of error.

```c
int bt_bap_stream_reconfig(struct bt_bap_stream *stream, struct bt_audio_codec_cfg *codec_cfg)
```
Reconfigure Audio Stream.

This procedure is used by a unicast client or unicast server to reconfigure a stream to use a different local codec configuration.

This can only be done for unicast streams.

Parameters
• stream – Stream object being reconfigured
• codec_cfg – Codec configuration

Returns
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_qos(struct bt_conn *conn, struct bt_bap_unicast_group *group)
```
Configure Audio Stream QoS.

This procedure is used by a client to configure the Quality of Service of streams in a unicast group. All streams in the group for the specified conn will have the Quality of Service configured. This shall only be used to configure unicast streams.

Parameters
• conn – Connection object
• group – Unicast group object

Returns
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_enable(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len)
```
Enable Audio Stream.

This procedure is used by a client to enable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters
• stream – Stream object
• meta – Metadata
• meta_len – Metadata length

Returns
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_metadata(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len)
```
Change Audio Stream Metadata.

This procedure is used by a unicast client or unicast server to change the metadata of a stream.

Parameters
• stream – Stream object
• meta – Metadata
• meta_len – Metadata length

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_disable(struct bt_bap_stream *stream)
Disable Audio Stream.
This procedure is used by a unicast client or unicast server to disable a stream.
This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_start(struct bt_bap_stream *stream)
Start Audio Stream.
This procedure is used by a unicast client or unicast server to make a stream start streaming.
For the unicast client, this will connect the CIS for the stream before sending the start command.
For the unicast server, this will put a BT_AUDIO_DIR_SINK stream into the streaming state if the CIS is connected (initialized by the unicast client). If the CIS is not connected yet, the stream will go into the streaming state as soon as the CIS is connected. BT_AUDIO_DIR_SOURCE streams will go into the streaming state when the unicast client sends the Receiver Start Ready operation, which will trigger the bt_bap_unicast_server_cb::start() callback.
This shall only be called for unicast streams.
Broadcast sinks will always be started once synchronized, and broadcast source streams shall be started with bt_bap_broadcast_source_start().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_stop(struct bt_bap_stream *stream)
Stop Audio Stream.
This procedure is used by a client to make a stream stop streaming.
This shall only be called for unicast streams. Broadcast sinks cannot be stopped. Broadcast sources shall be stopped with bt_bap_broadcast_source_stop().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.
int bt_bap_stream_release(struct bt_bap_stream *stream)
Release Audio Stream.

This procedure is used by a unicast client or unicast server to release a unicast stream.

Broadcast sink streams cannot be released, but can be deleted by
bt_bap_broadcast_sink_delete(). Broadcast source streams cannot be released,
but can be deleted by bt_bap_broadcast_source_delete().

Parameters

• stream – Stream object

Returns

0 in case of success or negative value in case of error.

int bt_bap_stream_send(struct bt_bap_stream *stream, struct net_buf *buf, uint16_t seq_num)
Send data to Audio stream without timestamp.
Send data from buffer to the stream.

Note: Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

Parameters

• stream – Stream object.

• buf – Buffer containing data to be sent.

• seq_num – Packet Sequence number. This value shall be incremented for
each call to this function and at least once per SDU interval for a specific
channel.

Returns

Bytes sent in case of success or negative value in case of error.

int bt_bap_stream_send_ts(struct bt_bap_stream *stream, struct net_buf *buf, uint16_t seq_num, uint32_t ts)
Send data to Audio stream with timestamp.
Send data from buffer to the stream.

Note: Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

Parameters

• stream – Stream object.

• buf – Buffer containing data to be sent.

• seq_num – Packet Sequence number. This value shall be incremented for
each call to this function and at least once per SDU interval for a specific
channel.

• ts – Timestamp of the SDU in microseconds (us). This value can be used
to transmit multiple SDUs in the same SDU interval in a CIG or BIG.

Returns

Bytes sent in case of success or negative value in case of error.
int bt_bap_stream_get_tx_sync(struct bt_bap_stream *stream, struct bt_iso_tx_info *info)

Get ISO transmission timing info for a Basic Audio Profile stream.

Reads timing information for transmitted ISO packet on an ISO channel. The 
HCI_LE_Read_ISO_TX_Sync HCI command is used to retrieve this information from the 
controller.

**Note:** An SDU must have already been successfully transmitted on the ISO channel 
for this function to return successfully. Support for sending must be supported, deter-
nined by CONFIG_BT_AUDIO_TX.

**Parameters**
- info – [out] Transmit info object.

**Return values**
- 0 – on success
- -EINVAL – if the stream is invalid, if the stream is not configured for send-
ing or if it is not connected with a isochronous stream
- Any – return value from bt_iso_chan_get_tx_sync()

void bt_bap_scan_delegator_register_cb(struct bt_bap_scan_delegator_cb *cb)

Register the callbacks for the Basic Audio Profile Scan Delegator.

**Parameters**
- cb – Pointer to the callback struct

int bt_bap_scan_delegator_set_pa_state(uint8_t src_id, enum bt_bap_pa_state pa_state)

Set the periodic advertising sync state to syncing.

Set the periodic advertising sync state for a receive state to syncing, notifying Broadcast 
Assistants.

**Parameters**
- src_id – The source id used to identify the receive state.
- pa_state – The Periodic Advertising sync state to set. 
  BT_BAP_PA_STATE_NOT_SYNCED and BT_BAP_PA_STATE_SYNCED is 
  not necessary to provide, as they are handled internally.

**Returns**
- int Error value. 0 on success, errno on fail.

int bt_bap_scan_delegator_set_bis_sync_state(uint8_t src_id, uint32_t
  bis_synced[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS])

Set the sync state of a receive state in the server.

**Parameters**
- src_id – The source id used to identify the receive state.
- bis_synced – Array of bitfields to set the BIS sync state for each subgroup.

**Returns**
- int Error value. 0 on success, ERRNO on fail.
int bt_bap_scan_delegator_add_src(const struct bt_bap_scan_delegator_add_src_param *param)

Add a receive state source locally.
This will notify any connected clients about the new source. This allows them to modify and even remove it.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are automatically added.

Parameters
  • param – The parameters for adding the new source

Returns
  int errno on failure, or source ID on success.

int bt_bap_scan_delegator_mod_src(const struct bt_bap_scan_delegator_mod_src_param *param)

Add a receive state source locally.
This will notify any connected clients about the new source. This allows them to modify and even remove it.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are automatically modified.

Parameters
  • param – The parameters for adding the new source

Returns
  int errno on failure, or source ID on success.

int bt_bap_scan_delegator_rem_src(uint8_t src_id)
Remove a receive state source.
This will remove the receive state. If the receive state periodic advertising is synced, bt_bap_scan_delegator_cb.pa_sync_term_req() will be called.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are automatically removed.

Parameters
  • src_id – The source ID to remove

Returns
  int Error value. 0 on success, errno on fail.

void bt_bap_scan_delegator_foreach_state(bt_bap_scan_delegator_state_func_t func,
void *user_data)
Iterate through all existing receive states.

Parameters
  • func – The callback function
  • user_data – User specified data that sent to the callback function

const struct bt_bap_scan_delegator_recv_state *bt_bap_scan_delegator_find_state(bt_bap_scan_delegator_state_func_t func,
void *user_data)
Find and return a receive state based on a compare function.

Parameters
  • func – The compare callback function
• **user_data** – User specified data that sent to the callback function

**Returns**
The first receive state where the `func` returned true, or NULL.

```c
int bt_bap_broadcast_assistant_discover(struct bt_conn *conn)
```
Discover Broadcast Audio Scan Service on the server.

Warning: Only one connection can be active at any time; discovering for a new connection, will delete all previous data.

**Parameters**

• `conn` – The connection

**Returns**
int Error value. 0 on success, GATT error or ERRNO on fail.

```c
int bt_bap_broadcast_assistant_scan_start(struct bt_conn *conn, bool start_scan)
```
Scan start for BISes for a remote server.

This will let the Broadcast Audio Scan Service server know that this device is actively scanning for broadcast sources. The function can optionally also start scanning, if the caller does not want to start scanning itself.

Scan results, if `start_scan` is true, is sent to the `bt_bap_broadcast_assistant_scan_cb` callback.

**Parameters**

• `conn` – Connection to the Broadcast Audio Scan Service server. Used to let the server know that we are scanning.

• `start_scan` – Start scanning if true. If false, the application should enable scan itself.

**Returns**
int Error value. 0 on success, GATT error or ERRNO on fail.

```c
int bt_bap_broadcast_assistant_scan_stop(struct bt_conn *conn)
```
Stop remote scanning for BISes for a server.

**Parameters**

• `conn` – Connection to the server.

**Returns**
int Error value. 0 on success, GATT error or ERRNO on fail.

```c
void bt_bap_broadcast_assistant_register_cb(struct bt_bap_broadcast_assistant_cb *cb)
```
Registers the callbacks used by Broadcast Audio Scan Service client.

```c
int bt_bap_broadcast_assistant_add_src(struct bt_conn *conn, const struct bt_bap_broadcast_assistant_add_src_param *param)
```
Add a source on the server.

**Parameters**

• `conn` – Connection to the server.

• `param` – Parameter struct.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.
int bt_bap_broadcast_assistant_mod_src(struct bt_conn *conn, const struct bt_bap_broadcast_assistant_mod_src_param *param)

Modify a source on the server.

**Parameters**
- **conn** – Connection to the server.
- **param** – Parameter struct.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_set_broadcast_code(struct bt_conn *conn, uint8_t src_id, const uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE])

Set a broadcast code to the specified receive state.

**Parameters**
- **conn** – Connection to the server.
- **src_id** – Source ID of the receive state.
- **broadcast_code** – The broadcast code.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_rem_src(struct bt_conn *conn, uint8_t src_id)

Remove a source from the server.

**Parameters**
- **conn** – Connection to the server.
- **src_id** – Source ID of the receive state.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_read_recv_state(struct bt_conn *conn, uint8_t idx)

Read the specified receive state from the server.

**Parameters**
- **conn** – Connection to the server.
- **idx** – The index of the receive start (0 up to the value from bt_bap_broadcast_assistant_discover_cb)

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

struct bt_bap_ascs_rsp

#include <bap.h> Structure storing values of fields of ASE Control Point notification.

**Public Members**

enum bt_bap_ascs_rsp_code code

Value of the Response Code field.

The following response codes are accepted:
- **BT_BAP_ASCS_RSP_CODE_SUCCESS**
enum bt_bap_ascs_reason reason
Response reason.
If the Response Code is one of the following:
- `BT_BAP_ASCII_RSP_CODE_CAP_UNSUPPORTED`
- `BT_BAP_ASCII_RSP_CODE_CONF_UNSUPPORTED`
  all values from `bt_bap_ascs_reason` can be used.
If the Response Code is one of the following:
- `BT_BAP_ASCII_RSP_CODE_SUCCESS`
- `BT_BAP_ASCII_RSP_CODE_CAP_UNSUPPORTED`
- `BT_BAP_ASCII_RSP_CODE_NO_MEM`
- `BT_BAP_ASCII_RSP_CODE_UNSPECIFIED`
  only value `BT_BAP_ASCII_REASON_NONE` shall be used.

enum bt_audio_metadata_type metadata_type
Response metadata type.
If the Response Code is one of the following:
- `BT_BAP_ASCII_RSP_CODE_METADATA_UNSUPPORTED`
- `BT_BAP_ASCII_RSP_CODE_METADATA_REJECTED`
  the value of the Metadata Type shall be used.

union bt_bap_ascs_rsp
Value of the Reason field.
The meaning of this value depend on the Response Code field.

struct bt_bap_bass_subgroup
#include <bap.h> Struct to hold subgroup specific information for the receive state.

Public Members

uint32_t bis_sync
  BIS synced bitfield.

uint8_t metadata_len
  Length of the metadata.

struct bt_bap_scan_delegator_recv_state
#include <bap.h> Represents the Broadcast Audio Scan Service receive state.

Public Members
uint8_t src_id
The source ID

bt_addr_le_t addr
The Bluetooth address.

uint8_t adv_sid
The advertising set ID.

enum bt_bap_pa_state pa_sync_state
The periodic advertising sync state.

enum bt_bap_big_enc_state encrypt_state
The broadcast isochronous group encryption state.

uint32_t broadcast_id
The 24-bit broadcast ID.

uint8_t bad_code[BT_AUDIO_BROADCAST_CODE_SIZE]
The bad broadcast code.
Only valid if encrypt_state is BT_BAP_BIG_ENC_STATE_BCODE_REQ

uint8_t num_subgroups
Number of subgroups.

struct bt_bap_bass_subgroup subgroups[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]
Subgroup specific information.

struct bt_bap_scan_delegator_cb
#include <bap.h>

Public Members

void (*recv_state_updated)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state)
Receive state updated.
Param conn
Pointer to the connection to a remote device if the change was caused by it, otherwise NULL.
Param recv_state
Pointer to the receive state that was updated.
Return
0 in case of success or negative value in case of error.

int (*pa_sync_req)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state, bool past_avail, uint16_t pa_interval)
Periodic advertising sync request.
Request from peer device to synchronize with the periodic advertiser denoted by the recv_state. To notify the Broadcast Assistant about any pending sync
**Param conn**
[in] Pointer to the connection requesting the periodic advertising sync.

**Param recv_state**
[in] Pointer to the receive state that is being requested for periodic advertising sync.

**Param past_avail**
[in] True if periodic advertising sync transfer is available.

**Param pa_interval**
[in] The periodic advertising interval.

**Param past_sync**
[out] Set to true if syncing via periodic advertising sync transfer, false otherwise. If past_avail is false, this value is ignored.

**Return**
0 in case of accept, or other value to reject.

```c
int (*pa_sync_term_req)(struct bt_conn *conn, const struct
bt_bap_scan_delegator_recv_state *recv_state)
```

Periodic advertising sync termination request.

Request from peer device to terminate the periodic advertiser sync denoted by the recv_state.

**Param conn**
Pointer to the connection requesting the periodic advertising sync termination.

**Param recv_state**
Pointer to the receive state that is being requested for periodic advertising sync.

**Return**
0 in case of success or negative value in case of error.

```c
void (*broadcast_code)(struct bt_conn *conn, const struct
bt_bap_scan_delegator_recv_state *recv_state, const uint8_t
broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE])
```

Broadcast code received.

Broadcast code received from a broadcast assistant

**Param conn**
Pointer to the connection providing the broadcast code.

**Param recv_state**
Pointer to the receive state the broadcast code is being provided for.

**Param broadcast_code**
The 16-octet broadcast code

```c
int (*bis_sync_req)(struct bt_conn *conn, const struct
bt_bap_scan_delegator_recv_state *recv_state, const uint32_t
bis_sync_req[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS])
```

Broadcast Isochronous Stream synchronize request.

Request from Broadcast Assistant device to modify the Broadcast Isochronous Stream states. The request shall be fulfilled with accordance to the bis_sync_req within reasonable time. The Broadcast Assistant may also request fewer, or none, indexes to be synchronized.

**Param conn**
[in] Pointer to the connection of the Broadcast Assistant requesting the sync.

**Param recv_state**
[in] Pointer to the receive state that is being requested for the sync.

**Param bis_sync_req**
Array of bitfields of which BIS indexes that is requested to sync for each subgroup by the Broadcast Assistant. A value of 0 indicates a request to terminate the BIG sync.

**Return**
0 in case of accept, or other value to reject.

```c
struct bt_bap_ep_info
#include <bap.h> Structure holding information of audio stream endpoint.

Public Members

uint8_t id
   The ID of the endpoint.

enum bt_bap_ep_state state
   The state of the endpoint.

enum bt_audio_dir dir
   Capabilities type.

bool can_send
   True if the stream associated with the endpoint is able to send data.

struct bt_bap_ep *paired_ep
   Pointer to paired endpoint if the endpoint is part of a bidirectional CIS, otherwise NULL.

struct bt_bap_stream
#include <bap.h> Basic Audio Profile stream structure.
Streams represents a stream configuration of a Remote Endpoint and a Local Capability.

**Note:** Streams are unidirectional but can be paired with other streams to use a bidirectional connected isochronous stream.

Public Members

struct bt_conn *conn
   Connection reference.

struct bt_bap_ep *ep
   Endpoint reference.

struct bt_audio_codec_cfg *codec_cfg
   Codec Configuration.
struct bt_audio_codec_qos *qos
  QoS Configuration.

struct bt_bap_stream_ops *ops
  Audio stream operations.

void *group
  Unicast or Broadcast group - Used internally.

void *user_data
  Stream user data.

struct bt_bap_stream_ops
  #include <bap.h> Stream operation.

Public Members

void (*started)(struct bt_bap_stream *stream)
  Stream started callback.
  Started callback is called whenever an Audio Stream has been started and will be usable for streaming.
    Param stream
      Stream object that has been started.

void (*stopped)(struct bt_bap_stream *stream, uint8_t reason)
  Stream stopped callback.
  Stopped callback is called whenever an Audio Stream has been stopped.
    Param stream
      Stream object that has been stopped.
    Param reason
      BT_HCI_ERR_ value for the disconnection.

void (*connected)(struct bt_bap_stream *stream)
  Isochronous channel connected callback.
  If this callback is provided it will be called whenever the isochronous channel for the stream has been connected. This does not mean that the stream is ready to be used, which is indicated by the bt_bap_stream_ops::started callback.
  If the stream shares an isochronous channel with another stream, then this callback may still be called, without the stream going into the started state.
    Param stream
      Stream object.

void (*disconnected)(struct bt_bap_stream *stream, uint8_t reason)
  Isochronous channel disconnected callback.
  If this callback is provided it will be called whenever the isochronous channel is disconnected, including when a connection gets rejected.
  If the stream shares an isochronous channel with another stream, then this callback may not be called, even if the stream is leaving the streaming state.
**Param stream**
Stream object.

**Param reason**
BT_HCI_ERR_\* reason for the disconnection.

```c
struct bt_bap_scan_delegator_add_src_param
#include <bap.h>
```

**Public Members**

```c
struct bt_le_per_adv_sync *pa_sync
The periodic advertising sync.
```

```c
enum bt_bap_big_enc_state encrypt_state
The broadcast isochronous group encryption state.
```

```c
uint32_t broadcast_id
The 24-bit broadcast ID.
```

```c
uint8_t num_subgroups
Number of subgroups.
```

```c
struct bt_bap_bass_subgroup subgroups[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]
Subgroup specific information.
```

```c
struct bt_bap_scan_delegator_mod_src_param
#include <bap.h>
```

**Public Members**

```c
uint8_t src_id
The periodic advertising sync.
```

```c
enum bt_bap_big_enc_state encrypt_state
The broadcast isochronous group encryption state.
```

```c
uint32_t broadcast_id
The 24-bit broadcast ID.
```

```c
uint8_t num_subgroups
Number of subgroups.
```

```c
struct bt_bap_bass_subgroup subgroups[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]
Subgroup specific information.
```

If a subgroup's metadata_len is set to 0, the existing metadata for the subgroup will remain unchanged.
Public Members

void (*discover)(struct bt_conn *conn, int err, uint8_t recv_state_count)
Callback function for bt_bap_broadcast_assistant_discover.
  
  **Param conn**
  The connection that was used to discover Broadcast Audio Scan Service.
  
  **Param err**
  Error value. 0 on success, GATT error or ERRNO on fail.
  
  **Param recv_state_count**
  Number of receive states on the server.

void (*scan)(const struct bt_le_scan_recv_info *info, uint32_t broadcast_id)
Callback function for Broadcast Audio Scan Service client scan results.
Called when the scanner finds an advertiser that advertises the
BT_UUID_BROADCAST_AUDIO UUID.
  
  **Param info**
  Advertiser information.
  
  **Param broadcast_id**
  24-bit broadcast ID.

void (*recv_state)(struct bt_conn *conn, int err, const struct bt_bap_scan_delegator_recv_state *state)
Callback function for when a receive state is read or updated.
Called whenever a receive state is read or updated.
  
  **Param conn**
  The connection to the Broadcast Audio Scan Service server.
  
  **Param err**
  Error value. 0 on success, GATT error on fail.
  
  **Param state**
  The receive state or NULL if the receive state is empty.

void (*recv_state_removed)(struct bt_conn *conn, int err, uint8_t src_id)
Callback function for when a receive state is removed.
  
  **Param conn**
  The connection to the Broadcast Audio Scan Service server.
  
  **Param err**
  Error value. 0 on success, GATT error on fail.
  
  **Param src_id**
  The receive state.

void (*scan_start)(struct bt_conn *conn, int err)
Callback function for bt_bap_broadcast_assistant_scan_start().
  
  **Param conn**
  The connection to the peer device.
  
  **Param err**
  Error value. 0 on success, GATT error on fail.

void (*scan_stop)(struct bt_conn *conn, int err)
Callback function for bt_bap_broadcast_assistant_scan_stop().
  
  **Param conn**
  The connection to the peer device.
  
  **Param err**
  Error value. 0 on success, GATT error on fail.
void (*add_src)(struct bt_conn *conn, int err)

Callback function for bt_bap_broadcast_assistant_add_src().

**Param conn**
The connection to the peer device.

**Param err**
Error value. 0 on success, GATT error on fail.

void (*mod_src)(struct bt_conn *conn, int err)

Callback function for bt_bap_broadcast_assistant_mod_src().

**Param conn**
The connection to the peer device.

**Param err**
Error value. 0 on success, GATT error on fail.

void (*broadcast_code)(struct bt_conn *conn, int err)

Callback function for bt_bap_broadcast_assistant_broadcast_code().

**Param conn**
The connection to the peer device.

**Param err**
Error value. 0 on success, GATT error on fail.

void (*rem_src)(struct bt_conn *conn, int err)

Callback function for bt_bap_broadcast_assistant_rem_src().

**Param conn**
The connection to the peer device.

**Param err**
Error value. 0 on success, GATT error on fail.

struct bt_bap_broadcast_assistant_add_src_param

#include <bap.h> Parameters for adding a source to a Broadcast Audio Scan Service server.

**Public Members**

bt_addr_le_t addr

Address of the advertiser.

uint8_t adv_sid

SID of the advertising set.

bool pa_sync

Whether to sync to periodic advertisements.

uint32_t broadcast_id

24-bit broadcast ID

uint16_t pa_interval

Periodic advertising interval in milliseconds.

BT_BAP_PA_INTERVAL_UNKNOWN if unknown.
uint8_t num_subgroups
   Number of subgroups.

struct bt_bap_bass_subgroup *subgroups
   Pointer to array of subgroups.

struct bt_bap_broadcast_assistant_mod_src_param
   #include <bap.h> Parameters for modifying a source.

Public Members

uint8_t src_id
   Source ID of the receive state.

bool pa_sync
   Whether to sync to periodic advertisements.

uint16_t pa_interval
   Periodic advertising interval.
   BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint8_t num_subgroups
   Number of subgroups.

struct bt_bap_bass_subgroup *subgroups
   Pointer to array of subgroups.

group bt_bap_unicast_client

Functions

int bt_bap_unicast_group_create(struct bt_bap_unicast_group_param *param, struct bt_bap_unicast_group **unicast_group)
   Create audio unicast group.
   Create a new audio unicast group with one or more audio streams as a unicast client.
   Streams in a unicast group shall share the same interval, framing and latency (see bt_audio_codec_qos).

   Parameters
   • param - [in] The unicast group create parameters.
   • unicast_group - [out] Pointer to the unicast group created.

   Returns
   Zero on success or (negative) error code otherwise.

int bt_bap_unicast_group_add_streams(struct bt_bap_unicast_group *unicast_group,
   struct bt_bap_unicast_group_stream_pair_param params[], size_t num_param)
Add streams to a unicast group as a unicast client.

This function can be used to add additional streams to a bt_bap_unicast_group. This can be called at any time before any of the streams in the group has been started (see `bt_bap_stream_ops.started()`). This can also be called after the streams have been stopped (see `bt_bap_stream_ops.stopped()`).

Once a stream has been added to a unicast group, it cannot be removed. To remove a stream from a group, the group must be deleted with `bt_bap_unicast_group_delete()`, but this will require all streams in the group to be released first.

**Parameters**

- `unicast_group` – Pointer to the unicast group
- `params` – Array of stream parameters with streams being added to the group.
- `num_param` – Number of parameters in `params`.

**Returns**

0 in case of success or negative value in case of error.

```c
int bt_bap_unicast_group_delete(struct bt_bap_unicast_group *unicast_group)
```

Delete audio unicast group.

Delete a audio unicast group as a client. All streams in the group shall be in the idle or configured state.

**Parameters**

- `unicast_group` – Pointer to the unicast group to delete

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_bap_unicast_client_register_cb(const struct bt_bap_unicast_client_cb *cb)
```

Register unicast client callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

**Parameters**

- `cb` – Unicast client callback structure.

**Returns**

0 in case of success or negative value in case of error.

```c
int bt_bap_unicast_client_discover(struct bt_conn *conn, enum bt_audio_dir dir)
```

Discover remote capabilities and endpoints.

This procedure is used by a client to discover remote capabilities and endpoints and notifies via params callback.

**Parameters**

- `conn` – Connection object
- `dir` – The type of remote endpoints and capabilities to discover.

```c
struct bt_bap_unicast_group_stream_param
```

#include `<bap.h>` Parameter struct for each stream in the unicast group.
Public Members

struct bt_bap_stream *stream
   Pointer to a stream object.

struct bt_audio_codec_qos *qos
   The QoS settings for the stream object.

struct bt_bap_unicast_group_stream_pair_param
   #include <bap.h> Parameter struct for the unicast group functions.
   Parameter struct for the bt_bap_unicast_group_create() and
   bt_bap_unicast_group_add_streams() functions.

Public Members

struct bt_bap_unicast_group_stream_param *rx_param
   Pointer to a receiving stream parameters.

struct bt_bap_unicast_group_stream_param *tx_param
   Pointer to a transmitting stream parameters.

struct bt_bap_unicast_group_param
   #include <bap.h>

Public Members

size_t params_count
   The number of parameters in params.

struct bt_bap_unicast_group_stream_pair_param *params
   Array of stream parameters.

uint8_t packing
   Unicast Group packing mode.
   BT_ISO PACKING SEQUENTIAL or BT_ISO PACKING INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.

struct bt_bap_unicast_client_cb
   #include <bap.h> Unicast Client callback structure.

Public Members

6.1. Bluetooth
void (*location)(struct bt_conn *conn, enum bt_audio_dir dir, enum bt_audio_location loc)

Remote Unicast Server Audio Locations.

This callback is called whenever the audio locations is read from the server or otherwise notified to the client.

  **Param conn**
  
  Connection to the remote unicast server.

  **Param dir**
  
  Direction of the location.

  **Param loc**
  
  The location bitfield value.

  **Return**
  
  0 in case of success or negative value in case of error.

void (*available_contexts)(struct bt_conn *conn, enum bt_audio_context snk_ctx, enum bt_audio_context src_ctx)

Remote Unicast Server Available Contexts.

This callback is called whenever the available contexts are read from the server or otherwise notified to the client.

  **Param conn**
  
  Connection to the remote unicast server.

  **Param snk_ctx**
  
  The sink context bitfield value.

  **Param src_ctx**
  
  The source context bitfield value.

  **Return**
  
  0 in case of success or negative value in case of error.

void (*config)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_config() and bt_bap_stream_reconfig().

Called when the codec configure operation is completed on the server.

  **Param stream**
  
  Stream the operation was performed on.

  **Param rsp_code**
  
  Response code.

  **Param reason**
  
  Reason code.

void (*qos)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_qos().

Called when the QoS configure operation is completed on the server. This will be called for each stream in the group that was being QoS configured.

  **Param stream**
  
  Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

  **Param rsp_code**
  
  Response code.

  **Param reason**
  
  Reason code.

void (*enable)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)
Callback function for `bt_bap_stream_enable()`. Called when the enable operation is completed on the server.

- **Param stream**
  Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

- **Param rsp_code**
  Response code.

- **Param reason**
  Reason code.

```c
void (*start)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)
```

Callback function for `bt_bap_stream_start()`. Called when the start operation is completed on the server. This will only be called if the stream supplied to `bt_bap_stream_start()` is for a `BT_AUDIO_DIR_SOURCE` endpoint.

- **Param stream**
  Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

- **Param rsp_code**
  Response code.

- **Param reason**
  Reason code.

```c
void (*stop)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)
```

Callback function for `bt_bap_stream_stop()`. Called when the stop operation is completed on the server. This will only be called if the stream supplied to `bt_bap_stream_stop()` is for a `BT_AUDIO_DIR_SOURCE` endpoint.

- **Param stream**
  Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

- **Param rsp_code**
  Response code.

- **Param reason**
  Reason code.

```c
void (*disable)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)
```

Callback function for `bt_bap_stream_disable()`. Called when the disable operation is completed on the server.

- **Param stream**
  Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

- **Param rsp_code**
  Response code.

- **Param reason**
  Reason code.

```c
void (*metadata)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)
```

Callback function for `bt_bap_stream_metadata()`.
Called when the metadata operation is completed on the server.

**Param stream**
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

**Param rsp_code**
Response code.

**Param reason**
Reason code.

```c
void (*release)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code,
               enum bt_bap_ascs_reason reason)
```

Callback function for `bt_bap_stream_release()`.

Called when the release operation is completed on the server.

**Param stream**
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

**Param rsp_code**
Response code.

**Param reason**
Reason code.

```c
void (*pac_record)(struct bt_conn *conn, enum bt_audio_dir dir, const struct bt_audio_codec_cap *codec_cap)
```

Remote Published Audio Capability (PAC) record discovered.

Called when a PAC record has been discovered as part of the discovery procedure.

The codec is only valid while in the callback, so the values must be stored by the receiver if future use is wanted.

If discovery procedure has complete both codec and `ep` are set to NULL.

**Param conn**
Connection to the remote unicast server.

**Param dir**
The type of remote endpoints and capabilities discovered.

**Param codec_cap**
Remote capabilities.

```c
void (*endpoint)(struct bt_conn *conn, enum bt_audio_dir dir, struct bt_bap_ep *ep)
```

Remote Audio Stream Endoint (ASE) discovered.

Called when an ASE has been discovered as part of the discovery procedure.

If discovery procedure has complete both codec and `ep` are set to NULL.

**Param conn**
Connection to the remote unicast server.

**Param dir**
The type of remote endpoints and capabilities discovered.

**Param ep**
Remote endpoint.

```c
void (*discover)(struct bt_conn *conn, int err, enum bt_audio_dir dir)
```

BAP discovery callback function.

If discovery procedure has completed `ep` is set to NULL and `err` is 0.
If discovery procedure has complete both codec and ep are set to NULL.

**Param conn**
- Connection to the remote unicast server.

**Param err**
- Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param dir**
- The type of remote endpoints and capabilities discovered.

---

### Group bt_bap_unicast_server

#### Typedefs

typedef void (*bt_bap_ep_func_t)(struct bt_bap_ep *ep, void *user_data)

The callback function called for each endpoint.

**Param ep**
- The structure object with endpoint info.

**Param user_data**
- Data to pass to the function.

#### Functions

**int bt_bap_unicast_server_register_cb(const struct bt_bap_unicast_server_cb *cb)**

Register unicast server callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

**Parameters**
- cb – Unicast server callback structure.

**Returns**
- 0 in case of success or negative value in case of error.

**int bt_bap_unicast_server_unregister_cb(const struct bt_bap_unicast_server_cb *cb)**

Unregister unicast server callbacks.

May only unregister a callback structure that has previously been registered by `bt_bap_unicast_server_register_cb()`.

**Parameters**
- cb – Unicast server callback structure.

**Returns**
- 0 in case of success or negative value in case of error.

**void bt_bap_unicast_server_foreach_ep(struct bt_conn *conn, bt_bap_ep_func_t func, void *user_data)**

Iterate through all endpoints of the given connection.

**Parameters**
- conn – Connection object
- func – Function to call for each endpoint.
• **user_data** – Data to pass to the callback function.

```c
int bt_bap_unicast_server_config_ase(struct bt_conn *conn, struct bt_bap_stream *stream, struct bt_audio_codec_cfg *codec_cfg, const struct bt_audio_codec_qos_pref *qos_pref)
```

Initialize and configure a new ASE.

**Parameters**
- **conn** – Connection object
- **stream** – Configured stream object to be attached to the ASE
- **codec_cfg** – Codec configuration
- **qos_pref** – Audio Stream Quality of Service Preference

**Returns**
- 0 in case of success or negative value in case of error.

```c
struct bt_bap_unicast_server_cb
#include <bap.h>
```

Unicast Server callback structure.

**Public Members**

```c
int (*config)(struct bt_conn *conn, const struct bt_bap_ep *ep, enum bt_audio_dir dir, const struct bt_audio_codec_cfg *codec_cfg, struct bt_bap_stream **stream, struct bt_audio_codec_qos_pref *const pref, struct bt_bap_ascs_rsp *rsp)
```

Endpoint config request callback.

Config callback is called whenever an endpoint is requested to be configured

- **conn** – Connection object.
- **ep** – Local Audio Endpoint being configured.
- **dir** – Direction of the endpoint.
- **codec_cfg** – Codec configuration.
- **stream** – Pointer to stream that will be configured for the endpoint.
- **pref** – Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.
- **rsp** – Object for the ASE operation response. Only used if the return value is non-zero.

**Return**
- 0 in case of success or negative value in case of error.

```c
int (*reconfig)(struct bt_bap_stream *stream, enum bt_audio_dir dir, const struct bt_audio_codec_cfg *codec_cfg, struct bt_audio_codec_qos_pref *const pref, struct bt_bap_ascs_rsp *rsp)
```

Stream reconfig request callback.

Reconfig callback is called whenever an Audio Stream needs to be reconfigured with different codec configuration.

- **stream** – Stream object being reconfigured.
Param dir
[in] Direction of the endpoint.

Param codec_cfg
[in] Codec configuration.

Param pref
[out] Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*qos)(struct bt_bap_stream *stream, const struct bt_audio_codec_qos *qos, struct bt_bap_ascs_rsp *rsp)

Stream QoS request callback.

QoS callback is called whenever an Audio Stream Quality of Service needs to be configured.

Param stream
[in] Stream object being reconfigured.

Param qos
[in] Quality of Service configuration.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*enable)(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len, struct bt_bap_ascs_rsp *rsp)

Stream Enable request callback.

Enable callback is called whenever an Audio Stream is requested to be enabled to stream.

Param stream
[in] Stream object being enabled.

Param meta

Param meta_len
[in] Length of metadata.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*start)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)

Stream Start request callback.

Start callback is called whenever an Audio Stream is requested to start streaming.

Param stream
[in] Stream object.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.
int (*metadata)(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len, struct bt_bap_ascs_rsp *rsp)

Stream Metadata update request callback.
Metadata callback is called whenever an Audio Stream is requested to update its metadata.

Param stream
[in] Stream object.

Param meta

Param meta_len
[in] Length of metadata.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*disable)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)

Stream Disable request callback.
Disable callback is called whenever an Audio Stream is requested to disable the stream.

Param stream
[in] Stream object being disabled.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*stop)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)

Stream Stop callback.
Stop callback is called whenever an Audio Stream is requested to stop streaming.

Param stream
[in] Stream object.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*release)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)

Stream release callback.
Release callback is called whenever a new Audio Stream needs to be released and thus deallocated.

Param stream
[in] Stream object.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.
BAP Broadcast APIs.

Functions

```c
const struct bt_bap_base *bt_bap_base_get_base_from_ad(const struct bt_data *ad)
```
Generate a pointer to a BASE from periodic advertising data.

**Parameters**
- *ad* – The periodic advertising data

**Return values**
- NULL – if the data does not contain a BASE
- Pointer – to a bt_bap_base structure

```c
int bt_bap_base_get_pres_delay(const struct bt_bap_base *base)
```
Get the presentation delay value of a BASE.

**Parameters**
- *base* – The BASE pointer

**Return values**
- EINVAL – if arguments are invalid
- The – 24-bit presentation delay value

```c
int bt_bap_base_get_subgroup_count(const struct bt_bap_base *base)
```
Get the subgroup count of a BASE.

**Parameters**
- *base* – The BASE pointer

**Return values**
- EINVAL – if arguments are invalid
- The – 8-bit subgroup count value

```c
int bt_bap_base_get_bis_indexes(const struct bt_bap_base *base, uint32_t *bis_indexes)
```
Get all BIS indexes of a BASE.

**Parameters**
- *base* – [in] The BASE pointer
- *bis_indexes* – [out] 32-bit BIS index bitfield that will be populated

**Return values**
- EINVAL – if arguments are invalid
- 0 – on success

```c
int bt_bap_base_foreach_subgroup(const struct bt_bap_base *base, bool (*func)(const struct bt_bap_base_subgroup *subgroup, void *user_data), void *user_data)
```
Iterate on all subgroups in the BASE.

**Parameters**
- *base* – The BASE pointer
- *func* – Callback function. Return true to continue iterating, or false to stop.
• **user_data** – Userdata supplied to `func`

**Return values**

• `-EINVAL` – if arguments are invalid
• `-ECANCELED` – if iterating over the subgroups stopped prematurely by `func`
• `0` – if all subgroups were iterated

```c
int bt_bap_base_get_subgroup_codec_id(const struct bt_bap_base_subgroup *subgroup,
                                       struct bt_bap_base_codec_id *codec_id)
```

Get the codec ID of a subgroup.

**Parameters**

• `subgroup` – [in] The subgroup pointer
• `codec_id` – [out] Pointer to the struct where the results are placed

**Return values**

• `-EINVAL` – if arguments are invalid
• `0` – on success

```c
int bt_bap_base_get_subgroup_codec_data(const struct bt_bap_base_subgroup *subgroup,
                                         uint8_t **data)
```

Get the codec configuration data of a subgroup.

**Parameters**

• `subgroup` – [in] The subgroup pointer
• `data` – [out] Pointer that will point to the resulting codec configuration data

**Return values**

• `-EINVAL` – if arguments are invalid
• `0` – on success

```c
int bt_bap_base_get_subgroup_codec_meta(const struct bt_bap_base_subgroup *subgroup,
                                        uint8_t **meta)
```

Get the codec metadata of a subgroup.

**Parameters**

• `subgroup` – [in] The subgroup pointer
• `meta` – [out] Pointer that will point to the resulting codec metadata

**Return values**

• `-EINVAL` – if arguments are invalid
• `0` – on success

```c
int bt_bap_base_subgroup_codec_to_codec_cfg(const struct bt_bap_base_subgroup *subgroup,
                                            struct bt_audio_codec_cfg *codec_cfg)
```

Store subgroup codec data in a [Codec config parsing APIs](#).

**Parameters**

• `subgroup` – [in] The subgroup pointer
• `codec_cfg` – [out] Pointer to the struct where the results are placed

**Return values**
-EINVAL – if arguments are invalid
-ENOMEM – if the codec_cfg cannot store the subgroup codec data
0 – on success

```c
int bt_bap_base_get_subgroup_bis_count(const struct bt_bap_base_subgroup *subgroup)
```

Get the BIS count of a subgroup.

**Parameters**
- subgroup – The subgroup pointer

**Return values**
-EINVAL – if arguments are invalid
-The – 8-bit BIS count value

```c
int bt_bap_base_subgroup_get_bis_indexes(const struct bt_bap_base_subgroup *subgroup, uint32_t *bis_indexes)
```

Get all BIS indexes of a subgroup.

**Parameters**
- subgroup – [in] The subgroup pointer
- bis_indexes – [out] 32-bit BIS index bitfield that will be populated

**Return values**
-EINVAL – if arguments are invalid
-0 – on success

```c
int bt_bap_base_subgroup_foreach_bis(const struct bt_bap_base_subgroup *subgroup,
bool (*func)(const struct
bt_bap_base_subgroup_bis *bis, void *user_data),
void *user_data)
```

Iterate on all BIS in the subgroup.

**Parameters**
- subgroup – The subgroup pointer
- func – Callback function. Return true to continue iterating, or false to stop.
- user_data – Userdata supplied to func

**Return values**
-EINVAL – if arguments are invalid
-ECANCELED – if iterating over the subgroups stopped prematurely by func
-0 – if all BIS were iterated

```c
int bt_bap_base_subgroup_bis_codec_to_codec_cfg(const struct
bt_bap_base_subgroup_bis *bis,
struct bt_audio_codec_cfg
*codec_cfg)
```

Store BIS codec configuration data in a **Codec config parsing APIs**.

This only sets the Codec config parsing APIs data and Codec config parsing APIs data_len, but is useful to use the BIS codec configuration data with the bt_audio_codec_cfg_* functions.

6.1. Bluetooth
Parameters

• **bis** – [in] The BIS pointer
• **codec_cfg** – [out] Pointer to the struct where the results are placed

Return values

• -EINVAL – if arguments are invalid
• -ENOMEM – if the codec_cfg cannot store the subgroup codec data
• 0 – on success

struct bt_bap_base_codec_id
#include <bap.h> Codec ID structure for a Broadcast Audio Source Endpoint (BASE)

Public Members

uint8_t id
Codec ID.

uint16_t cid
Codec Company ID.

uint16_t vid
Codec Company Vendor ID.

struct bt_bap_base_subgroup_bis
#include <bap.h> BIS structure for each BIS in a Broadcast Audio Source Endpoint (BASE) subgroup.

Public Members

uint8_t data_len
Codec Specific Data length.

uint8_t *data
Codec Specific Data.

group bt_bap_broadcast_sink
BAP Broadcast Sink APIs.

Functions

int bt_bap_broadcast_sink_register_cb(struct bt_bap_broadcast_sink_cb *cb)
Register Broadcast sink callbacks *.

Parameters

• **cb** – Broadcast sink callback structure.
int bt_bap_broadcast_sink_create(struct bt_le_per_adv_sync *pa_sync, uint32_t broadcast_id, struct bt_bap_broadcast_sink **sink)

Create a Broadcast Sink from a periodic advertising sync.

This should only be done after verifying that the periodic advertising sync is from a Broadcast Source.

The created Broadcast Sink will need to be supplied to `bt_bap_broadcast_sink_sync()` in order to synchronize to the broadcast audio.

`bt_bap_broadcast_sink_cb::pa_synced()` will be called with the Broadcast Sink object created if this is successful.

**Parameters**

- **pa_sync** – Pointer to the periodic advertising sync object.
- **broadcast_id** – 24-bit broadcast ID.
- **sink** – [out] Pointer to the Broadcast Sink created.

**Returns**

0 in case of success or errno value in case of error.

int bt_bap_broadcast_sink_sync(struct bt_bap_broadcast_sink *sink, uint32_t indexes_bitfield, struct bt_bap_stream *streams[], const uint8_t broadcast_code[16])

Sync to a broadcaster’s audio.

Example: The string “Broadcast Code” shall be [42 72 6F 64 65 61 64 63 74 20 43 6F 64 65 00 00]

**Parameters**

- **sink** – Pointer to the sink object from the base_recv callback.
- **indexes_bitfield** – Bitfield of the BIS index to sync to. To sync to e.g. BIS index 1 and 2, this should have the value of `BIT(1) | BIT(2)`.
- **streams** – Stream object pointers to be used for the receiver. If multiple BIS indexes shall be synchronized, multiple streams shall be provided.
- **broadcast_code** – The 16-octet broadcast code. Shall be supplied if the broadcast is encrypted (see `bt_bap_broadcast_sink_cb::syncable`). If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

**Returns**

0 in case of success or negative value in case of error.

int bt_bap_broadcast_sink_stop(struct bt_bap_broadcast_sink *sink)

Stop audio broadcast sink.

Stop an audio broadcast sink. The broadcast sink will stop receiving BIGInfo, and audio data can no longer be streamed.

**Parameters**

- **sink** – Pointer to the broadcast sink

**Returns**

Zero on success or (negative) error code otherwise.
int bt_bap_broadcast_sink_delete(struct bt_bap_broadcast_sink *sink)
    Release a broadcast sink.

    Once a broadcast sink has been allocated after the pa_synced callback, it can be deleted
    using this function. If the sink has synchronized to any broadcast audio streams, these
    must first be stopped using bt_bap_stream_stop.

    **Parameters**
    - sink – Pointer to the sink object to delete.

    **Returns**
    0 in case of success or negative value in case of error.

struct bt_bap_broadcast_sink_cb
    #include <bap.h> Broadcast Audio Sink callback structure.

    **Public Members**

    void (*base_recv)(struct bt_bap_broadcast_sink *sink, const struct bt_bap_base *base, size_t base_size)
        Broadcast Audio Source Endpoint (BASE) received.
        Callback for when we receive a BASE from a broadcaster after syncing to the broad-
        caster's periodic advertising.
        **Param sink**
        Pointer to the sink structure.
        **Param base**
        Broadcast Audio Source Endpoint (BASE).
        **Param base_size**
        Size of the base

    void (*syncable)(struct bt_bap_broadcast_sink *sink, bool encrypted)
        Broadcast sink is syncable.
        Called whenever a broadcast sink is not synchronized to audio, but the audio is
        synchronizable. This is inferred when a BIGInfo report is received.
        Once this callback has been called, it is possible to call
        bt_bap_broadcast_sink_sync() to synchronize to the audio stream(s).
        **Param sink**
        Pointer to the sink structure.
        **Param encrypted**
        Whether or not the broadcast is encrypted

    **group bt_bap_broadcast_source**
    BAP Broadcast Source APIs.

    **Functions**

    int bt_bap_broadcast_source_create(struct bt_bap_broadcast_source_param *param,
                                            struct bt_bap_broadcast_source **source)
        Create audio broadcast source.
        Create a new audio broadcast source with one or more audio streams.
The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

No audio data can be sent until `bt_bap_broadcast_source_start()` has been called and no audio information (BIGInfo) will be visible to scanners (see `bt_le_per_adv_sync_cb`).

**Parameters**

- **param** – [in] Pointer to parameters used to create the broadcast source.
- **source** – [out] Pointer to the broadcast source created

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_reconfig(struct bt_bap_broadcast_source *source, struct bt_bap_broadcast_source_param *param)
```

Reconfigure audio broadcast source.

Reconfigure an audio broadcast source with a new codec and codec quality of service parameters. This can only be done when the source is stopped.

Since this may modify the Broadcast Audio Source Endpoint (BASE), `bt_bap_broadcast_source_get_base()` should be called after this to get the new BASE information.

If the `param.params_count` is smaller than the number of subgroups that have been created in the Broadcast Source, only the first `param.params_count` subgroups are updated. If a stream exist in a subgroup not part of `param`, then that stream is left as is (i.e. it is not removed; the only way to remove a stream from a Broadcast Source is to recreate the Broadcast Source).

**Parameters**

- **source** – Pointer to the broadcast source
- **param** – Pointer to parameters used to reconfigure the broadcast source.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_update_metadata(struct bt_bap_broadcast_source *source, const uint8_t meta[], size_t meta_len)
```

Modify the metadata of an audio broadcast source.

Modify the metadata an audio broadcast source. This can only be done when the source is started. To update the metadata in the stopped state, use `bt_bap_broadcast_source_reconfig()`.

**Parameters**

- **source** – Pointer to the broadcast source.
- **meta** – Metadata.
- **meta_len** – Length of metadata.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_start(struct bt_bap_broadcast_source *source, struct bt_le_ext_adv *adv)
```

Start audio broadcast source.

Start an audio broadcast source with one or more audio streams. The broadcast source will start advertising BIGInfo, and audio data can be streamed.

**Parameters**
• `source` – Pointer to the broadcast source
• `adv` – Pointer to an extended advertising set with periodic advertising configured.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_stop(struct bt_bap_broadcast_source *source)
```
Stop audio broadcast source.

Stop an audio broadcast source. The broadcast source will stop advertising BIGInfo, and audio data can no longer be streamed.

**Parameters**
• `source` – Pointer to the broadcast source

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_delete(struct bt_bap_broadcast_source *source)
```
Delete audio broadcast source.

Delete an audio broadcast source. The broadcast source will stop advertising entirely, and the source can no longer be used.

**Parameters**
• `source` – Pointer to the broadcast source

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_get_id(struct bt_bap_broadcast_source *source, uint32_t *const broadcast_id)
```
Get the broadcast ID of a broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with `BT_UUID_BROADCAST_AUDIO_VAL` as `BT_DATA_SVC_DATA16`. See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

**Parameters**
• `source` – [in] Pointer to the broadcast source.
• `broadcast_id` – [out] Pointer to the 3-octet broadcast ID.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_get_base(struct bt_bap_broadcast_source *source, struct net_buf_simple *base_buf)
```
Get the Broadcast Audio Stream Endpoint of a broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see `bt_le_per_adv_set_data()`).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

**Parameters**
• `source` – Pointer to the broadcast source.
• `base_buf` – Pointer to a buffer where the BASE will be inserted.

**Returns**
Zero on success or (negative) error code otherwise.
struct bt_bap_broadcast_source_stream_param
#include <bap.h> Broadcast Source stream parameters.

Public Members

struct bt_bap_stream *stream
Audio stream.

struct bt_bap_broadcast_source_subgroup_param
#include <bap.h> Broadcast Source subgroup parameters.

Public Members

size_t params_count
The number of parameters in stream_params.

struct bt_bap_broadcast_source_stream_param *params
Array of stream parameters.

struct bt_audio_codec_cfg *codec_cfg
Subgroup Codec configuration.

struct bt_bap_broadcast_source_param
#include <bap.h> Broadcast Source create parameters.

Public Members

size_t params_count
The number of parameters in subgroup_params.

struct bt_bap_broadcast_source_subgroup_param *params
Array of stream parameters.

struct bt_audio_codec_qos *qos
Quality of Service configuration.

uint8_t packing
Broadcast Source packing mode.
BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.

bool encryption
Whether or not to encrypt the streams.

6.1. Bluetooth
uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE]

Broadcast code.

If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

Common Audio Profile

API Reference

group bt_cap

Common Audio Profile (CAP)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Enums

define bt_cap_set_type

Type of CAP set.

Values:

enumerator BT_CAP_SET_TYPE_AD_HOC

The set is an ad-hoc set.

enumerator BT_CAP_SET_TYPE_CSIP

The set is a CSIP Coordinated Set.

Functions

int bt_cap_acceptor_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)

Register the Common Audio Service.

This will register and enable the service and make it discoverable by clients. This will also register a Coordinated Set Identification Service instance.

This shall only be done as a server, and requires BT_CAP_ACCEPTOR_SET_MEMBER. If BT_CAP_ACCEPTOR_SET_MEMBER is not enabled, the Common Audio Service will by statically registered.

Parameters

- svc_inst – [out] Pointer to the registered Coordinated Set Identification Service.

Returns

0 if success, errno on failure.
int bt_cap_initiator_unicast_discover(struct bt_conn *conn)

Discovers audio support on a remote device.

This will discover the Common Audio Service (CAS) on the remote device, to verify if the remote device supports the Common Audio Profile.

**Parameters**

- conn – Connection to a remote server.

**Return values**

- 0 – Success
- -EINVAL – conn is NULL
- -ENOTCONN – conn is not connected
- -ENOMEM – Could not allocated memory for the request

void bt_cap_stream_ops_register(struct bt_cap_stream *stream, struct bt_bap_stream_ops *ops)

Register Audio operations for a Common Audio Profile stream.

Register Audio operations for a stream.

**Parameters**

- stream – Stream object.
- ops – Stream operations structure.

int bt_cap_stream_send(struct bt_cap_stream *stream, struct net_buf *buf, uint16_t seq_num)

Send data to Common Audio Profile stream without timestamp.

See `bt_bap_stream_send()` for more information.

**Note:** Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

**Parameters**

- stream – Stream object.
- buf – Buffer containing data to be sent.
- seq_num – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.

**Return values**

- -EINVAL – if stream object is NULL
- Any – return value from `bt_bap_stream_send()`

int bt_cap_stream_send_ts(struct bt_cap_stream *stream, struct net_buf *buf, uint16_t seq_num, uint32_t ts)

Send data to Common Audio Profile stream with timestamp.

See `bt_bap_stream_send()` for more information.

**Note:** Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

**Parameters**
• stream – Stream object.
• buf – Buffer containing data to be sent.
• seq_num – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.
• ts – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG.

Return values
• -EINVAL – if stream object is NULL
• Any – return value from `bt_bap_stream_send()`

`int bt_cap_stream_get_tx_sync(struct bt_cap_stream *stream, struct bt_iso_tx_info *info)`
Get ISO transmission timing info for a Common Audio Profile stream.

See `bt_bap_stream_get_tx_sync()` for more information

**Note:** Support for sending must be supported, determined by `CONFIG_BT_AUDIO_TX`.

**Parameters**
- info – [out] Transmit info object.

**Return values**
- -EINVAL – if stream object is NULL
- Any – return value from `bt_bap_stream_get_tx_sync()`

`int bt_cap_initiator_register_cb(const struct bt_cap_initiator_cb *cb)`
Register Common Audio Profile Initiator callbacks.

**Parameters**
- cb – The callback structure. Shall remain static.

**Returns**
0 on success or negative error value on failure.

`int bt_cap_initiator_unicast_audio_start(const struct bt_cap_unicast_audio_start_param *param)`
Setup and start unicast audio streams for a set of devices.

The result of this operation is that the streams in `param` will be initialized and will be usable for streaming audio data. The `unicast_group` value can be used to update and stop the streams.

**Note:** `CONFIG_BT_CAP_INITIATOR` and `CONFIG_BT_BAP_UNICAST_CLIENT` must be enabled for this function to be enabled.

**Parameters**
- param – Parameters to start the audio streams.

**Returns**
0 on success or negative error value on failure.
int bt_cap_initiator_unicast_audio_update(const struct bt_cap_unicast_audio_update_param *param)

Update unicast audio streams.
This will update the metadata of one or more streams.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

**Parameters**

- param – Update parameters.

**Returns**

0 on success or negative error value on failure.

int bt_cap_initiator_unicast_audio_stop(const struct bt_cap_unicast_audio_stop_param *param)

Stop unicast audio streams.
This will stop one or more streams.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

**Parameters**

- param – Stop parameters.

**Returns**

0 on success or negative error value on failure.

int bt_cap_initiator_unicast_audio_cancel(void)

Cancel any current Common Audio Profile procedure.
This will stop the current procedure from continuing and making it possible to run a new Common Audio Profile procedure.

It is recommended to do this if any existing procedure takes longer time than expected, which could indicate a missing response from the Common Audio Profile Acceptor.

This does not send any requests to any Common Audio Profile Acceptors involved with the current procedure, and thus notifications from the Common Audio Profile Acceptors may arrive after this has been called. It is thus recommended to either only use this if a procedure has stalled, or wait a short while before starting any new Common Audio Profile procedure after this has been called to avoid getting notifications from the cancelled procedure. The wait time depends on the connection interval, the number of devices in the previous procedure and the behavior of the Common Audio Profile Acceptors.

The respective callbacks of the procedure will be called as part of this with the connection pointer set to 0 and the err value set to -EALREADY.

**Return values**

- 0 – on success
- -EALREADY – if no procedure is active
Create a Common Audio Profile broadcast source.
Create a new audio broadcast source with one or more audio streams.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

### Parameters
- `param` – [in] Parameters to start the audio streams.
- `broadcast_source` – [out] Pointer to the broadcast source created.

### Returns
0 on success or negative error value on failure.

### Returns
Start Common Audio Profile broadcast source.
The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.
This will allow the streams in the broadcast source to send audio by calling `bt_bap_stream_send()`.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

### Parameters
- `broadcast_source` – Pointer to the broadcast source.
- `adv` – Pointer to an extended advertising set with periodic advertising configured.

### Returns
0 on success or negative error value on failure.

### Returns
Update broadcast audio streams for a Common Audio Profile broadcast source.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

### Parameters
- `broadcast_source` – The broadcast source to update.
- `meta` – The new metadata. The metadata shall contain a list of CCIDs as well as a non-0 context bitfield.
• **meta_len** – The length of meta.

**Returns**
0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_audio_stop(struct bt_cap_broadcast_source *broadcast_source)
```

Stop broadcast audio streams for a Common Audio Profile broadcast source.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**
• **broadcast_source** – The broadcast source to stop. The audio streams in this will be stopped and reset.

**Returns**
0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_audio_delete(struct bt_cap_broadcast_source *broadcast_source)
```

Delete Common Audio Profile broadcast source.

This can only be done after the broadcast source has been stopped by calling `bt_cap_initiator_broadcast_audio_stop()` and after the `bt_bap_stream_ops.stopped()` callback has been called for all streams in the broadcast source.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**
• **broadcast_source** – The broadcast source to delete. The broadcast_source will be invalidated.

**Returns**
0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_get_id(const struct bt_cap_broadcast_source *broadcast_source, uint32_t *const broadcast_id)
```

Get the broadcast ID of a Common Audio Profile broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with `BT_UUID_BROADCAST_AUDIO_VAL` as `BT_DATA_SVC_DATA16`.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

**Parameters**
• **broadcast_source** – [in] Pointer to the broadcast source.
• **broadcast_id** – [out] Pointer to the 3-octet broadcast ID.

**Returns**
int 0 if on success, errno on error.
int bt_cap_initiator_broadcast_get_base(struct bt_cap_broadcast_source *broadcast_source, struct net_buf_simple *base_buf)

Get the Broadcast Audio Stream Endpoint of a Common Audio Profile broadcast source.
This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see bt_le_per_adv_set_data()).
See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
  • broadcast_source – Pointer to the broadcast source.
  • base_buf – Pointer to a buffer where the BASE will be inserted.

Returns
  int 0 if on success, errno on error.

int bt_cap_initiator_unicast_to_broadcast(const struct bt_cap_unicast_to_broadcast_param *param, struct bt_cap_broadcast_source **source)

Hands over the data streams in a unicast group to a broadcast source.
The streams in the unicast group will be stopped and the unicast group will be deleted.
This can only be done for source streams.

Note:  CONFIG_BT_CAP_INITIATOR, CONFIG_BT_BAP_UNICAST_CLIENT and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters
  • param – The parameters for the handover.
  • source – The resulting broadcast source.

Returns
  0 on success or negative error value on failure.

int bt_cap_initiator_broadcast_to_unicast(const struct bt_cap_broadcast_to_unicast_param *param, struct bt_bap_unicast_group **unicast_group)

Hands over the data streams in a broadcast source to a unicast group.
The streams in the broadcast source will be stopped and the broadcast source will be deleted.

Note:  CONFIG_BT_CAP_INITIATOR, CONFIG_BT_BAP_UNICAST_CLIENT and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters
  • param – [in] The parameters for the handover.
  • unicast_group – [out] The resulting broadcast source.

Returns
  0 on success or negative error value on failure.
int bt_cap_commander_register_cb(const struct bt_cap_commander_cb *cb)

Register Common Audio Profile Commander callbacks.

**Parameters**
- cb – The callback structure. Shall remain static.

**Return values**
- 0 – Success
- -EINVAL – cb is NULL
- -EALREADY – Callbacks are already registered

int bt_cap_commander_unregister_cb(const struct bt_cap_commander_cb *cb)

Unregister Common Audio Profile Commander callbacks.

**Parameters**
- cb – The callback structure that was previously registered.

**Return values**
- 0 – Success
- -EINVAL – cb is NULL or cb was not registered

int bt_cap_commander_discover(struct bt_conn *conn)

Discovers audio support on a remote device.

This will discover the Common Audio Service (CAS) on the remote device, to verify if the remote device supports the Common Audio Profile.

**Note:** CONFIG_BT_CAP_COMMANDER must be enabled for this function. If CONFIG_BT_CAP_INITIATOR is also enabled, it does not matter if `bt_cap_commander_discover()` or `bt_cap_initiator_unicast_discover()` is used.

**Parameters**
- conn – Connection to a remote server.

**Return values**
- 0 – Success
- -EINVAL – conn is NULL
- -ENOTCONN – conn is not connected
- -ENOMEM – Could not allocated memory for the request
- -EBUSY – Already doing discovery for conn

int bt_cap_commander_cancel(void)

Cancel any current Common Audio Profile commander procedure.

This will stop the current procedure from continuing and making it possible to run a new Common Audio Profile procedure.

It is recommended to do this if any existing procedure takes longer time than expected, which could indicate a missing response from the Common Audio Profile Acceptor.

This does not send any requests to any Common Audio Profile Acceptors involved with the current procedure, and thus notifications from the Common Audio Profile Acceptors may arrive after this has been called. It is thus recommended to either only use this if a procedure has stalled, or wait a short while before starting any new Common Audio Profile procedure after this has been called to avoid getting notifications.
from the cancelled procedure. The wait time depends on the connection interval, the
number of devices in the previous procedure and the behavior of the Common Audio
Profile Acceptors.

The respective callbacks of the procedure will be called as part of this with the connec-
tion pointer set to NULL and the err value set to -ECANCELED.

**Return values**

- 0 – on success
- -EALREADY – if no procedure is active

```c
int bt_cap_commander_broadcast_reception_start(const struct
    bt_cap_commander_broadcast_reception_start_param
    *param)
```

Starts the reception of broadcast audio on one or more remote Common Audio Profile
Acceptors.

**Parameters**

- `param` – The parameters to start the broadcast audio

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_commander_broadcast_reception_stop(const struct
    bt_cap_commander_broadcast_reception_stop_param
    *param)
```

Stops the reception of broadcast audio on one or more remote Common Audio Profile
Acceptors.

**Parameters**

- `param` – The parameters to stop the broadcast audio

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_commander_change_volume(const struct
    bt_cap_commander_change_volume_param
    *param)
```

Change the volume on one or more Common Audio Profile Acceptors.

**Parameters**

- `param` – The parameters for the volume change

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_commander_change_volume_offset(const struct
    bt_cap_commander_change_volume_offset_param
    *param)
```

Change the volume offset on one or more Common Audio Profile Acceptors.

**Parameters**

- `param` – The parameters for the volume offset change

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_commander_change_volume_mute_state(const struct
    bt_cap_commander_change_volume_mute_state_param
    *param)
```

Change the volume mute state on one or more Common Audio Profile Acceptors.
Parameters

• param – The parameters for the volume mute state change

Returns

0 on success or negative error value on failure.

int bt_cap_commander_change_microphone_mute_state(const struct bt_cap_commander_change_microphone_mute_state_param *param)

Change the microphone mute state on one or more Common Audio Profile Acceptors.

Parameters

• param – The parameters for the microphone mute state change

Returns

0 on success or negative error value on failure.

int bt_cap_commander_change_microphone_gain_setting(const struct bt_cap_commander_change_microphone_gain_setting_param *param)

Change the microphone gain setting on one or more Common Audio Profile Acceptors.

Parameters

• param – The parameters for the microphone gain setting change

Returns

0 on success or negative error value on failure.

struct bt_cap_initiator_cb
#include <cap.h> Callback structure for CAP procedures.

union bt_cap_set_member
#include <cap.h> Represents a Common Audio Set member that are either in a Coordinated or ad-hoc set.

Public Members

struct bt_conn **member
Connection pointer if the type is BT_CAP_SET_TYPE_AD_HOC.

struct bt_csip_set_coordinator_csis_inst *csip
CSIP Coordinated Set struct used if type is BT_CAP_SET_TYPE_CSIP.

struct bt_cap_stream
#include <cap.h>

struct bt_cap_unicast_audio_start_stream_param
#include <cap.h> Stream specific parameters for the bt_cap_initiator_unicast_audio_start() function.

Public Members
union \texttt{bt\_cap\_set\_member} member
\begin{verbatim}
    Coordinated or ad-hoc set member.
\end{verbatim}

struct \texttt{bt\_cap\_stream} *stream
\begin{verbatim}
    Stream for the member.
\end{verbatim}

struct \texttt{bt\_bap\_ep} *ep
\begin{verbatim}
    Endpoint reference for the stream.
\end{verbatim}

struct \texttt{bt\_audio\_codec\_cfg} *codec\_cfg
\begin{verbatim}
    Codec configuration.
    The codec\_cfg.meta shall include a list of CCIDs
    (\texttt{BT\_AUDIO\_METADATA\_TYPE\_CCID\_LIST}) as well as a non-0 stream context
    (\texttt{BT\_AUDIO\_METADATA\_TYPE\_STREAM\_CONTEXT}) bitfield.
\end{verbatim}

struct \texttt{bt\_cap\_unicast\_audio\_start\_param}
\begin{verbatim}
#include <cap.h> Parameters for the \texttt{bt\_cap\_initiator\_unicast\_audio\_start()} function.
\end{verbatim}

\textbf{Public Members}

enum \texttt{bt\_cap\_set\_type} type
\begin{verbatim}
    The type of the set.
\end{verbatim}

size_t count
\begin{verbatim}
    The number of parameters in stream\_params.
\end{verbatim}

struct \texttt{bt\_cap\_unicast\_audio\_start\_stream\_param} *stream\_params
\begin{verbatim}
    Array of stream parameters.
\end{verbatim}

struct \texttt{bt\_cap\_unicast\_audio\_update\_stream\_param}
\begin{verbatim}
#include <cap.h> Stream specific parameters for the \texttt{bt\_cap\_initiator\_unicast\_audio\_update()} function.
\end{verbatim}

\textbf{Public Members}

struct \texttt{bt\_cap\_stream} *stream
\begin{verbatim}
    Stream to update.
\end{verbatim}

size_t meta\_len
\begin{verbatim}
    The length of meta.
\end{verbatim}

uint8_t *meta
\begin{verbatim}
    The new metadata.
    The metadata shall a list of CCIDs as well as a non-0 context bitfield.
\end{verbatim}

struct \texttt{bt\_cap\_unicast\_audio\_update\_param}
\begin{verbatim}
#include <cap.h> Parameters for the \texttt{bt\_cap\_initiator\_unicast\_audio\_update()} function.
\end{verbatim}
Public Members

enum bt_cap_set_type type
   The type of the set.

size_t count
   The number of parameters in stream_params.

struct bt_cap_unicast_audio_update_stream_param *stream_params
   Array of stream parameters.

struct bt_cap_unicast_audio_stop_param
   #include <cap.h> Parameters for the bt_cap_initiator_unicast_audio_stop() function.

Public Members

enum bt_cap_set_type type
   The type of the set.

size_t count
   The number of streams in streams.

struct bt_cap_stream **streams
   Array of streams to stop.

struct bt_cap_initiator_broadcast_stream_param
   #include <cap.h>

Public Members

struct bt_cap_stream *stream
   Audio stream.

size_t data_len
   The length of the p data array.
   The BIS specific data may be omitted and this set to 0.

uint8_t *data
   BIS Codec Specific Configuration.

struct bt_cap_initiator_broadcast_subgroup_param
   #include <cap.h>

6.1. Bluetooth
Public Members

size_t stream_count
   The number of parameters in stream_params.

struct bt_cap_initiator_broadcast_stream_param *stream_params
   Array of stream parameters.

struct bt_audio_codec_cfg *codec_cfg
   Subgroup Codec configuration.

struct bt_cap_initiator_broadcast_create_param
   #include <cap.h>

Public Members

size_t subgroup_count
   The number of parameters in subgroup_params.

struct bt_cap_initiator_broadcast_subgroup_param *subgroup_params
   Array of stream parameters.

struct bt_audio_codec_qos *qos
   Quality of Service configuration.

uint8_t packing
   Broadcast Source packing mode.
   BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.

bool encryption
   Whether or not to encrypt the streams.

uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE]
   16-octet broadcast code.
   Only valid if encrypt is true.
   If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.
   Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 74 20 43 6F 64 65 00 00]

struct bt_cap_unicast_to_broadcast_param
   #include <cap.h>
Public Members

struct bt_bap_unicast_group *unicast_group
    The source unicast group with the streams.

bool encrypt
    Whether or not to encrypt the streams.
    If set to true, then the broadcast code in broadcast_code will be used to encrypt
    the streams.

uint8_t broadcast_code[BT_ISO_BROADCAST_CODE_SIZE]
    16-octet broadcast code.
    Only valid if encrypt is true.
    If the value is a string or a the value is less than 16 octets, the remaining octets
    shall be 0.
    Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F
            64 65 00 00]

Public Members

struct bt_cap_broadcast_to_unicast_param
    #include <cap.h>

Public Members

struct bt_cap_broadcast_source *broadcast_source
    The source broadcast source with the streams.
    The broadcast source will be stopped and deleted.

enum bt_cap_set_type type
    The type of the set.

size_t count
    The number of set members in members.
    This value shall match the number of streams in the broadcast_source.

union bt_cap_set_member **members
    Coordinated or ad-hoc set members.

struct bt_cap_commander_cb
    #include <cap.h> Callback structure for CAP procedures.

Public Members

void (*discovery_complete)(struct bt_conn *conn, int err, const struct
    bt_csip_set_coordinator_csis_inst *csis_inst)
    Callback for bt_cap_initiator_unicast_discover().
Param conn
   The connection pointer supplied to \texttt{bt_cap_initiator_unicast_discover}().

Param err
   0 if Common Audio Service was found else -ENODATA.

Param csis_inst
   The Coordinated Set Identification Service if Common Audio Service was found and includes a Coordinated Set Identification Service. NULL on error or if remote device does not include Coordinated Set Identification Service.

\textbf{struct bt_cap_commander_broadcast_reception_start_member_param}
\begin{verbatim}
#include <cap.h>
\end{verbatim}

\textbf{Public Members}

\begin{itemize}
\item \textbf{union bt_cap_set_member} member
   Coordinated or ad-hoc set member.
\item \textbf{bt_addr_le_t} addr
   Address of the advertiser.
\item \textbf{uint8_t} adv_sid
   SID of the advertising set.
\item \textbf{uint16_t} pa_interval
   Periodic advertising interval in milliseconds.
   BT_BAP_PA_INTERVAL_UNKNOWN if unknown.
\item \textbf{uint32_t} broadcast_id
   24-bit broadcast ID
\item \textbf{struct bt_bap_bass_subgroup *}subgroups
   Pointer to array of subgroups.
   At least one bit in one of the subgroups bis_sync parameters shall be set.
\item \textbf{size_t} num_subgroups
   Number of subgroups.
\end{itemize}

\textbf{struct bt_cap_commander_broadcast_reception_start_param}
\begin{verbatim}
#include <cap.h> \end{verbatim} Parameters for starting broadcast reception

\textbf{Public Members}

\begin{itemize}
\item \textbf{enum bt_cap_set_type} type
   The type of the set.
\item \textbf{struct bt_cap_commander_broadcast_reception_start_member_param *}param
   The set of devices for this procedure.
\end{itemize}
size_t count
    The number of parameters in param.

struct bt_cap_commander_broadcast_reception_stop_param
    #include <cap.h> Parameters for stopping broadcast reception

Public Members

enum bt_cap_set_type type
    The type of the set.

union bt_cap_member *members
    Coordinated or ad-hoc set member.

size_t count
    The number of members in members.

struct bt_cap_commander_change_volume_param
    #include <cap.h> Parameters for changing absolute volume

Public Members

enum bt_cap_set_type type
    The type of the set.

union bt_cap_set_member *members
    Coordinated or ad-hoc set member.

size_t count
    The number of members in members.

uint8_t volume
    The absolute volume to set.

struct bt_cap_commander_change_volume_offset_member_param
    #include <cap.h>

Public Members

union bt_cap_set_member member
    Coordinated or ad-hoc set member.

int16_t offset
    The offset to set.
    Value shall be between BT_VOCS_MIN_OFFSET and BT_VOCS_MAX_OFFSET
struct bt_cap_commander_change_volume_offset_param
   #include <cap.h> Parameters for changing volume offset.

   Public Members

   enum bt_cap_set_type type
       The type of the set.

   struct bt_cap_commander_change_volume_offset_member_param *param
       The set of devices for this procedure.

   size_t count
       The number of parameters in param.

struct bt_cap_commander_change_volume_mute_state_param
   #include <cap.h> Parameters for changing volume mute state.

   Public Members

   enum bt_cap_set_type type
       The type of the set.

   union bt_cap_set_member *members
       Coordinated or ad-hoc set member.

   size_t count
       The number of members in members.

   bool mute
       The volume mute state to set.
       true to mute, and false to unmute

struct bt_cap_commander_change_microphone_mute_state_param
   #include <cap.h> Parameters for changing microphone mute state.

   Public Members

   enum bt_cap_set_type type
       The type of the set.

   union bt_cap_set_member *members
       Coordinated or ad-hoc set member.

   size_t count
       The number of members in members.
bool mute
  The microphone mute state to set.
  true to mute, and false to unmute

struct bt_cap_commander_change_microphone_gain_setting_member_param
#include <cap.h>

Public Members

union bt_cap_set_member member
  Coordinated or ad-hoc set member.

int8_t gain
  The microphone gain setting to set.

struct bt_cap_commander_change_microphone_gain_setting_param
#include <cap.h>
Parameters for changing microphone mute state.

Public Members

enum bt_cap_set_type type
  The type of the set.

struct bt_cap_commander_change_microphone_gain_setting_member_param *param
  The set of devices for this procedure.

size_t count
  The number of parameters in param.

Connection Management

The Zephyr Bluetooth stack uses an abstraction called bt_conn to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the bt_conn_get_info() API. Connection objects are reference counted, and the application is expected to use the bt_conn_ref() API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the bt_conn_unref() API is to be used when releasing a reference to a connection.

An application may track connections by registering a bt_conn_cb struct using the bt_conn_cb_register() or BT_CONN_CB_DEFINE APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the bt_conn_le_create() API.
API Reference

group bt_conn
Connection management.

Defines

**BT_LE_CONN_PARAM_INIT** (int_min, int_max, lat, to)
Initialize connection parameters.

**Parameters**
- int_min – Minimum Connection Interval (N * 1.25 ms)
- int_max – Maximum Connection Interval (N * 1.25 ms)
- lat – Connection Latency
- to – Supervision Timeout (N * 10 ms)

**BT_LE_CONN_PARAM** (int_min, int_max, lat, to)
Helper to declare connection parameters inline.

**Parameters**
- int_min – Minimum Connection Interval (N * 1.25 ms)
- int_max – Maximum Connection Interval (N * 1.25 ms)
- lat – Connection Latency
- to – Supervision Timeout (N * 10 ms)

**BT_LE_CONN_PARAM_DEFAULT**
Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s.

**BT_CONN_LE_PHY_PARAM_INIT** (_pref_tx_phy, _pref_rx_phy)
Initialize PHY parameters.

**Parameters**
- _pref_tx_phy – Bitmask of preferred transmit PHYs.
- _pref_rx_phy – Bitmask of preferred receive PHYs.

**BT_CONN_LE_PHY_PARAM** (_pref_tx_phy, _pref_rx_phy)
Helper to declare PHY parameters inline.

**Parameters**
- _pref_tx_phy – Bitmask of preferred transmit PHYs.
- _pref_rx_phy – Bitmask of preferred receive PHYs.

**BT_CONN_LE_PHY_PARAM_1M**
Only LE 1M PHY.

**BT_CONN_LE_PHY_PARAM_2M**
Only LE 2M PHY.

**BT_CONN_LE_PHY_PARAM_CODED**
Only LE Coded PHY.
BT_CONN_LE_PHY_PARAM_ALL
All LE PHYs.

BT_CONN_LE_DATA_LEN_PARAM_INIT(_tx_max_len, _tx_max_time)
Initialize transmit data length parameters.

Parameters
• _tx_max_len – Maximum Link Layer transmission payload size in bytes.
• _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_CONN_LE_DATA_LEN_PARAM(_tx_max_len, _tx_max_time)
Helper to declare transmit data length parameters inline.

Parameters
• _tx_max_len – Maximum Link Layer transmission payload size in bytes.
• _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_LE_DATA_LEN_PARAM_DEFAULT
Default LE data length parameters.

BT_LE_DATA_LEN_PARAM_MAX
Maximum LE data length parameters.

BT_CONN_INTERVAL_TO_MS(interval)
Convert connection interval to milliseconds.
Multiply by 1.25 to get milliseconds.
Note that this may be inaccurate, as something like 7.5 ms cannot be accurately presented with integers.

BT_CONN_INTERVAL_TO_US(interval)
Convert connection interval to microseconds.
Multiply by 1250 to get microseconds.

BT_CONN_ROLE_MASTER
Connection role (central or peripheral)

BT_CONN_ROLE_SLAVE

BT_CONN_LE_CREATE_PARAM_INIT(_options, _interval, _window)
Initialize create connection parameters.

Parameters
• _options – Create connection options.
• _interval – Create connection scan interval (N * 0.625 ms).
• _window – Create connection scan window (N * 0.625 ms).

BT_CONN_LE_CREATE_PARAM(_options, _interval, _window)
Helper to declare create connection parameters inline.

Parameters
• _options – Create connection options.
• _interval – Create connection scan interval (N * 0.625 ms).
• \_window – Create connection scan window (N * 0.625 ms).

**BT\_CONN\_LE\_CREATE\_CONN**

Default LE create connection parameters.
Scan continuously by setting scan interval equal to scan window.

**BT\_CONN\_LE\_CREATE\_CONN\_AUTO**

Default LE create connection using filter accept list parameters.
Scan window: 30 ms. Scan interval: 60 ms.

**BT\_CONN\_CB\_DEFINE(_name)**

Register a callback structure for connection events.

**Parameters**

- _name – Name of callback structure.

**BT\_PASSKEY\_INVALID**

Special passkey value that can be used to disable a previously set fixed passkey.

**BT\_BR\_CONN\_PARAM\_INIT(role\_switch)**

Initialize BR/EDR connection parameters.

**Parameters**

- role\_switch – True if role switch is allowed

**BT\_BR\_CONN\_PARAM(role\_switch)**

Helper to declare BR/EDR connection parameters inline.

**Parameters**

- role\_switch – True if role switch is allowed

**BT\_BR\_CONN\_PARAM\_DEFAULT**

Default BR/EDR connection parameters: Role switch allowed.

**Enums**

Connection PHY options.

**Values:**

- enumerator **BT\_CONN\_LE\_PHY\_OPT\_NONE = 0**
  Convenience value when no options are specified.

- enumerator **BT\_CONN\_LE\_PHY\_OPT\_CODED\_S2 = BIT(0)**
  LE Coded using S=2 coding preferred when transmitting.

- enumerator **BT\_CONN\_LE\_PHY\_OPT\_CODED\_S8 = BIT(1)**
  LE Coded using S=8 coding preferred when transmitting.
enum bt_conn_type
    Connection Type.
    Values:

    enumerator BT_CONN_TYPE_LE = BIT(0)
        LE Connection Type.

    enumerator BT_CONN_TYPE_BR = BIT(1)
        BR/EDR Connection Type.

    enumerator BT_CONN_TYPE_SCO = BIT(2)
        SCO Connection Type.

    enumerator BT_CONN_TYPE_ISO = BIT(3)
        ISO Connection Type.

    enumerator BT_CONN_TYPE_ALL = BT_CONN_TYPE_LE | BT_CONN_TYPE_BR | BT_CONN_TYPE_SCO | BT_CONN_TYPE_ISO
        All Connection Type.

    Values:

    enumerator BT_CONN_ROLE_CENTRAL = 0

    enumerator BT_CONN_ROLE_PERIPHERAL = 1

enum bt_conn_state
    Values:

    enumerator BT_CONN_STATE_DISCONNECTED
        Channel disconnected.

    enumerator BT_CONN_STATE_CONNECTING
        Channel in connecting state.

    enumerator BT_CONN_STATE_CONNECTED
        Channel connected and ready for upper layer traffic on it.

    enumerator BT_CONN_STATE_DISCONNECTING
        Channel in disconnecting state.

enum bt_security_t
    Security level.
    Values:

    enumerator BT_SECURITY_L0
        Level 0: Only for BR/EDR special cases, like SDP.
enumerator BT_SECURITY_L1
    Level 1: No encryption and no authentication.

enumerator BT_SECURITY_L2
    Level 2: Encryption and no authentication (no MITM).

enumerator BT_SECURITY_L3
    Level 3: Encryption and authentication (MITM).

enumerator BT_SECURITY_L4
    Level 4: Authenticated Secure Connections and 128-bit key.

enumerator BT_SECURITY_FORCE_PAIR = BIT(7)
    Bit to force new pairing procedure, bit-wise OR with requested security level.

definition bt_security_flag
    Security Info Flags.
    Values:

enumerator BT_SECURITY_FLAG_SC = BIT(0)
    Paired with Secure Connections.

enumerator BT_SECURITY_FLAG_OOB = BIT(1)
    Paired with Out of Band method.

definition bt_conn_le_tx_power_phy
    Values:

enumerator BT_CONN_LE_TX_POWER_PHY_NONE
    Convenience macro for when no PHY is set.

enumerator BT_CONN_LE_TX_POWER_PHY_1M
    LE 1M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_2M
    LE 2M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
    LE Coded PHY using S=8 coding.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
    LE Coded PHY using S=2 coding.

definition bt_conn_auth_keypress
    Passkey Keypress Notification type.
    The numeric values are the same as in the Core specification for Pairing Keypress Notification PDU.
    Values:
enumerator BT_CONN_AUTH_KEYPRESS_ENTRY_STARTED = 0x00
enumerator BT_CONN_AUTH_KEYPRESS_DIGIT_ENTERED = 0x01
enumerator BT_CONN_AUTH_KEYPRESS_DIGIT_ERASED = 0x02
enumerator BT_CONN_AUTH_KEYPRESS_CLEARED = 0x03
enumerator BT_CONN_AUTH_KEYPRESS_ENTRY_COMPLETED = 0x04

Values:
enumerator BT_CONN_LE_OPT_NONE = 0
   Convenience value when no options are specified.
enumerator BT_CONN_LE_OPT_CODED = \texttt{BIT}(0)
   Enable LE Coded PHY.
   Enable scanning on the LE Coded PHY.
enumerator BT_CONN_LE_OPT_NO_1M = \texttt{BIT}(1)
   Disable LE 1M PHY.
   Disable scanning on the LE 1M PHY.
   @note Requires @ref BT_CONN_LE_OPT_CODED.

enum \texttt{bt\_security\_err}
Values:
enumerator BT_SECURITY_ERR_SUCCESS
   Security procedure successful.
enumerator BT_SECURITY_ERR_AUTH_FAIL
   Authentication failed.
enumerator BT_SECURITY_ERR_PIN_OR_KEY_MISSING
   PIN or encryption key is missing.
enumerator BT_SECURITY_ERR_OOB_NOT_AVAILABLE
   OOB data is not available.
enumerator BT_SECURITY_ERR_AUTH_REQUIREMENT
   The requested security level could not be reached.
enumerator BT_SECURITY_ERR_PAIR_NOT_SUPPORTED
   Pairing is not supported.
enumerator **BT_SECURITY_ERR_PAIR_NOT_ALLOWED**
    Pairing is not allowed.

enumerator **BT_SECURITY_ERR_INVALID_PARAM**
    Invalid parameters.

enumerator **BT_SECURITY_ERR_KEY_REJECTED**
    Distributed Key Rejected.

enumerator **BT_SECURITY_ERR_UNSPECIFIED**
    Pairing failed but the exact reason could not be specified.

### Functions

**struct bt_conn **bt_conn_ref**(struct bt_conn *conn)**

Increment a connection’s reference count.

Increment the reference count of a connection object.

**Note:** Will return NULL if the reference count is zero.

**Parameters**

- *conn* – Connection object.

**Returns**

Connection object with incremented reference count, or NULL if the reference count is zero.

**void bt_conn_unref**(struct bt_conn *conn)**

Decrement a connection's reference count.

Decrement the reference count of a connection object.

**Parameters**

- *conn* – Connection object.

**void bt_conn_foreach**(enum **bt_conn_type** type, **void (**)**(struct bt_conn *conn, **void (**)**(data), **data)**)

Iterate through all bt_conn objects.

Iterates trough all bt_conn objects that are alive in the Host allocator.

To find established connections, combine this with **bt_conn_get_info**. Check that **bt_conn_info::state** is **BT_CONN_STATE_CONNECTED**.

Thread safety: This API is thread safe, but it does not guarantee a sequentially-consistent view for objects allocated during the current invocation of this API. E.g. If preempted while allocations A then B then C happen then results may include A and C but miss B.

**Parameters**

- *type* – Connection Type
- *func* – Function to call for each connection.
- *data* – Data to pass to the callback function.
struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const bt_addr_le_t *peer)
Look up an existing connection by address.
Look up an existing connection based on the remote address.
The caller gets a new reference to the connection object which must be released with 
bt_conn_unref() once done using the object.

Parameters
• id – Local identity (in most cases BT_ID_DEFAULT).
• peer – Remote address.

Returns
Connection object or NULL if not found.

const bt_addr_le_t *bt_conn_get_dst(const struct bt_conn *conn)
Get destination (peer) address of a connection.

Parameters
• conn – Connection object.

Returns
Destination address.

uint8_t bt_conn_index(const struct bt_conn *conn)
Get array index of a connection.
This function is used to map bt_conn to index of an array of connections. The array has CONFIG_BT_MAX_CONN elements.

Parameters
• conn – Connection object.

Returns
Index of the connection object. The range of the returned value is 0..CONFIG_BT_MAX_CONN-1

int bt_conn_get_info(const struct bt_conn *conn, struct bt_conn_info *info)
Get connection info.

Parameters
• conn – Connection object.
• info – Connection info object.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_get_remote_info(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)
Get connection info for the remote device.

Note: In order to retrieve the remote version (version, manufacturer and subversion) 
CONFIG_BT_REMOTE_VERSION must be enabled

Note: The remote information is exchanged directly after the connection has been established. The application can be notified about when the remote information is available through the remote_info_available callback.
Parameters
- conn – Connection object.
- remote_info – Connection remote info object.

Returns
Zero on success or (negative) error code on failure.

Returns
-EBUSY The remote information is not yet available.

int bt_conn_le_get_tx_power_level(struct bt_conn *conn, struct bt_conn_le_tx_power *tx_power_level)

Get connection transmit power level.

Parameters
- conn – Connection object.
- tx_power_level – Transmit power level descriptor.

Returns
Zero on success or (negative) error code on failure.

Returns
-ENOBUFS HCI command buffer is not available.

int bt_conn_le_enhanced_get_tx_power_level(struct bt_conn *conn, struct bt_conn_le_tx_power *tx_power)

Get local enhanced connection transmit power level.

Parameters
- conn – Connection object.
- tx_power – Transmit power level descriptor.

Return values
-ENOBUS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_get_remote_tx_power_level(struct bt_conn *conn, enum bt_conn_le_tx_power_phy phy)

Get remote (peer) transmit power level.

Parameters
- conn – Connection object.
- phy – PHY information.

Return values
-ENOBUS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_set_tx_power_report_enable(struct bt_conn *conn, bool local_enable, bool remote_enable)

Enable transmit power reporting.

Parameters
- conn – Connection object.
- local_enable – Enable/disable reporting for local.
• remote_enable – Enable/disable reporting for remote.

Return values
-ENOBUS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_param_update(struct bt_conn *conn, const struct bt_le_conn_param *param)

Update the connection parameters.

If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the CONFIG_BT_CONN_PARAM_UPDATE_TIMEOUT option.

Parameters
• conn – Connection object.
• param – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_data_len_update(struct bt_conn *conn, const struct bt_conn_le_data_len_param *param)

Update the connection transmit data length parameters.

Parameters
• conn – Connection object.
• param – Updated data length parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_phy_update(struct bt_conn *conn, const struct bt_conn_le_phy_param *param)

Update the connection PHY parameters.

Update the preferred transmit and receive PHYs of the connection. Use BT_GAP_LE_PHY_NONE to indicate no preference.

Parameters
• conn – Connection object.
• param – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_disconnect(struct bt_conn *conn, uint8_t reason)

Disconnect from a remote device or cancel pending connection.

Disconnect an active connection with the specified reason code or cancel pending outgoing connection.

The disconnect reason for a normal disconnect should be: BT_HCI_ERR_REMOTE_USER_TERM_CONN.

The following disconnect reasons are accepted:
• BT_HCI_ERR_AUTH_FAIL
• BT_HCI_ERR_REMOTE_USER_TERM_CONN
• BT_HCI_ERR_REMOTE_LOW_RESOURCES
• BT_HCI_ERR_REMOTE_POWER_OFF
• BT_HCI_ERR_UNSUPP_REMOTE_FEATURE
• BT_HCI_ERR_PAIRING_NOT_SUPPORTED
• BT_HCI_ERR_UNACCEPT_CONN_PARAM

Parameters
• conn – Connection to disconnect.
• reason – Reason code for the disconnection.

Returns
Zero on success or (negative) error code on failure.

```
int bt_conn_le_create(const bt_addr_le_t *peer, const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)
```

Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection.

Parameters
• peer – [in] Remote address.
• create_param – [in] Create connection parameters.
• conn_param – [in] Initial connection parameters.
• conn – [out] Valid connection object on success.

Returns
Zero on success or (negative) error code on failure.

```
int bt_conn_le_create_synced(const struct bt_le_ext_adv *adv, const struct bt_conn_le_create_synced_param *synced_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)
```

Create a connection to a synced device.

Initiate a connection to a synced device from a Periodic Advertising with Responses (PAwR) train.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

This uses the Periodic Advertising Connection Procedure.

Parameters
• adv – [in] The advertising set the PAwR advertiser belongs to.
• synced_param – [in] Create connection parameters.
• conn_param – [in] Initial connection parameters.
• conn – [out] Valid connection object on success.

Returns
Zero on success or (negative) error code on failure.
int bt_conn_le_create_auto(const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param)

Automatically connect to remote devices in the filter accept list.
This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through `bt_conn_create_auto_stop`. To establish connections to all devices in the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

**Parameters**
- `create_param` – Create connection parameters
- `conn_param` – Initial connection parameters.

**Returns**
- Zero on success or (negative) error code on failure.

**Returns**
- -ENOMEM No free connection object available.

int bt_conn_create_auto_stop(void)

Stop automatic connect creation.

**Returns**
- Zero on success or (negative) error code on failure.

int bt_le_set_auto_conn(const bt_addr_le_t *addr, const struct bt_le_conn_param *param)

Automatically connect to remote device if it's in range.
This function enables/disables automatic connection initiation. Every time the device loses the connection with peer, this connection will be re-established if connectable advertisement from peer is received.

**Note:** Auto connect is disabled during explicit scanning.

**Parameters**
- `addr` – Remote Bluetooth address.
- `param` – If non-NULL, auto connect is enabled with the given parameters. If NULL, auto connect is disabled.

**Returns**
- Zero on success or error code otherwise.

int bt_conn_set_security(struct bt_conn *conn, bt_security_t sec)

Set security level for a connection.
This function enable security (encryption) for a connection. If the device has bond information for the peer with sufficiently strong key encryption will be enabled. If the connection is already encrypted with sufficiently strong key this function does nothing.
If the device has no bond information for the peer and is not already paired then the pairing procedure will be initiated. Note that `sec` has no effect on the security level selected for the pairing process. The selection is instead controlled by the values of the registered `bt_conn_auth_cb`. If the device has bond information or is already paired and the keys are too weak then the pairing procedure will be initiated.
This function may return an error if the required level of security defined using `sec` is not possible to achieve due to local or remote device limitation (e.g., input output capabilities), or if the maximum number of paired devices has been reached.
This function may return an error if the pairing procedure has already been initiated by the local device or the peer device.

**Note:** When CONFIG_BT_SMP_SC_ONLY is enabled then the security level will always be level 4.

**Note:** When CONFIG_BT_SMP_OOB_LEGACY_PAIR_ONLY is enabled then the security level will always be level 3.

**Note:** When `BT_SECURITY_FORCE_PAIR` within `sec` is enabled then the pairing procedure will always be initiated.

**Parameters**

- conn – Connection object.
- sec – Requested minimum security level.

**Returns**

0 on success or negative error

```c
bt_security_t bt_conn_get_security(const struct bt_conn *conn)
```

Get security level for a connection.

**Returns**

Connection security level

```c
uint8_t bt_conn_enc_key_size(const struct bt_conn *conn)
```

Get encryption key size.

This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

**Parameters**

- conn – Existing connection object.

**Returns**

Encryption key size.

```c
void bt_conn_cb_register(struct bt_conn_cb *cb)
```

Register connection callbacks.

Register callbacks to monitor the state of connections.

**Parameters**

- cb – Callback struct. Must point to memory that remains valid.

```c
int bt_conn_cb_unregister(struct bt_conn_cb *cb)
```

Unregister connection callbacks.

Unregister the state of connections callbacks.

**Parameters**

- cb – Callback struct point to memory that remains valid.

**Return values**

- 0 – Success
- -EINVAL – If cb is NULL
void `bt_set_bondable` (bool enable)
Enable/disable bonding.

Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn't be needed.

**Parameters**
- enable – Value allowing/disallowing to be bondable.

int `bt_conn_set_bondable` (struct bt_conn *conn, bool enable)
Set/clear the bonding flag for a given connection.

Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data for a given connection.

The bonding flag for a given connection cannot be set/cleared if security procedures in the SMP module have already started. This function can be called only once per connection.

If the bonding flag is not set/cleared for a given connection, the value will depend on global configuration which is set using `bt_set_bondable`. The default value of the global configuration is defined using CONFIG_BT_BONDABLE Kconfig option.

**Parameters**
- conn – Connection object.
- enable – Value allowing/disallowing to be bondable.

void `bt_le_oob_set_sc_flag` (bool enable)
Allow/disallow remote LE SC OOB data to be used for pairing.

Set/clear the OOB data flag for LE SC SMP Pairing Request/Response data.

**Parameters**
- enable – Value allowing/disallowing remote LE SC OOB data.

void `bt_le_oob_set_legacy_flag` (bool enable)
Allow/disallow remote legacy OOB data to be used for pairing.

Set/clear the OOB data flag for legacy SMP Pairing Request/Response data.

**Parameters**
- enable – Value allowing/disallowing remote legacy OOB data.

int `bt_le_oob_set_legacy_tk` (struct bt_conn *conn, const uint8_t *tk)
Set OOB Temporary Key to be used for pairing.

This function allows to set OOB data for the LE legacy pairing procedure. The function should only be called in response to the oob_data_request() callback provided that the legacy method is user pairing.

**Parameters**
- conn – Connection object
- tk – Pointer to 16 byte long TK array

**Returns**
Zero on success or -EINVAL if NULL.
int bt_le_oob_set_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data *oobd_local, const struct bt_le_oob_sc_data *oobd_remote)

Set OOB data during LE Secure Connections (SC) pairing procedure.

This function allows to set OOB data during the LE SC pairing procedure. The function should only be called in response to the oob_data_request() callback provided that LE SC method is used for pairing.

The user should submit OOB data according to the information received in the callback. This may yield three different configurations: with only local OOB data present, with only remote OOB data present or with both local and remote OOB data present.

**Parameters**

- **conn** – Connection object
- **oobd_local** – Local OOB data or NULL if not present
- **oobd_remote** – Remote OOB data or NULL if not present

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_oob_get_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data **oobd_local, const struct bt_le_oob_sc_data **oobd_remote)

Get OOB data used for LE Secure Connections (SC) pairing procedure.

This function allows to get OOB data during the LE SC pairing procedure that were set by the bt_le_oob_set_sc_data() API.

**Note:** The OOB data will only be available as long as the connection object associated with it is valid.

**Parameters**

- **conn** – Connection object
- **oobd_local** – Local OOB data or NULL if not set
- **oobd_remote** – Remote OOB data or NULL if not set

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_passkey_set(unsigned int passkey)

Set a fixed passkey to be used for pairing.

This API is only available when the CONFIG_BT_FIXED_PASSKEY configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the pairing_confirm() callback will be called for all incoming pairings.

**Parameters**

- **passkey** – A valid passkey (0 - 999999) or BT_PASSKEY_INVALID to disable a previously set fixed passkey.

**Returns**

0 on success or a negative error code on failure.
int bt_conn_auth_cb_register(const struct bt_conn_auth_cb *cb)
    Register authentication callbacks.
    Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

    **Parameters**
    • cb – Callback struct.

    **Returns**
    Zero on success or negative error code otherwise

int bt_conn_auth_cb_overlay(struct bt_conn *conn, const struct bt_conn_auth_cb *cb)
    Overlay authentication callbacks used for a given connection.
    This function can be used only for Bluetooth LE connections. The CONFIG_BT_SMP must be enabled for this function.
    The authentication callbacks for a given connection cannot be overlaid if security procedures in the SMP module have already started. This function can be called only once per connection.

    **Parameters**
    • conn – Connection object.
    • cb – Callback struct.

    **Returns**
    Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_register(struct bt_conn_auth_info_cb *cb)
    Register authentication information callbacks.
    Register callbacks to get authenticated pairing information. Multiple registrations can be done.

    **Parameters**
    • cb – Callback struct.

    **Returns**
    Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_unregister(struct bt_conn_auth_info_cb *cb)
    Unregister authentication information callbacks.
    Unregister callbacks to stop getting authenticated pairing information.

    **Parameters**
    • cb – Callback struct.

    **Returns**
    Zero on success or negative error code otherwise

int bt_conn_auth_passkey_entry(struct bt_conn *conn, unsigned int passkey)
    Reply with entered passkey.
    This function should be called only after passkey_entry callback from bt_conn_auth_cb structure was called.

    **Parameters**
    • conn – Connection object.
    • passkey – Entered passkey.
Returns
Zero on success or negative error code otherwise

```
int bt_conn_auth_keypress_notify(struct bt_conn *conn, enum bt_conn_auth_keypress type)
```

Send Passkey Keypress Notification during pairing.
This function may be called only after passkey_entry callback from `bt_conn_auth_cb`
structure was called.
Requires `CONFIG_BT_PASSKEY_KEYPRESS`.

See also:
`bt_conn_auth_keypress`.

Parameters
- `conn` – Destination for the notification.
- `type` – What keypress event type to send.

Return values
- `0` – Success
- `-EINVAL` – Improper use of the API.
- `-ENOMEM` – Failed to allocate.
- `-ENOBUS` – Failed to allocate.

```
int bt_conn_auth_cancel(struct bt_conn *conn)
```

Cancel ongoing authenticated pairing.
This function allows to cancel ongoing authenticated pairing.

Parameters
- `conn` – Connection object.

Returns
Zero on success or negative error code otherwise

```
int bt_conn_auth_passkey_confirm(struct bt_conn *conn)
```

Reply if passkey was confirmed to match by user.
This function should be called only after passkey_confirm callback from `bt_conn_auth_cb`
structure was called.

Parameters
- `conn` – Connection object.

Returns
Zero on success or negative error code otherwise

```
int bt_conn_auth_pairing_confirm(struct bt_conn *conn)
```

Reply if incoming pairing was confirmed by user.
This function should be called only after pairing_confirm callback from `bt_conn_auth_cb`
structure was called if user confirmed incoming pairing.

Parameters
- `conn` – Connection object.

Returns
Zero on success or negative error code otherwise
int bt_conn_auth_pincode_entry(struct bt_conn *conn, const char *pin)
    Reply with entered PIN code.

This function should be called only after PIN code callback from bt_conn_auth_cb structure was called. It’s for legacy 2.0 devices.

Parameters
- conn – Connection object.
- pin – Entered PIN code.

Returns
Zero on success or negative error code otherwise

struct bt_conn *bt_conn_create_br(const bt_addr_t *peer, const struct bt_br_conn_param *param)
Initiate an BR/EDR connection to a remote device.
Allows initiate new BR/EDR link to remote peer using its address.
The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

Parameters
- peer – Remote address.
- param – Initial connection parameters.

Returns
Valid connection object on success or NULL otherwise.

struct bt_conn *bt_conn_create_sco(const bt_addr_t *peer)
Initiate an SCO connection to a remote device.
Allows initiate new SCO link to remote peer using its address.
The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

Parameters
- peer – Remote address.

Returns
Valid connection object on success or NULL otherwise.

struct bt_le_conn_param
    #include <conn.h> Connection parameters for LE connections.

struct bt_conn_le_phy_info
    #include <conn.h> Connection PHY information for LE connections.

Public Members

uint8_t rx_phy
    Connection transmit PHY.

struct bt_conn_le_phy_param
    #include <conn.h> Preferred PHY parameters for LE connections.
Public Members

uint16_t options
    Connection PHY options.

uint8_t pref_tx_phy
    Bitmask of preferred transmit PHYs.

uint8_t pref_rx_phy
    Bitmask of preferred receive PHYs.

struct bt_conn_le_data_len_info
    #include <conn.h> Connection data length information for LE connections.

Public Members

uint16_t tx_max_len
    Maximum Link Layer transmission payload size in bytes.

uint16_t tx_max_time
    Maximum Link Layer transmission payload time in us.

uint16_t rx_max_len
    Maximum Link Layer reception payload size in bytes.

uint16_t rx_max_time
    Maximum Link Layer reception payload time in us.

struct bt_conn_le_data_len_param
    #include <conn.h> Connection data length parameters for LE connections.

Public Members

uint16_t tx_max_len
    Maximum Link Layer transmission payload size in bytes.

uint16_t tx_max_time
    Maximum Link Layer transmission payload time in us.

struct bt_conn_le_info
    #include <conn.h> LE Connection Info Structure.

Public Members

const bt_addr_le_t *src
    Source (Local) Identity Address.
const bt_addr_le_t *dst
   Destination (Remote) Identity Address or remote Resolvable Private Address (RPA) before identity has been resolved.

const bt_addr_le_t *local
   Local device address used during connection setup.

const bt_addr_le_t *remote
   Remote device address used during connection setup.

uint16_t interval
   Connection interval.

uint16_t latency
   Connection peripheral latency.

uint16_t timeout
   Connection supervision timeout.

struct bt_conn_br_info
   #include <conn.h> BR/EDR Connection Info Structure.

   Public Members

   const bt_addr_t *dst
      Destination (Remote) BR/EDR address.

struct bt_security_info
   #include <conn.h> Security Info Structure.

   Public Members

   bt_security_t level
      Security Level.

   uint8_t enc_key_size
      Encryption Key Size.

   enum bt_security_flag flags
      Flags.

struct bt_conn_info
   #include <conn.h> Connection Info Structure.

6.1. Bluetooth
Public Members

enum bt_conn_type type
    Connection Type.

uint8_t role
    Connection Role.

uint8_t id
    Which local identity the connection was created with.

struct bt_conn_le_info le
    LE Connection specific Info.

struct bt_conn_br_info br
    BR/EDR Connection specific Info.

union bt_conn_info
    Connection Type specific Info.

enum bt_conn_state state
    Connection state.

struct bt_security_info security
    Security specific info.

struct bt_conn_le_remote_info
    #include <conn.h> LE Connection Remote Info Structure.

Public Members

const uint8_t *features
    Remote LE feature set (bitmask).

struct bt_conn_br_remote_info
    #include <conn.h> BR/EDR Connection Remote Info structure.

Public Members

const uint8_t *features
    Remote feature set (pages of bitmasks).

uint8_t num_pages
    Number of pages in the remote feature set.
**struct bt_conn_remote_info**
#include <conn.h> Connection Remote Info Structure.

**Note:** The version, manufacturer and subversion fields will only contain valid data if CONFIG_BT_REMOTE_VERSION is enabled.

**Public Members**

- **uint8_t** *type*
  Connection Type.

- **uint8_t** *version*
  Remote Link Layer version.

- **uint16_t** *manufacturer*
  Remote manufacturer identifier.

- **uint16_t** *subversion*
  Per-manufacturer unique revision.

**struct bt_conn_le_remote_info** *le*
LE connection remote info.

**struct bt_conn_br_remote_info** *br*
BR/EDR connection remote info.

**struct bt_conn_le_tx_power**
#include <conn.h> LE Transmit Power Level Structure.

**Public Members**

- **uint8_t** *phy*
  Input: 1M, 2M, Coded S2 or Coded S8.

- **int8_t** *current_level*
  Output: current transmit power level.

- **int8_t** *max_level*
  Output: maximum transmit power level.

**struct bt_conn_le_tx_power_report**
#include <conn.h> LE Transmit Power Reporting Structure.
Public Members

`uint8_t reason`
Reason for Transmit power reporting, as documented in Core Spec.
Version 5.4 Vol. 4, Part E, 7.7.65.33.

`enum bt_conn_le_tx_power_phy phy`
Phy of Transmit power reporting.

`int8_t tx_power_level`
Transmit power level.

- 0xXX - Transmit power level
  - Range: -127 to 20
  - Units: dBm
- 0x7E - Remote device is not managing power levels on this PHY.
- 0x7F - Transmit power level is not available

`uint8_t tx_power_level_flag`
Bit 0: Transmit power level is at minimum level.
Bit 1: Transmit power level is at maximum level.

`int8_t delta`
Change in transmit power level.

- 0xXX - Change in transmit power level (positive indicates increased power, negative indicates decreased power, zero indicates unchanged) Units: dB
- 0x7F - Change is not available or is out of range.

`struct bt_conn_le_create_param`

```
#include <conn.h>
```

Public Members

`uint32_t options`
Bit-field of create connection options.

`uint16_t interval`
Scan interval (N * 0.625 ms)

`uint16_t window`
Scan window (N * 0.625 ms)

`uint16_t interval_coded`
Scan interval LE Coded PHY (N * 0.625 MS)
Set zero to use same as LE 1M PHY scan interval
uint16_t window_coded
    Scan window LE Coded PHY (N * 0.625 MS)
    Set zero to use same as LE 1M PHY scan window.

uint16_t timeout
    Connection initiation timeout (N * 10 MS)
    Set zero to use the default CONFIG_BT_CREATE_CONN_TIMEOUT timeout.

**Note:** Unused in `bt_conn_le_create_auto`

```c
struct bt_conn_le_create_synced_param
    #include <conn.h>
```

**Public Members**

```c
const bt_addr_le_t *peer
    Remote address.
    The peer must be synchronized to the PAWR train.
```

```c
uint8_t subevent
    The subevent where the connection will be initiated.
```

```c
struct bt_conn_cb
    #include <conn.h> Connection callback structure.

This structure is used for tracking the state of a connection. It is registered with the help of the `bt_conn_cb_register()` API. It's permissible to register multiple instances of this `bt_conn_cb` type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

**Public Members**

```c
void (*connected)(struct bt_conn *conn, uint8_t err)
    A new connection has been established.
    This callback notifies the application of a new connection. In case the err parameter is non-zero it means that the connection establishment failed.
    `err` can mean either of the following:
    • BT_HCI_ERR_UNKNOWN_CONN_ID Creating the connection started by `bt_conn_le_create` was canceled either by the user through `bt_conn_disconnect` or by the timeout in the host through `bt_conn_le_create_param` timeout parameter, which defaults to CONFIG_BT_CREATE_CONN_TIMEOUT seconds.
    • BT_HCI_ERR_ADV_TIMEOUT High duty cycle directed connectable advertiser started by `bt_le_adv_start` failed to be connected within the timeout.
```
Note: If the connection was established from an advertising set then the advertising set cannot be restarted directly from this callback. Instead use the connected callback of the advertising set.

void (*disconnected)(struct bt_conn *conn, uint8_t reason)
A connection has been disconnected.
This callback notifies the application that a connection has been disconnected.
When this callback is called the stack still has one reference to the connection object. If the application in this callback tries to start either a connectable advertiser or create a new connection this might fail because there are no free connection objects available. To avoid this issue it is recommended to either start connectable advertise or create a new connection using k_work_submit or increase CONFIG_BT_MAX_CONN.

Param conn
Connection object.
Param reason
BT_HCI_ERR_* reason for the disconnection.

void (*recycled)(void)
A connection object has been returned to the pool.
This callback notifies the application that it might be able to allocate a connection object. No guarantee, first come, first serve.
Use this to e.g. re-start connectable advertising or scanning.
Treat this callback as an ISR, as it originates from bt_conn_unref which is used by the BT stack. Making Bluetooth API calls in this context is error-prone and strongly discouraged.

bool (*le_param_req)(struct bt_conn *conn, struct bt_le_conn_param *param)
LE connection parameter update request.

This callback notifies the application that a remote device is requesting to update the connection parameters. The application accepts the parameters by returning true, or rejects them by returning false. Before accepting, the application may also adjust the parameters to better suit its needs.

It is recommended for an application to have just one of these callbacks for simplicity. However, if an application registers multiple it needs to manage the potentially different requirements for each callback. Each callback gets the parameters as returned by previous callbacks, i.e. they are not necessarily the same ones as the remote originally sent.

If the application does not have this callback then the default is to accept the parameters.

Param conn
Connection object.
Param param
Proposed connection parameters.
Return
true to accept the parameters, or false to reject them.
void (*le_param_updated)(struct bt_conn *conn, uint16_t interval, uint16_t latency, uint16_t timeout)

  The parameters for an LE connection have been updated.
  This callback notifies the application that the connection parameters for an LE connection have been updated.

  **Param conn**
  Connection object.

  **Param interval**
  Connection interval.

  **Param latency**
  Connection latency.

  **Param timeout**
  Connection supervision timeout.

void (*identity_resolved)(struct bt_conn *conn, const bt_addr_le_t *rpa, const bt_addr_le_t *identity)

  Remote Identity Address has been resolved.
  This callback notifies the application that a remote Identity Address has been resolved.

  **Param conn**
  Connection object.

  **Param rpa**
  Resolvable Private Address.

  **Param identity**
  Identity Address.

void (*security_changed)(struct bt_conn *conn, bt_security_t level, enum bt_security_err err)

  The security level of a connection has changed.
  This callback notifies the application that the security of a connection has changed.
  The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

  **Param conn**
  Connection object.

  **Param level**
  New security level of the connection.

  **Param err**

void (*remote_info_available)(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)

  Remote information procedures has completed.
  This callback notifies the application that the remote information has been retrieved from the remote peer.

  **Param conn**
  Connection object.

  **Param remote_info**
  Connection information of remote device.

void (*le_phy_updated)(struct bt_conn *conn, struct bt_conn_le_phy_info *param)
The PHY of the connection has changed. This callback notifies the application that the PHY of the connection has changed.

**Param conn**
Connection object.

**Param info**
Connection LE PHY information.

```c
void (*le_data_len_updated)(struct bt_conn *conn, struct bt_conn_le_data_len_info *info)
```

The data length parameters of the connection has changed. This callback notifies the application that the maximum Link Layer payload length or transmission time has changed.

**Param conn**
Connection object.

**Param info**
Connection data length information.

```c
struct bt_conn_oob_info
```

#include <conn.h> Info Structure for OOB pairing.

### Public Types

Type of OOB pairing method.

**Values:**

- enumerator **BT_CONN_OOB_LE_LEGACY**
  LE legacy pairing.

- enumerator **BT_CONN_OOB_LE_SC**
  LE SC pairing.

### Public Members

```c
enum bt_conn_oob_info type
```

Type of OOB pairing method.

```c
enum bt_conn_oob_info oob_config
```

OOB data configuration.

```c
struct bt_conn_oob_info lesc
```

LE Secure Connections OOB pairing parameters.

```c
struct bt_conn_pairing_feat
```

#include <conn.h> Pairing request and pairing response info structure.

This structure is the same for both smp_pairing_req and smp_pairing_rsp and a subset of the packet data, except for the initial Code octet. It is documented in Core Spec. Vol. 3, Part H, 3.5.1 and 3.5.2.
Public Members

`struct bt_conn_auth_cb`

#include <conn.h> Authenticated pairing callback structure.

Public Members

`enum bt_security_err (*pairing_accept)(struct bt_conn *conn, const struct bt_conn_pairing_feat *const feat)`
Query to proceed incoming pairing or not.

On any incoming pairing req/rsp this callback will be called for the application to decide whether to allow for the pairing to continue.

The pairing info received from the peer is passed to assist making the decision.

As this callback is synchronous the application should return a response value immediately. Otherwise it may affect the timing during pairing. Hence, this information should not be conveyed to the user to take action.

The remaining callbacks are not affected by this, but do notice that other callbacks can be called during the pairing. Eg. if pairing_confirm is registered both will be called for Just-Works pairings.

This callback may be unregistered in which case pairing continues as if the Kconfig flag was not set.

This callback is not called for BR/EDR Secure Simple Pairing (SSP).
Param conn
Connection where pairing is initiated.

Param feat
Pairing req/resp info.

void (*passkey_display)(struct bt_conn *conn, unsigned int passkey)
Display a passkey to the user.

When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability to display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

Param conn
Connection where pairing is currently active.

Param passkey
Passkey to show to the user.

void (*passkey_entry)(struct bt_conn *conn)
Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that’s how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the `bt_conn_auth_passkey_entry()` API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.

Param conn
Connection where pairing is currently active.

Param passkey
Passkey to be confirmed.

void (*passkey_confirm)(struct bt_conn *conn, unsigned int passkey)
Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the `bt_conn_auth_passkey_confirm()` API should be called. If the user concluded that the passkey doesn’t match the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.

Param conn
Connection where pairing is currently active.

Param passkey
Passkey to be confirmed.

void (*oob_data_request)(struct bt_conn *conn, struct bt_conn_oob_info *info)
Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the `bt_le_oob_set_sc_data()` API.

This callback must be set to non-NULL in order to support OOB pairing.

**Param conn**
- Connection where pairing is currently active.

**Param info**
- OOB pairing information.

```c
void (*cancel)(struct bt_conn *conn)
```

Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the `passkey_display`, `passkey_entry` `passkey_confirm` or `pairing_confirm` callback has been provided.

**Param conn**
- Connection where pairing is currently active.

```c
void (*pairing_confirm)(struct bt_conn *conn)
```

Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the `bt_conn_auth_pairing_confirm()` API should be called. If the user decides to reject the pairing the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

**Param conn**
- Connection where pairing is currently active.

```c
void (*pincode_entry)(struct bt_conn *conn, bool highsec)
```

Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the `highsec` parameter is set to true the PIN code must be 16 digits long.

Once entered, the PIN code should be given to the stack using the `bt_conn_auth_pincode_entry()` API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

**Param conn**
- Connection where pairing is currently active.

**Param highsec**
- true if 16 digit PIN is required.
struct bt_conn_auth_info_cb
#include <conn.h> Authenticated pairing information callback structure.

Public Members

void (*pairing_complete)(struct bt_conn *conn, bool bonded)
notify that pairing procedure was complete.
This callback notifies the application that the pairing procedure has been completed.
  Param conn
  Connection object.
  Param bonded
  Bond information has been distributed during the pairing procedure.

void (*pairing_failed)(struct bt_conn *conn, enum bt_security_err reason)
notify that pairing process has failed.
  Param conn
  Connection object.
  Param reason
  Pairing failed reason

void (*bond_deleted)(uint8_t id, const bt_addr_le_t *peer)
Notify that bond has been deleted.
This callback notifies the application that the bond information for the remote peer has been deleted
  Param id
  Which local identity had the bond.
  Param peer
  Remote address.

sys_snodie_t node
  Internally used field for list handling.

struct bt_br_conn_param
#include <conn.h> Connection parameters for BR/EDR connections.

Bluetooth Controller

API Reference

group bt_ctrl
  Bluetooth Controller.

Functions

void bt_ctlr_set_public_addr(const uint8_t *addr)
  Set public address for controller.
  Should be called before bt_enable().
Parameters
  • addr – Public address

Bluetooth Coordinated Sets

API Reference

group bt_gatt_csip
Copyright (c) 2021-2022 Nordic Semiconductor ASA.
SPDX-License-Identifier: Apache-2.0
Coordinated Set Identification Profile (CSIP)

  • [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_CSIP_SET_COORDINATOR_DISCOVER_TIMER_VALUE
  Recommended timer for member discovery.

BT_CSIP_SET_COORDINATOR_MAX_CSIS_INSTANCES

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT
  Accept the request to read the SIRK as plaintext.

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT_ENC
  Accept the request to read the SIRK, but return encrypted SIRK.

BT_CSIP_READ_SIRK_REQ_RSP_REJECT
  Reject the request to read the SIRK.

BT_CSIP_READ_SIRK_REQ_RSP_OOB_ONLY
  SIRK is available only via an OOB procedure.

BT_CSIP_SET_SIRK_SIZE
  Size of the Set Identification Resolving Key (SIRK)

BT_CSIP_RSI_SIZE
  Size of the Resolvable Set Identifier (RSI)

BT_CSIP_ERROR_LOCK_DENIED
  Service is already locked.

BT_CSIP_ERROR_LOCK_RELEASE_DENIED
  Service is not locked.
Invalid lock value.

SIRK only available out-of-band.

Client is already owner of the lock.

Helper to declare `bt_data` array including RSI.

This macro is mainly for creating an array of struct `bt_data` elements which is then passed to e.g. `bt_le_ext_adv_start()`.

**Parameters**

- `_rsi` – Pointer to the RSI value

**Typedefs**

typedef void (*`bt_csip_set_coordinator_discover_cb`)(struct bt_conn *conn, const struct `bt_csip_set_coordinator_set_member` *member, int err, size_t set_count)

Callback for discovering Coordinated Set Identification Services.

**Param conn**

Pointer to the remote device.

**Param member**

Pointer to the set member.

**Param err**

0 on success, or an errno value on error.

**Param set_count**

Number of sets on the member.

typedef void (*`bt_csip_set_coordinator_lock_set_cb`)(int err)

Callback for locking a set across one or more devices.

**Param err**

0 on success, or an errno value on error.

typedef void (*`bt_csip_set_coordinator_lock_changed_cb`)(struct `bt_csip_set_coordinator_csis_inst` *inst, bool locked)

Callback when the lock value on a set of a connected device changes.

**Param inst**

The Coordinated Set Identification Service instance that was changed.

**Param locked**

Whether the lock is locked or release.

**Return**

int Return 0 on success, or an errno value on error.
typedef void (*bt_csip_set_coordinator_sirk_changed_cb)(struct bt_csip_set_coordinator_csis_inst *inst)

Callback when the SIRK value of a set of a connected device changes.

**Param inst**
The Coordinated Set Identification Service instance that was changed. The new SIRK can be accessed via the inst.info.

typedef void (*bt_csip_set_coordinator_ordered_access_cb_t)(const struct bt_csip_set_coordinator_set_info *set_info, int err, bool locked, struct bt_csip_set_coordinator_set_member *member)

Callback for bt_csip_set_coordinator_ordered_access()

If any of the set members supplied to bt_csip_set_coordinator_ordered_access() is in the locked state, this will be called with locked true and member will be the locked member, and the ordered access procedure is cancelled. Likewise, if any error occurs, the procedure will also be aborted.

**Param set_info**
Pointer to the a specific set_info struct.

**Param err**
Error value. 0 on success, GATT error or errno on fail.

**Param locked**
Whether the lock is locked or release.

**Param member**
The locked member if locked is true, otherwise NULL.

typedef bool (*bt_csip_set_coordinator_ordered_access_t)(const struct bt_csip_set_coordinator_set_info *set_info, struct bt_csip_set_coordinator_set_member *members[], size_t count)

Callback function definition for bt_csip_set_coordinator_ordered_access()

**Param set_info**
Pointer to the a specific set_info struct.

**Param members**
Array of members ordered by rank. The procedure shall be done on the members in ascending order.

**Param count**
Number of members in members.

**Return**
true if the procedures can be successfully done, or false to stop the procedure.

Functions

void *bt_csip_set_member_svc_decl_get(const struct bt_csip_set_member_svc_inst *svc_inst)

Get the service declaration attribute.

The first service attribute can be included in any other GATT service.

**Parameters**
- **svc_inst** – Pointer to the Coordinated Set Identification Service.
Returns

The first CSIS attribute instance.

```c
int bt_csip_set_member_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)
```

Register a Coordinated Set Identification Service instance.
This will register and enable the service and make it discoverable by clients.
This shall only be done as a server.

**Parameters**

- `param` – Coordinated Set Identification Service register parameters.
- `svc_inst` – [out] Pointer to the registered Coordinated Set Identification Service.

**Returns**

0 if success, errno on failure.

```c
int bt_csip_set_member_unregister(struct bt_csip_set_member_svc_inst *svc_inst)
```

Unregister a Coordinated Set Identification Service instance.
This will unregister and disable the service instance.

**Parameters**

- `svc_inst` – Pointer to the registered Coordinated Set Identification Service.

**Returns**

0 if success, errno on failure.

```c
int bt_csip_set_member_set_sirk(struct bt_csip_set_member_svc_inst *svc_inst, const uint8_t sirk[16])
```

Set the SIRK of a service instance.

**Parameters**

- `svc_inst` – Pointer to the registered Coordinated Set Identification Service.
- `sirk` – The new SIRK.

```c
int bt_csip_set_member_get_sirk(struct bt_csip_set_member_svc_inst *svc_inst, uint8_t sirk[16])
```

Get the SIRK of a service instance.

**Parameters**

- `sirk` – [out] Array to store the SIRK in.

```c
int bt_csip_set_member_generate_rsi(const struct bt_csip_set_member_svc_inst *svc_inst, uint8_t rsi[6])
```

Generate the Resolvable Set Identifier (RSI) value.
This will generate RSI for given `svc_inst` instance.

**Parameters**

- `svc_inst` – Pointer to the Coordinated Set Identification Service.
- `rsi` – Pointer to the 6-octet newly generated RSI data in little-endian.
**Returns**

int 0 if on success, errno on error.

int bt_csip_set_member_lock(struct bt_csip_set_member_svc_inst *svc_inst, bool lock, bool force)

Locks a specific Coordinated Set Identification Service instance on the server.

**Parameters**

- **svc_inst** – Pointer to the Coordinated Set Identification Service.
- **lock** – If true lock the set, if false release the set.
- **force** – This argument only have meaning when lock is false (release) and will force release the lock, regardless of who took the lock.

**Returns**

0 on success, GATT error on error.

int bt_csip_set_coordinator_discover(struct bt_conn *conn)

Initialise the csip_set_coordinator instance for a connection. This will do a discovery on the device and prepare the instance for following commands.

**Parameters**

- **conn** – Pointer to remote device to perform discovery on.

**Returns**

int Return 0 on success, or an errno value on error.

bool bt_csip_set_coordinator_is_set_member(const uint8_t set_sirk[16], struct bt_data *data)

Check if advertising data indicates a set member.

**Parameters**

- **set_sirk** – The SIRK of the set to check against
- **data** – The advertising data

**Returns**

true if the advertising data indicates a set member, false otherwise

int bt_csip_set_coordinator_register_cb(struct bt_csip_set_coordinator_cb *cb)

Registers callbacks for csip_set_coordinator.

**Parameters**

- **cb** – Pointer to the callback structure.

**Returns**

Return 0 on success, or an errno value on error.

int bt_csip_set_coordinator_ordered_access(const struct bt_csip_set_coordinator_set_member *members[], uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info, bt_csip_set_coordinator_ordered_access_t cb)

Access Coordinated Set devices in an ordered manner as a client.

This function will read the lock state of all devices and if all devices are in the unlocked state, then cb will be called with the same members as provided by members, but where the members are ordered by rank (if present). Once this procedure is finished or an error occurs, bt_csip_set_coordinator_cb::ordered_access will be called.
This procedure only works if all the members have the lock characteristic, and all either has rank = 0 or unique ranks.

If any of the members are in the locked state, the procedure will be cancelled.

This can only be done on members that are bonded.

**Parameters**
- **members** – Array of set members to access.
- **count** – Number of set members in `members`.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.
- **cb** – The callback function to be called for each member.

```c
int bt_csip_set_coordinator_lock(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Lock an array of set members.

The members will be locked starting from lowest rank going up.

TODO: If locking fails, the already locked members will not be unlocked.

**Parameters**
- **members** – Array of set members to lock.
- **count** – Number of set members in `members`.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**
- Return 0 on success, or an errno value on error.

```c
int bt_csip_set_coordinator_release(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Release an array of set members.

The members will be released starting from highest rank going down.

**Parameters**
- **members** – Array of set members to lock.
- **count** – Number of set members in `members`.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**
- Return 0 on success, or an errno value on error.

```c
struct bt_csip_set_member_cb
#include <csip.h> Callback structure for the Coordinated Set Identification Service.
```

**Public Members**

```c
void (*lock_changed)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst, bool locked)
```

Callback whenever the lock changes on the server.
Param conn
The connection to the client that changed the lock. NULL if server changed it, either by calling bt_csip_set_member_lock() or by timeout.

Param svc_inst
Pointer to the Coordinated Set Identification Service.

Param locked
Whether the lock was locked or released.

uint8_t (*sirk_read_req)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst)
Request from a peer device to read the sirk.

If this callback is not set, all clients will be allowed to read the SIRK unencrypted.

Param conn
The connection to the client that requested to read the SIRK.

Param svc_inst
Pointer to the Coordinated Set Identification Service.

Return
A BT_CSIP_READ_SIRK_REQ_RSP_* response code.

struct bt_csip_set_member_register_param
#include <csip.h> Register structure for Coordinated Set Identification Service.

Public Members

uint8_t set_size
Size of the set.

If set to 0, the set size characteristic won’t be initialized.

uint8_t set_sirk[16]
The unique Set Identity Resolving Key (SIRK)
This shall be unique between different sets, and shall be the same for each set member for each set.

bool lockable
Boolean to set whether the set is lockable by clients.
Setting this to false will disable the lock characteristic.

uint8_t rank
Rank of this device in this set.

If the lockable parameter is set to true, this shall be > 0 and <= to the set_size.
If the lockable parameter is set to false, this may be set to 0 to disable the rank characteristic.

struct bt_csip_set_member_cb *cb
Pointer to the callback structure.

struct bt_csip_set_coordinator_set_info
#include <csip.h> Information about a specific set.
Public Members

uint8_t set_sirk[16]
The 16 octet Set Identity Resolving Key (SIRK)
The Set SIRK may not be exposed by the server over Bluetooth, and may require
an out-of-band solution.

uint8_t set_size
The size of the set.
Will be 0 if not exposed by the server.

uint8_t rank
The rank of the set on on the remote device.
Will be 0 if not exposed by the server.

bool lockable
Whether or not the set can be locked on this device.

struct bt_csip_set_coordinator_csis_inst
#include <csip.h> Struct representing a coordinated set instance on a remote device.
The values in this struct will be populated during discovery of sets
(bt_csip_set_coordinator_discover()).

Public Members

void *svc_inst
Internally used pointer value.

struct bt_csip_set_coordinator_set_member
#include <csip.h> Struct representing a remote device as a set member.

Public Members

struct bt_csip_set_coordinator_csis_inst insts[0]
Array of Coordinated Set Identification Service instances for the remote device.

struct bt_csip_set_coordinator_cb
#include <csip.h>

Cryptography

API Reference

group bt_crypto
Cryptography.
Functions

int bt_rand(void *buf, size_t len)
Generate random data.
A random number generation helper which utilizes the Bluetooth controller's own RNG.

Parameters
• buf – Buffer to insert the random data
• len – Length of random data to generate

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

int bt_encrypt_le(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
AES encrypt little-endian data.
An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters
• key – 128 bit LS byte first key for the encryption of the plaintext
• plaintext – 128 bit LS byte first plaintext data block to be encrypted
• enc_data – 128 bit LS byte first encrypted data block

Returns
Zero on success or error code otherwise.

int bt_encrypt_be(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
AES encrypt big-endian data.
An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters
• key – 128 bit MS byte first key for the encryption of the plaintext
• plaintext – 128 bit MS byte first plaintext data block to be encrypted
• enc_data – 128 bit MS byte first encrypted data block

Returns
Zero on success or error code otherwise.

int bt_ccm_decrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)
Decrypt big-endian data with AES-CCM.
Decrypts and authorizes enc_data with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.
Assumes that the MIC follows directly after the encrypted data.

Parameters
• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• enc_data – Encrypted data
int bt_ccm_encrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)

Encrypt big-endian data with AES-CCM.

Encrypts and generates a MIC from plaintext with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Places the MIC directly after the encrypted data.

Parameters

- key – 128 bit MS byte first key
- nonce – 13 byte MS byte first nonce
- plaintext – Plaintext buffer to encrypt
- len – Length of the encrypted data
- aad – Additional authenticated data
- aad_len – Additional authenticated data length
- enc_data – Buffer to place encrypted data in
- mic_size – Size of the trailing MIC (in bytes)

Return values

- 0 – Successfully encrypted the data.
- -EINVAL – Invalid parameters.
- -EBADMSG – Authentication failed.

Data Buffers

API Reference

group bt_buf

Data buffers.

Defines

BT_BUF_RESERVE

BT_BUF_SIZE(size)

Helper to include reserved HCI data in buffer calculations.
**BT_BUF_ACL_SIZE(size)**
Helper to calculate needed buffer size for HCI ACL packets.

**BT_BUF_EVT_SIZE(size)**
Helper to calculate needed buffer size for HCI Event packets.

**BT_BUF_CMD_SIZE(size)**
Helper to calculate needed buffer size for HCI Command packets.

**BT_BUF_ISO_SIZE(size)**
Helper to calculate needed buffer size for HCI ISO packets.

**BT_BUF_ACL_RX_SIZE**
Data size needed for HCI ACL RX buffers.

**BT_BUF_EVT_RX_SIZE**
Data size needed for HCI Event RX buffers.

**BT_BUF_ISO_RX_SIZE**

**BT_BUF_ISO_RX_COUNT**

**BT_BUF_RX_SIZE**
Data size needed for HCI ACL, HCI ISO or Event RX buffers.

**BT_BUF_RX_COUNT**
Buffer count needed for HCI ACL, HCI ISO or Event RX buffers.

**BT_BUF_CMD_TX_SIZE**
Data size needed for HCI Command buffers.

**Enums**

**enum bt_buf_type**
Possible types of buffers passed around the Bluetooth stack.

*Values:*

enumerator **BT_BUF_CMD**
HCI command.

enumerator **BT_BUF_EVT**
HCI event.

enumerator **BT_BUF_ACL_OUT**
Outgoing ACL data.

enumerator **BT_BUF_ACL_IN**
Incoming ACL data.
enumerator BT_BUF_ISO_OUT
   Outgoing ISO data.

enumerator BT_BUF_ISO_IN
   Incoming ISO data.

enumerator BT_BUF_H4
   H:4 data.

Functions

struct net_buf *bt_buf_get_rx(enum bt_buf_type type, k_timeout_t timeout)
   Allocate a buffer for incoming data.
   This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

   Parameters
   • type – Type of buffer. Only BT_BUF_EVT, BT_BUF_ACL_IN and BT_BUF_ISO_IN are allowed.
   • timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

   Returns
   A new buffer.

struct net_buf *bt_buf_get_tx(enum bt_buf_type type, k_timeout_t timeout, const void *data, size_t size)
   Allocate a buffer for outgoing data.
   This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_send().

   Parameters
   • type – Type of buffer. Only BT_BUF_CMD, BT_BUF_ACL_OUT or BT_BUF_H4, when operating on H:4 mode, are allowed.
   • timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.
   • data – Initial data to append to buffer.
   • size – Initial data size.

   Returns
   A new buffer.

struct net_buf *bt_buf_get_evt(uint8_t evt, bool discardable, k_timeout_t timeout)
   Allocate a buffer for an HCI Event.
   This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio() or bt_recv().

   Parameters
   • evt – HCI event code
   • discardable – Whether the driver considers the event discardable.
   • timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.
Returns
A new buffer.

static inline void bt_buf_set_type(struct net_buf *buf, enum bt_buf_type type)
Set the buffer type.

Parameters
• buf – Bluetooth buffer
• type – The BT_* type to set the buffer to

static inline enum bt_buf_type bt_buf_get_type(struct net_buf *buf)
Get the buffer type.

Parameters
• buf – Bluetooth buffer

Returns
The BT_* type to of the buffer

struct bt_buf_data
#include <buf.h> This is a base type for bt_buf user data.

Generic Access Profile (GAP)

API Reference

group bt_gap
Generic Access Profile (GAP)

Defines

BT_ID_DEFAULT
Convenience macro for specifying the default identity.
This helps make the code more readable, especially when only one identity is sup-ported.

BT_DATA_SERIALIZED_SIZE(data_len)
Bluetooth data serialized size.
Get the size of a serialized bt_data given its data length.
Size of ‘AD Structure’->’Length’ field, equal to 1. Size of ‘AD Structure’->’Data’->’AD Type’ field, equal to 1. Size of ‘AD Structure’->’Data’->’AD Data’ field, equal to data_len.
See Core Specification Version 5.4 Vol. 3 Part C, 11, Figure 11.1.

BT_DATA(_type, _data, _data_len)
Helper to declare elements of bt_data arrays.
This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_adv_start().

Parameters
• _type – Type of advertising data field
• _data – Pointer to the data field payload
• _data_len – Number of bytes behind the _data pointer
BT_DATA_BYTES(_type, _bytes...)
Helper to declare elements of \textit{bt\_data} arrays.
This macro is mainly for creating an array of struct \textit{bt\_data} elements which is then passed to e.g. \textit{bt\_le\_adv\_start()}.

\textbf{Parameters}

\begin{itemize}
  \item _type – Type of advertising data field
  \item _bytes – Variable number of single-byte parameters
\end{itemize}

BT_LEADV_PARAM_INIT(_options, _int\_min, _int\_max, _peer)
Initialize advertising parameters.

\textbf{Parameters}

\begin{itemize}
  \item _options – Advertising Options
  \item _int\_min – Minimum advertising interval
  \item _int\_max – Maximum advertising interval
  \item _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.
\end{itemize}

BT_LEADV_PARAM(_options, _int\_min, _int\_max, _peer)
Helper to declare advertising parameters inline.

\textbf{Parameters}

\begin{itemize}
  \item _options – Advertising Options
  \item _int\_min – Minimum advertising interval
  \item _int\_max – Maximum advertising interval
  \item _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.
\end{itemize}

BT_LEADV_CONN_DIR(_peer)

BT_LEADV_CONN

BT_LEADV_CONN_NAME

BT_LEADV_CONN_NAME_AD

BT_LEADV_CONN_DIR_LOW_DUTY(_peer)

BT_LEADV_NCONN
Non-connectable advertising with private address.

BT_LEADV_NCONN_NAME
Non-connectable advertising with \textit{BT\_LE\_ADV\_OPT\_USE\_NAME}.

BT_LEADV_NCONN_IDENTITY
Non-connectable advertising with \textit{BT\_LE\_ADV\_OPT\_USE\_IDENTITY}.

BT_LEEXT_ADV_CONN_NAME
Connectable extended advertising with \textit{BT\_LE\_ADV\_OPT\_USE\_NAME}. 
BT_LE_EXT_ADV_SCAN_NAME
  Scannable extended advertising with BT_LEADV_OPT_USE_NAME.

BT_LE_EXT_ADV_NCONN
  Non-connectable extended advertising with private address.

BT_LE_EXT_ADV_NCONN_NAME
  Non-connectable extended advertising with BT_LEADV_OPT_USE_NAME.

BT_LE_EXT_ADV_NCONN_IDENTITY
  Non-connectable extended advertising with BT_LEADV_OPT_USE_IDENTITY.

BT_LE_EXT_ADV_CODED_NCONN
  Non-connectable extended advertising on coded PHY with private address.

BT_LE_EXT_ADV_CODED_NCONN_NAME
  Non-connectable extended advertising on coded PHY with BT_LEADV_OPT_USE_NAME.

BT_LE_EXT_ADV_CODED_NCONN_IDENTITY
  Non-connectable extended advertising on coded PHY with BT_LEADV_OPT_USE_IDENTITY.

BT_LE_EXT_ADV_START_PARAM_INIT(_timeout, _n_evts)
  Helper to initialize extended advertising start parameters inline.

  Parameters
  • _timeout – Advertiser timeout
  • _n_evts – Number of advertising events

BT_LE_EXT_ADV_START_PARAM(_timeout, _n_evts)
  Helper to declare extended advertising start parameters inline.

  Parameters
  • _timeout – Advertiser timeout
  • _n_evts – Number of advertising events

BT_LE_EXT_ADV_START_DEFAULT

BT_LE_PER_ADV_PARAM_INIT(_int_min, _int_max, _options)
  Helper to declare periodic advertising parameters inline.

  Parameters
  • _int_min – Minimum periodic advertising interval
  • _int_max – Maximum periodic advertising interval
  • _options – Periodic advertising properties bitfield.

BT_LE_PER_ADV_PARAM(_int_min, _int_max, _options)
  Helper to declare periodic advertising parameters inline.

  Parameters
  • _int_min – Minimum periodic advertising interval
• _int_max – Maximum periodic advertising interval
• _options – Periodic advertising properties bitfield.

BT_LE_PER_ADV_DEFAULT

BT_LE_SCAN_OPT_FILTER_WHITELIST

BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)
Initialize scan parameters.

Parameters
• _type – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
• _options – Scan options
• _interval – Scan Interval (N * 0.625 ms)
• _window – Scan Window (N * 0.625 ms)

BT_LE_SCAN_PARAM(_type, _options, _interval, _window)
Helper to declare scan parameters inline.

Parameters
• _type – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
• _options – Scan options
• _interval – Scan Interval (N * 0.625 ms)
• _window – Scan Window (N * 0.625 ms)

BT_LE_SCAN_ACTIVE
Helper macro to enable active scanning to discover new devices.

BT_LE_SCAN_PASSIVE
Helper macro to enable passive scanning to discover new devices.
This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

BT_LE_SCAN_CODED_ACTIVE
Helper macro to enable active scanning to discover new devices.
Include scanning on Coded PHY in addition to 1M PHY.

BT_LE_SCAN_CODED_PASSIVE
Helper macro to enable passive scanning to discover new devices.
Include scanning on Coded PHY in addition to 1M PHY.
This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

Typedefs
typedef void (*bt_ready_cb_t)(int err)
Callback for notifying that Bluetooth has been enabled.

**Param err**
zero on success or (negative) error code otherwise.

typedef void bt_le_scan_cb_t(const bt_addr_le_t *addr, int8_t rssi, uint8_t adv_type, struct net_buf_simple *buf)
Callback type for reporting LE scan results.
A function of this type is given to the *bt_le_scan_start()* function and will be called for any discovered LE device.

**Param addr**
Advertiser LE address and type.

**Param rssi**
Strength of advertiser signal.

**Param adv_type**
Type of advertising response from advertiser. Uses the BT_GAP_ADV_TYPE_* values.

**Param buf**
Buffer containing advertiser data.

typedef void bt_br_discovery_cb_t(struct bt_br_discovery_result *results, size_t count)
Callback type for reporting BR/EDR discovery (inquiry) results.
A callback of this type is given to the *bt_br_discovery_start()* function and will be called at the end of the discovery with information about found devices populated in the results array.

**Param results**
Storage used for discovery results

**Param count**
Number of valid discovery results.

### Enums

Advertising options.

**Values:**

enumerator BT_LE_ADV_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_ADV_OPT_CONNECTABLE = BIT(0)
Advertise as connectable.
Advertise as connectable. If not connectable then the type of advertising is determined by providing scan response data. The advertiser address is determined by the type of advertising and/or enabling privacy CONFIG_BT_PRIVACY.

enumerator BT_LE_ADV_OPT_ONE_TIME = BIT(1)
Advertise one time.
Don’t try to resume connectable advertising after a connection. This option is only meaningful when used together with BT_LE_ADV_OPT_CONNECTABLE. If set the
advertising will be stopped when `bt_le_adv_stop()` is called or when an incoming (peripheral) connection happens. If this option is not set the stack will take care of keeping advertising enabled even as connections occur. If Advertising directed or the advertiser was started with `bt_le_ext_adv_start` then this behavior is the default behavior and this flag has no effect.

enumerator `BT_LE_ADV_OPT_USE_IDENTITY = BIT(2)`
Advertise using identity address.
Advertise using the identity address as the advertiser address.

**Note:** The address used for advertising will not be the same as returned by `bt_le_oob_get_local`, instead `bt_id_get` should be used to get the LE address.

**Warning:** This will compromise the privacy of the device, so care must be taken when using this option.

enumerator `BT_LE_ADV_OPT_USE_NAME = BIT(3)`
Advertise using GAP device name.

Include the GAP device name automatically when advertising. By default the GAP device name is put at the end of the scan response data.
When advertising using `@ref BT_LE_ADV_OPT_EXT_ADV` and not `@ref BT_LE_ADV_OPT_SCANNABLE` then it will be put at the end of the advertising data.
If the GAP device name does not fit into advertising data it will be converted to a shortened name if possible.
`@ref BT_LE_ADV_OPT_FORCE_NAME_IN_AD` can be used to force the device name to appear in the advertising data of an advert with scan response data.
The application can set the device name itself by including the following in the advertising data.
```
@code
BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
@endcode
```

enumerator `BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY = BIT(4)`
Low duty cycle directed advertising.
Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator `BT_LE_ADV_OPT_DIR_ADDR_RPA = BIT(5)`
Directed advertising to privacy-enabled peer.
Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator `BT_LE_ADV_OPT_FILTER_SCAN_REQ = BIT(6)`
Use filter accept list to filter devices that can request scan response data.
enumerator BT_LE_ADV_OPT_FILTER_CONN = BIT(7)
Use filter accept list to filter devices that can connect.

enumerator BT_LE_ADV_OPT_NOTIFY_SCAN_REQ = BIT(8)
Notify the application when a scan response data has been sent to an active scanner.

enumerator BT_LE_ADV_OPT_SCANNABLE = BIT(9)
Support scan response data.
When used together with BT_LE_ADV_OPT_EXT_ADV then this option cannot be used together with the BT_LE_ADV_OPT_CONNECTABLE option. When used together with BT_LE_ADV_OPT_EXT_ADV then scan response data must be set.

enumerator BT_LE_ADV_OPT_EXT_ADV = BIT(10)
Advertise with extended advertising.
This options enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.

Without this option the advertiser will send advertising data on the three primary advertising channels.

Note: Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.

Note: This cannot be used with bt_le_adv_start().

enumerator BT_LE_ADV_OPT_NO_2M = BIT(11)
Disable use of LE 2M PHY on the secondary advertising channel.
Disabling the use of LE 2M PHY could be necessary if scanners don’t support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

Note: Cannot be set if BT_LE_ADV_OPT_CODED is set.

Note: Requires BT_LE_ADV_OPT_EXT_ADV.

enumerator BT_LE_ADV_OPT_CODED = BIT(12)
Advertise on the LE Coded PHY (Long Range).
The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.
Note: Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

enumerator \texttt{BT\_LE\_ADV\_OPT\_ANONYMOUS} = \texttt{BIT}(13)
Advertise without a device address (identity or RPA).

Note: Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

enumerator \texttt{BT\_LE\_ADV\_OPT\_USE\_TX\_POWER} = \texttt{BIT}(14)
Advertise with transmit power.

Note: Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

enumerator \texttt{BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_37} = \texttt{BIT}(15)
Disable advertising on channel index 37.

enumerator \texttt{BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_38} = \texttt{BIT}(16)
Disable advertising on channel index 38.

enumerator \texttt{BT\_LE\_ADV\_OPT\_DISABLE\_CHAN\_39} = \texttt{BIT}(17)
Disable advertising on channel index 39.

enumerator \texttt{BT\_LE\_ADV\_OPT\_FORCE\_NAME\_IN\_AD} = \texttt{BIT}(18)
Put GAP device name into advert data.
Will place the GAP device name into the advertising data rather than the scan response data.

Note: Requires \texttt{BT\_LE\_ADV\_OPT\_USE\_NAME}

enumerator \texttt{BT\_LE\_ADV\_OPT\_USE\_NRPA} = \texttt{BIT}(19)
Advertise using a Non-Resolvable Private Address.
A new NRPA is set when updating the advertising parameters.
This is an advanced feature; most users will want to enable \texttt{CONFIG\_BT\_EXT\_ADV}
instead.

Note: Not implemented when \texttt{CONFIG\_BT\_PRIVACY}.

Note: Mutually exclusive with \texttt{BT\_LE\_ADV\_OPT\_USE\_IDENTITY}.

Periodic Advertising options.

Values:
enumerator `BT_LE_PER_ADV_OPT_NONE` = 0
Convenience value when no options are specified.

enumerator `BT_LE_PER_ADV_OPT_USE_TX_POWER` = `BIT(1)`
Advertise with transmit power.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

enumerator `BT_LE_PER_ADV_OPT_INCLUDE_ADI` = `BIT(2)`
Advertise with included AdvDataInfo (ADI).

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

Periodic advertising sync options.

**Values:**

enumerator `BT_LE_PER_ADV_SYNC_OPT_NONE` = 0
Convenience value when no options are specified.

enumerator `BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST` = `BIT(0)`
Use the periodic advertising list to sync with advertiser.
When this option is set, the address and SID of the parameters are ignored.

enumerator `BT_LE_PER_ADV_SYNC_OPT_REPORTING_INITIALLY_DISABLED` = `BIT(1)`
Disables periodic advertising reports.
No advertisement reports will be handled until enabled.

enumerator `BT_LE_PER_ADV_SYNC_OPT_FILTER_DUPLICATE` = `BIT(2)`
Filter duplicate Periodic Advertising reports.

enumerator `BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOA` = `BIT(3)`
Sync with Angle of Arrival (AoA) constant tone extension.

enumerator `BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_1US` = `BIT(4)`
Sync with Angle of Departure (AoD) 1us constant tone extension.

enumerator `BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_2US` = `BIT(5)`
Sync with Angle of Departure (AoD) 2us constant tone extension.

enumerator `BT_LE_PER_ADV_SYNC_OPT_SYNC_ONLY_CONST_TONE_EXT` = `BIT(6)`
Do not sync to packets without a constant tone extension.

Periodic Advertising Sync Transfer options.

**Values:**

6.1. Bluetooth
enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOA = BIT(0)
No Angle of Arrival (AoA)
Do not sync with Angle of Arrival (AoA) constant tone extension

denumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_1US = BIT(1)
No Angle of Departure (AoD) 1 us.
Do not sync with Angle of Departure (AoD) 1 us constant tone extension

denumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_2US = BIT(2)
No Angle of Departure (AoD) 2.
Do not sync with Angle of Departure (AoD) 2 us constant tone extension

denumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_ONLY_CTE = BIT(3)
Only sync to packets with constant tone extension.

denumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTING_INITIALLY_DISABLED = BIT(4)
Sync to received PAST packets but don’t generate sync reports.
This option must not be set at the same time as
BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES.

denumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES = BIT(5)
Sync to received PAST packets and generate sync reports with duplicate filtering.
This option must not be set at the same time as
BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTING_INITIALLY_DISABLED.

Values:

denumerator BT_LE_SCAN_OPT_NONE = 0
Convenience value when no options are specified.

denumerator BT_LE_SCAN_OPT_FILTER_DUPLICATE = BIT(0)
Filter duplicates.

denumerator BT_LE_SCAN_OPT_FILTER_ACCEPT_LIST = BIT(1)
Filter using filter accept list.

denumerator BT_LE_SCAN_OPT_CODED = BIT(2)
Enable scan on coded PHY (Long Range).

denumerator BT_LE_SCAN_OPT_NO_1M = BIT(3)
Disable scan on 1M phy.

Note: Requires BT_LE_SCAN_OPT_CODED.
Values:

enumerator `BT_LE_SCAN_TYPE_PASSIVE` = 0x00
  Scan without requesting additional information from advertisers.

enumerator `BT_LE_SCAN_TYPE_ACTIVE` = 0x01
  Scan and request additional information from advertisers.

  Using this scan type will automatically send scan requests to all devices. Scan responses are received in the same manner and using the same callbacks as advertising reports.

Functions

```c
int bt_enable(bt_ready_cb_t cb)
```

Enable Bluetooth.

Enable Bluetooth. Must be the called before any calls that require communication with the local Bluetooth hardware.

When `CONFIG_BT_SETTINGS` is enabled, the application must load the Bluetooth settings after this API call successfully completes before Bluetooth APIs can be used. Loading the settings before calling this function is insufficient. Bluetooth settings can be loaded with `settings_load()` or `settings_load_subtree()` with argument “bt”. The latter selectively loads only Bluetooth settings and is recommended if `settings_load()` has been called earlier.

Parameters

- `cb` – Callback to notify completion or NULL to perform the enabling synchronously.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_disable(void)
```

Disable Bluetooth.

Disable Bluetooth. Can’t be called before `bt_enable` has completed.

Close and release HCI resources. Result is architecture dependent.

Returns

Zero on success or (negative) error code otherwise.

```c
bool bt_is_ready(void)
```

Check if Bluetooth is ready.

Returns

true when Bluetooth is ready, false otherwise

```c
int bt_set_name(const char *name)
```

Set Bluetooth Device Name.

Set Bluetooth GAP Device Name.

When advertising with device name in the advertising data the name should be updated by calling `bt_le_adv_update_data` or `bt_le_ext_adv_set_data`. 
zephyr project documentation, release 3.6.99

See also:

CONFIG_BT_DEVICE_NAME_MAX.

Note: Requires CONFIG_BT_DEVICE_NAME_DYNAMIC.

Parameters

• name – New name

Returns

Zero on success or (negative) error code otherwise.

const char *bt_get_name(void)
Get Bluetooth Device Name.
Get Bluetooth GAP Device Name.

Returns

Bluetooth Device Name

uint16_t bt_get_appearance(void)
Get local Bluetooth appearance.

Bluesooth Appearance is a description of the external appearance of a device in terms
of an Appearance Value.

See also:

https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

Returns

Appearance Value of local Bluetooth host.

int bt_set_appearance(uint16_t new_appearance)
Set local Bluetooth appearance.

Automatically preserves the new appearance across reboots if CONFIG_BT_SETTINGS is
enabled.

This symbol is linkable if CONFIG_BT_DEVICE_APPEARANCE_DYNAMIC is enabled.

Parameters

• new_appearance – Appearance Value

Return values

• 0 – Success.
• other – Persistent storage failed. Appearance was not updated.

void bt_id_get(bt_addr_le_t *addr, size_t *count)
Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all avail-
able identities can be retrieved, the number of elements in the addr array should be
CONFIG_BT_ID_MAX. The identity identifier that some APIs expect (such as advertising
parameters) is simply the index of the identity in the addr array.

If addr is passed as NULL, then returned count contains the count of all available
identities that can be retrieved with a subsequent call to this function with non-NULL
addr parameter.
Parameters

- `addrs` – Array where to store the configured identities.
- `count` – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

```c
int bt_id_create(bt_addr_le_t *addr, uint8_t *irk)
```
Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling `bt_enable()`. However, the new identity will only be stored persistently in flash when this API is used after `bt_enable()`. The reason is that the persistent settings are loaded after `bt_enable()` and would therefore cause potential conflicts with the stack blindly overwriting what's stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before `bt_enable()`.

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using `bt_enable()`), then call `settings_load()`, and after that check with `bt_id_get()` how many identities were recovered. If an insufficient amount of identities were recovered the app may then call `bt_id_create()` to create new ones.

If supported by the HCI driver (indicated by setting `CONFIG_BT_HCI_SET_PUBLIC_ADDR`), the first call to this function can be used to set the controller's public identity address. This call must happen before calling `bt_enable()`. Subsequent calls always add/generate random static addresses.

Parameters

- `addr` – Address to use for the new identity. If NULL or initialized to `BT_ADDR_LE_ANY` the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- `irk` – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy `CONFIG_BT_PRIVACY` is not enabled this parameter must be NULL.

Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.

```c
int bt_id_reset(uint8_t id, bt_addr_le_t *addr, uint8_t *irk)
```
Reset/reclaim an identity for reuse.

The semantics of the `addr` and `irk` parameters of this function are the same as with `bt_id_create()`. The difference is the first `id` parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the `addr` and `irk` parameters.
Note: the default identity (BT_ID_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

Parameters

- **id** – Existing identity identifier.
- **addr** – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- **irk** – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.

```
int bt_id_delete(uint8_t id)
```

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag is as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the `bt_id_reset()` API needs to be used.

Note: the default identity (BT_ID_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

Parameters

- **id** – Existing identity identifier.

Returns

0 in case of success, or a negative error code on failure.

```
size_t bt_data_get_len(const struct bt_data data[], size_t data_count)
```

Get the total size (in bytes) of a given set of `bt_data` structures.

Parameters

- **data_count** – [in] Number of `bt_data` structures in `data`.

Returns

Size of the concatenated data, built from the `bt_data` structure set.

```
size_t bt_data_serialize(const struct bt_data *input, uint8_t *output)
```

Serialize a `bt_data` struct into an advertising structure (a flat byte array).

The data are formatted according to the Bluetooth Core Specification v. 5.4, vol. 3, part C, 11.

Parameters

- **input** – [in] Single `bt_data` structure to read from.
• **output** – [out] Buffer large enough to store the advertising structure in input. The size of it must be at least the size of the input->data_len + 2 (for the type and the length).

**Returns**
Number of bytes written in output.

```c
int bt_le_adv_start(const struct bt_le_adv_param *param, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
```

Start advertising.

Set advertisement data, scan response data, advertisement parameters and start advertising.

When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be `BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT`.

This function cannot be used with `BT_LE_ADV_OPT_EXT_ADV` in the param.options. For extended advertising, the bt_le_ext_adv_* functions must be used.

**Parameters**
- `param` – Advertising parameters.
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in `ad`.
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in `sd`.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_adv_update_data(const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
```

Update advertising.

Update advertisement and scan response data.

**Parameters**
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in `ad`.
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in `sd`.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_adv_stop(void)
```

Stop advertising.

Stops ongoing advertising.
Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_create(const struct bt_le_adv_param *param, const struct bt_le_ext_adv_cb *cb, struct bt_le_ext_adv **adv)

Create advertising set.
Create a new advertising set and set advertising parameters. Advertising parameters can be updated with bt_le_ext_adv_update_param.

Parameters
• cb – [in] Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
• adv – [out] Valid advertising set object on success.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_start(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_start_param *param)

Start advertising with the given advertising set.
If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

Parameters
• adv – Advertising set object.
• param – Advertise start parameters.

int bt_le_ext_adv_stop(struct bt_le_ext_adv *adv)

Stop advertising with the given advertising set.
Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

Parameters
• adv – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_set_data(struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)

Set an advertising set's advertising or scan response data.
Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.
When both BT_LE_ADV_OPT_EXT_ADV and BT_LE_ADV_OPT_SCANNABLE are enabled then advertising data is ignored. When BT_LE_ADV_OPT_SCANNABLE is not enabled then scan response data is ignored.
If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is BT_GAP_ADV_MAX_ADV_DATA_LEN bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN bytes.
**Note:** Not all scanners support extended data length advertising data.

**Note:** When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

### Parameters
- `adv` – Advertising set object.
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in ad
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in sd

### Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_ext_adv_update_param(struct bt_le_ext_adv *adv, const struct bt_le_adv_param *param)
```

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

**Note:** When changing the option `BT_LE_ADV_OPT_USE_NAME` then `bt_le_ext_adv_set_data` needs to be called in order to update the advertising data and scan response data.

### Parameters
- `adv` – Advertising set object.
- `param` – Advertising parameters.

### Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_ext_adv_delete(struct bt_le_ext_adv *adv)
```

Delete advertising set.

Delete advertising set. This will free up the advertising set and make it possible to create a new advertising set.

### Returns
Zero on success or (negative) error code otherwise.

```c
uint8_t bt_le_ext_adv_get_index(struct bt_le_ext_adv *adv)
```

Get array index of an advertising set.

This function is used to map bt_adv to index of an array of advertising sets. The array has `CONFIG_BT_EXT_ADV_MAX_ADV_SET` elements.

### Parameters
- `adv` – Advertising set.
Returns
Index of the advertising set object. The range of the returned value is
0..CONFIG_BT_EXT_ADV_MAX_ADV_SET-1

int bt_le_ext_adv_get_info(const struct bt_le_ext_adv *adv, struct bt_le_ext_adv_info *info)

Get advertising set info.

Parameters
• adv – Advertising set object
• info – Advertising set info object

Returns
Zero on success or (negative) error code on failure.

int bt_le_per_adv_set_param(struct bt_le_ext_adv *adv, const struct bt_le_per_adv_param *param)

Set or update the periodic advertising parameters.
The periodic advertising parameters can only be set or updated on an extended advertise-
tment set which is neither scannable, connectable nor anonymous.

Parameters
• adv – Advertising set object.
• param – Advertising parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_data(const struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len)

Set or update the periodic advertising data.
The periodic advertisement data can only be set or updated on an extended advertise-
tment set which is neither scannable, connectable nor anonymous.

Parameters
• adv – Advertising set object.
• ad – Advertising data.
• ad_len – Advertising data length.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_subevent_data(const struct bt_le_ext_adv *adv, uint8_t num_subevents, const struct bt_le_per_adv_subevent_data_params *params)

Set the periodic advertising with response subevent data.
Set the data for one or more subevents of a Periodic Advertising with Responses Adver-
tiser in reply data request.

Parameters
• adv – The extended advertiser the PAwR train belongs to.
• num_subevents – The number of subevents to set data for.
• params – Subevent parameters.

Pre
There are num_subevents elements in params.
**Pre**
The controller has requested data for the subevents in params.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_start(struct bt_le_ext_adv *adv)
```
Starts periodic advertising.

Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.

Once periodic advertising has been enabled, it will continue advertising until `bt_le_per_adv_stop()` has been called, or if the advertising set is deleted by `bt_le_ext_adv_delete()`. Calling `bt_le_ext_adv_stop()` will not stop the periodic advertising.

**Parameters**
- `adv` – Advertising set object.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_stop(struct bt_le_ext_adv *adv)
```
Stops periodic advertising.

Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

**Parameters**
- `adv` – Advertising set object.

**Returns**
Zero on success or (negative) error code otherwise.

```c
uint8_t bt_le_per_adv_sync_get_index(struct bt_le_per_adv_sync *per_adv_sync)
```
Get array index of an periodic advertising sync object.

This function is get the index of an array of periodic advertising sync objects. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

**Parameters**
- `per_adv_sync` – The periodic advertising sync object.

**Returns**
Index of the periodic advertising sync object. The range of the returned value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

```c
struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_index(uint8_t index)
```
Get a periodic advertising sync object from the array index.

This function is to get the periodic advertising sync object from the array index. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

**Parameters**
- `index` – The index of the periodic advertising sync object. The range of the index value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

**Returns**
The periodic advertising sync object of the array index or NULL if invalid index.
Get periodic adv sync information.

**Parameters**
- `per_adv_sync` – Periodic advertising sync object.
- `info` – Periodic advertising sync info object

**Returns**
Zero on success or (negative) error code on failure.

Look up an existing periodic advertising sync object by advertiser address.

**Parameters**
- `adv_addr` – Advertiser address.
- `sid` – The advertising set ID.

**Returns**
Periodic advertising sync object or NULL if not found.

Create a periodic advertising sync object.

Create a periodic advertising sync object that can try to synchronize to periodic advertising reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

This function does not timeout, and will continue to look for an advertiser until it either finds it or `bt_le_per_adv_sync_delete()` is called. It is thus suggested to implement a timeout when using this, if it is expected to find the advertiser within a reasonable timeframe.

**Parameters**
- `out_sync` – [out] Periodic advertising sync object on.

**Returns**
Zero on success or (negative) error code otherwise.

Delete periodic advertising sync.

Delete the periodic advertising sync object. Can be called regardless of the state of the sync. If the syncing is currently syncing, the syncing is cancelled. If the sync has been established, it is terminated. The periodic advertising sync object will be invalidated afterwards.

If the state of the sync object is syncing, then a new periodic advertising sync object may not be created until the controller has finished canceling this object.

**Parameters**
- `per_adv_sync` – The periodic advertising sync object.

**Returns**
Zero on success or (negative) error code otherwise.
void bt_le_per_adv_sync_cb_register(struct bt_le_adv_sync_cb *cb)
    Register periodic advertising sync callbacks.
    Adds the callback structure to the list of callback structures for periodic advertising
    syncs.
    This callback will be called for all periodic advertising sync activity, such as synced,
    terminated and when data is received.

    Parameters
    • cb – Callback struct. Must point to memory that remains valid.

int bt_le_per_adv_sync_recv_enable(struct bt_le_adv_sync *per_adv_sync)
    Enables receiving periodic advertising reports for a sync.
    If the sync is already receiving the reports, -EALREADY is returned.

    Parameters
    • per_adv_sync – The periodic advertising sync object.

    Returns
    Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_recv_disable(struct bt_le_adv_sync *per_adv_sync)
    Disables receiving periodic advertising reports for a sync.
    If the sync report receiving is already disabled, -EALREADY is returned.

    Parameters
    • per_adv_sync – The periodic advertising sync object.

    Returns
    Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer(const struct bt_le_adv_sync *per_adv_sync, const
    struct bt_conn *conn, uint16_t service_data)
    Transfer the periodic advertising sync information to a peer device.
    This will allow another device to quickly synchronize to the same periodic advertising
    train that this device is currently synced to.

    Parameters
    • per_adv_sync – The periodic advertising sync to transfer.
    • conn – The peer device that will receive the sync information.
    • service_data – Application service data provided to the remote host.

    Returns
    Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_info_transfer(const struct bt_le_ext_adv *adv, const struct
    bt_conn *conn, uint16_t service_data)
    Transfer the information about a periodic advertising set.
    This will allow another device to quickly synchronize to periodic advertising set from
    this device.

    Parameters
    • adv – The periodic advertising set to transfer info of.
    • conn – The peer device that will receive the information.
    • service_data – Application service data provided to the remote host.
Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer_subscribe(const struct bt_conn *conn, const struct bt_le_per_adv_sync_transfer_param *param)

Subscribe to periodic advertising sync transfers (PASTs).
Sets the parameters and allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
• param – The periodic advertising sync transfer parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer_unsubscribe(const struct bt_conn *conn)

Unsubscribe from periodic advertising sync transfers (PASTs).
Remove the parameters that allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_add(const bt_addr_le_t *addr, uint8_t sid)

Add a device to the periodic advertising list.
Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the bt_le_scan_recv_info in the scan callback.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_remove(const bt_addr_le_t *addr, uint8_t sid)

Remove a device from the periodic advertising list.
Removes peer device LE address from the periodic advertising list.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the bt_le_scan_recv_info in the scan callback.

Returns
Zero on success or (negative) error code otherwise.
int bt_le_per_adv_list_clear(void)
    Clear the periodic advertising list.
    Clears the entire periodic advertising list.

    Returns
    Zero on success or (negative) error code otherwise.

int bt_le_scan_start(const struct bt_le_scan_param *param, bt_le_scan_cb_t cb)
    Start (LE) scanning.
    Start LE scanning with given parameters and provide results through the specified callback.

    Note: The LE scanner by default does not use the Identity Address of the local device when CONFIG_BT_PRIVACY is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then CONFIG_BT_SCAN_WITH_IDENTITY must be enabled.

    Parameters
    • param – Scan parameters.
    • cb – Callback to notify scan results. May be NULL if callback registration through bt_le_scan_cb_register is preferred.

    Returns
    Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_scan_stop(void)
    Stop (LE) scanning.
    Stops ongoing LE scanning.

    Returns
    Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

void bt_le_scan_cb_register(struct bt_le_scan_cb *cb)
    Register scanner packet callbacks.
    Adds the callback structure to the list of callback structures that monitors scanner activity.
    This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

    Parameters
    • cb – Callback struct. Must point to memory that remains valid.

void bt_le_scan_cb_unregister(struct bt_le_scan_cb *cb)
    Unregister scanner packet callbacks.
    Remove the callback structure from the list of scanner callbacks.

    Parameters
    • cb – Callback struct. Must point to memory that remains valid.
int bt_le_filter_accept_list_add(const bt_addr_le_t *addr)
Add device (LE) to filter accept list.
Add peer device LE address to the filter accept list.

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

**Parameters**

- `addr` – Bluetooth LE identity address.

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_add(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_remove(const bt_addr_le_t *addr)
Remove device (LE) from filter accept list.
Remove peer device LE address from the filter accept list.

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

**Parameters**

- `addr` – Bluetooth LE identity address.

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_remove(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_clear(void)
Clear filter accept list.
Clear all devices from the filter accept list.

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_clear(void)

int bt_le_set_chan_map(uint8_t chan_map[5])
Set (LE) channel map.

**Parameters**
• chan_map – Channel map.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_set_rpa_timeout(uint16_t new_rpa_timeout)
Set the Resolvable Private Address timeout in runtime.

The new RPA timeout value will be used for the next RPA rotation and all subsequent rotations until another override is scheduled with this API.

Initially, the if CONFIG_BT_RPA_TIMEOUT is used as the RPA timeout.

This symbol is linkable if CONFIG_BT_RPA_TIMEOUT_DYNAMIC is enabled.

Parameters
• new_rpa_timeout – Resolvable Private Address timeout in seconds

Return values
• 0 – Success.
• -EINVAL – RPA timeout value is invalid. Valid range is 1s - 3600s.

void bt_data_parse(struct net_buf_simple *ad, bool (*func)(struct bt_data *data, void *user_data), void *user_data)
Helper for parsing advertising (or EIR or OOB) data.

A helper for parsing the basic data types used for Extended Inquiry Response (EIR), Advertising Data (AD), and OOB data blocks. The most common scenario is to call this helper on the advertising data received in the callback that was given to bt_le_scan_start().

Warning: This helper function will consume ad when parsing. The user should make a copy if the original data is to be used afterwards.

Parameters
• ad – Advertising data as given to the bt_le_scan_ch_t callback.
• func – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.
• user_data – User data to be passed to the callback.

int bt_le_oob_get_local(uint8_t id, struct bt_le_oob *oob)
Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used for advertising started by bt_le_adv_start, active scanning and connection creation.

Note: If privacy is enabled the RPA cannot be refreshed in the following cases:
• Creating a connection in progress, wait for the connected callback. In addition when extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller:
- Advertiser is enabled using a Random Static Identity Address for a different local identity.
- The local identity conflicts with the local identity used by other roles.

Parameters

- **id** – [in] Local identity, in most cases BT_ID_DEFAULT.
- **oob** – [out] LE OOB information

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_le_ext_adv_oob_get_local(struct bt_le_ext_adv *adv, struct bt_le_oob *oob)
```

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used by the advertising set.

**Note:** When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:
- Creating a connection in progress, wait for the connected callback.

Parameters

- **adv** – [in] The advertising set object
- **oob** – [out] LE OOB information

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_br_discovery_start(const struct bt_br_discovery_param *param, struct bt_br_discovery_result *results, size_t count, bt_br_discovery_cb_t cb)
```

Start BR/EDR discovery.

Start BR/EDR discovery (inquiry) and provide results through the specified callback. When `bt_br_discovery_cb_t` is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

Parameters

- **param** – Discovery parameters.
- **results** – Storage for discovery results.
- **count** – Number of results in storage. Valid range: 1-255.
- **cb** – Callback to notify discovery results.
Returns
 Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_stop(void)
Stop BR/EDR discovery.
Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won’t be reported.

Returns
 Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_oob_get_local(struct bt_br_oob *oob)
Get BR/EDR local Out Of Band information.
This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

Parameters
• oob – Out Of Band information

int bt_br_set_discoverable(bool enable)
Enable/disable set controller in discoverable state.
Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it's mandatory to first be in connectable state.

Parameters
• enable – Value allowing/disallowing controller to become discoverable.

Returns
 Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_br_set_connectable(bool enable)
Enable/disable set controller in connectable state.
Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

Parameters
• enable – Value allowing/disallowing controller to be connectable.

Returns
 Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_unpair(uint8_t id, const bt_addr_le_t *addr)
Clear pairing information.

Parameters
• id – Local identity (mostly just BT_ID_DEFAULT).
• addr – Remote address, NULL or BT_ADDR_LE_ANY to clear all remote devices.

Returns
 0 on success or negative error value on failure.
void bt_foreach_bond(uint8_t id, void (*func)(const struct bt_bond_info *info, void *user_data), void *user_data)

Iterate through all existing bonds.

**Parameters**

- **id** – Local identity (mostly just BT_ID_DEFAULT).
- **func** – Function to call for each bond.
- **user_data** – Data to pass to the callback function.

int bt_configure_data_path(uint8_t dir, uint8_t id, uint8_t vs_config_len, const uint8_t *vs_config)

Configure vendor data path.

Request the Controller to configure the data transport path in a given direction between the Controller and the Host.

**Parameters**

- **dir** – Direction to be configured, BT_HCI_DATAPATH_DIR_HOST_TO_CTLR or BT_HCI_DATAPATH_DIR_CTLR_TO_HOST
- **id** – Vendor specific logical transport channel ID, range [BT_HCI_DATAPATH_ID_VS..BT_HCI_DATAPATH_ID_VS_END]
- **vs_config_len** – Length of additional vendor specific configuration data
- **vs_config** – Pointer to additional vendor specific configuration data

**Returns**

0 in case of success or negative value in case of error.

int bt_le_per_adv_sync_subevent(struct bt_le_per_adv_sync *per_adv_sync, struct bt_le_per_adv_sync_subevent_params *params)

Synchronize with a subset of subevents.

Until this command is issued, the subevent(s) the controller is synchronized to is unspecified.

**Parameters**

- **per_adv_sync** – The periodic advertising sync object.
- **params** – Parameters.

**Returns**

0 in case of success or negative value in case of error.

int bt_le_per_adv_set_response_data(struct bt_le_per_adv_sync *per_adv_sync, const struct bt_le_per_adv_response_params *params, const struct net_buf_simple *data)

Set the data for a response slot in a specific subevent of the PAwR.

This function is called by the application to set the response data. The data for a response slot shall be transmitted only once.

**Parameters**

- **per_adv_sync** – The periodic advertising sync object.
- **params** – Parameters.
- **data** – The response data to send.

**Returns**

Zero on success or (negative) error code otherwise.
struct bt_le_ext_adv_sent_info
#include <bluetooth.h>

Public Members

uint8_t num_sent
  The number of advertising events completed.

struct bt_le_ext_adv_connected_info
#include <bluetooth.h>

Public Members

struct bt_conn *conn
  Connection object of the new connection.

struct bt_le_ext_adv_scanned_info
#include <bluetooth.h>

Public Members

bt_addr_le_t *addr
  Active scanner LE address and type.

struct bt_le_per_adv_data_request
#include <bluetooth.h>

Public Members

uint8_t start
  The first subevent data can be set for.

uint8_t count
  The number of subevents data can be set for.

struct bt_le_per_adv_response_info
#include <bluetooth.h>

Public Members

uint8_t subevent
  The subevent the response was received in.

6.1. Bluetooth
uint8_t tx_status
    Status of the subevent indication.
    0 if subevent indication was transmitted. 1 if subevent indication was not trans-
    mitted. All other values RFU.

int8_t tx_power
    The TX power of the response in dBm.

int8_t rssi
    The RSSI of the response in dBm.

uint8_t cte_type
    The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

uint8_t response_slot
    The slot the response was received in.

struct bt_le_ext_adv_cb
    
    #include <bluetooth.h>

Public Members

void (*sent)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_sent_info *info)
    The advertising set has finished sending adv data.
    This callback notifies the application that the advertising set has finished sending
    advertising data. The advertising set can either have been stopped by a timeout or
    because the specified number of advertising events has been reached.
    
    Param adv
        The advertising set object.
    
    Param info
        Information about the sent event.

void (*connected)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_connected_info
    *info)
    The advertising set has accepted a new connection.
    This callback notifies the application that the advertising set has accepted a new
    connection.
    
    Param adv
        The advertising set object.
    
    Param info
        Information about the connected event.

void (*scanned)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_scanned_info
    *info)
    The advertising set has sent scan response data.
    This callback notifies the application that the advertising set has has received a
    Scan Request packet, and has sent a Scan Response packet.
    
    Param adv
        The advertising set object.
    
    Param addr
        Information about the scanned event.
struct bt_data
   
\#include <bluetooth.h> Bluetooth data.

Description of different data types that can be encoded into advertising data. Used to form arrays that are passed to the `bt_le_adv_start()` function.

struct bt_le_adv_param
   
\#include <bluetooth.h> LE Advertising Parameters.

Public Members

uint8_t id
   
Local identity.

**Note:** When extended advertising `CONFIG_BT_EXT_ADV` is not enabled or not supported by the controller it is not possible to scan and advertise simultaneously using two different random addresses.

uint8_t sid
   
Advertising Set Identifier, valid range 0x00 - 0x0f.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

uint8_t secondary_max_skip
   
Secondary channel maximum skip count. Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

uint32_t options
   
Bit-field of advertising options.

uint32_t interval_min
   
Minimum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

uint32_t interval_max
   
Maximum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

6.1. Bluetooth  1763
const bt_addr_le_t *peer

Directed advertising to peer.

When this parameter is set the advertiser will send directed advertising to the remote device.

The advertising type will either be high duty cycle, or low duty cycle if the BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY option is enabled. When using BT_LE_ADV_OPT_EXT_ADV then only low duty cycle is allowed.

In case of connectable high duty cycle if the connection could not be established within the timeout the connected() callback will be called with the status set to BT_HCI_ERR_ADV_TIMEOUT.

struct bt_le_per_adv_param
#include <bluetooth.h>

Public Members

uint16_t interval_min
Minimum Periodic Advertising Interval (N * 1.25 ms)

Shall be greater or equal to BT_GAP_PER_ADV_MIN_INTERVAL and less or equal to interval_max.

uint16_t interval_max
Maximum Periodic Advertising Interval (N * 1.25 ms)

Shall be less or equal to BT_GAP_PER_ADV_MAX_INTERVAL and greater or equal to interval_min.

uint32_t options
Bit-field of periodic advertising options.

struct bt_le_ext_adv_start_param
#include <bluetooth.h>

Public Members

uint16_t timeout
Advertiser timeout (N * 10 ms).

Application will be notified by the advertiser sent callback. Set to zero for no timeout.

When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT.

If privacy CONFIG_BT_PRIVACY is enabled then the timeout must be less than CONFIG_BT_RPA_TIMEOUT.
uint8_t num_events
    Number of advertising events.
    Application will be notified by the advertiser sent callback. Set to zero for no limit.

struct bt_le_ext_adv_info
    #include <bluetooth.h> Advertising set info structure.

    Public Members

    int8_t tx_power
        Currently selected Transmit Power (dBm).

    const bt_addr_le_t *addr
        Current local advertising address used.

struct bt_le_per_adv_subevent_data_params
    #include <bluetooth.h>

    Public Members

    uint8_t subevent
        The subevent to set data for.

    uint8_t response_slot_start
        The first response slot to listen to.

    uint8_t response_slot_count
        The number of response slots to listen to.

    const struct net_buf_simple *data
        The data to send.

struct bt_le_per_adv_sync_synced_info
    #include <bluetooth.h>

    Public Members

    const bt_addr_le_t *addr
        Advertiser LE address and type.

    uint8_t sid
        Advertiser SID.

    uint16_t interval
        Periodic advertising interval (N * 1.25 ms)
uint8_t phy
   Advertiser PHY.

bool recv_enabled
   True if receiving periodic advertisements, false otherwise.

uint16_t service_data
   Service Data provided by the peer when sync is transferred.
   Will always be 0 when the sync is locally created.

struct bt_conn *conn
   Peer that transferred the periodic advertising sync.
   Will always be 0 when the sync is locally created.

struct bt_le_per_adv_sync_term_info
   #include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
   Advertiser LE address and type.

uint8_t sid
   Advertiser SID.

uint8_t reason
   Cause of periodic advertising termination.

struct bt_le_per_adv_sync_recv_info
   #include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
   Advertiser LE address and type.

uint8_t sid
   Advertiser SID.

int8_t tx_power
   The TX power of the advertisement.

int8_t rssi
   The RSSI of the advertisement excluding any CTE.
**uint8_t cte_type**

The Constant Tone Extension (CTE) of the advertisement (bt_df_cce_type)

**struct bt_le_per_adv_sync_state_info**

```c
#include <bluetooth.h>
```

### Public Members

**bool recv_enabled**

True if receiving periodic advertisements, false otherwise.

**struct bt_le_per_adv_sync_cb**

```c
#include <bluetooth.h>
```

### Public Members

#### void (*synced)(struct bt_le_per_adv_sync *sync, struct bt_le_per_adv_sync_synced_info *info)

The periodic advertising has been successfully synced.

This callback notifies the application that the periodic advertising set has been successfully synced, and will now start to receive periodic advertising reports.

- **Param sync**
  - The periodic advertising sync object.

- **Param info**
  - Information about the sync event.

#### void (*term)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_term_info *info)

The periodic advertising sync has been terminated.

This callback notifies the application that the periodic advertising sync has been terminated, either by local request, remote request or because due to missing data, e.g. by being out of range or sync.

- **Param sync**
  - The periodic advertising sync object.

#### void (*recv)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_recv_info *info, struct net_buf_simple *buf)

Periodic advertising data received.

This callback notifies the application of an periodic advertising report.

- **Param sync**
  - The advertising set object.

- **Param info**
  - Information about the periodic advertising event.

- **Param buf**
  - Buffer containing the periodic advertising data. NULL if the controller failed to receive a subevent indication. Only happens if CONFIG_BT_PER_ADV_SYNC_RSP is enabled.
void (*state_changed)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_state_info *info)

The periodic advertising sync state has changed.
This callback notifies the application about changes to the sync state. Initialize sync and termination is handled by their individual callbacks, and won't be notified here.

**Param sync**
The periodic advertising sync object.

**Param info**
Information about the state change.

void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)

BIGInfo advertising report received.
This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

**Param sync**
The advertising set object.

**Param biginfo**
The BIGInfo report.

void (*cte_report_cb)(struct bt_le_per_adv_sync *sync, struct bt_df_per_adv_sync_iq_samples_report const *info)

Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

**Param sync**
The periodic advertising sync object.

**Param info**
Information about the sync event.

struct bt_le_per_adv_sync_param

#include <bluetooth.h>

Public Members

*bt_addr_le_t* addr

Periodic Advertiser Address.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

*uint8_t* sid

Advertiser SID.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

*uint32_t* options

Bit-field of periodic advertising sync options.

*uint16_t* skip
Maximum event skip.
Maximum number of periodic advertising events that can be skipped after a successful receive. Range: 0x0000 to 0x01F3

\texttt{uint16_t timeout}
Synchronization timeout (N * 10 ms)
Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

\texttt{struct bt\_le\_per\_adv\_sync\_info}
#include <bluetooth.h> Advertising set info structure.

\textbf{Public Members}

\texttt{bt\_addr\_le\_t addr}
Periodic Advertiser Address.

\texttt{uint8\_t sid}
Advertiser SID.

\texttt{uint16\_t interval}
Periodic advertising interval (N * 1.25 ms)

\texttt{uint8\_t phy}
Advertiser PHY.

\texttt{struct bt\_le\_per\_adv\_sync\_transfer\_param}
#include <bluetooth.h>

\textbf{Public Members}

\texttt{uint16\_t skip}
Maximum event skip.
The number of periodic advertising packets that can be skipped after a successful receive.

\texttt{uint16\_t timeout}
Synchronization timeout (N * 10 ms)
Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

\texttt{uint32\_t options}
Periodic Advertising Sync Transfer options.

\texttt{struct bt\_le\_scan\_param}
#include <bluetooth.h> LE scan parameters.
Public Members

uint8_t * type
Scan type (BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE)

uint32_t options
Bit-field of scanning options.

uint16_t interval
Scan interval (N * 0.625 ms)

uint16_t window
Scan window (N * 0.625 ms)

uint16_t timeout
Scan timeout (N * 10 ms)
Application will be notified by the scan timeout callback. Set zero to disable timeout.

uint16_t interval_coded
Scan interval LE Coded PHY (N * 0.625 MS)
Set zero to use same as LE 1M PHY scan interval.

uint16_t window_coded
Scan window LE Coded PHY (N * 0.625 MS)
Set zero to use same as LE 1M PHY scan window.

struct bt_le_scan_recv_info
#include <bluetooth.h> LE advertisement and scan response packet information.

Public Members

const bt_addr_le_t * addr
Advertiser LE address and type.
If advertiser is anonymous then this address will be BT_ADDR_LE_ANY.

uint8_t sid
Advertising Set Identifier.

int8_t rssi
Strength of advertiser signal.

int8_t tx_power
Transmit power of the advertiser.
uint8_t adv_type
    Advertising packet type.
    Uses the BT_GAP_ADV_TYPE_* value.
    May indicate that this is a scan response if the type is
    BT_GAP_ADV_TYPE_SCAN_RSP.

uint16_t adv_props
    Advertising packet properties bitfield.
    Uses the BT_GAP_ADV_PROP_* values. May indicate that this is a scan response if
    the value contains the BT_GAP_ADV_PROP_SCAN_RESPONSE bit.

uint16_t interval
    Periodic advertising interval.
    If 0 there is no periodic advertising.

uint8_t primary_phy
    Primary advertising channel PHY.

uint8_t secondary_phy
    Secondary advertising channel PHY.

struct bt_le_scan_cb
    include <bluetooth.h> Listener context for (LE) scanning.

    Public Members

    void (*recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *buf)
        Advertisement packet and scan response received callback.
        Param info
            Advertiser packet and scan response information.
        Param buf
            Buffer containing advertiser data.

    void (*timeout)(void)
        The scanner has stopped scanning after scan timeout.

struct bt_le_oob_sc_data
    include <bluetooth.h> LE Secure Connections pairing Out of Band data.

    Public Members

    uint8_t r[16]
        Random Number.

    uint8_t c[16]
        Confirm Value.

6.1. Bluetooth
struct bt_le_oob
#include <bluetooth.h> LE Out of Band information.

Public Members

bt_addr_le_t addr
LE address.
If privacy is enabled this is a Resolvable Private Address.

struct bt_le_oob_sc_data le_sc_data
LE Secure Connections pairing Out of Band data.

struct bt_br_discovery_result
#include <bluetooth.h> BR/EDR discovery result structure.

Public Members

bt_addr_t addr
Remote device address.

int8_t rssi
RSSI from inquiry.

uint8_t cod[3]
Class of Device.

uint8_t eir[240]
Extended Inquiry Response.

struct bt_br_discovery_param
#include <bluetooth.h> BR/EDR discovery parameters.

Public Members

uint8_t length
Maximum length of the discovery in units of 1.28 seconds.
Valid range is 0x01 - 0x30.

bool limited
True if limited discovery procedure is to be used.
Public Members

bt_addr_t addr
    BR/EDR address.

struct bt_bond_info
    #include <bluetooth.h> Information about a bond with a remote device.

Public Members

bt_addr_le_t addr
    Address of the remote device.

struct bt_le_per_adv_sync_subevent_params
    #include <bluetooth.h>

Public Members

uint16_t properties
    Periodic Advertising Properties.
    Bit 6 is include TxPower, all others RFU.

uint8_t num_subevents
    Number of subevents to sync to.

uint8_t *subevents
    The subevent(s) to synchronize with.
    The array must have num_subevents elements.

struct bt_le_per_adv_response_params
    #include <bluetooth.h>

Public Members

uint16_t request_event
    The periodic event counter of the request the response is sent to.

    bt_le_per_adv_sync_recv_info

    Note: The response can be sent up to one periodic interval after the request was received.

uint8_t request_subevent
    The subevent counter of the request the response is sent to.

    bt_le_per_adv_sync_recv_info
uint8_t response_subevent
    The subevent the response shall be sent in.

uint8_t response_slot
    The response slot the response shall be sent in.

group bt_addr
    Bluetooth device address definitions and utilities.

Defines

BT_ADDR_LE_PUBLIC

BT_ADDR_LE_RANDOM

BT_ADDR_LE_PUBLIC_ID

BT_ADDR_LE_RANDOM_ID

BT_ADDR_LE_UNRESOLVED

BT_ADDR_LE_ANONYMOUS

BT_ADDR_SIZE
    Length in bytes of a standard Bluetooth address.

BT_ADDR_LE_SIZE
    Length in bytes of an LE Bluetooth address.
    Not packed, so no sizeof()

BT_ADDR_ANY
    Bluetooth device “any” address, not a valid address.

BT_ADDR_NONE
    Bluetooth device “none” address, not a valid address.

BT_ADDR_LE_ANY
    Bluetooth LE device “any” address, not a valid address.

BT_ADDR_LE_NONE
    Bluetooth LE device “none” address, not a valid address.

BT_ADDR_IS_RPA(a)
    Check if a Bluetooth LE random address is resolvable private address.

BT_ADDR_IS_NRPA(a)
    Check if a Bluetooth LE random address is a non-resolvable private address.
**BT_ADDR_IS_STATIC(a)**
Check if a Bluetooth LE random address is a static address.

**BT_ADDR_SET_RPA(a)**
Set a Bluetooth LE random address as a resolvable private address.

**BT_ADDR_SET_NRPA(a)**
Set a Bluetooth LE random address as a non-resolvable private address.

**BT_ADDR_SET_STATIC(a)**
Set a Bluetooth LE random address as a static address.

**BT_ADDR_STR_LEN**
Recommended length of user string buffer for Bluetooth address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

**BT_ADDR_LE_STR_LEN**
Recommended length of user string buffer for Bluetooth LE address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

**Functions**

static inline int bt_addr_cmp(const bt_addr_t *a, const bt_addr_t *b)
Compare Bluetooth device addresses.

**Parameters**
- **a** – First Bluetooth device address to compare
- **b** – Second Bluetooth device address to compare

**Returns**
- negative value if \( a < b \), 0 if \( a == b \), else positive

static inline bool bt_addr_eq(const bt_addr_t *a, const bt_addr_t *b)
Determine equality of two Bluetooth device addresses.

**Return values**
- **true** – if the two addresses are equal
- **false** – otherwise

static inline int bt_addr_le_cmp(const bt_addr_le_t *a, const bt_addr_le_t *b)
Compare Bluetooth LE device addresses.

**See also:**
*bt_addr_le_eq*

**Parameters**
- **a** – First Bluetooth LE device address to compare
- **b** – Second Bluetooth LE device address to compare

**Returns**
- negative value if \( a < b \), 0 if \( a == b \), else positive
static inline bool bt_addr_le_eq(const bt_addr_le_t *a, const bt_addr_le_t *b)
    Determine equality of two Bluetooth LE device addresses.
    The Bluetooth LE addresses are equal iff both the types and the 48-bit addresses are numerically equal.

    **Return values**
    • true – if the two addresses are equal
    • false – otherwise

static inline void bt_addr_copy(bt_addr_t *dst, const bt_addr_t *src)
    Copy Bluetooth device address.

    **Parameters**
    • dst – Bluetooth device address destination buffer.
    • src – Bluetooth device address source buffer.

static inline void bt_addr_le_copy(bt_addr_le_t *dst, const bt_addr_le_t *src)
    Copy Bluetooth LE device address.

    **Parameters**
    • dst – Bluetooth LE device address destination buffer.
    • src – Bluetooth LE device address source buffer.

int bt_addr_le_create_nrpa(bt_addr_le_t *addr)
    Create a Bluetooth LE random non-resolvable private address.

int bt_addr_le_create_static(bt_addr_le_t *addr)
    Create a Bluetooth LE random static address.

static inline bool bt_addr_le_is_rpa(const bt_addr_le_t *addr)
    Check if a Bluetooth LE address is a random private resolvable address.

    **Parameters**
    • addr – Bluetooth LE device address.

    **Returns**
    true if address is a random private resolvable address.

static inline bool bt_addr_le_is_identity(const bt_addr_le_t *addr)
    Check if a Bluetooth LE address is valid identity address.

    Valid Bluetooth LE identity addresses are either public address or random static address.

    **Parameters**
    • addr – Bluetooth LE device address.

    **Returns**
    true if address is a valid identity address.

static inline int bt_addr_to_str(const bt_addr_t *addr, char *str, size_t len)
    Converts binary Bluetooth address to string.

    **Parameters**
    • addr – Address of buffer containing binary Bluetooth address.
    • str – Address of user buffer with enough room to store formatted string containing binary address.
• \texttt{len} – Length of data to be copied to user string buffer. Refer to BT_ADDR_STR_LEN about recommended value.

**Returns**
Number of successfully formatted bytes from binary address.

static inline int \texttt{bt_addr_le_to_str(const bt_addr_le_t *addr, char *str, size_t len)}
Converts binary LE Bluetooth address to string.

**Parameters**
- \texttt{addr} – Address of buffer containing binary LE Bluetooth address.
- \texttt{str} – Address of user buffer with enough room to store formatted string containing binary LE address.
- \texttt{len} – Length of data to be copied to user string buffer. Refer to BT_ADDR_LE_STR_LEN about recommended value.

**Returns**
Number of successfully formatted bytes from binary address.

int \texttt{bt_addr_from_str(const char *str, bt_addr_t *addr)}
Convert Bluetooth address from string to binary.

**Parameters**
- \texttt{str} – \texttt{[in]} The string representation of a Bluetooth address.
- \texttt{addr} – \texttt{[out]} Address of buffer to store the Bluetooth address

**Return values**
\texttt{0} – Success. The parsed address is stored in \texttt{addr}.

**Returns**
-EINVAL Invalid address string. \texttt{str} is not a well-formed Bluetooth address.

int \texttt{bt_addr_le_from_str(const char *str, const char *type, bt_addr_le_t *addr)}
Convert LE Bluetooth address from string to binary.

**Parameters**
- \texttt{str} – \texttt{[in]} The string representation of an LE Bluetooth address.
- \texttt{type} – \texttt{[in]} The string representation of the LE Bluetooth address type.
- \texttt{addr} – \texttt{[out]} Address of buffer to store the LE Bluetooth address

**Returns**
Zero on success or (negative) error code otherwise.

**Variables**

const \texttt{bt_addr_t} bt_addr_any
const \texttt{bt_addr_t} bt_addr_none
const \texttt{bt_addr_le_t} bt_addr_le_any
const \texttt{bt_addr_le_t} bt_addr_le_none
struct bt_addr_t
   #include <addr.h> Bluetooth Device Address.

struct bt_addr_le_t
   #include <addr.h> Bluetooth LE Device Address.

BT_APPEARANCE_CYCLING_SPEED_CADENCE
   Speed and Cadence Sensor.

BT_APPEARANCE GENERIC_CONTROLDEVICE
   Generic Control Device.

BT_APPEARANCE_CONTROL SWITCH
   Switch.

BT_APPEARANCE_CONTROL_MULTI_SWITCH
   Multi-switch.

BT_APPEARANCE_CONTROL_BUTTON
   Button.

BT_APPEARANCE_CONTROL_SLIDER
   Slider.

BT_APPEARANCE_CONTROL_ROTARY_SWITCH
   Rotary Switch.

BT_APPEARANCE_CONTROL_TOUCH PANEL
   Touch Panel.

BT_APPEARANCE_CONTROL_SINGLE_SWITCH
   Single Switch.

BT_APPEARANCE_CONTROL_DOUBLE_SWITCH
   Double Switch.

BT_APPEARANCE_CONTROL_TRIPLE_SWITCH
   Triple Switch.

BT_APPEARANCE_CONTROL_BATTERY_SWITCH
   Battery Switch.

BT_APPEARANCE_CONTROL_ENERGY_HARVESTING_SWITCH
   Energy Harvesting Switch.

BT_APPEARANCE_CONTROL_PUSH_BUTTON
   Push Button.

BT_APPEARANCE GENERIC_NETWORKDEVICE
   Generic Network Device.

BT_APPEARANCE_NETWORK_ACCESS_POINT
   Access Point.
BT_APPEARANCE_NETWORK_MESH_DEVICE
   Mesh Device.

BT_APPEARANCE_NETWORK_MESH_PROXY
   Mesh Network Proxy.

BT_APPEARANCE_GENERIC_SENSOR
   Generic Sensor.

BT_APPEARANCE_SENSOR_MOTION
   Motion Sensor.

BT_APPEARANCE_SENSOR_AIR_QUALITY
   Air quality Sensor.

BT_APPEARANCE_SENSOR_TEMPERATURE
   Temperature Sensor.

BT_APPEARANCE_SENSOR_HUMIDITY
   Humidity Sensor.

BT_APPEARANCE_SENSOR_LEAK
   Leak Sensor.

BT_APPEARANCE_SENSOR_SMOKE
   Smoke Sensor.

BT_APPEARANCE_SENSOR_OCCUPANCY
   Occupancy Sensor.

BT_APPEARANCE_SENSOR_CONTACT
   Contact Sensor.

BT_APPEARANCE_SENSOR_PXMONOXIDE
   Carbon Monoxide Sensor.

BT_APPEARANCE_SENSOR_PXDIOXIDE
   Carbon Dioxide Sensor.

BT_APPEARANCE_SENSOR_AMBIENT_LIGHT
   Ambient Light Sensor.

BT_APPEARANCE_SENSOR_ENERGY
   Energy Sensor.

BT_APPEARANCE_SENSOR_COLOR_LIGHT
   Color Light Sensor.
BT_APPEARANCE_SENSOR_RAIN
Rain Sensor.

BT_APPEARANCE_SENSOR_FIRE
Fire Sensor.

BT_APPEARANCE_SENSOR_WIND
Wind Sensor.

BT_APPEARANCE_SENSOR_PROXIMITY
Proximity Sensor.

BT_APPEARANCE_SENSOR_MULTI
Multi-Sensor.

BT_APPEARANCE_SENSOR_FLUSH_MOUNTED
Flush Mounted Sensor.

BT_APPEARANCE_SENSOR_CEILING_MOUNTED
Ceiling Mounted Sensor.

BT_APPEARANCE_SENSOR_WALL_MOUNTED
Wall Mounted Sensor.

BT_APPEARANCE_MULTISENSOR
Multisensor.

BT_APPEARANCE_SENSOR_ENERGY_METER
Energy Meter.

BT_APPEARANCE_SENSOR_FLAME_DETECTOR
Flame Detector.

BT_APPEARANCE_SENSOR_VEHICLE_TIRE_PRESSURE
Vehicle Tire Pressure Sensor.

BT_APPEARANCE_GENERIC_LIGHT_FIXTURES
Generic Light Fixtures.

BT_APPEARANCE_LIGHT_FIXTURES_WALL
Wall Light.

BT_APPEARANCE_LIGHT_FIXTURES_CEILING
Ceiling Light.

BT_APPEARANCE_LIGHT_FIXTURES_FLOOR
Floor Light.
BT_APPEARANCE_LIGHT_FIXTURES_CABINET
Cabinet Light.

BT_APPEARANCE_LIGHT_FIXTURES_DESK
Desk Light.

BT_APPEARANCE_LIGHT_FIXTURES_TROFFER
Troffer Light.

BT_APPEARANCE_LIGHT_FIXTURES_PENDANT
Pendant Light.

BT_APPEARANCE_LIGHT_FIXTURES_IN_GROUND
In-ground Light.

BT_APPEARANCE_LIGHT_FIXTURES_FLOOD
Flood Light.

BT_APPEARANCE_LIGHT_FIXTURES_UNDERWATER
Underwater Light.

BT_APPEARANCE_LIGHT_FIXTURES_BOLLARD_WITH
Bollard with Light.

BT_APPEARANCE_LIGHT_FIXTURES_PATHWAY
Pathway Light.

BT_APPEARANCE_LIGHT_FIXTURES_GARDEN
Garden Light.

BT_APPEARANCE_LIGHT_FIXTURES_POLE_TOP
Pole-top Light.

BT_APPEARANCE_SPOT_LIGHT
Spotlight.

BT_APPEARANCE_LIGHT_FIXTURES_LINEAR
Linear Light.

BT_APPEARANCE_LIGHT_FIXTURES_STREET
Street Light.

BT_APPEARANCE_LIGHT_FIXTURES_SHELVES
Shelves Light.

BT_APPEARANCE_LIGHT_FIXTURES_BAY
Bay Light.
BT_APPEARANCE_LIGHT_FIXTURES_EMERGENCY_EXIT
   Emergency Exit Light.

BT_APPEARANCE_LIGHT_FIXTURES_CONTROLLER
   Light Controller.

BT_APPEARANCE_LIGHT_FIXTURES_DRIVER
   Light Driver.

BT_APPEARANCE_LIGHT_FIXTURES_BULB
   Bulb.

BT_APPEARANCE_LIGHT_FIXTURES_LOW_BAY
   Low-bay Light.

BT_APPEARANCE_LIGHT_FIXTURES_HIGH_BAY
   High-bay Light.

BT_APPEARANCE_GENERIC_FAN
   Generic Fan.

BT_APPEARANCE_FAN_CEILING
   Ceiling Fan.

BT_APPEARANCE_FAN_AXIAL
   Axial Fan.

BT_APPEARANCE_FAN_EXHAUST
   Exhaust Fan.

BT_APPEARANCE_FAN_PEDESTAL
   Pedestal Fan.

BT_APPEARANCE_FAN_DESK
   Desk Fan.

BT_APPEARANCE_FAN_WALL
   Wall Fan.

BT_APPEARANCE_GENERIC_HVAC
   Generic HVAC.

BT_APPEARANCE_HVAC_THERMOSTAT
   Thermostat.

BT_APPEARANCE_HVAC_HUMIDIFIER
   Humidifier.
BT_APPEARANCE_HVAC_DEHUMIDIFIER
De-humidifier.

BT_APPEARANCE_HVAC_HEATER
Heater.

BT_APPEARANCE_HVAC_RADIATOR
Radiator.

BT_APPEARANCE_HVAC_BOILER
Boiler.

BT_APPEARANCE_HVAC_HEAT_PUMP
Heat Pump.

BT_APPEARANCE_HVAC_INFRARED_HEATER
Infrared Heater.

BT_APPEARANCE_HVAC_RADIANT_PANEL_HEATER
Radiant Panel Heater.

BT_APPEARANCE_HVAC_FAN_HEATER
Fan Heater.

BT_APPEARANCE_HVAC_AIR_CURTAIN
Air Curtain.

BT_APPEARANCE_GENERIC_AIR_CONDITIONING
Generic Air Conditioning.

BT_APPEARANCE_GENERIC_HUMIDIFIER
Generic Humidifier.

BT_APPEARANCE_GENERIC_HEATING
Generic Heating.

BT_APPEARANCE_HEATING_RADIATOR
Radiator.

BT_APPEARANCE_HEATING_BOILER
Boiler.

BT_APPEARANCE_HEATING_HEAT_PUMP
Heat Pump.

BT_APPEARANCE_HEATING_INFRARED_HEATER
Infrared Heater.
BT_APPEARANCE_HEATING_RADIANT_PANEL_HEATER
    Radiant Panel Heater.

BT_APPEARANCE_HEATING_FAN_HEATER
    Fan Heater.

BT_APPEARANCE_HEATING_AIR_CURTAIN
    Air Curtain.

BT_APPEARANCE_GENERIC_ACCESS_CONTROL
    Generic Access Control.

BT_APPEARANCE_CONTROL_ACCESS_DOOR
    Access Door.

BT_APPEARANCE_CONTROL_GARAGE_DOOR
    Garage Door.

BT_APPEARANCE_CONTROL_EMERGENCY_EXIT_DOOR
    Emergency Exit Door.

BT_APPEARANCE_CONTROL_ACCESS_LOCK
    Access Lock.

BT_APPEARANCE_CONTROL_ELEVATOR
    Elevator.

BT_APPEARANCE_CONTROL_WINDOW
    Window.

BT_APPEARANCE_CONTROL_ENTRANCE_GATE
    Entrance Gate.

BT_APPEARANCE_CONTROL_DOOR_LOCK
    Door Lock.

BT_APPEARANCE_CONTROL_LOCKER
    Locker.

BT_APPEARANCE_GENERIC_MOTORIZED_DEVICE
    Generic Motorized Device.

BT_APPEARANCE_MOTORIZED_GATE
    Motorized Gate.

BT_APPEARANCE_MOTORIZED_AWNING
    Awning.
BT_INSTANCE_MOTORIZED_BLINDS_OR_SHADES
Blinds or Shades.

BT_INSTANCE_MOTORIZED_CURTAINS
Curtains.

BT_INSTANCE_MOTORIZED_SCREEN
Screen.

BT_INSTANCE_GENERIC_POWER_DEVICE
Generic Power Device.

BT_INSTANCE_POWER_OUTLET
Power Outlet.

BT_INSTANCE_POWER_STRIP
Power Strip.

BT_INSTANCE_POWER_PLUG
Plug.

BT_INSTANCE_POWER_SUPPLY
Power Supply.

BT_INSTANCE_POWER_LED_DRIVER
LED Driver.

BT_INSTANCE_POWER_FLUORESCENT_LAMP_GEAR
Fluorescent Lamp Gear.

BT_INSTANCE_POWER_HID_LAMP_GEAR
HID Lamp Gear.

BT_INSTANCE_POWER_CHARGE_CASE
Charge Case.

BT_INSTANCE_POWER_BANK
Power Bank.

BT_INSTANCE_GENERIC_LIGHT_SOURCE
Generic Light Source.

BT_INSTANCE_LIGHT_SOURCE_INCANDESCENT_BULB
Incandescent Light Bulb.

BT_INSTANCE_LIGHT_SOURCE_LED_LAMP
LED Lamp.
BT_APPEARANCE_LIGHT_SOURCE_HID_LAMP
   HID Lamp.

BT_APPEARANCE_LIGHT_SOURCE_FLUORESCENT_LAMP
   Fluorescent Lamp.

BT_APPEARANCE_LIGHT_SOURCE_LED_ARRAY
   LED Array.

BT_APPEARANCE_LIGHT_SOURCE_MULTICOLOR_LED_ARRAY
   Multi-Color LED Array.

BT_APPEARANCE_LIGHT_SOURCE_LOW_VOLTAGE_HALOGEN
   Low voltage halogen.

BT_APPEARANCE_LIGHT_SOURCE_OLED
   Organic light emitting diode.

BT_APPEARANCE_GENERIC_WINDOW_COVERING
   Generic Window Covering.

BT_APPEARANCE_WINDOW_SHADERS
   Window Shades.

BT_APPEARANCE_WINDOW_BLINDS
   Window Blinds.

BT_APPEARANCE_WINDOW_AWNING
   Window Awning.

BT_APPEARANCE_WINDOW_CURTAIN
   Window Curtain.

BT_APPEARANCE_WINDOW_EXTERIOR_SHUTTER
   Exterior Shutter.

BT_APPEARANCE_WINDOW_EXTERIOR_SCREEN
   Exterior Screen.

BT_APPEARANCE_GENERIC_AUDIO_SINK
   Generic Audio Sink.

BT_APPEARANCE_AUDIO_SINK_STANDALONE_SPEAKER
   Standalone Speaker.

BT_APPEARANCE_AUDIO_SINK_SOUNDBAR
   Soundbar.
Bookshelf Speaker.

Standmounted Speaker.

Speakerphone.

Generic Audio Source.

Microphone.

Alarm.

Bell.

Horn.

Broadcasting Device.

Service Desk.

Kiosk.

Broadcasting Room.

Auditorium.

Generic Motorized Vehicle.

Car.

Large Goods Vehicle.
BT_APPEARANCE_VEHICLE_TWO_WHEELED
2-Wheeled Vehicle

BT_APPEARANCE_VEHICLE_MOTORBIKE
Motorbike.

BT_APPEARANCE_VEHICLE_SCOOTER
Scooter.

BT_APPEARANCE_VEHICLE_MOPED
Moped.

BT_APPEARANCE_VEHICLE_THREE_WHEELED
3-Wheeled Vehicle

BT_APPEARANCE_VEHICLE_LIGHT
Light Vehicle.

BT_APPEARANCE_VEHICLE_QUAD_BIKE
Quad Bike.

BT_APPEARANCE_VEHICLE_MINIBUS
Minibus.

BT_APPEARANCE_VEHICLE_BUS
Bus.

BT_APPEARANCE_VEHICLE_TROLLEY
Trolley.

BT_APPEARANCE_VEHICLE_AGRICULTURAL
Agricultural Vehicle.

BT_APPEARANCE_VEHICLE_CAMPER_OR_CARAVAN
Camper/Caravan.

BT_APPEARANCE_VEHICLE_RECREATIONAL
Recreational Vehicle/Motor Home.

BT_APPEARANCE_GENERIC_DOMESTIC_APPLIANCE
Generic Domestic Appliance.

BT_APPEARANCE_APPLIANCE_REFRIGERATOR
Refrigerator.

BT_APPEARANCE_APPLIANCE_FREEZE
Freezer.
BT_APPEARANCE_APPLIANCE_OVEN
   Oven.

BT_APPEARANCE_APPLIANCE_MICROWAVE
   Microwave.

BT_APPEARANCE_APPLIANCE_TOASTER
   Toaster.

BT_APPEARANCE_APPLIANCE_WASHING_MACHINE
   Washing Machine.

BT_APPEARANCE_APPLIANCE_DRYER
   Dryer.

BT_APPEARANCE_APPLIANCE_COFFEE_MAKER
   Coffee maker.

BT_APPEARANCE_APPLIANCE_CLOTHES_IRON
   Clothes iron.

BT_APPEARANCE_APPLIANCE CURLING_IRON
   Curling iron.

BT_APPEARANCE_APPLIANCE_HAIR_DRYER
   Hair dryer.

BT_APPEARANCE_APPLIANCE_VACUUM_CLEANER
   Vacuum cleaner.

BT_APPEARANCE_APPLIANCE ROBOTIC_VACUUM_CLEANER
   Robotic vacuum cleaner.

BT_APPEARANCE_APPLIANCE_RICE_COOKER
   Rice cooker.

BT_APPEARANCE_APPLIANCE_CLOTHES_STEAMER
   Clothes steamer.

BT_APPEARANCE_GENERIC_WEARABLE_AUDIO_DEVICE
   Generic Wearable Audio Device.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_EARBUD
   Earbud.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADSET
   Headset.
BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADPHONES
Headphones.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_NECK_BAND
Neck Band.

BT_APPEARANCE_GENERIC_AIRCRAFT
Generic Aircraft.

BT_APPEARANCE_AIRCRAFT_LIGHT
Light Aircraft.

BT_APPEARANCE_AIRCRAFT_MICROLIGHT
Microlight.

BT_APPEARANCE_AIRCRAFT_PARAGlider
Paraglider.

BT_APPEARANCE_AIRCRAFT_LARGE_PASSENGER
Large Passenger Aircraft.

BT_APPEARANCE_GENERIC_AV_EQUIPMENT
Generic AV Equipment.

BT_APPEARANCE_AV_EQUIPMENT_AMPLIFIER
Amplifier.

BT_APPEARANCE_AV_EQUIPMENT_RECEIVER
Receiver.

BT_APPEARANCE_AV_EQUIPMENT_RADIO
Radio.

BT_APPEARANCE_AV_EQUIPMENT_TUNER
Tuner.

BT_APPEARANCE_AV_EQUIPMENT_TURNTABLE
Turntable.

BT_APPEARANCE_AV_EQUIPMENT_CD_PLAYER
CD Player.

BT_APPEARANCE_AV_EQUIPMENT_DVD_PLAYER
DVD Player.

BT_APPEARANCE_AV_EQUIPMENT_BLURAY_PLAYER
Bluray Player.
BT_APPEARANCE_AV_EQUIPMENT_OPTICAL_DISC_PLAYER
Optical Disc Player.

BT_APPEARANCE_AV_EQUIPMENT_SET_TOP_BOX
Set-Top Box.

BT_APPEARANCE_GENERIC_DISPLAY_EQUIPMENT
Generic Display Equipment.

BT_APPEARANCE_DISPLAY_EQUIPMENT_TELEVISION
Television.

BT_APPEARANCE_DISPLAY_EQUIPMENT_MONITOR
Monitor.

BT_APPEARANCE_DISPLAY_EQUIPMENT_PROJECTOR
Projector.

BT_APPEARANCE_GENERIC_HEARING_AID
Generic Hearing aid.

BT_APPEARANCE_HEARING_AID_IN_EAR
In-ear hearing aid.

BT_APPEARANCE_HEARING_AID_BEHIND_EAR
Behind-ear hearing aid.

BT_APPEARANCE_HEARING_AID_COCHLEAR_IMPLANT
Cochlear Implant.

BT_APPEARANCE_GENERIC_GAMING
Generic Gaming.

BT_APPEARANCE_HOME_VIDEO_GAME_CONSOLE
Home Video Game Console.

BT_APPEARANCE_PORTABLE_HANDHELD_CONSOLE
Portable handheld console.

BT_APPEARANCE_GENERIC_SIGNAGE
Generic Signage.

BT_APPEARANCE_SIGNAGE_DIGITAL
Digital Signage.

BT_APPEARANCE_SIGNAGE ELECTRONIC_LABEL
Electronic Label.
BT_APPEARANCE_GENERIC_PULSE_OXIMETER
   Generic Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_FINGERTIP
   Fingertip Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_WRIST
   Wrist Worn Pulse Oximeter.

BT_APPEARANCE_GENERIC_WEIGHT_SCALE
   Generic Weight Scale.

BT_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
   Generic Personal Mobility Device.

BT_APPEARANCE_MOBILITY_POWERED_WHEELCHAIR
   Powered Wheelchair.

BT_APPEARANCE_MOBILITY_SCOOTER
   Mobility Scooter.

BT_APPEARANCE_CONTINUOUS_GLUCOSE_MONITOR
   Continuous Glucose Monitor.

BT_APPEARANCE_GENERIC_INSULIN_PUMP
   Generic Insulin Pump.

BT_APPEARANCE_INSULIN_PUMP_DURABLE
   Insulin Pump, durable pump.

BT_APPEARANCE_INSULIN_PUMP_PATCH
   Insulin Pump, patch pump.

BT_APPEARANCE_INSULIN_PEN
   Insulin Pen.

BT_APPEARANCE_GENERIC_MEDICATION_DELIVERY
   Generic Medication Delivery.

BT_APPEARANCE_GENERIC_SPIROMETER
   Generic Spirometer.

BT_APPEARANCE_SPIROMETER_HANDHELD
   Handheld Spirometer.

BT_APPEARANCE_GENERIC_OUTDOOR_SPORTS
   Generic Outdoor Sports Activity.
Defined GAP timers

BT_GAP_SCAN_FAST_INTERVAL

BT_GAP_SCAN_FAST_WINDOW

BT_GAP_SCAN_SLOW_INTERVAL_1

BT_GAP_SCAN_SLOW_WINDOW_1

BT_GAP_SCAN_SLOW_INTERVAL_2

BT_GAP_SCAN_SLOW_WINDOW_2

BT_GAP_ADV_FAST_INT_MIN_1

BT_GAP_ADV_FAST_INT_MAX_1

BT_GAP_ADV_FAST_INT_MIN_2

BT_GAP_ADV_FAST_INT_MAX_2

BT_GAP_ADV_SLOW_INT_MIN

BT_GAP_ADV_SLOW_INT_MAX

BT_GAP_PER_ADV_FAST_INT_MIN_1

BT_GAP_PER_ADV_FAST_INT_MAX_1

BT_GAP_PER_ADV_FAST_INT_MIN_2

BT_GAP_PER_ADV_FAST_INT_MAX_2
Defines

BT_GAP_ADV_MAX_ADV_DATA_LEN
Maximum advertising data length.

BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN
Maximum extended advertising data length.

Note: The maximum advertising data length that can be sent by an extended advertiser is defined by the controller.

BT_GAP_TX_POWER_INVALID

BT_GAP_RSSI_INVALID

BT_GAP_SID_INVALID

BT_GAP_NO_TIMEOUT

BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT

BT_GAP_DATA_LEN_DEFAULT
Default data length.

BT_GAP_DATA_LEN_MAX
Maximum data length.

BT_GAP_DATA_TIME_DEFAULT
Default data time.

BT_GAP_DATA_TIME_MAX
Maximum data time.

BT_GAP_SID_MAX
Maximum advertising set number.
BT_GAP_PER_ADV_MAX_SKIP
Maximum number of consecutive periodic advertisement events that can be skipped after a successful receive.

BT_GAP_PER_ADV_MIN_TIMEOUT
Minimum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MAX_TIMEOUT
Maximum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MIN_INTERVAL
Minimum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_MAX_INTERVAL
Maximum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_INTERVAL_TO_MS(interval)
Convert periodic advertising interval (N * 1.25 ms) to milliseconds.
5 / 4 represents 1.25 ms unit.

BT_LE_SUPP_FEAT_40_ENCODE(w64)
Encode 40 least significant bits of 64-bit LE Supported Features into array values in little-endian format.
Helper macro to encode 40 least significant bits of 64-bit LE Supported Features value into advertising data. The number of bits that are encoded is a number of LE Supported Features defined by BT 5.3 Core specification.
Example of how to encode the 0x000000DFF00DF00D into advertising data.

\[\text{BT\_DATA\_BYTES(BT\_DATA\_LE\_SUPPORTED\_FEATURES, BT\_LE\_SUPP\_FEAT\_40\_\_ENCODE(0x000000DFF00DF00D))}\]

Parameters
• w64 – LE Supported Features value (64-bits)

Returns
The comma separated values for LE Supported Features value that may be used directly as an argument for \text{BT\_DATA\_BYTES}.

BT_LE_SUPP_FEAT_32_ENCODE(w64)
Encode 4 least significant bytes of 64-bit LE Supported Features into 4 bytes long array of values in little-endian format.
Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 4 least significant bytes into advertising data. Other 4 bytes are not encoded.
Example of how to encode the 0x000000DFF00DF00D into advertising data.

\[\text{BT\_DATA\_BYTES(BT\_DATA\_LE\_SUPPORTED\_FEATURES, BT\_LE\_SUPP\_FEAT\_32\_\_ENCODE(0x000000DFF00DF00D))}\]

Parameters
• w64 – LE Supported Features value (64-bits)
Returns
The comma separated values for LE Supported Features value that may be used directly as an argument for \texttt{BT\_DATA\_BYTES}.

\textbf{BT\_LE\_SUPP\_FEAT\_24\_ENCODE}(w64)

Encode 3 least significant bytes of 64-bit LE Supported Features into 3 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 5 bytes are not encoded.

Example of how to encode the \texttt{0x000000DFF00DF00D} into advertising data.

\texttt{BT\_DATA\_BYTES(BT\_DATA\_LE\_SUPPORTED\_FEATURES, BT\_LE\_SUPP\_FEAT\_24\_ENCODE(0x000000DFF00DF00D))}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{w64} – LE Supported Features value (64-bits)
\end{itemize}

\textbf{Returns}

The comma separated values for LE Supported Features value that may be used directly as an argument for \texttt{BT\_DATA\_BYTES}.

\textbf{BT\_LE\_SUPP\_FEAT\_16\_ENCODE}(w64)

Encode 2 least significant bytes of 64-bit LE Supported Features into 2 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 6 bytes are not encoded.

Example of how to encode the \texttt{0x000000DFF00DF00D} into advertising data.

\texttt{BT\_DATA\_BYTES(BT\_DATA\_LE\_SUPPORTED\_FEATURES, BT\_LE\_SUPP\_FEAT\_16\_ENCODE(0x000000DFF00DF00D))}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{w64} – LE Supported Features value (64-bits)
\end{itemize}

\textbf{Returns}

The comma separated values for LE Supported Features value that may be used directly as an argument for \texttt{BT\_DATA\_BYTES}.

\textbf{BT\_LE\_SUPP\_FEAT\_8\_ENCODE}(w64)

Encode the least significant byte of 64-bit LE Supported Features into single byte long array.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes the least significant byte into advertising data. Other 7 bytes are not encoded.

Example of how to encode the \texttt{0x000000DFF00DF00D} into advertising data.

\texttt{BT\_DATA\_BYTES(BT\_DATA\_LE\_SUPPORTED\_FEATURES, BT\_LE\_SUPP\_FEAT\_8\_ENCODE(0x000000DFF00DF00D))}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{w64} – LE Supported Features value (64-bits)
\end{itemize}
**Returns**
The value of least significant byte of LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_VALIDATE(w64)`
Validate whether LE Supported Features value does not use bits that are reserved for future use.
Helper macro to check if `w64` has zeros as bits 40-63. The macro is compliant with BT 5.3 Core Specification where bits 0-40 has assigned values. In case of invalid value, build time error is reported.

**Enums**

LE PHY types.

*Values:*

enumerator `BT_GAP_LE_PHY_NONE` = 0
Convenience macro for when no PHY is set.

eumerator `BT_GAP_LE_PHY_1M` = `BIT`(0)
LE 1M PHY.

eumerator `BT_GAP_LE_PHY_2M` = `BIT`(1)
LE 2M PHY.

eumerator `BT_GAP_LE_PHY_CODED` = `BIT`(2)
LE Coded PHY.

Advertising PDU types.

*Values:*

eumerator `BT_GAP_ADV_TYPE_ADV_IND` = 0x00
Scannable and connectable advertising.

eenumerator `BT_GAP_ADV_TYPE_ADV_DIRECT_IND` = 0x01
Directed connectable advertising.

eenumerator `BT_GAP_ADV_TYPE_ADV_SCAN_IND` = 0x02
Non-connectable and scannable advertising.

eenumerator `BT_GAP_ADV_TYPE_ADV_NONCONN_IND` = 0x03
Non-connectable and non-scannable advertising.

eenumerator `BT_GAP_ADV_TYPE_SCAN_RSP` = 0x04
Additional advertising data requested by an active scanner.
enumerator BT_GAP_ADV_TYPE_EXT_ADV = 0x05
Extended advertising, see advertising properties.

Advertising PDU properties.
Values:

enumerator BT_GAP_ADV_PROP_CONNECTABLE = BIT(0)
Connectable advertising.

enumerator BT_GAP_ADV_PROP_SCANNABLE = BIT(1)
Scannable advertising.

enumerator BT_GAP_ADV_PROP_DIRECTED = BIT(2)
Directed advertising.

enumerator BT_GAP_ADV_PROP_SCAN_RESPONSE = BIT(3)
Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_PROP_EXT_ADV = BIT(4)
Extended advertising.

Constant Tone Extension (CTE) types.
Values:

enumerator BT_GAP_CTE_AOA = 0x00
Angle of Arrival.

enumerator BT_GAP_CTE_AOD_1US = 0x01
Angle of Departure with 1 us slots.

enumerator BT_GAP_CTE_AOD_2US = 0x02
Angle of Departure with 2 us slots.

enumerator BT_GAP_CTE_NONE = 0xFF
No extensions.

Peripheral sleep clock accuracy (SCA) in ppm (parts per million)
Values:

enumerator BT_GAP_SCA_UNKNOWN = 0
Unknown.

enumerator BT_GAP_SCA_251_500 = 0
251 ppm to 500 ppm
enumerator BT_GAP_SCA_151_250 = 1
    151 ppm to 250 ppm
enumerator BT_GAP_SCA_101_150 = 2
    101 ppm to 150 ppm
enumerator BT_GAP_SCA_76_100 = 3
    76 ppm to 100 ppm
enumerator BT_GAP_SCA_51_75 = 4
    51 ppm to 75 ppm
enumerator BT_GAP_SCA_31_50 = 5
    31 ppm to 50 ppm
enumerator BT_GAP_SCA_21_30 = 6
    21 ppm to 30 ppm
enumerator BT_GAP_SCA_0_20 = 7
    0 ppm to 20 ppm

**Generic Attribute Profile (GATT)**

GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using `bt_gatt_service_register()` API which takes the `bt_gatt_service` struct that provides the list of attributes the service contains. The helper macro `BT_GATT_SERVICE()` can be used to declare a service.

Attributes can be declared using the `bt_gatt_attr` struct or using one of the helper macros:

- **BT_GATT_PRIMARY_SERVICE**
  Declares a Primary Service.

- **BT_GATT_SECONDARY_SERVICE**
  Declares a Secondary Service.

- **BT_GATT_INCLUDE_SERVICE**
  Declares an Include Service.

- **BT_GATT_CHARACTERISTIC**
  Declares a Characteristic.

- **BT_GATT_DESCRIPTOR**
  Declares a Descriptor.

- **BT_GATT_ATTRIBUTE**
  Declares an Attribute.

- **BT_GATT_CCC**
  Declares a Client Characteristic Configuration.

- **BT_GATT_CEP**
  Declares a Characteristic Extended Properties.

- **BT_GATT_CUD**
  Declares a Characteristic User Format.
Each attribute contains a uuid, which describes their type, a read callback, a write callback and a set of permissions. Both read and write callbacks can be set to NULL if the attribute permission don't allow their respective operations.

**Note:** 32-bit UUIDs are not supported in GATT. All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU.

**Note:** Attribute read and write callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

Attribute value changes can be notified using `bt_gatt_notify()` API, alternatively there is `bt_gatt_notify_cb()` where it is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by `bt_gatt_indicate()` API.

Client procedures can be enabled with the configuration option: CONFIG_BT_GATT_CLIENT

Discover procedures can be initiated with the use of `bt_gatt_discover()` API which takes the `bt_gatt_discover_params` struct which describes the type of discovery. The parameters also serves as a filter when setting the uuid field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

**Note:** Caching discovered attributes is not supported.

Read procedures are supported by `bt_gatt_read()` API which takes the `bt_gatt_read_params` struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: CONFIG_BT_GATT_READ_MULTIPLE

Write procedures are supported by `bt_gatt_write()` API and takes `bt_gatt_write_params` struct as parameters. In case the write operation don't require a response `bt_gatt_write_without_response()` or `bt_gatt_write_without_response_cb()` APIs can be used, with the later working similarly to `bt_gatt_notify_cb()`.

Subscriptions to notification and indication can be initiated with use of `bt_gatt_subscribe()` API which takes `bt_gatt_subscribe_params` as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple notify callback being triggered for the same attribute. Subscriptions can be removed with use of `bt_gatt_unsubscribe()` API.

**Note:** When subscriptions are removed notify callback is called with the data set to NULL.

**API Reference**

### BLE logging backend

Send log messages over BLE using the BLE logging backend.

**group** `bt_gatt`

Generic Attribute Profile (GATT)

**Defines**
BT_GATT_ERR(_att_err)

Construct error return value for attribute read and write callbacks.

Parameters

• _att_err – ATT error code

Returns

Appropriate error code for the attribute callbacks.

BT_GATT_CHRC_BROADCAST

Characteristic Properties Bit field values.

Characteristic broadcast property.

If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

BT_GATT_CHRC_READ

Characteristic read property.

If set, permits reads of the Characteristic Value.

BT_GATT_CHRC_WRITE_WITHOUT_RESP

Characteristic write without response property.

If set, permits write of the Characteristic Value without response.

BT_GATT_CHRC_WRITE

Characteristic write with response property.

If set, permits write of the Characteristic Value with response.

BT_GATT_CHRC_NOTIFY

Characteristic notify property.

If set, permits notifications of a Characteristic Value without acknowledgment.

BT_GATT_CHRC_INDICATE

Characteristic indicate property.

If set, permits indications of a Characteristic Value with acknowledgment.

BT_GATT_CHRC_AUTH

Characteristic Authenticated Signed Writes property.

If set, permits signed writes to the Characteristic Value.

BT_GATT_CHRC_EXT_PROP

Characteristic Extended Properties property.

If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

BT_GATT_CEP_RELIABLE_WRITE

Characteristic Extended Properties Bit field values.

BT_GATT_CEP_WRITABLE_AUX
BT_GATT_CCC_NOTIFY
Client Characteristic Configuration Values.
Client Characteristic Configuration Notification.
If set, changes to Characteristic Value shall be notified.

BT_GATT_CCC_INDICATE
Client Characteristic Configuration Indication.
If set, changes to Characteristic Value shall be indicated.

BT_GATT_SCC_BROADCAST
Server Characteristic Configuration Values.
Server Characteristic Configuration Broadcast
If set, the characteristic value shall be broadcast in the advertising data when the server is advertising.

Typedefs

typedef ssize_t (*bt_gatt_attr_read_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
    Attribute read callback.
    The callback can also be used locally to read the contents of the attribute in which case no connection will be set.
    
    **Param conn**
    The connection that is requesting to read

    **Param attr**
    The attribute that's being read

    **Param buf**
    Buffer to place the read result in

    **Param len**
    Length of data to read

    **Param offset**
    Offset to start reading from

    **Return**
    Number of bytes read, or in case of an error BT_GATT_ERR() with a specific BT_ATT_ERR_* error code.

typedef ssize_t (*bt_gatt_attr_write_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)
    Attribute write callback.
    
    **Param conn**
    The connection that is requesting to write

    **Param attr**
    The attribute that's being written

    **Param buf**
    Buffer with the data to write
**Param len**  
Number of bytes in the buffer

**Param offset**  
Offset to start writing from

**Param flags**  
Flags (BT_GATT_WRITE_FLAG_*)

**Return**  
Number of bytes written, or in case of an error *BT_GATT_ERR()* with a specific BT_ATT_ERR_* error code.

**Enums**

```c
enum bt_gatt_perm
{
    BT_GATT_PERM_NONE = 0,
    BT_GATT_PERM_READ = BIT(0),
    BT_GATT_PERM_WRITE = BIT(1),
    BT_GATT_PERM_READ_ENCRYPT = BIT(2),
    BT_GATT_PERM_WRITE_ENCRYPT = BIT(3),
    BT_GATT_PERM_READ_AUTHEN = BIT(4),
    BT_GATT_PERM_WRITE_AUTHEN = BIT(5),
}
```

**Values:**

- **enumerator BT_GATT_PERM_NONE = 0**  
  No operations supported, e.g. for notify-only

- **enumerator BT_GATT_PERM_READ = BIT(0)**  
  Attribute read permission.

- **enumerator BT_GATT_PERM_WRITE = BIT(1)**  
  Attribute write permission.

- **enumerator BT_GATT_PERM_READ_ENCRYPT = BIT(2)**  
  Attribute read permission with encryption.

  If set, requires encryption for read access.

- **enumerator BT_GATT_PERM_WRITE_ENCRYPT = BIT(3)**  
  Attribute write permission with encryption.

  If set, requires encryption for write access.

- **enumerator BT_GATT_PERM_READ_AUTHEN = BIT(4)**  
  Attribute read permission with authentication.

  If set, requires encryption using authenticated link-key for read access.

- **enumerator BT_GATT_PERM_WRITE_AUTHEN = BIT(5)**  
  Attribute write permission with authentication.

  If set, requires encryption using authenticated link-key for write access.
enumerator BT_GATT_PERM_PREPARE_WRITE = BIT(6)
Attribute prepare write permission.

If set, allows prepare writes with use of `BT_GATT_WRITE_FLAG_PREPARE` passed to write callback.

enumerator BT_GATT_PERM_READ_LESC = BIT(7)
Attribute read permission with LE Secure Connection encryption.

If set, requires that LE Secure Connections is used for read access.

enumerator BT_GATT_PERM_WRITE_LESC = BIT(8)
Attribute write permission with LE Secure Connection encryption.

If set, requires that LE Secure Connections is used for write access.

GATT attribute write flags.
Values:

enumerator BT_GATT_WRITE_FLAG_PREPARE = BIT(0)
Attribute prepare write flag.

If set, write callback should only check if the device is authorized but no data shall be written.

enumerator BT_GATT_WRITE_FLAG_CMD = BIT(1)
Attribute write command flag.

If set, indicates that write operation is a command (Write without response) which doesn’t generate any response.

enumerator BT_GATT_WRITE_FLAG_EXECUTE = BIT(2)
Attribute write execute flag.

If set, indicates that write operation is a execute, which indicates the end of a long write, and will come after 1 or more `BT_GATT_WRITE_FLAG_PREPARE`.

struct bt_gatt_attr
#include <gatt.h> GATT Attribute structure.

Public Members

const struct bt_uuid *uuid
Attribute UUID.

bt_gatt_attr_write_func_t write
Attribute write callback.
void *user_data
    Attribute user data.

uint16_t handle
    Attribute handle.

uint16_t perm
    Attribute permissions.
    Will be 0 if returned from bt_gatt_discover().

struct bt_gatt_service_static
    #include <gatt.h> GATT Service structure.

    **Public Members**

    const struct bt_gatt_attr *attrs
        Service Attributes.

    size_t attr_count
        Service Attribute count.

struct bt_gatt_service
    #include <gatt.h> GATT Service structure.

    **Public Members**

    struct bt_gatt_attr *attrs
        Service Attributes.

    size_t attr_count
        Service Attribute count.

struct bt_gatt_service_val
    #include <gatt.h> Service Attribute Value.

    **Public Members**

    const struct bt_uuid *uuid
        Service UUID.

    uint16_t end_handle
        Service end handle.

struct bt_gatt_include
    #include <gatt.h> Include Attribute Value.
Public Members

const struct bt_uuid *uuid
Service UUID.

uint16_t start_handle
Service start handle.

uint16_t end_handle
Service end handle.

struct bt_gatt_cb
#include <gatt.h> GATT callback structure.

Public Members

void (*att_mtu_updated)(struct bt_conn *conn, uint16_t tx, uint16_t rx)
The maximum ATT MTU on a connection has changed.
This callback notifies the application that the maximum TX or RX ATT MTU has increased.
   Param conn
       Connection object.
   Param tx
       Updated TX ATT MTU.
   Param rx
       Updated RX ATT MTU.

struct bt_gatt_authorization_cb
#include <gatt.h> GATT authorization callback structure.

Public Members

bool (*read_authorize)(struct bt_conn *conn, const struct bt_gatt_attr *attr)
Authorize the GATT read operation.
This callback allows the application to authorize the GATT read operation for the attribute that is being read.
   Param conn
       Connection object.
   Param attr
       The attribute that is being read.
   Retval true
       Authorize the operation and allow it to execute.
   Retval false
       Reject the operation and prevent it from executing.

bool (*write_authorize)(struct bt_conn *conn, const struct bt_gatt_attr *attr)
Authorize the GATT write operation.
This callback allows the application to authorize the GATT write operation for the attribute that is being written.
**Param conn**
Connection object.

**Param attr**
The attribute that is being written.

**Retval true**
Authorize the operation and allow it to execute.

**Retval false**
Reject the operation and prevent it from executing.

```c
struct bt_gatt_chrc
#include <gatt.h> Characteristic Attribute Value.

Public Members

const struct bt_uuid *uuid
Characteristic UUID.

uint16_t value_handle
Characteristic Value handle.

uint8_t properties
Characteristic properties.
```

```c
struct bt_gatt_cep
#include <gatt.h> Characteristic Extended Properties Attribute Value.

Public Members

uint16_t properties
Characteristic Extended properties.
```

```c
struct bt_gatt_ccc
#include <gatt.h> Client Characteristic Configuration Attribute Value.

Public Members

uint16_t flags
Client Characteristic Configuration flags.
```

```c
struct bt_gatt_scc
#include <gatt.h> Server Characteristic Configuration Attribute Value.

Public Members

uint16_t flags
Server Characteristic Configuration flags.
```
struct bt_gatt_cpf

#include <gatt.h> GATT Characteristic Presentation Format Attribute Value.

**Public Members**

- **uint8_t format**
  Format of the value of the characteristic.

- **int8_t exponent**
  Exponent field to determine how the value of this characteristic is further formatted.

- **uint16_t unit**
  Unit of the characteristic.

- **uint8_t name_space**
  Name space of the description.

- **uint16_t description**
  Description of the characteristic as defined in a higher layer profile.

**GATT Server**

group bt_gatt_server

**Defines**

- **BT_GATT_SERVICE_DEFINE(_name, ...)**
  Statically define and register a service.

  Helper macro to statically define and register a service.

  **Parameters**
  
  - `_name` – Service name.

- **BT_GATT_SERVICE_INSTANCE_DEFINE(_name, _instances, _instance_num, _attrs_def)**
  Statically define service structure array.

  Helper macro to statically define service structure array. Each element of the array is linked to the service attribute array which is also defined in this scope using _attrs_def macro.

  **Parameters**

  - `_name` – Name of service structure array.
  
  - `_instances` – Array of instances to pass as user context to the attribute callbacks.
  
  - `_instance_num` – Number of elements in instance array.
  
  - `_attrs_def` – Macro provided by the user that defines attribute array for the service. This macro should accept single parameter which is the instance context.
BT_GATT_SERVICE(_attrs)
Service Structure Declaration Macro.
Helper macro to declare a service structure.

Parameters
  • _attrs – Service attributes.

BT_GATT_PRIMARY_SERVICE(_service)
Primary Service Declaration Macro.
Helper macro to declare a primary service attribute.

Parameters
  • _service – Service attribute value.

BT_GATT_SECONDARY_SERVICE(_service)
Secondary Service Declaration Macro.
Helper macro to declare a secondary service attribute.

Note: A secondary service is only intended to be included from a primary service or another secondary service or other higher layer specification.

Parameters
  • _service – Service attribute value.

BT_GATT_INCLUDE_SERVICE(_service_incl)
Include Service Declaration Macro.
Helper macro to declare database internal include service attribute.

Parameters
  • _service_incl – the first service attribute of service to include

BT_GATT_CHRC_INIT(_uuid, _handle, _props)
BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)
Characteristic and Value Declaration Macro.
Helper macro to declare a characteristic attribute along with its attribute value.

Parameters
  • _uuid – Characteristic attribute uuid.
  • _props – Characteristic attribute properties, a bitmap of BT_GATT_CHRC_* macros.
  • _perm – Characteristic Attribute access permissions, a bitmap of bt_gatt_perm values.
  • _read – Characteristic Attribute read callback (bt_gatt_attr_read_func_t).
  • _write – Characteristic Attribute write callback (bt_gatt_attr_write_func_t).
  • _user_data – Characteristic Attribute user data.
\textbf{BT\_GATT\_CCC\_INITIALIZER}(_changed, _write, _match)

Initialize Client Characteristic Configuration Declaration Macro.

Helper macro to initialize a Managed CCC attribute value.

\textbf{Parameters}

- \_changed – Configuration changed callback.
- \_write – Configuration write callback.
- \_match – Configuration match callback.

\textbf{BT\_GATT\_CCC\_MANAGED}(_ccc, _perm)

Managed Client Characteristic Configuration Declaration Macro.

Helper macro to declare a Managed CCC attribute.

\textbf{Parameters}

- \_ccc – CCC attribute user data, shall point to a \_bt\_gatt\_ccc.
- \_perm – CCC access permissions, a bitmap of \textit{bt\_gatt\_perm} values.

\textbf{BT\_GATT\_CCC}(_changed, _perm)

Client Characteristic Configuration Declaration Macro.

Helper macro to declare a CCC attribute.

\textbf{Parameters}

- \_changed – Configuration changed callback.
- \_perm – CCC access permissions, a bitmap of \textit{bt\_gatt\_perm} values.

\textbf{BT\_GATT\_CEP}(_value)

Characteristic Extended Properties Declaration Macro.

Helper macro to declare a CEP attribute.

\textbf{Parameters}

- \_value – Pointer to a struct \textit{bt\_gatt\_cep}.

\textbf{BT\_GATT\_CUD}(_value, _perm)

Characteristic User Format Descriptor Declaration Macro.

Helper macro to declare a CUD attribute.

\textbf{Parameters}

- \_value – User description NULL-terminated C string.
- \_perm – Descriptor attribute access permissions, a bitmap of \textit{bt\_gatt\_perm} values.

\textbf{BT\_GATT\_CPF}(_value)

Characteristic Presentation Format Descriptor Declaration Macro.

Helper macro to declare a CPF attribute.

\textbf{Parameters}

- \_value – Pointer to a struct \textit{bt\_gatt\_cpf}.

\textbf{BT\_GATT\_DESCRIPTOR}(_uuid, _perm, _read, _write, _user\_data)

Descriptor Declaration Macro.

Helper macro to declare a descriptor attribute.

\textbf{Parameters}

- \_uuid – UUID of the descriptor.
- \_perm – Descriptor attribute access permissions, a bitmap of \textit{bt\_gatt\_perm} values.
- \_read – Descriptor attribute read callback.
- \_write – Descriptor attribute write callback.
- \_user\_data – User data.
• _uuid – Descriptor attribute uuid.
• _perm – Descriptor attribute access permissions, a bitmap of `bt_gatt_perm` values.
• _read – Descriptor attribute read callback (`bt_gatt_attr_read_func_t`).
• _write – Descriptor attribute write callback (`bt_gatt_attr_write_func_t`).
• _user_data – Descriptor attribute user data.

`BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)`

Attribute Declaration Macro.

Helper macro to declare an attribute.

**Parameters**

• _uuid – Attribute uuid.
• _perm – Attribute access permissions, a bitmap of `bt_gatt_perm` values.
• _read – Attribute read callback (`bt_gatt_attr_read_func_t`).
• _write – Attribute write callback (`bt_gatt_attr_write_func_t`).
• _user_data – Attribute user data.

**Typedefs**

typedef uint8_t (*`bt_gatt_attr_func_t`)(const struct `bt_gatt_attr` *attr, uint16_t handle, void *user_data)

Attribute iterator callback.

**Param** attr
Attribute found.

**Param** handle
Attribute handle found.

**Param** user_data
Data given.

**Return**

`BT_GATT_ITER_CONTINUE` if should continue to the next attribute.

**Return**

`BT_GATT_ITER_STOP` to stop.

typedef void (*`bt_gatt_complete_func_t`)(struct bt_conn *conn, void *user_data)

Notification complete result callback.

**Param** conn
Connection object.

**Param** user_data
Data passed in by the user.

typedef void (*`bt_gatt_indicate_func_t`)(struct bt_conn *conn, struct `bt_gatt_indicate_params` *params, uint8_t err)

Indication complete result callback.

**Param** conn
Connection object.
**Param params**
Indication params object.

**Param err**
ATT error code

typedef void (*bt_gatt_indicate_params_destroy_t)(struct bt_gatt_indicate_params *params)

**Enums**

*Values:*

enumerator BT_GATT_ITER_STOP = 0

enumerator BT_GATT_ITER_CONTINUE

**Functions**

void bt_gatt_cb_register(struct bt_gatt_cb *cb)

Register GATT callbacks.

Register callbacks to monitor the state of GATT. The callback struct must remain valid for the remainder of the program.

**Parameters**

• cb – Callback struct.

int bt_gatt_authorization_cb_register(const struct bt_gatt_authorization_cb *cb)

Register GATT authorization callbacks.

Register callbacks to perform application-specific authorization of GATT operations on all registered GATT attributes. The callback structure must remain valid throughout the entire duration of the Bluetooth subsys activity.

The CONFIG_BT_GATT_AUTHORIZATION_CUSTOM Kconfig must be enabled to make this API functional.

This API allows the user to register only one callback structure concurrently. Passing NULL unregisters the previous set of callbacks and makes it possible to register a new one.

**Parameters**

• cb – Callback struct.

**Returns**

Zero on success or negative error code otherwise

int bt_gatt_service_register(struct bt_gatt_service *svc)

Register GATT service.

Register GATT service. Applications can make use of macros such as BT_GATT_PRIMARY_SERVICE, BT_GATT_CHARACTERISTIC, BT_GATT_DESCRIPTOR, etc.

When using CONFIG_BT_SETTINGS then all services that should have bond configuration loaded, i.e. CCC values, must be registered before calling settings_load.
When using `CONFIG_BT_GATT_CACHING` and `CONFIG_BT_SETTINGS` then all services that should be included in the GATT Database Hash calculation should be added before calling `settings_load()`. All services registered after `settings_load()` will trigger a new database hash calculation and a new hash stored.

There are two situations where this function can be called: either before `bt_init()` has been called, or after `settings_load()` has been called. Registering a service in the middle is not supported and will return an error.

**Parameters**
- `svc` – Service containing the available attributes

**Returns**
- 0 in case of success or negative value in case of error.

**Returns**
- EAGAIN if `bt_init()` has been called but `settings_load()` hasn’t yet.

```c
int bt_gatt_service_unregister(struct bt_gatt_service *svc)
```

Unregister GATT service.

**Parameters**
- `svc` – Service to be unregistered.

**Returns**
- 0 in case of success or negative value in case of error.

```c
bool bt_gatt_service_is_registered(const struct bt_gatt_service *svc)
```

Check if GATT service is registered.

**Parameters**
- `svc` – Service to be checked.

**Returns**
- true if registered or false if not register.

```c
void bt_gatt_foreach_attr_type(uint16_t start_handle, uint16_t end_handle, const struct bt_uuid *uuid, const void *attr_data, uint16_t num_matches, bt_gatt_attr_func_t func, void *user_data)
```

Attribute iterator by type.

Iterate attributes in the given range matching given UUID and/or data.

**Parameters**
- `start_handle` – Start handle.
- `end_handle` – End handle.
- `uuid` – UUID to match, passing NULL skips UUID matching.
- `attr_data` – Attribute data to match, passing NULL skips data matching.
- `num_matches` – Number matches, passing 0 makes it unlimited.
- `func` – Callback function.
- `user_data` – Data to pass to the callback.
• **start_handle** – Start handle.
• **end_handle** – End handle.
• **func** – Callback function.
• **user_data** – Data to pass to the callback.

```c
struct bt_gatt_attr *bt_gatt_attr_next(const struct bt_gatt_attr *attr)
```
Iterate to the next attribute.

```c
struct bt_gatt_attr *bt_gatt_find_by_uuid(const struct bt_gatt_attr *attr, uint16_t attr_count, const struct bt_uuid *uuid)
```
Find Attribute by UUID.

```
uint16_t bt_gatt_attr_get_handle(const struct bt_gatt_attr *attr)
```
Get Attribute handle.

```
uint16_t bt_gatt_attr_value_handle(const struct bt_gatt_attr *attr)
```
Get the handle of the characteristic value descriptor.

**Note:** The `user_data` of the attribute must of type `bt_gatt_chrc`.

```c
ssize_t bt_gatt_attr_read(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t buf_len, uint16_t offset, const void *value, uint16_t value_len)
```
Generic Read Attribute value helper.
Read attribute value from local database storing the result into buffer.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value.
- `buf_len` – Buffer length.
- `offset` – Start offset.
- `value` – Attribute value.
- `value_len` – Length of the attribute value.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_service(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Service Attribute helper.
Read service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which `user_data` is a `bt_uuid`.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_included(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Include Attribute helper.
Read include service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which `user_data` is a `bt_gatt_include`.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
• **offset** – Start offset.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_chrc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Characteristic Attribute helper.
Read characteristic attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a **bt_gatt_chrc**.

**Parameters**
- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read CCC Characteristic Configuration Attribute helper.
Read CCC attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a **bt_gatt_ccc**.

**Parameters**
- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_write_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)
```

Write CCC Characteristic Configuration Attribute helper.
Write value in the buffer into CCC attribute.

**Note:** Only use this with attributes which user_data is a **bt_gatt_ccc**.
Parameters
- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.
- `flags` – Write flags.

Returns
number of bytes written in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_cep(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Characteristic Extended Properties Attribute helper.
Read CEP attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_gatt_cep`.

Parameters
- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length
- `offset` – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_cud(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Characteristic User Description Descriptor Attribute helper.
Read CUD attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a NULL-terminated C string.
ssize_t bt_gatt_attr_read_cpf(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Presentation format Descriptor Attribute helper.
Read CPF attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a bt_gatt_pf.

### Parameters
- conn – Connection object
- attr – Attribute to read
- buf – Buffer to store the value read
- len – Buffer length
- offset – Start offset

### Returns
number of bytes read in case of success or negative values in case of error.

int bt_gatt_notify_cb(struct bt_conn *conn, struct bt_gatt_notify_params *params)

Notify attribute value change.

This function works in the same way as **bt_gatt_notify**. With the addition that after sending the notification the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.

Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

### Parameters
- conn – Connection object.
- params – Notification parameters.

### Returns
0 in case of success or negative value in case of error.

int bt_gatt_notify_multiple(struct bt_conn *conn, uint16_t num_params, struct bt_gatt_notify_params params[])

Send multiple notifications in a single PDU.

The GATT Server will send a single ATT_MULTIPLE_HANDLE_VALUE_NTF PDU containing all the notifications passed to this API.

All params must have the same func and user_data (due to implementation limitation). But func(user_data) will be invoked for each parameter.

As this API may block to wait for Bluetooth Host resources, it is not recommended to call it from a cooperative thread or a Bluetooth callback.

The peer’s GATT Client must write to this device’s Client Supported Features attribute and set the bit for Multiple Handle Value Notifications before this API can be used.
Only use this API to force the use of the ATT_MULTIPLE_HANDLE_VALUE_NTF PDU. For standard applications, bt_gatt_notify_cb is preferred, as it will use this PDU if supported and automatically fallback to ATT_HANDLE_VALUE_NTF when not supported by the peer.

This API has an additional limitation: it only accepts valid attribute references and not UUIDs like bt_gatt_notify and bt_gatt_notify_cb.

**Parameters**

- conn – Target client. Notifying all connected clients by passing NULL is not yet supported, please use bt_gatt_notify instead.
- num_params – Element count of params array. Has to be greater than 1.
- params – Array of notification parameters. It is okay to free this after calling this function.

**Return values**

- 0 – Success. The PDU is queued for sending.
- -EINVAL –
  - One of the attribute handles is invalid.
  - Only one parameter was passed. This API expects 2 or more.
  - Not all func were equal or not all user_data were equal.
  - One of the characteristics is not notifiable.
  - An UUID was passed in one of the parameters.
- -ERANGE –
  - The notifications cannot all fit in a single ATT_MULTIPLE_HANDLE_VALUE_NTF.
  - They exceed the MTU of all open ATT bearers.
- -EPERM – The connection has a lower security level than required by one of the attributes.
- -EOPNOTSUPP – The peer hasn’t yet communicated that it supports this PDU type.

```c
static inline int bt_gatt_notify(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

Notify attribute value change.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

**Parameters**

- conn – Connection object.
- attr – Characteristic or Characteristic Value attribute.
- data – Pointer to Attribute data.
- len – Attribute value length.
Returns
0 in case of success or negative value in case of error.

static inline int bt_gatt_notify_uuid(struct bt_conn *conn, const struct bt_uuid *uuid, const struct bt_gatt_attr *attr, const void *data, uint16_t len)

Notify attribute value change by UUID.
Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection.
The attribute object is the starting point for the search of the UUID.

Parameters
- *conn – Connection object.
- *uuid – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the attr given, is used.
- *attr – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
- *data – Pointer to Attribute data.
- *len – Attribute value length.

Returns
0 in case of success or negative value in case of error.

int bt_gatt_indicate(struct bt_conn *conn, struct bt_gatt_indicate_params *params)
Indicate attribute value change.
Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.
The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.
Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Note: This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

Parameters
- *conn – Connection object.
- *params – Indicate parameters.

Returns
0 in case of success or negative value in case of error.

bool bt_gatt_is_subscribed(struct bt_conn *conn, const struct bt_gatt_attr *attr, uint16_t ccc_type)
Check if connection have subscribed to attribute.
Check if connection has subscribed to attribute value change.

6.1. Bluetooth
The attribute object can be the so-called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`, or the Client Characteristic Configuration Descriptor (CCCD) which is created by `BT_GATT_CCC`.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute object.
- `ccc_type` – The subscription type, `BT_GATT_CCC_NOTIFY` and/or `BT_GATT_CCC_INDICATE`.

**Returns**
true if the attribute object has been subscribed.

```c
uint16_t bt_gatt_get_mtu(struct bt_conn *conn)
```

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

**Parameters**
- `conn` – Connection object.

**Returns**
MTU in bytes

The attribute object can be the so-called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`, or the Client Characteristic Configuration Descriptor (CCCD) which is created by `BT_GATT_CCC`.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute object.
- `ccc_type` – The subscription type, `BT_GATT_CCC_NOTIFY` and/or `BT_GATT_CCC_INDICATE`.

**Returns**
true if the attribute object has been subscribed.

```c
uint16_t bt_gatt_get_mtu(struct bt_conn *conn)
```

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

**Parameters**
- `conn` – Connection object.

**Returns**
MTU in bytes

```c
struct bt_gatt_ccc_cfg
```

`#include <gatt.h>` GATT CCC configuration entry.

**Public Members**

```c
uint8_t id
```

Local identity, `BT_ID_DEFAULT` in most cases.

```c
bt_addr_le_t peer
```

Remote peer address.

```c
uint16_t value
```

Configuration value.

```c
struct bt_gatt_notify_params
```

`#include <gatt.h>`

**Public Members**

```c
const struct bt_uuid *uuid
```

Notification Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.
const struct bt_gatt_attr *attr
    Notification Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for
    the attribute with the given UUID.

const void *data
    Notification Value data.

uint16_t len
    Notification Value length.

bt_gatt_complete_func_t func
    Notification Value callback.

void *user_data
    Notification Value callback user data.

struct bt_gatt_indicate_params
    #include <gatt.h> GATT Indicate Value parameters.

Public Members

const struct bt_uuid *uuid
    Indicate Attribute UUID type.
    Optional, use to search for an attribute with matching UUID when the attribute
    object pointer is not known.

const struct bt_gatt_attr *attr
    Indicate Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for
    the attribute with the given UUID.

bt_gatt_indicate_func_t func
    Indicate Value callback.

bt_gatt_indicate_params_destroy_t destroy
    Indicate operation complete callback.

cast void *data
    Indicate Value data.

uint16_t len
    Indicate Value length.

GATT Client

group bt_gatt_client
Typedefs

typedef uint8_t (*bt_gatt_discover_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, struct bt_gatt_discover_params *params)

Discover attribute callback function.

If discovery procedure has completed this callback will be called with attr set to NULL. This will not happen if procedure was stopped by returning BT_GATT_ITER_STOP.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:
- uuid UUID representing the type of attribute.
- handle Handle in the remote database.
- user_data The value of the attribute, if the discovery type maps to an ATT operation that provides this information. NULL otherwise. See below.

The effective type of attr->user_data is determined by params. Note that the fields params->type and params->uuid are left unchanged by the discovery procedure.

<table>
<thead>
<tr>
<th>params-&gt;type</th>
<th>params-&gt;uuid</th>

<td>any</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Also consider if using read-by-type instead of discovery is more convenient. See bt_gatt_read with bt_gatt_read_params::handle_count set to 0.

**Param conn**
Connection object.

**Param attr**
Attribute found, or NULL if not found.

**Param params**
Discovery parameters given.

**Return**
BT_GATT_ITER_CONTINUE to continue discovery procedure.

**Return**
BT_GATT_ITER_STOP to stop discovery procedure.

typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_read_params *params, const void *data, uint16_t length)

Read callback function.
When reading using by_uuid, params->start_handle is the attribute handle for this data item.

**Param conn**  
Connection object.

**Param err**  
ATT error code.

**Param params**  
Read parameters used.

**Param data**  
Attribute value data. NULL means read has completed.

**Param length**  
Attribute value length.

**Return**  
BT_GATT_ITER_CONTINUE if should continue to the next attribute.

**Return**  
BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_write_params *params)

Write callback function.

**Param conn**  
Connection object.

**Param err**  
ATT error code.

**Param params**  
Write parameters used.

typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)

Notification callback function.

In the case of an empty notification, the data pointer will be non-NULL while the length will be 0, which is due to the special case where a data NULL pointer means unsubscribed.

**Param conn**  
Connection object. May be NULL, indicating that the peer is being unpaired

**Param params**  
Subscription parameters.

**Param data**  
Attribute value data. If NULL then subscription was removed.

**Param length**  
Attribute value length.

**Return**  
BT_GATT_ITER_CONTINUE to continue receiving value notifications.

**Return**  
BT_GATT_ITER_STOP to unsubscribe from value notifications.

typedef void (*bt_gatt_subscribe_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_subscribe_params *params)

Subscription callback function.

6.1. Bluetooth
**Param conn**
Connection object.

**Param err**
ATT error code.

**Param params**
Subscription parameters used.

---

**Enums**

GATT Discover types.

*Values:*

- **enumerator BT_GATT_DISCOVER_PRIMARY**
  Discover Primary Services.

- **enumerator BT_GATT_DISCOVER_SECONDARY**
  Discover Secondary Services.

- **enumerator BT_GATT_DISCOVER_INCLUDE**
  Discover Included Services.

- **enumerator BT_GATT_DISCOVER_CHARACTERISTIC**
  Discover Characteristic Values.

  Discover Characteristic Value and its properties.

- **enumerator BT_GATT_DISCOVER_DESCRIPTOR**
  Discover Descriptors.

  Discover Attributes which are not services or characteristics.

  @note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in extra round trips.

- **enumerator BT_GATT_DISCOVER_ATTRIBUTE**
  Discover Attributes.

  Discover Attributes of any type.

  @note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in more round trips.

- **enumerator BT_GATT_DISCOVER_STD_CHAR_DESC**
  Discover standard characteristic descriptor values.

  Discover standard characteristic descriptor values and their properties.

  Supported descriptors:
Subscription flags.

**Values:**

**enumerator BT_GATT_SUBSCRIBE_FLAG_VOLATILE**

Persistence flag.

- If set, indicates that the subscription is not saved on the GATT server side. Therefore, upon disconnection, the subscription will be automatically removed from the client’s subscriptions list and when the client reconnects, it will have to issue a new subscription.

**enumerator BT_GATT_SUBSCRIBE_FLAG_NO_RESUB**

No resubscribe flag.

- By default when BT_GATT_SUBSCRIBE_FLAG_VOLATILE is unset, the subscription will be automatically renewed when the client reconnects, as a workaround for GATT servers that do not persist subscriptions.

  This flag will disable the automatic resubscription. It is useful if the application layer knows that the GATT server remembers subscriptions from previous connections and wants to avoid renewing the subscriptions.

**enumerator BT_GATT_SUBSCRIBE_FLAG_WRITE_PENDING**

Write pending flag.

- If set, indicates write operation is pending waiting remote end to respond.

  @note Internal use only.

**enumerator BT_GATT_SUBSCRIBE_FLAG_SENT**

Sent flag.

- If set, indicates that a subscription request (CCC write) has already been sent in the active connection.

  Used to avoid sending subscription requests multiple times when the \htmlonly <code>CONFIG_BT_GATT_AUTO_RESUBSCRIBE</code> \endhtmlonly \xmlonly <verbatim>embed:rst:inline :kconfig:option:`CONFIG_BT_GATT_AUTO_RESUBSCRIBE`</verbatim> \endxmlonly quirk is enabled.

  @note Internal use only.

**enumerator BT_GATT_SUBSCRIBE_NUM_FLAGS**
Functions

```c
int bt_gatt_exchange_mtu(struct bt_conn *conn, struct bt_gatt_exchange_params *params)
```

Exchange MTU.
This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

The Response comes in callback params->func. The callback is run from the context specified by ‘config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** Shall only be used once per connection.

**Parameters**
- `conn` – Connection object.
- `params` – Exchange MTU parameters.

**Return values**
- `0` – Successfully queued request. Will call `params->func` on resolution.
- `-ENOMEM` – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.
- `-EALREADY` – The MTU exchange procedure has been already performed.

```c
int bt_gatt_discover(struct bt_conn *conn, struct bt_gatt_discover_params *params)
```

GATT Discover function.

This procedure is used by a client to discover attributes on a server.

**Primary Service Discovery:** Procedure allows to discover primary services either by Discover All Primary Services or Discover Primary Services by Service UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

The Response comes in callback params->func. The callback is run from the BT RX thread. params must remain valid until start of callback where `iter attr` is NULL or callback will return `BT_GATT_ITER_STOP`.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Parameters**
- `conn` – Connection object.
- `params` – Discover parameters.
Return values

• 0 – Successfully queued request. Will call params->func on resolution.

• -ENOMEM – ATT request queue is full and blocking would cause deadlock.
  Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT.

int bt_gatt_read(struct bt_conn *conn, struct bt_gatt_read_params *params)

Read Attribute Value by handle.

This procedure read the attribute value and return it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the start_handle being updated for each instance.

To perform a GATT Long Read procedure, start with a Characteristic Value Read (by setting offset 0 and handle_count 1) and then return BT_GATT_ITER_CONTINUE from the callback. This is equivalent to calling bt_gatt_read again, but with the correct offset to continue the read. This may be repeated until the procedure is complete, which is signaled by the callback being called with data set to NULL.

Note that returning BT_GATT_ITER_CONTINUE is really starting a new ATT operation, so this can fail to allocate resources. However, all API errors are reported as if the server returned BT_ATT_ERR_UNLIKELY. There is no way to distinguish between this condition and a BT_ATT_ERR_UNLIKELY response from the server itself.

Note that the effect of returning BT_GATT_ITER_CONTINUE from the callback varies depending on the type of read operation.

The Response comes in callback params->func. The callback is run from the context specified by ‘config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

• conn – Connection object.

• params – Read parameters.

Return values

• 0 – Successfully queued request. Will call params->func on resolution.

• -ENOMEM – ATT request queue is full and blocking would cause deadlock.
  Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT.

int bt_gatt_write(struct bt_conn *conn, struct bt_gatt_write_params *params)

Write Attribute Value by handle.

The Response comes in callback params->func. The callback is run from the context specified by ‘config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from Bluetooth event context. When called from Bluetooth context, this function will instead return -ENOMEM if it would block to avoid a deadlock.

Parameters

• conn – Connection object.
• **params** – Write parameters.

**Return values**

• 0 – Successfully queued request. Will call params->func on resolution.

• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside Bluetooth event context to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT.

```c
int bt_gatt_write_without_response_cb(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign,
                                      bt_gatt_complete_func_t func, void *user_data)
```

Write Attribute Value by handle without response with callback.

This function works in the same way as `bt_gatt_write_without_response`. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

**Parameters**

• conn – Connection object.

• handle – Attribute handle.

• data – Data to be written.

• length – Data length.

• sign – Whether to sign data

• func – Transmission complete callback.

• user_data – User data to be passed back to callback.

**Return values**

• 0 – Successfully queued request.

• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT.

```c
static inline int bt_gatt_write_without_response(struct bt_conn *conn, uint16_t handle,
                                                  const void *data, uint16_t length, bool sign)
```

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed.
This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Parameters**
- conn – Connection object.
- handle – Attribute handle.
- data – Data to be written.
- length – Data length.
- sign – Whether to sign data

**Return values**
- 0 – Successfully queued request.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.

```c
int bt_gatt_subscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)
```

Subscribe Attribute Value Notification.

This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

The Response comes in callback `params->subscribe`. The callback is run from the context specified by `config BT_RECV_CONTEXT`. The Notification callback `params->notify` is also called from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** Notifications are asynchronous therefore the `params` must remain valid while subscribed and cannot be reused for additional subscriptions whilst active.

**Parameters**
- conn – Connection object.
- params – Subscribe parameters.

**Return values**
- 0 – Successfully queued request. Will call `params->write` on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.
- -EALREADY – if there already exist a subscription using the `params`.
- -EBUSY – if `params.ccc_handle` is 0 and `CONFIG_BT_GATT_AUTO_DISCOVER_CCC` is enabled and discovery for the `params` is already in progress.
int bt_gatt_resubscribe(uint8_t id, const bt_addr_le_t *peer, struct bt_gatt_subscribe_params *params)

Resubscribe Attribute Value Notification subscription.

Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

**Note:** Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

**Parameters**
- `id` – Local identity (in most cases BT_ID_DEFAULT).
- `peer` – Remote address.
- `params` – Subscribe parameters.

**Returns**
- 0 in case of success or negative value in case of error.

int bt_gatt_unsubscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)

Unsubscribe Attribute Value Notification.

This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.

The Response comes in callback `params->func`. The callback is run from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Parameters**
- `conn` – Connection object.
- `params` – Subscribe parameters.

**Return values**
- 0 – Successfully queued request. Will call `params->write` on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.

void bt_gatt_cancel(struct bt_conn *conn, void *params)

Try to cancel the first pending request identified by `params`.

This function does not release `params` for reuse. The usual callbacks for the request still apply. A successful cancel simulates a `BT_ATT_ERR_UNLIKELY` response from the server.

This function can cancel the following request functions:
- `bt_gatt_exchange_mtu`
- `bt_gatt_discover`
- `bt_gatt_read`
• `bt_gatt_write`
• `bt_gatt_subscribe`
• `bt_gatt_unsubscribe`

**Parameters**
- `conn` – The connection the request was issued on.
- `params` – The address `params` used in the request function call.

```c
struct bt_gatt_exchange_params
    #include <gatt.h> GATT Exchange MTU parameters.
```

**Public Members**

```c
void (*func)(struct bt_conn *conn, uint8_t err, struct bt_gatt_exchange_params *params)
    Response callback.
```

```c
struct bt_gatt_discover_params
    #include <gatt.h> GATT Discover Attributes parameters.
```

**Public Members**

```c
const struct bt_uuid *uuid
    Discover UUID type.
```

```c
bt_gatt_discover_func_t func
    Discover attribute callback.
```

```c
uint16_t attr_handle
    Include service attribute declaration handle.
```

```c
uint16_t start_handle
    Included service start handle.
    Discover start handle.
```

```c
uint16_t end_handle
    Included service end handle.
    Discover end handle.
```

```c
uint8_t type
    Discover type.
```

```c
struct bt_gatt_subscribe_params *sub_params
    Only for stack-internal use, used for automatic discovery.
```

```c
struct bt_gatt_read_params
    #include <gatt.h> GATT Read parameters.
```

6.1. Bluetooth
### Public Members

**bt_gatt_read_func_t** `func`
Read attribute callback.

**size_t handle_count**
- If equals to 1 single.handle and single.offset are used.
- If greater than 1 multiple.handles are used. If equals to 0 by_uuid is used for Read Using Characteristic UUID.

**uint16_t handle**
Attribute handle.

**uint16_t offset**
Attribute data offset.

**uint16_t *handles**
Attribute handles to read with Read Multiple Characteristic Values.

**bool variable**
- If true use Read Multiple Variable Length Characteristic Values procedure.
- The values of the set of attributes may be of variable or unknown length. If false use Read Multiple Characteristic Values procedure. The values of the set of attributes must be of a known fixed length, with the exception of the last value that can have a variable length.

**uint16_t start_handle**
First requested handle number.

**uint16_t end_handle**
Last requested handle number.

**const struct bt_uuid *uuid**
2 or 16 octet UUID.

**struct bt_gatt_write_params**
`#include <gatt.h>` GATT Write parameters.

### Public Members

**bt_gatt_write_func_t** `func`
Response callback.

**uint16_t handle**
Attribute handle.

**uint16_t offset**
Attribute data offset.
const void *data
   Data to be written.

uint16_t length
   Length of the data.

struct bt_gatt_subscribe_params
   #include <gatt.h> GATT Subscribe parameters.

Public Members

bt_gatt_notify_func_t notify
   Notification value callback.

bt_gatt_subscribe_func_t subscribe
   Subscribe CCC write request response callback If given, called with the subscription parameters given when subscribing.

bt_gatt_write_func_t write
   Deprecated:

uint16_t value_handle
   Subscribe value handle.

uint16_t ccc_handle
   Subscribe CCC handle.

uint16_t end_handle
   Subscribe End handle (for automatic discovery)

struct bt_gatt_discover_params *disc_params
   Discover parameters used when ccc_handle = 0.

uint16_t value
   Subscribe value.

bt_security_t min_security
   Minimum required security for received notification.
   Notifications and indications received over a connection with a lower security level are silently discarded.

atomic_t flags[ATOMIC_BITMAP_SIZE](BT_GATT_SUBSCRIBE_NUM_FLAGS]
   Subscription flags.

enumerator BT_QUIRK_NO_RESET = BIT(0)

enumerator BT_QUIRK_NO_AUTO_DLE = BIT(1)

elemnt bt_hci_driver_bus

Possible values for the 'bus' member of the bt_hci_driver struct.

Values:

enumerator BT_HCI_DRIVER_BUS_VIRTUAL = 0

enumerator BT_HCI_DRIVER_BUS_USB = 1

enumerator BT_HCI_DRIVER_BUS_PCCARD = 2

enumerator BT_HCI_DRIVER_BUS_UART = 3

enumerator BT_HCI_DRIVER_BUS_RS232 = 4

enumerator BT_HCI_DRIVER_BUS_PCI = 5

enumerator BT_HCI_DRIVER_BUS_SDIO = 6

enumerator BT_HCI_DRIVER_BUS_SPI = 7

enumerator BT_HCI_DRIVER_BUS_I2C = 8

enumerator BT_HCI_DRIVER_BUS_IPM = 9
Functions

static inline uint8_t bt_hci_evt_get_flags(uint8_t evt)
Get HCI event flags.
Helper for the HCI driver to get HCI event flags that describes rules that must be followed.
When CONFIG_BT_RECV_BLOCKING is enabled the flags BT_HCI_EVT_FLAG_RECV and BT_HCI_EVT_FLAG_RECV_PRIO indicates if the event should be given to bt_recv or bt_recv_prio.

Parameters
• evt – HCI event code.

Returns
 HCI event flags for the specified event.

int bt_recv(struct net_buf *buf)
Receive data from the controller/HCI driver.
This is the main function through which the HCI driver provides the host with data from the controller. The buffer needs to have its type set with the help of bt_buf_set_type() before calling this API.
When CONFIG_BT_RECV_BLOCKING is defined then this API should not be used for so-called high priority HCI events, which should instead be delivered to the host stack through bt_recv_prio().

Note: This function must only be called from a cooperative thread.

Parameters
• buf – Network buffer containing data from the controller.

Returns
0 on success or negative error number on failure.

int bt_recv_prio(struct net_buf *buf)
Receive high priority data from the controller/HCI driver.
This is the same as bt_recv(), except that it should be used for so-called high priority HCI events. There’s a separate bt_hci_evt_get_flags() helper that can be used to identify which events have the BT_HCI_EVT_FLAG_RECV_PRIO flag set.
As with bt_recv(), the buffer needs to have its type set with the help of bt_buf_set_type() before calling this API. The only exception is so called high priority HCI events which should be delivered to the host stack through bt_recv_prio() instead.

Parameters
• buf – Network buffer containing data from the controller.

Returns
0 on success or negative error number on failure.

uint8_t bt_read_static_addr(struct bt_hci_vs_static_addr addr[], uint8_t size)
Read static addresses from the controller.

Parameters
• addr – Random static address and Identity Root (IR) array.
• size – Size of array.
Returns
Number of addresses read.

`int bt_hci_driver_register(const struct bt_hci_driver *drv)`
Register a new HCI driver to the Bluetooth stack.
This needs to be called before any application code runs. The `bt_enable()` API will fail if there is no driver registered.

**Parameters**
- `drv` – A `bt_hci_driver` struct representing the driver.

**Returns**
0 on success or negative error number on failure.

`int bt_hci_transport_setup(const struct device *dev)`
Setup the HCI transport, which usually means to reset the Bluetooth IC.

**Note:** A weak version of this function is included in the H4 driver, so defining it is optional per board.

**Parameters**
- `dev` – The device structure for the bus connecting to the IC

**Returns**
0 on success, negative error value on failure.

`int bt_hci_transport_teardown(const struct device *dev)`
Teardown the HCI transport.

**Note:** A weak version of this function is included in the IPC driver, so defining it is optional. NRF5340 includes support to put network core in reset state.

**Parameters**
- `dev` – The device structure for the bus connecting to the IC

**Returns**
0 on success, negative error value on faulure

`struct net_buf *bt_hci_evt_create(uint8_t evt, uint8_t len)`
Allocate an HCI event buffer.

This function allocates a new buffer for an HCI event. It is given the event code and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

**Parameters**
- `len` – Length of event parameters.

**Returns**
Newly allocated buffer.
struct net_buf *bt_hci_cmd_complete_create(uint16_t op, uint8_t plen)
Allocate an HCI Command Complete event buffer.

This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- **op** – Command OpCode.
- **plen** – Length of command parameters.

Returns
Newly allocated buffer.

struct net_buf *bt_hci_cmd_status_create(uint16_t op, uint8_t status)
Allocate an HCI Command Status event buffer.

This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- **op** – Command OpCode.
- **status** – Status code.

Returns
Newly allocated buffer.

struct bt_hci_setup_params

#include <hci_driver.h>

**Public Members**

bt_addr_t **public_addr**
The public identity address to give to the controller.

This field is used when the driver selects CONFIG_BT_HCI_SET_PUBLIC_ADDR to indicate that it supports setting the controller's public address.

struct bt_hci_driver

#include <hci_driver.h> Abstraction which represents the HCI transport to the controller.

This struct is used to represent the HCI transport to the Bluetooth controller.

**Public Members**

const char **name**
Name of the driver.

enum bt_hci_driver_bus **bus**
Bus of the transport (BT_HCI_DRIVER_BUS_*)
uint32_t quirks

Specific controller quirks.

These are set by the HCI driver and acted upon by the host. They can either be statically set at buildtime, or set at runtime before the HCI driver’s open() callback returns.

int (*open)(void)

Open the HCI transport.

Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the send() handler.

If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to start that thread.

Return

0 on success or negative error number on failure.

int (*close)(void)

Close the HCI transport.

Closes the HCI transport. This function must not return until the transport is closed.

If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to abort that thread.

Return

0 on success or negative error number on failure.

int (*send)(struct net_buf *buf)

Send HCI buffer to controller.

Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of bt_buf_get_type().

Note: This function must only be called from a cooperative thread.

Param buf

Buffer containing data to be sent to the controller.

Return

0 on success or negative error number on failure.

int (*setup)(const struct bt_hci_setup_params *params)

HCI vendor-specific setup.

Executes vendor-specific commands sequence to initialize BT Controller before BT Host executes Reset sequence.

Note: CONFIG_BT_HCI_SETUP must be selected for this field to be available.

Return

0 on success or negative error number on failure.
HCI RAW channel

Overview  HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

API Reference

*group hci_raw*

HCI RAW channel.

Defines

**BT_HCI_ERR_EXT_HANDLED**

**BT_HCI_RAW_CMD_EXT(_op, _min_len, _func)**

Helper macro to define a command extension.

Parameters

- _op – Opcode of the command.
- _min_len – Minimal length of the command.
- _func – Handler function to be called.

Enums

Values:

enumerator **BT_HCI_RAW_MODE_PASSTHROUGH** = 0x00

Passthrough mode.

While in this mode the buffers are passed as is between the stack and the driver.

enumerator **BT_HCI_RAW_MODE_H4** = 0x01

H:4 mode.

While in this mode H:4 headers will added into the buffers according to the buffer type when coming from the stack and will be removed and used to set the buffer type.

Functions

**int bt_send(struct net_buf *buf)**

Send packet to the Bluetooth controller.

Send packet to the Bluetooth controller. Caller needs to implement netbuf pool.

Parameters

- buf – netbuf packet to be send
Returns
Zero on success or (negative) error code otherwise.

int bt_hci_raw_set_mode(uint8_t mode)
Set Bluetooth RAW channel mode.
Set access mode of Bluetooth RAW channel.

Parameters
• mode – Access mode.

Returns
Zero on success or (negative) error code otherwise.

uint8_t bt_hci_raw_get_mode(void)
Get Bluetooth RAW channel mode.
Get access mode of Bluetooth RAW channel.

Returns
Access mode.

void bt_hci_raw_cmd_ext_register(struct bt_hci_raw_cmd_ext *cmds, size_t size)
Register Bluetooth RAW command extension table.
Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

Parameters
• cmds – Pointer to the command extension table.
• size – Size of the command extension table.

int bt_enable_raw(struct k_fifo *rx_queue)
Enable Bluetooth RAW channel:
Enable Bluetooth RAW HCI channel.

Parameters
• rx_queue – netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

Returns
Zero on success or (negative) error code otherwise.

struct bt_hci_raw_cmd_ext
#include <hci_raw.h>

Public Members

uint16_t op
Opcode of the command.

size_t min_len
Minimal length of the command.
uint8_t (*func)(struct net_buf *buf)

Handler function.

Handler function to be called when a command is intercepted.

**Param buf**
Buffer containing the command.

**Return**
HCI Status code or BT_HCI_ERR_EXT_HANDLED if command has been handled already and a response has been sent as oppose to BT_HCI_ERR_SUCCESS which just indicates that the command can be sent to the controller to be processed.

**Hands Free Profile (HFP)**

**API Reference**

*group bt_hfp*

Hands Free Profile (HFP)

**Defines**

HFP_HF_CMD_OK

HFP_HF_CMD_ERROR

HFP_HF_CMD_CME_ERROR

HFP_HF_CMD_UNKNOWN_ERROR

**Enums**

enum bt_hfp_hf_at_cmd

**Values:**

enumerator BT_HFP_HF_ATA

enumerator BT_HFP_HF_AT_CHUP

**Functions**

int bt_hfp_hf_register(struct bt_hfp_hf_cb *cb)

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

**Parameters**

- cb – callback structure.
Returns
0 in case of success or negative value in case of error.

```
int bt_hfp_hf_send_cmd(struct bt_conn *conn, enum bt_hfp_hf_at_cmd cmd)
```
Send specific AT commands to handsfree client profile.

**Parameters**
- `conn` – Connection object.
- `cmd` – AT command to be sent.

**Returns**
0 in case of success or negative value in case of error.

```c
struct bt_hfp_hf_cmd_complete
#include <hfp_hf.h> HFP HF Command completion field.
```

```c
struct bt_hfp_hf_cb
#include <hfp_hf.h> HFP profile application callback.
```

**Public Members**

```c
void (*connected)(struct bt_conn *conn)
HF connected callback to application.
If this callback is provided it will be called whenever the connection completes.
**Param conn**
Connection object.
```

```c
void (*disconnected)(struct bt_conn *conn)
HF disconnected callback to application.
If this callback is provided it will be called whenever the connection gets disconnected, including when a connection gets rejected or cancelled or any error in SLC establishment.
**Param conn**
Connection object.
```

```c
void (*service)(struct bt_conn *conn, uint32_t value)
HF indicator Callback.
This callback provides service indicator value to the application
**Param conn**
Connection object.
**Param value**
service indicator value received from the AG.
```

```c
void (*call)(struct bt_conn *conn, uint32_t value)
HF indicator Callback.
This callback provides call indicator value to the application
**Param conn**
Connection object.
**Param value**
call indicator value received from the AG.
void (*call_setup)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback.
    This callback provides call setup indicator value to the application
    Param conn
        Connection object.
    Param value
        call setup indicator value received from the AG.

void (*call_held)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback.
    This callback provides call held indicator value to the application
    Param conn
        Connection object.
    Param value
        call held indicator value received from the AG.

void (*signal)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback.
    This callback provides signal indicator value to the application
    Param conn
        Connection object.
    Param value
        signal indicator value received from the AG.

void (*roam)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback.
    This callback provides roaming indicator value to the application
    Param conn
        Connection object.
    Param value
        roaming indicator value received from the AG.

void (*battery)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback.
    This callback battery service indicator value to the application
    Param conn
        Connection object.
    Param value
        battery indicator value received from the AG.

void (*ring_indication)(struct bt_conn *conn)
    HF incoming call Ring indication callback to application.
    If this callback is provided it will be called whenever there is an incoming call.
    Param conn
        Connection object.

void (*cmd_complete_cb)(struct bt_conn *conn, struct bt_hfp_hf_cmd_complete *cmd)
    HF notify command completed callback to application.
    The command sent from the application is notified about its status
    Param conn
        Connection object.
**Param cmd**
structure contains status of the command including cme.

**Logical Link Control and Adaptation Protocol (L2CAP)**

L2CAP layer enables connection-oriented channels which can be enable with the configuration option: CONFIG_BT_L2CAP_DYNAMIC_CHANNEL. This channels support segmentation and reassembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the `bt_l2cap_chan` struct which contains the callbacks in the `bt_l2cap_chan_ops` struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the `recv` callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using `bt_l2cap_chan_recv_complete()` API if processing is asynchronous.

**Note:** The `recv` callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

For sending data the `bt_l2cap_chan_send()` API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using `bt_l2cap_server_register()` API passing the `bt_l2cap_server` struct which informs what psm it should listen to, the required security level `sec_level`, and the callback `accept` which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of `bt_l2cap_chan_connect()` API and can be disconnected with the `bt_l2cap_chan_disconnect()` API. Note that the later can also disconnect channel instances created by servers.

**API Reference**

*group bt_l2cap

**L2CAP.**

**Defines**

**BT_L2CAP_HDR_SIZE**
L2CAP PDU header size, used for buffer size calculations.

**BT_L2CAP_TX_MTU**
Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

**BT_L2CAP_RX_MTU**
Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

**BT_L2CAP_BUF_SIZE(mtu)**
Helper to calculate needed buffer size for L2CAP PDUs.
Useful for creating buffer pools.

**Parameters**
- `mtu` – Needed L2CAP PDU MTU.
Returns
Needed buffer size to match the requested L2CAP PDU MTU.

BT_L2CAP_SDU_HDR_SIZE
L2CAP SDU header size, used for buffer size calculations.

BT_L2CAP_SDU_TX_MTU
Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.
The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.
The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application buffer pool.

BT_L2CAP_SDU_RX_MTU
Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.
The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.
The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application buffer pool. The application will have to define an alloc_buf callback for the channel in order to support receiving segmented L2CAP SDUs.

BT_L2CAP_SDU_BUF_SIZE(mtu)
Helper to calculate needed buffer size for L2CAP SDUs.
Useful for creating buffer pools.

Parameters
• mtu – Required BT_L2CAP_*_SDU.

Returns
Needed buffer size to match the requested L2CAP SDU MTU.

BT_L2CAP_LE_CHAN(_ch)
Helper macro getting container object of type bt_l2cap_le_chan address having the same container chan member address as object in question.

Parameters
• _ch – Address of object of bt_l2cap_chan type

Returns
Address of in memory bt_l2cap_le_chan object type containing the address of in question object.

BT_L2CAP_CHAN_SEND_RESERVE
Headroom needed for outgoing L2CAP PDUs.

BT_L2CAP_SDU_CHAN_SEND_RESERVE
Headroom needed for outgoing L2CAP SDUs.

Typedefs
typedef void (*bt_l2cap_chan_destroy_t)(struct bt_l2cap_chan *chan)
Channel destroy callback.
**Param chan**  
Channel object.

typedef enum **bt_l2cap_chan_state** bt_l2cap_chan_state_t  
Life-span states of L2CAP CoC channel.  
Used only by internal APIs dealing with setting channel to proper state depending on operational context.

A channel enters the **BT_L2CAP_CONNECTING** state upon *bt_l2cap_chan_connect*, *bt_l2cap_ecred_chan_connect* or upon returning from *bt_l2cap_server::accept*.

When a channel leaves the **BT_L2CAP_CONNECTING** state, *bt_l2cap_chan_ops::connected* is called.

typedef enum **bt_l2cap_chan_status** bt_l2cap_chan_status_t  
Status of L2CAP channel.

**Enums**

enum **bt_l2cap_chan_state**  
Life-span states of L2CAP CoC channel.  
Used only by internal APIs dealing with setting channel to proper state depending on operational context.

A channel enters the **BT_L2CAP_CONNECTING** state upon *bt_l2cap_chan_connect*, *bt_l2cap_ecred_chan_connect* or upon returning from *bt_l2cap_server::accept*.

When a channel leaves the **BT_L2CAP_CONNECTING** state, *bt_l2cap_chan_ops::connected* is called.

*Values:*

enumerator **BT_L2CAP_DISCONNECTED**  
Channel disconnected.

enumerator **BT_L2CAP_CONNECTING**  
Channel in connecting state.

enumerator **BT_L2CAP_CONFIG**  
Channel in config state, BR/EDR specific.

enumerator **BT_L2CAP_CONNECTED**  
Channel ready for upper layer traffic on it.

enumerator **BT_L2CAP_DISCONNECTING**  
Channel in disconnecting state.

enum **bt_l2cap_chan_status**  
Status of L2CAP channel.

*Values:*
enumerator BT_L2CAP_STATUS_OUT
   Channel can send at least one PDU.

enumerator BT_L2CAP_STATUS_SHUTDOWN
   Channel shutdown status.
   Once this status is notified it means the channel will no longer be able to transmit or receive data.

enumerator BT_L2CAP_STATUS_ENCRYPT_PENDING
   Channel encryption pending status.

enumerator BT_L2CAP_NUM_STATUS

Functions

int bt_l2cap_server_register(struct bt_l2cap_server *server)
Register L2CAP server.
Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

   Parameters
   • server – Server structure.

   Returns
   0 in case of success or negative value in case of error.

int bt_l2cap_br_server_register(struct bt_l2cap_server *server)
Register L2CAP server on BR/EDR oriented connection.
Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

   Parameters
   • server – Server structure.

   Returns
   0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan **chans, uint16_t psm)
Connect Enhanced Credit Based L2CAP channels.
Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

   Parameters
• **conn** – Connection object.
• **chans** – Array of channel objects.
• **psm** – Channel PSM to connect to.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_l2cap_ecred_chan_reconfigure(struct bt_l2cap_chan **chans, uint16_t mtu)
```

Reconfigure Enhanced Credit Based L2CAP channels.

Reconfigure up to 5 L2CAP channels. Channels must be from the same `bt_conn`. Once reconfiguration is completed each channel reconfigured() callback will be called. MTU cannot be decreased on any of provided channels.

**Parameters**
• **chans** – Array of channel objects. Null-terminated. Elements after the first 5 are silently ignored.
• **mtu** – Channel MTU to reconfigure to.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_l2cap_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan *chan, uint16_t psm)
```

Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead. Channel object passed (over an address of it) as second parameter shouldn’t be instantiatted in application as standalone. Instead of, application should
create transport dedicated L2CAP objects, i.e. type of `bt_l2cap_le_chan` for LE and/or type of `bt_l2cap_br_chan` for BR/EDR. Then pass to this API the location (address) of `bt_l2cap_chan` type object which is a member of both transport dedicated objects.

**Parameters**
• **conn** – Connection object.
• **chan** – Channel object.
• **psm** – Channel PSM to connect to.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_l2cap_chan_disconnect(struct bt_l2cap_chan *chan)
```

Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result the channel disconnected() callback is called. Regarding to input parameter, to get details see reference description to `bt_l2cap_chan_connect()` API above.

**Parameters**
• **chan** – Channel object.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_l2cap_chan_send(struct bt_l2cap_chan *chan, struct net_buf *buf)
```

Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, buf will be queued and sent as and when credits are received from peer. Regarding to first input parameter, to get details see reference description to `bt_l2cap_chan_connect()` API above.
When sending L2CAP data over an BR/EDR connection the application is sending L2CAP PDUs. The application is required to have reserved `BT_L2CAP_CHAN_SEND_reserve` bytes in the buffer before sending. The application should use the `BT_L2CAP_BUF_SIZE()` helper to correctly size the buffers for the for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs. The application shall reserve `BT_L2CAP_SDU_CHAN_SEND_reserve` bytes in the buffer before sending.

The application can use the `BT_L2CAP_SDU_BUF_SIZE()` helper to correctly size the buffer to account for the reserved headroom.

When segmenting an L2CAP SDU into L2CAP PDUs the stack will first attempt to allocate buffers from the channel's alloc_seg callback and will fallback on the stack's global buffer pool (sized `CONFIG_BT_L2CAP_TX_BUF_COUNT`).

Note: Buffer ownership is transferred to the stack in case of success, in case of an error the caller retains the ownership of the buffer.

**Returns**
- 0 in case of success or negative value in case of error.

**Returns**
- EINVAL if `buf` or `chan` is NULL.

**Returns**
- EINVAL if `chan` is not either BR/EDR or LE credit-based.

**Returns**
- EINVAL if buffer doesn’t have enough bytes reserved to fit header.

**Returns**
- EMSGSIZE if `buf` is larger than `chan`'s MTU.

**Returns**
- ENOTCONN if underlying conn is disconnected.

**Returns**
- ESHUTDOWN if L2CAP channel is disconnected.

**Returns**
- other (from lower layers) if chan is BR/EDR.

```c
int bt_l2cap_chan_give_credits(struct bt_l2cap_chan *chan, uint16_t additional_credits)
```

Give credits to the remote.

Only available for channels using `bt_l2cap_chan_ops::seg_recv`. CONFIG_BT_L2CAP_SEG_RECV must be enabled to make this function available.

Each credit given allows the peer to send one segment.

This function depends on a valid `chan` object. Make sure to default-initialize or memset `chan` when allocating or reusing it for new connections.

Adding zero credits is not allowed.

Credits can be given before entering the `BT_L2CAP_CONNECTING` state. Doing so will adjust the ‘initial credits’ sent in the connection PDU.

Must not be called while the channel is in `BT_L2CAP_CONNECTING` state.

**Returns**
- 0 in case of success or negative value in case of error.
int bt_l2cap_chan_recv_complete(struct bt_l2cap_chan *chan, struct net_buf *buf)
  Complete receiving L2CAP channel data.
  Complete the reception of incoming data. This shall only be called if the channel recv callback has returned -EINPROGRESS to process some incoming data. The buffer shall contain the original user_data as that is used for storing the credits/segments used by the packet.

  **Parameters**
  - chan – Channel object.
  - buf – Buffer containing the data.

  **Returns**
  0 in case of success or negative value in case of error.

struct bt_l2cap_chan
  #include <l2cap.h> L2CAP Channel structure.

  **Public Members**

  struct bt_conn *conn
    Channel connection reference.

  const struct bt_l2cap_chan_ops *ops
    Channel operations reference.

struct bt_l2cap_le_endpoint
  #include <l2cap.h> LE L2CAP Endpoint structure.

  **Public Members**

  #include <l2cap.h> LE L2CAP Channel structure.
Public Members

struct bt_l2cap_chan chan
Common L2CAP channel reference object.

struct bt_l2cap_le_endpoint rx
Channel Receiving Endpoint.
If the application has set an alloc_buf channel callback for the channel to support receiving segmented L2CAP SDUs the application should initialize the MTU of the Receiving Endpoint. Otherwise the MTU of the receiving endpoint will be initialized to BT_L2CAP_SDU_RX_MTU by the stack.

This is the source of the MTU, MPS and credit values when sending L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP and L2CAP_CONFIGURATION_REQ.

uint16_t pending_rx_mtu
Pending RX MTU on ECFC reconfigure, used internally by stack.

struct bt_l2cap_le_endpoint tx
Channel Transmission Endpoint.
This is an image of the remote’s rx.
The MTU and MPS is controlled by the remote by L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP or L2CAP_CONFIGURATION_REQ.

struct bt_l2cap_br_endpoint
#include <l2cap.h> BREDR L2CAP Endpoint structure.

Public Members

uint16_t cid
Endpoint Channel Identifier (CID)

uint16_t mtu
Endpoint Maximum Transmission Unit.

struct bt_l2cap_br_chan
#include <l2cap.h> BREDR L2CAP Channel structure.

Public Members

struct bt_l2cap_chan chan
Common L2CAP channel reference object.

struct bt_l2cap_br_endpoint rx
Channel Receiving Endpoint.
struct `bt_l2cap_br_endpoint` *tx*
  Channel Transmission Endpoint.

`uint16_t` `psm`
  Remote PSM to be connected.

`uint8_t` `ident`
  Helps match request context during CoC.

struct `bt_l2cap_chan_ops`
#include `<l2cap.h>` L2CAP Channel operations structure.

**Public Members**

void (*`connected`)(struct `bt_l2cap_chan` *chan)
  Channel connected callback.
  If this callback is provided it will be called whenever the connection completes.
  **Param chan**
  The channel that has been connected

void (*`disconnected`)(struct `bt_l2cap_chan` *chan)
  Channel disconnected callback.
  If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.
  **Param chan**
  The channel that has been Disconnected

void (*`encrypt_change`)(struct `bt_l2cap_chan` *chan, `uint8_t` hci_status)
  Channel encrypt_change callback.
  If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host's controller.
  **Param chan**
  The channel which has made encryption status changed.
  **Param status**
  HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

struct `net_buf` *(*`allocSeg`)(struct `bt_l2cap_chan` *chan)
  Channel alloc_seg callback.
  If this callback is provided the channel will use it to allocate buffers to store segments. This avoids wasting big SDU buffers with potentially much smaller PDUs. If this callback is supplied, it must return a valid buffer.
  **Param chan**
  The channel requesting a buffer.
  **Return**
  Allocated buffer.
struct net_buf *(*alloc_buf)(struct bt_l2cap_chan *chan)
    Channel alloc_buf callback.
    If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that require segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to BT_L2CAP_SDU_RX_MTU.
    
    **Param chan**
    The channel requesting a buffer.
    **Return**
    Allocated buffer.

int (*recv)(struct bt_l2cap_chan *chan, struct net_buf *buf)
    Channel recv callback.
    **Param chan**
    The channel receiving data.
    **Param buf**
    Buffer containing incoming data.
    **Return**
    0 in case of success or negative value in case of error.
    **Return**
    -EINPROGRESS in case where user has to confirm once the data has been processed by calling bt_l2cap_chan_recv_complete passing back the buffer received with its original user_data which contains the number of segments/credits used by the packet.

void (*sent)(struct bt_l2cap_chan *chan)
    Channel sent callback.
    This callback will be called once the controller marks the SDU as completed. When the controller does so is implementation dependent. It could be after the SDU is enqueued for transmission, or after it is sent on air.
    **Param chan**
    The channel which has sent data.

void (*status)(struct bt_l2cap_chan *chan, atomic_t *status)
    Channel status callback.
    If this callback is provided it will be called whenever the channel status changes.
    **Param chan**
    The channel which status changed
    **Param status**
    The channel status

void (*reconfigured)(struct bt_l2cap_chan *chan)
    Channel reconfigured callback.
    If this callback is provided it will be called whenever peer or local device requested reconfiguration. Application may check updated MTU and MPS values by inspecting chan->le endpoints.
    **Param chan**
    The channel which was reconfigured

void (*seg_recv)(struct bt_l2cap_chan *chan, size_t sdu_len, off_t seg_offset, struct net_buf_simple *seg)
    Handle L2CAP segments directly.

6.1. Bluetooth
This is an alternative to `bt_l2cap_chan_ops::recv`. They cannot be used together.

This is called immediately for each received segment.

Unlike with `bt_l2cap_chan_ops::recv`, flow control is explicit. Each time this handler is invoked, the remote has permanently used up one credit. Use `bt_l2cap_chan_give_credits` to give credits.

The start of an SDU is marked by `seg_offset == 0`. The end of an SDU is marked by `seg_offset + seg->len == sdu_len`.

The stack guarantees that:
- The sender had the credit.
- The SDU length does not exceed MTU.
- The segment length does not exceed MPS.

Additionally, the L2CAP protocol is such that:
- Segments come in order.
- SDUs cannot be interleaved or aborted halfway.

**Note:** With this alternative API, the application is responsible for setting the RX MTU and MPS. The MPS must not exceed `BT_L2CAP_RX_MTU`.

**Param chan**
The receiving channel.

**Param sdu_len**
Byte length of the SDU this segment is part of.

**Param seg_offset**
The byte offset of this segment in the SDU.

**Param seg**
The segment payload.

```c
struct bt_l2cap_server
#include <l2cap.h> L2CAP Server structure.
```

**Public Members**

**uint16_t psm**
Server PSM.

Possible values: 0 A dynamic value will be auto-allocated when `bt_l2cap_server_register()` is called.

0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.

0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

**bt_security_t sec_level**
Required minimum security level.

**int (*accept)(struct bt_conn *conn, struct bt_l2cap_server *server, struct bt_l2cap_chan **chan)**
Server accept callback.

This callback is called whenever a new incoming connection requires authorization.
Param conn
The connection that is requesting authorization

Param server
Pointer to the server structure this callback relates to

Param chan
Pointer to received the allocated channel

Return
0 in case of success or negative value in case of error.

Return
-ENOMEM if no available space for new channel.

Return
-EACCES if application did not authorize the connection.

Return
-EPERM if encryption key size is too short.

Bluetooth Media

API Reference

Media Control Service

group bt_mcs
Media Control Service (MCS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Definitions and types related to the Media Control Service and Media Control Profile specifications.

Defines

BT_MCS_ERR_LONG_VAL_CHANGED

BT_MCS_PLAYBACK_SPEED_MIN
Playback speeds.
All values from -128 to 127 allowed, only some defined

BT_MCS_PLAYBACK_SPEED_QUARTER

BT_MCS_PLAYBACK_SPEED_HALF

BT_MCS_PLAYBACK_SPEED_UNITY

BT_MCS_PLAYBACK_SPEED_DOUBLE

BT_MCS_PLAYBACK_SPEED_MAX
The allowed values for seeking speed are the range -64 to -4 (endpoints included), the value 0, and the range 4 to 64 (endpoints included).
BT_MCS_PLAYING_ORDERS_SUPPORTED_NEWEST_REPEAT

BT_MCS_PLAYING_ORDERS_SUPPORTED_SHUFFLE_ONCE

BT_MCS_PLAYING_ORDERS_SUPPORTED_SHUFFLE_REPEAT

BT_MCS_MEDIA_STATE_INACTIVE
   Media states.

BT_MCS_MEDIA_STATE_PLAYING

BT_MCS_MEDIA_STATE_PAUSED

BT_MCS_MEDIA_STATE_SEEKING

BT_MCS_MEDIA_STATE_LAST

BT_MCS_OPC_PLAY
   Media control point opcodes.

SEARCH_LEN_MAX

SEARCH_PARAM_MAX

BT_MCS_SCP_NTF_SUCCESS
  Search notification result codes.

BT_MCS_SCP_NTF_FAILURE

BT_MCS_GROUP_OBJECT_TRACK_TYPE

BT_MCS_GROUP_OBJECT_GROUP_TYPE

**Media Proxy**

`group bt_media_proxy`

Media proxy module.

The media proxy module is the connection point between media players and media controllers.

A media player has (access to) media content and knows how to navigate and play this content. A media controller reads or gets information from a player and controls the player by setting player parameters and giving the player commands.

The media proxy module allows media player implementations to make themselves available to media controllers. And it allows controllers to access, and get updates from, any player.

The media proxy module allows both local and remote control of local player instances: A media controller may be a local application, or it may be a Media Control Service relaying requests from a remote Media Control Client. There may be either local or remote control, or both, or even multiple instances of each.

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

`MEDIA_PROXY_PLAYBACK_SPEED_MIN`

Playback speed parameters.

All values from -128 to 127 allowed, only some defined

`MEDIA_PROXY_PLAYBACK_SPEED_QUARTER`

`MEDIA_PROXY_PLAYBACK_SPEED_HALF`

`MEDIA_PROXY_PLAYBACK_SPEED_UNITY`

`MEDIA_PROXY_PLAYBACK_SPEED_DOUBLE`
MEDIA_PROXY_PLAYBACK_SPEED_MAX

MEDIA_PROXY_SEEKING_SPEED_FACTOR_MAX
Seeking speed factors.
The allowed values for seeking speed are the range -64 to -4 (endpoints included), the value 0, and the range 4 to 64 (endpoints included).

MEDIA_PROXY_SEEKING_SPEED_FACTOR_MIN

MEDIA_PROXY_SEEKING_SPEED_FACTOR_ZERO

MEDIA_PROXY_PLAYING_ORDER_SINGLE_ONCE
Playing orders.

MEDIA_PROXY_PLAYING_ORDER_SINGLE_REPEAT

MEDIA_PROXY_PLAYING_ORDER_INORDER_ONCE

MEDIA_PROXY_PLAYING_ORDER_INORDER_REPEAT

MEDIA_PROXY_PLAYING_ORDER_OLDEST_ONCE

MEDIA_PROXY_PLAYING_ORDER_OLDEST_REPEAT

MEDIA_PROXY_PLAYING_ORDER_NEWEST_ONCE

MEDIA_PROXY_PLAYING_ORDER_NEWEST_REPEAT

MEDIA_PROXY_PLAYING_ORDER_SHUFFLE_ONCE

MEDIA_PROXY_PLAYING_ORDER_SHUFFLE_REPEAT

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SINGLE_ONCE
Playing orders supported.
A bitmap, in the same order as the playing orders above. Note that playing order 1 corresponds to bit 0, and so on.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SINGLE_REPEAT

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_INORDER_ONCE

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_INORDER_REPEAT

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_OLDEST_ONCE

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_OLDEST_REPEAT

MEDIA_PROXY_SEARCH_SUCCESS
  Search operation result codes.
Functions

int media_proxy_ctrl_register(struct media_proxy_ctrl_cbs *ctrl_cbs)
Register a controller with the media_proxy.

Parameters
• ctrl_cbs – Callbacks to the controller

Returns
0 if success, errno on failure

int media_proxy_ctrl_discover_player(struct bt_conn *conn)
Discover a remote media player.

Discover a remote media player instance. The remote player instance will be discovered, and accessed, using Bluetooth, via the media control client and a remote media control service. This call will start a GATT discovery of the Media Control Service on the peer, and setup handles and subscriptions.

This shall be called once before any other actions can be executed for the remote player. The remote player instance will be returned in the discover_player() callback.

Parameters
• conn – The connection to do discovery for

Returns
0 if success, errno on failure

int media_proxy_ctrl_get_player_name(struct media_player *player)
Read Media Player Name.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_id(struct media_player *player)
Read Icon Object ID.

Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_icon_url(struct media_player *player)
    Read Icon URL.
    Get a URL to the media player’s icon.

    Parameters
    • player – Media player instance pointer

int media_proxy_ctrl_get_track_title(struct media_player *player)
    Read Track Title.

    Parameters
    • player – Media player instance pointer

    Returns
    0 if success, errno on failure.

int media_proxy_ctrl_get_track_duration(struct media_player *player)
    Read Track Duration.
    The duration of a track is measured in hundredths of a second.

    Parameters
    • player – Media player instance pointer

    Returns
    0 if success, errno on failure.

int media_proxy_ctrl_get_track_position(struct media_player *player)
    Read Track Position.
    The position of the player (the playing position) is measured in hundredths of a second
    from the beginning of the track

    Parameters
    • player – Media player instance pointer

    Returns
    0 if success, errno on failure.

int media_proxy_ctrl_set_track_position(struct media_player *player, int32_t position)
    Set Track Position.
    Set the playing position of the media player in the current track. The position is given
    in in hundredths of a second, from the beginning of the track of the track for positive
    values, and (backwards) from the end of the track for negative values.

    Parameters
    • player – Media player instance pointer
    • position – The track position to set

    Returns
    0 if success, errno on failure.

int media_proxy_ctrl_get_playback_speed(struct media_player *player)
    Get Playback Speed.
    The playback speed parameter is related to the actual playback speed as follows: actual
    playback speed = 2^(speed_parameter/64)

    A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal”
    speed). A speed parameter of -128 corresponds to playback at one fourth of normal
    speed, 127 corresponds to playback at almost four times the normal speed.
Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_playback_speed(struct media_player *player, int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Parameters
• player – Media player instance pointer
• speed – The playback speed parameter to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_seeking_speed(struct media_player *player)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_segments_id(struct media_player *player)
Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service.

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_current_track_id(struct media_player *player)
Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service.
See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Requires Object Transfer Service

**Parameters**

- `player` – Media player instance pointer

**Returns**

0 if success, errno on failure.

```c
int media_proxy_ctrl_set_current_track_id(struct media_player *player, uint64_t id)
```

Set Current Track Object ID.

Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Requires Object Transfer Service

**Parameters**

- `player` – Media player instance pointer
- `id` – The ID of a track object

**Returns**

0 if success, errno on failure.

```c
int media_proxy_ctrl_get_next_track_id(struct media_player *player)
```

Read Next Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service.

Requires Object Transfer Service

**Parameters**

- `player` – Media player instance pointer

**Returns**

0 if success, errno on failure.

```c
int media_proxy_ctrl_set_next_track_id(struct media_player *player, uint64_t id)
```

Set Next Track Object ID.

Change the player's next track to the track given by the ID.

Requires Object Transfer Service

**Parameters**

- `player` – Media player instance pointer
- `id` – The ID of a track object

**Returns**

0 if success, errno on failure.

```c
int media_proxy_ctrl_get_parent_group_id(struct media_player *player)
```

Read Parent Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service.

The parent group is the parent of the current group.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Requires Object Transfer Service
Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_get_current_group_id(struct media_player *player)

Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

Requires Object Transfer Service

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_set_current_group_id(struct media_player *player, uint64_t id)

Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

Requires Object Transfer Service

Parameters

- player – Media player instance pointer
- id – The ID of a group object

Returns

0 if success, errno on failure.

int media_proxy_ctrl_get_playing_order(struct media_player *player)

Read Playing Order.

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_set_playing_order(struct media_player *player, uint8_t order)

Set Playing Order.

Set the media player's playing order

Parameters

- player – Media player instance pointer
- order – The playing order to set

Returns

0 if success, errno on failure.

int media_proxy_ctrl_get_playing_orders_supported(struct media_player *player)

Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders.
Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_media_state(struct media_player *player)
Read Media State.
Read the media player's state

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_command(struct media_player *player, const struct mpl_cmd *command)
Send Command.
Send a command to the media player. Commands may cause the media player to
change its state. May result in two callbacks - one for the actual sending of the com-
mand to the player, one for the result of the command from the player.

Parameters
• player – Media player instance pointer
• command – The command to send

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_commands_supported(struct media_player *player)
Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_search(struct media_player *player, const struct mpl_search *search)
Set Search.
Write a search to the media player. If the search is successful, the search results will
be available as a group object in the Object Transfer Service (OTS).
May result in up to three callbacks
• one for the actual sending of the search to the player
• one for the result code for the search from the player
• if the search is successful, one for the the search results object ID in the OTs
Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• search – The search to write
Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_search_results_id(struct media_player *player)
Read Search Results Object ID.
Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service
The search results object is a group object. The search results object only exists if a successful search operation has been done.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

uint8_t media_proxy_ctrl_get_content_ctrl_id(struct media_player *player)
Read Content Control ID.
The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_pl_register(struct media_proxy_pl_calls *pl_calls)
Register a player with the media proxy.
Register a player with the media proxy module, for use by media controllers.
The media proxy may call any non-NULL function pointers in the supplied media_proxy_pl_calls structure.

Parameters
• pl_calls – Function pointers to the media player's calls

Returns
0 if success, errno on failure

int media_proxy_pl_init(void)

struct bt_ots *bt_mcs_get_ots(void)

void media_proxy_pl_name_cb(const char *name)
Player name changed callback.
To be called when the player's name is changed.

Parameters
• name – The name of the player

void media_proxy_pl_icon_url_cb(const char *url)
Player icon URL changed callback.
To be called when the player's icon URL is changed.

Parameters
• url – The URL of the player's icon
void media_proxy_pl_track_changed_cb(void)
    Track changed callback.
    To be called when the player’s current track is changed

void media_proxy_pl_track_title_cb(char *title)
    Track title callback.
    To be called when the player’s current track is changed

    Parameters
    • title – The title of the track

void media_proxy_pl_track_duration_cb(int32_t duration)
    Track duration callback.
    To be called when the current track’s duration is changed (e.g. due to a track change)
    The track duration is given in hundredths of a second.

    Parameters
    • duration – The track duration

void media_proxy_pl_track_position_cb(int32_t position)
    Track position callback.
    To be called when the media player’s position in the track is changed, or when the player is paused or similar.
    Exception: This callback should not be called when the position changes during regular playback, i.e. while the player is playing and playback happens at a constant speed.
    The track position is given in hundredths of a second from the start of the track.

    Parameters
    • position – The media player’s position in the track

void media_proxy_pl_playback_speed_cb(int8_t speed)
    Playback speed callback.
    To be called when the playback speed is changed.

    Parameters
    • speed – The playback speed parameter

void media_proxy_plseeking_speed_cb(int8_t speed)
    Seeking speed callback.
    To be called when the seeking speed is changed.

    Parameters
    • speed – The seeking speed factor

void media_proxy_pl_current_track_id_cb(uint64_t id)
    Current track object ID callback.
    To be called when the ID of the current track is changed (e.g. due to a track change).

    Parameters
    • id – The ID of the current track object in the OTS
void media_proxy_pl_next_track_id_cb(uint64_t id)
    Next track object ID callback.
    To be called when the ID of the current track is changes

    Parameters
    • id – The ID of the next track object in the OTS

void media_proxy_pl_parent_group_id_cb(uint64_t id)
    Parent group object ID callback.
    To be called when the ID of the parent group is changed

    Parameters
    • id – The ID of the parent group object in the OTS

void media_proxy_pl_current_group_id_cb(uint64_t id)
    Current group object ID callback.
    To be called when the ID of the current group is changed

    Parameters
    • id – The ID of the current group object in the OTS

void media_proxy_pl_playing_order_cb(uint8_t order)
    Playing order callback.
    To be called when the playing order is changed

    Parameters
    • order – The playing order

void media_proxy_pl_media_state_cb(uint8_t state)
    Media state callback.
    To be called when the media state is changed

    Parameters
    • state – The media player’s state

void media_proxy_pl_command_cb(const struct mpl_cmd_ntf *cmd_ntf)
    Command callback.
    To be called when a command has been sent, to notify whether the command was
    successfully performed or not. See the MEDIA_PROXY_CMD_* result code defines.

    Parameters
    • cmd_ntf – The result of the command

void media_proxy_pl_commands_supported_cb(uint32_t opcodes)
    Commands supported callback.
    To be called when the set of commands supported is changed

    Parameters
    • opcodes – The supported commands opcodes

void media_proxy_pl_search_cb(uint8_t result_code)
    Search callback.
    To be called when a search has been set to notify whether the search was successfully
    performed or not. See the MEDIA_PROXY_SEARCH_* result code defines.
    The actual results of the search, if successful, can be found in the search results object.
Parameters

- `result_code` – The result (success or failure) of the search

```c
void media_proxy_pl_search_results_id_cb(uint64_t id)
```

Search Results object ID callback.
To be called when the ID of the search results is changed (typically as the result of a new successful search).

Parameters

- `id` – The ID of the search results object in the OTS

```c
struct mpl_cmd
#include <media_proxy.h> Media player command.
```

```c
struct mpl_cmd_ntf
#include <media_proxy.h> Media command notification.
```

```c
struct mpl_sci
#include <media_proxy.h> Search control item.
```

Public Members

```c
uint8_t len
```
Length of type and parameter.

```c
uint8_t type
```
`MEDIA_PROXY_SEARCH_TYPE_`...

```c
char param[62]
```
Search parameter.

```c
struct mpl_search
#include <media_proxy.h> Search.
```

```c
struct media_proxy_ctrl_cbs
#include <media_proxy.h> Callbacks to a controller, from the media proxy.
```

Given by a controller when registering

Public Members

```c
void (*local_player_instance)(struct media_player *player, int err)
```
Media Player Instance callback.
Called when the local Media Player instance is registered or read (TODO). Also called if the local player instance is already registered when the controller is registered. Provides the controller with the pointer to the local player instance.

- **Param player**
  Media player instance pointer

- **Param err**
  Error value. 0 on success, or `errno` on negative value.
void (*player_name_recv)(struct media_player *player, int err, const char *name)

Media Player Name receive callback.

Called when the Media Player Name is read or changed See also media_proxy_ctrl_name_get()

  Param player
    Media player instance pointer
  Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param name
    The name of the media player

void (*icon_id_recv)(struct media_player *player, int err, uint64_t id)

Media Player Icon Object ID receive callback.

Called when the Media Player Icon Object ID is read See also media_proxy_ctrl_get_icon_id()

  Param player
    Media player instance pointer
  Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param id
    The ID of the Icon object in the Object Transfer Service (48 bits)

void (*icon_url_recv)(struct media_player *player, int err, const char *url)

Media Player Icon URL receive callback.

Called when the Media Player Icon URL is read See also media_proxy_ctrl_get_icon_url()

  Param player
    Media player instance pointer
  Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param url
    The URL of the icon

void (*track_changed_recv)(struct media_player *player, int err)

Track changed receive callback.

Called when the Current Track is changed

  Param player
    Media player instance pointer
  Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*track_title_recv)(struct media_player *player, int err, const char *title)

Track Title receive callback.

Called when the Track Title is read or changed See also media_proxy_ctrl_get_track_title()

  Param player
    Media player instance pointer
Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.

Param title
    The title of the current track

void (*track_duration_recv)(struct media_player *player, int err, int32_t duration)
Track Duration receive callback.
Called when the Track Duration is read or changed See also media_proxy_ctrl_get_track_duration()
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, GATT error on positive value or errno on negative value.
    Param duration
        The duration of the current track

void (*track_position_recv)(struct media_player *player, int err, int32_t position)
Track Position receive callback.
Called when the Track Position is read or changed See also media_proxy_ctrl_get_track_duration() and media_proxy_ctrl_set_track_position()
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, GATT error on positive value or errno on negative value.
    Param position
        The player's position in the track

void (*track_position_write)(struct media_player *player, int err, int32_t position)
Track Position write callback.
Called when the Track Position is written See also media_proxy_ctrl_set_track_position()
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, GATT error on positive value or errno on negative value.
    Param position
        The position given attempted to write

void (*playback_speed_recv)(struct media_player *player, int err, int8_t speed)
Playback Speed receive callback.
Called when the Playback Speed is read or changed See also media_proxy_ctrl_get_playback_speed() and media_proxy_ctrl_set_playback_speed()
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, GATT error on positive value or errno on negative value.
    Param speed
        The playback speed parameter
void (*playback_speed_write)(struct media_player *player, int err, int8_t speed)
Playback Speed write callback.
Called when the Playback Speed is written. See also media_proxy_ctrl_set_playback_speed()
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param speed
The playback speed parameter attempted to write

void (*seeking_speed_recv)(struct media_player *player, int err, int8_t speed)
Seeking Speed receive callback.
Called when the Seeking Speed is read or changed. See also media_proxy_ctrl_get_seeking_speed()
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param speed
The seeking speed factor

void (*track_segments_id_recv)(struct media_player *player, int err, uint64_t id)
Track Segments Object ID receive callback.
Called when the Track Segments Object ID is read. See also media_proxy_ctrl_get_track_segments_id()
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID of the track segments object in Object Transfer Service (48 bits)

void (*current_track_id_recv)(struct media_player *player, int err, uint64_t id)
Current Track Object ID receive callback.
Called when the Current Track Object ID is read or changed. See also media_proxy_ctrl_get_current_track_id() and media_proxy_ctrl_set_current_track_id()
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID of the current track object in Object Transfer Service (48 bits)

void (*current_track_id_write)(struct media_player *player, int err, uint64_t id)
Current Track Object ID write callback.
Called when the Current Track Object ID is written. See also media_proxy_ctrl_set_current_track_id()
The ID (48 bits) attempted to write.

```c
void (*next_track_id_recv)(struct media_player *player, int err, uint64_t id)
```

Next Track Object ID receive callback.

Called when the Next Track Object ID is read or changed. See also `media_proxy_ctrl_get_next_track_id()` and `media_proxy_ctrl_set_next_track_id()`

- **Param player**
  - Media player instance pointer

- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param id**
  - The ID of the next track object in Object Transfer Service (48 bits)

```c
void (*next_track_id_write)(struct media_player *player, int err, uint64_t id)
```

Next Track Object ID write callback.

Called when the Next Track Object ID is written. See also `media_proxy_ctrl_set_next_track_id()`

- **Param player**
  - Media player instance pointer

- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param id**
  - The ID (48 bits) attempted to write

```c
void (*parent_group_id_recv)(struct media_player *player, int err, uint64_t id)
```

Parent Group Object ID receive callback.

Called when the Parent Group Object ID is read or changed. See also `media_proxy_ctrl_get_parent_group_id()`

- **Param player**
  - Media player instance pointer

- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param id**
  - The ID of the parent group object in Object Transfer Service (48 bits)

```c
void (*current_group_id_recv)(struct media_player *player, int err, uint64_t id)
```

Current Group Object ID receive callback.

Called when the Current Group Object ID is read or changed. See also `media_proxy_ctrl_get_current_group_id()` and `media_proxy_ctrl_set_current_group_id()`

- **Param player**
  - Media player instance pointer

- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
**Param id**
The ID of the current group object in Object Transfer Service (48 bits)

```c
void (*current_group_id_write)(struct media_player *player, int err, uint64_t id)
```
Current Group Object ID write callback.
Called when the Current Group Object ID is written See also `media_proxy_ctrl_set_current_group_id()`

- **Param player**
  Media player instance pointer
- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**
  The ID (48 bits) attempted to write

```c
void (*playing_order_recv)(struct media_player *player, int err, uint8_t order)
```
Playing Order receive callback.
Called when the Playing Order is read or changed See also `media_proxy_ctrl_get_playing_order()` and `media_proxy_ctrl_set_playing_order()`

- **Param player**
  Media player instance pointer
- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param order**
  The playing order

```c
void (*playing_order_write)(struct media_player *player, int err, uint8_t order)
```
Playing Order write callback.
Called when the Playing Order is written See also `media_proxy_ctrl_set_playing_order()`

- **Param player**
  Media player instance pointer
- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param order**
  The playing order attempted to write

```c
void (*playing_orders_supported_recv)(struct media_player *player, int err, uint16_t orders)
```
Playing Orders Supported receive callback.
Called when the Playing Orders Supported is read See also `media_proxy_ctrl_get_playing_orders_supported()`

- **Param player**
  Media player instance pointer
- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param orders**
  The playing orders supported

```c
void (*media_state_recv)(struct media_player *player, int err, uint8_t state)
```
Media State receive callback.
Called when the Media State is read or changed. See also `media_proxy_ctrl_get_media_state()` and `media_proxy_ctrl_send_command()`.

**Param player**
Media player instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param state**
The media player state.

```c
void (*command_send)(struct media_player *player, int err, const struct mpl_cmd *cmd)
```

Command send callback. Called when a command has been sent. See also `media_proxy_ctrl_send_command()`.

**Param player**
Media player instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param cmd**
The command sent.

```c
void (*command_recv)(struct media_player *player, int err, const struct mpl_cmd_ntf *result)
```

Command result receive callback. Called when a command result has been received. See also `media_proxy_ctrl_send_command()`.

**Param player**
Media player instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param result**
The result received.

```c
void (*commands_supported_recv)(struct media_player *player, int err, uint32_t opcodes)
```

Commands supported receive callback. Called when the Commands Supported is read or changed. See also `media_proxy_ctrl_get_commands_supported()`.

**Param player**
Media player instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param opcodes**
The supported command opcodes (bitmap).

```c
void (*search_send)(struct media_player *player, int err, const struct mpl_search *search)
```

Search send callback. Called when a search has been sent. See also `media_proxy_ctrl_send_search()`.

**Param player**
Media player instance pointer.
**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param search**
The search sent

```c
void (*search_recv)(struct media_player *player, int err, uint8_t result_code)
```
Search result code receive callback.
Called when a search result code has been received. See also `media_proxy_ctrl_send_search()`.

The search result code tells whether the search was successful or not. For a successful search, the actual results of the search (i.e. what was found as a result of the search) can be accessed using the Search Results Object ID. The Search Results Object ID has a separate callback - `search_results_id_recv()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param result_code**
Search result code

```c
void (*search_results_id_recv)(struct media_player *player, int err, uint64_t id)
```
Search Results Object ID receive callback.
Called when the Search Results Object ID is read or changed.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID of the search results object in Object Transfer Service (48 bits)

```c
void (*content_ctrl_id_recv)(struct media_player *player, int err, uint8_t ccid)
```
Content Control ID receive callback.
Called when the Content Control ID is read. See also `media_proxy_ctrl_get_content_ctrl_id()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param ccid**
The content control ID

```c
struct media_proxy_pl_calls
```

include `<media_proxy.h>` Available calls in a player, that the media proxy can call.

Given by a player when registering.

**Public Members**

6.1. Bluetooth
const char *(*get_player_name)(void)
Read Media Player Name.
Return
The name of the media player

uint64_t (*get_icon_id)(void)
Read Icon Object ID.
Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service.
See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.
Return
The Icon Object ID

const char *(*get_icon_url)(void)
Read Icon URL.
Get a URL to the media player's icon.
Return
The URL of the Icon

const char *(*get_track_title)(void)
Read Track Title.
Return
The title of the current track

int32_t (*get_track_duration)(void)
Read Track Duration.
The duration of a track is measured in hundredths of a second.
Return
The duration of the current track

int32_t (*get_track_position)(void)
Read Track Position.
The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track.
Return
The position of the player in the current track

void (*set_track_position)(int32_t position)
Set Track Position.
Set the playing position of the media player in the current track. The position is given in in hundredths of a second, from the beginning of the track for positive values, and (backwards) from the end of the track for negative values.
Param position
The player position to set

int8_t (*get_playback_speed)(void)
Get Playback Speed.
The playback speed parameter is related to the actual playback speed as follows: actual playback speed = $2^{(speed\_parameter/64)}$
A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Return
The playback speed parameter

void (*set_playback_speed)(int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter: If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Param speed
The playback speed parameter to set

int8_t (*get_seeking_speed)(void)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

Return
The seeking speed factor

uint64_t (*get_track_segments_id)(void)
Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Return
Current The Track Segments Object ID

uint64_t (*get_current_track_id)(void)
Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Return
The Current Track Object ID

void (*set_current_track_id)(uint64_t id)
Set Current Track Object ID.

Change the player’s current track to the track given by the ID. (Behaves similarly to the goto track command.)
Param id
The ID of a track object

uint64_t (*get_next_track_id)(void)
Read Next Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service
Return
The Next Track Object ID

void (*set_next_track_id)(uint64_t id)
Set Next Track Object ID.
Change the player's next track to the track given by the ID.
Param id
The ID of a track object

uint64_t (*get_parent_group_id)(void)
Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service
The parent group is the parent of the current group.
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.
Return
The Current Group Object ID

uint64_t (*get_current_group_id)(void)
Read Current Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.
Return
The Current Group Object ID

void (*set_current_group_id)(uint64_t id)
Set Current Group Object ID.
Change the player's current group to the group given by the ID, and the current track to the first track in that group.
Param id
The ID of a group object

uint8_t (*get_playing_order)(void)
Read Playing Order.
return The media player's current playing order

void (*set_playing_order)(uint8_t order)
Set Playing Order.
Set the media player's playing order. See the MEDIA_PROXY_PLAYING_ORDER_* defines.
**Param order**
The playing order to set

uint16_t (*get_playing_orders_supported)(void)
Read Playing Orders Supported.
Read a bitmap containing the media player’s supported playing orders. See the MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_* defines.

**Return**
The media player’s supported playing orders

uint8_t (*get_media_state)(void)
Read Media State.
Read the media player’s state See the MEDIA_PROXY_MEDIA_STATE_* defines.

**Return**
The media player’s state

void (*send_command)(const struct mpl_cmd *command)
Send Command.
Send a command to the media player. For command opcodes (play, pause, ...) - see the MEDIA_PROXY_OP_* defines.

**Param command**
The command to send

uint32_t (*get_commands_supported)(void)
Read Commands Supported.
Read a bitmap containing the media player’s supported command opcodes. See the MEDIA_PROXY_OP_SUP_* defines.

**Return**
The media player’s supported command opcodes

void (*send_search)(const struct mpl_search *search)
Set Search.
Write a search to the media player. (For the formatting of a search, see the Media Control Service spec and the mcs.h file.)

**Param search**
The search to write

uint64_t (*get_search_results_id)(void)
Read Search Results Object ID.
Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service
The search results object is a group object. The search results object only exists if a successful search operation has been done.

**Return**
The Search Results Object ID

uint8_t (*get_content_ctrl_id)(void)
Read Content Control ID.
The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.
**Return**

The content control ID for the media player

---

**Media Control Client**

*group bt_gatt_mcc*

Bluetooth Media Control Client (MCC) interface.

Updated to the Media Control Profile specification revision 1.0

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Typedefs**

typedef void (*bt_mcc_discover_mcs_cb)(struct bt_conn *conn, int err)

Callback function for `bt_mcc_discover_mcs()`

Called when a media control server is discovered

**Param conn**

The connection that was used to initialise the media control client

**Param err**

Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_player_name_cb)(struct bt_conn *conn, int err, const char *name)

Callback function for `bt_mcc_read_player_name()`

Called when the player name is read or notified

**Param conn**

The connection that was used to initialise the media control client

**Param err**

Error value. 0 on success, GATT error or errno on fail

**Param name**

Player name

typedef void (*bt_mcc_read_icon_obj_id_cb)(struct bt_conn *conn, int err, uint64_t icon_id)

Callback function for `bt_mcc_read_icon_obj_id()`

Called when the icon object ID is read

**Param conn**

The connection that was used to initialise the media control client

**Param err**

Error value. 0 on success, GATT error or errno on fail

**Param icon_id**

The ID of the Icon Object. This is a UINT48 in a uint64_t

typedef void (*bt_mcc_read_icon_url_cb)(struct bt_conn *conn, int err, const char *icon_url)

Callback function for `bt_mcc_read_icon_url()`

Called when the icon URL is read
**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param icon_url**  
The URL of the Icon

default void (*bt_mcc_track_changed_ntf_cb)(struct bt_conn *conn, int err)  
Callback function for track changed notifications.  
Called when a track change is notified.  
The track changed characteristic is a special case. It can not be read or set, it can only be notified.

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_track_title_cb)(struct bt_conn *conn, int err, const char *title)  
Callback function for bt_mcc_read_track_title()  
Called when the track title is read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param title**  
The title of the track

default void (*bt_mcc_read_track_duration_cb)(struct bt_conn *conn, int err, int32_t dur)  
Callback function for bt_mcc_read_track_duration()  
Called when the track duration is read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param dur**  
The duration of the track

default void (*bt_mcc_read_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)  
Callback function for bt_mcc_read_track_position()  
Called when the track position is read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param pos**  
The Track Position

6.1. Bluetooth
typedef void (*bt_mcc_set_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for \textit{bt\_mcc\_set\_track\_position()}
Called when the track position is set

\begin{description}
\item[Param conn] The connection that was used to initialise the media control client
\item[Param err] Error value. 0 on success, GATT error or errno on fail
\item[Param pos] The Track Position set (or attempted to set)
\end{description}

typedef void (*bt_mcc_read_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for \textit{bt\_mcc\_read\_playback\_speed()}
Called when the playback speed is read or notified

\begin{description}
\item[Param conn] The connection that was used to initialise the media control client
\item[Param err] Error value. 0 on success, GATT error or errno on fail
\item[Param speed] The Playback Speed
\end{description}

typedef void (*bt_mcc_set_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for \textit{bt\_mcc\_set\_playback\_speed()}
Called when the playback speed is set

\begin{description}
\item[Param conn] The connection that was used to initialise the media control client
\item[Param err] Error value. 0 on success, GATT error or errno on fail
\item[Param speed] The Playback Speed set (or attempted to set)
\end{description}

typedef void (*bt_mcc_read_seeking_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for \textit{bt\_mcc\_read\_seeking\_speed()}
Called when the seeking speed is read or notified

\begin{description}
\item[Param conn] The connection that was used to initialise the media control client
\item[Param err] Error value. 0 on success, GATT error or errno on fail
\item[Param speed] The Seeking Speed
\end{description}

typedef void (*bt_mcc_read_segments_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)
Callback function for \textit{bt\_mcc\_read\_segments\_obj\_id()}
Called when the track segments object ID is read
**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param id**
The Track Segments Object ID (UINT48)

typedef void (*bt_mcc_read_current_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_current_track_obj_id()*
Called when the current track object ID is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param id**
The Current Track Object ID (UINT48)

typedef void (*bt_mcc_set_current_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_set_current_track_obj_id()*
Called when the current track object ID is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param id**
The Object ID (UINT48) set (or attempted to set)

typedef void (*bt_mcc_read_next_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_next_track_obj_id_obj()*
Called when the next track object ID is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param id**
The Next Track Object ID (UINT48)

typedef void (*bt_mcc_set_next_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_set_next_track_obj_id()*
Called when the next track object ID is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

6.1. Bluetooth
typedef void (*bt_mcc_read_parent_group_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for \texttt{bt_mcc_read_parent_group_obj_id()}
Called when the parent group object ID is read or notified

\textbf{Param conn}  
The connection that was used to initialise the media control client

\textbf{Param err}  
Error value. 0 on success, GATT error or errno on fail

\textbf{Param id}  
The Parent Group Object ID (UINT48)

typedef void (*bt_mcc_read_current_group_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for \texttt{bt_mcc_read_current_group_obj_id()}
Called when the current group object ID is read or notified

\textbf{Param conn}  
The connection that was used to initialise the media control client

\textbf{Param err}  
Error value. 0 on success, GATT error or errno on fail

\textbf{Param id}  
The Current Group Object ID (UINT48)

typedef void (*bt_mcc_set_current_group_obj_id_cb)(struct bt_conn *conn, int err, uint64_t obj_id)

Callback function for \texttt{bt_mcc_set_current_group_obj_id()}
Called when the current group object ID is set

\textbf{Param conn}  
The connection that was used to initialise the media control client

\textbf{Param err}  
Error value. 0 on success, GATT error or errno on fail

\textbf{Param obj_id}  
The Object ID (UINT48) set (or attempted to set)

typedef void (*bt_mcc_read_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)

Callback function for \texttt{bt_mcc_read_playing_order()}
Called when the playing order is read or notified

\textbf{Param conn}  
The connection that was used to initialise the media control client

\textbf{Param err}  
Error value. 0 on success, GATT error or errno on fail

\textbf{Param order}  
The playback order
typedef void (*bt_mcc_set_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)
Callback function for `bt_mcc_set_playing_order()`
Called when the playing order is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param order**
The Playing Order set (or attempted to set)

typedef void (*bt_mcc_read_playing_orders_supported_cb)(struct bt_conn *conn, int err, uint16_t orders)
Callback function for `bt_mcc_read_playing_orders_supported()`
Called when the supported playing orders are read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param orders**
The playing orders supported (bitmap)

typedef void (*bt_mcc_read_media_state_cb)(struct bt_conn *conn, int err, uint8_t state)
Callback function for `bt_mcc_read_media_state()`
Called when the media state is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param state**
The Media State

typedef void (*bt_mcc_send_cmd_cb)(struct bt_conn *conn, int err, const struct mpl_cmd *cmd)
Callback function for `bt_mcc_send_cmd()`
Called when a command is sent, i.e. when the media control point is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param cmd**
The command sent

typedef void (*bt_mcc_cmd_ntf_cb)(struct bt_conn *conn, int err, const struct mpl_cmd_ntf *ntf)
Callback function for command notifications.
Called when the media control point is notified

6.1. Bluetooth
Notifications for commands (i.e. for writes to the media control point) use a different parameter structure than what is used for sending commands (writing to the media control point)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ntf
The command notification

typedef void (*bt_mcc_read_opcodes_supported_cb)(struct bt_conn *conn, int err, uint32_t opcodes)
Callback function for bt_mcc_read_opcodes_supported()
Called when the supported opcodes (commands) are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param opcodes
The supported opcodes

typedef void (*bt_mcc_send_search_cb)(struct bt_conn *conn, int err, const struct mpl_search *search)
Callback function for bt_mcc_send_search()
Called when a search is sent, i.e. when the search control point is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param search
The search set (or attempted to set)

typedef void (*bt_mcc_search_ntf_cb)(struct bt_conn *conn, int err, uint8_t result_code)
Callback function for search notifications.
Called when the search control point is notified
Notifications for searches (i.e. for writes to the search control point) use a different parameter structure than what is used for sending searches (writing to the search control point)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param result_code
The search notification

typedef void (*bt_mcc_read_search_results_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)
Callback function for `bt_mcc_read_search_results_obj_id()`
Called when the search results object ID is read or notified
Note that the Search Results Object ID value may be zero, in case the characteristic does not exist on the server. (This will be the case if there has not been a successful search.)

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param id**
The Search Results Object ID (UINT48)

typedef void (*`bt_mcc_read_content_control_id_cb`(struct bt_conn *conn, int err , uint8_t ccid))

Callback function for `bt_mcc_read_content_control_id()`
Called when the content control ID is read

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param ccid**
The Content Control ID

typedef void (*`bt_mcc_otc_obj_selected_cb`(struct bt_conn *conn, int err))

Callback function for `object selected.`
Called when an object is selected

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

typedef void (*`bt_mcc_otc_obj_metadata_cb`(struct bt_conn *conn, int err))

Callback function for `bt_mcc_otc_read_object_meatadata()`
Called when object metadata is read

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

typedef void (*`bt_mcc_otc_read_icon_object_cb`(struct bt_conn *conn, int err , struct net_buf_simple *buf))

Callback function for `bt_mcc_otc_read_icon_object()`
Called when the icon object is read

If err is EMSGSIZE, the object contents have been truncated.
Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_track_segments_object_cb)(struct bt_conn *conn, int err, struct net_buf_simple *buf)
Callback function for \texttt{bt\_mcc\_otc\_read\_track\_segments\_object()}
Called when the track segments object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_current_track_object_cb)(struct bt_conn *conn, int err, struct net_buf_simple *buf)
Callback function for \texttt{bt\_mcc\_otc\_read\_current\_track\_object()}
Called when the current track object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_next_track_object_cb)(struct bt_conn *conn, int err, struct net_buf_simple *buf)
Callback function for \texttt{bt\_mcc\_otc\_read\_next\_track\_object()}
Called when the next track object is read

If err is EMSGSIZE, the object contents have been truncated.
typedef void (*bt_mcc_otc_read_parent_group_object_cb)(struct bt_conn *conn, int err, struct net_buf_simple *buf)

Callback function for \texttt{bt\_mcc\_otc\_read\_parent\_group\_object()}
Called when the parent group object is read

If err is EMSGSIZE, the object contents have been truncated.

\begin{description}
\item[D:\textbf{Param conn}]
The connection that was used to initialise the media control client
\item[D:\textbf{Param err}]
Error value. 0 on success, GATT error or errno on fail
\item[D:\textbf{Param buf}]
Buffer containing the object contents
\end{description}

typedef void (*bt_mcc_otc_read_current_group_object_cb)(struct bt_conn *conn, int err, struct net_buf_simple *buf)

Callback function for \texttt{bt\_mcc\_otc\_read\_current\_group\_object()}
Called when the current group object is read

If err is EMSGSIZE, the object contents have been truncated.

\begin{description}
\item[D:\textbf{Param conn}]
The connection that was used to initialise the media control client
\item[D:\textbf{Param err}]
Error value. 0 on success, GATT error or errno on fail
\item[D:\textbf{Param buf}]
Buffer containing the object contents
\end{description}

\textbf{Functions}

\begin{description}
\item[D:\texttt{int bt\_mcc\_init(struct bt\_mcc\_cb *cb)}]
Initialize Media Control Client.
\item[D:\textbf{Parameters}]
• \texttt{cb} – Callbacks to be used
\item[D:\textbf{Returns}]
0 if success, errno on failure.
\item[D:\texttt{int bt\_mcc\_discover\_mcs(struct bt\_conn *conn, bool subscribe)}]
Discover Media Control Service.
\item[D:\textbf{Parameters}]
• \texttt{conn} – Connection to the peer device
• \texttt{subscribe} – Whether to subscribe to notifications
\end{description}
Returns
0 if success, errno on failure.

```c
int bt_mcc_read_player_name(struct bt_conn *conn)
```
Read Media Player Name.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_icon_obj_id(struct bt_conn *conn)
```
Read Icon Object ID.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_icon_url(struct bt_conn *conn)
```
Read Icon Object URL.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_track_title(struct bt_conn *conn)
```
Read Track Title.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_track_duration(struct bt_conn *conn)
```
Read Track Duration.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_track_position(struct bt_conn *conn)
```
Read Track Position.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_set_track_position(struct bt_conn *conn, int32_t pos)
```
Set Track position.

**Parameters**
- `conn` – Connection to the peer device
pos – Track position

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_playback_speed(struct bt_conn *conn)
```
Read Playback speed.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_set_playback_speed(struct bt_conn *conn, int8_t speed)
```
Set Playback Speed.

**Parameters**
- conn – Connection to the peer device
- speed – Playback speed

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_seeking_speed(struct bt_conn *conn)
```
Read Seeking speed.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_segments_obj_id(struct bt_conn *conn)
```
Read Track Segments Object ID.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_read_current_track_obj_id(struct bt_conn *conn)
```
Read Current Track Object ID.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

```c
int bt_mcc_set_current_track_obj_id(struct bt_conn *conn, uint64_t id)
```
Set Current Track Object ID.

Set the Current Track to the the track given by the id parameter

**Parameters**
- conn – Connection to the peer device
- id – Object Transfer Service ID (UINT48) of the track to set as the current track

**Returns**
0 if success, errno on failure.
`int bt_mcc_read_next_track_obj_id(struct bt_conn *conn)`
Read Next Track Object ID.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

`int bt_mcc_set_next_track_obj_id(struct bt_conn *conn, uint64_t id)`
Set Next Track Object ID.

Set the Next Track to the the track given by the `id` parameter

**Parameters**
- `conn` – Connection to the peer device
- `id` – Object Transfer Service ID (UINT48) of the track to set as the next track

**Returns**
0 if success, errno on failure.

`int bt_mcc_read_current_group_obj_id(struct bt_conn *conn)`
Read Current Group Object ID.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

`int bt_mcc_set_current_group_obj_id(struct bt_conn *conn, uint64_t id)`
Set Current Group Object ID.

Set the Current Group to the the group given by the `id` parameter

**Parameters**
- `conn` – Connection to the peer device
- `id` – Object Transfer Service ID (UINT48) of the group to set as the current group

**Returns**
0 if success, errno on failure.

`int bt_mcc_read_parent_group_obj_id(struct bt_conn *conn)`
Read Parent Group Object ID.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.

`int bt_mcc_read_playing_order(struct bt_conn *conn)`
Read Playing Order.

**Parameters**
- `conn` – Connection to the peer device

**Returns**
0 if success, errno on failure.
int bt_mcc_set_playing_order(struct bt_conn *conn, uint8_t order)
Set Playing Order.

Parameters
- conn – Connection to the peer device
- order – Playing order

Returns
0 if success, errno on failure.

int bt_mcc_read_playing_orders_supported(struct bt_conn *conn)
Read Playing Orders Supported.

Parameters
- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_media_state(struct bt_conn *conn)
Read Media State.

Parameters
- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_send_cmd(struct bt_conn *conn, const struct mpl_cmd *cmd)
Send a command.
Write a command (e.g. “play”, “pause”) to the server’s media control point.

Parameters
- conn – Connection to the peer device
- cmd – The command to send

Returns
0 if success, errno on failure.

int bt_mcc_read_opcodes_supported(struct bt_conn *conn)
Read Opcodes Supported.

Parameters
- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_send_search(struct bt_conn *conn, const struct mpl_search *search)
Send a Search command.
Write a search to the server’s search control point.

Parameters
- conn – Connection to the peer device
- search – The search

Returns
0 if success, errno on failure.
int bt_mcc_read_search_results_obj_id(struct bt_conn *conn)
Search Results Group Object ID.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_read_content_control_id(struct bt_conn *conn)
Read Content Control ID.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_otc_read_object_metadata(struct bt_conn *conn)
Read the current object metadata.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_otc_read_icon_object(struct bt_conn *conn)
Read the Icon Object.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_otc_read_track_segments_object(struct bt_conn *conn)
Read the Track Segments Object.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_otc_read_current_track_object(struct bt_conn *conn)
Read the Current Track Object.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.

int bt_mcc_otc_read_next_track_object(struct bt_conn *conn)
Read the Next Track Object.

**Parameters**
- conn – Connection to the peer device

**Returns**
0 if success, errno on failure.
int bt_mcc_otc_read_current_group_object(struct bt_conn *conn)
  Read the Current Group Object.

  Parameters
  • conn – Connection to the peer device

  Returns
  0 if success, errno on failure.

int bt_mcc_otc_read_parent_group_object(struct bt_conn *conn)
  Read the Parent Group Object.

  Parameters
  • conn – Connection to the peer device

  Returns
  0 if success, errno on failure.

struct bt_ots_client *bt_mcc_otc_inst(struct bt_conn *conn)
  Look up MCC OTC instance.

  Parameters
  • conn – The connection to the MCC server.

  Returns
  Pointer to a MCC OTC instance if found else NULL.

#include <mcc.h> Media control client callbacks.

Bluetooth Mesh Profile
The Bluetooth Mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy. This module implements the Bluetooth Mesh Protocol Specification v1.1.
Read more about Bluetooth Mesh on the Bluetooth SIG Website.

Core
The core provides functionality for managing the general Bluetooth Mesh state.

Low Power Node
The Low Power Node (LPN) role allows battery powered devices to participate in a mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages.

The radio control and polling is managed automatically by the mesh stack, but the LPN API allows the application to trigger the polling at any time through bt_mesh_lpn_poll(). The LPN operation parameters, including poll interval, poll event timing and Friend requirements is controlled through the CONFIG_BT_MESH_LOW_POWER option and related configuration options.

When using the LPN feature with logging, it is strongly recommended to only use the CONFIG_LOG_MODE_DEFERRED option. Log modes other than the deferred may cause unintended delays during processing of log messages. This in turns will affect scheduling of the receive delay and receive window. The same limitation applies for the CONFIG_BT_MESH_FRIEND option.
Replay Protection List  The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks.

To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, CONFIG_BT_MESH_RPL_STORE_TIMEOUT can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn't completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss) by calling `bt_mesh_rpl_pending_store()`. This is up to the node to decide, which RPL entries are to be stored in this case.

Setting CONFIG_BT_MESH_RPL_STORE_TIMEOUT to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between CONFIG_BT_MESH_RPL_STORE_TIMEOUT and calling `bt_mesh_rpl_pending_store()` may reduce a risk of security vulnerability and flash wear out.

Persistent storage  The mesh stack uses the Settings Subsystem for storing the device configuration persistently. When the stack configuration changes and the change needs to be stored persistently, the stack schedules a work item. The delay between scheduling the work item and submitting it to the workqueue is defined by the CONFIG_BT_MESH_STORE_TIMEOUT option. Once storing of data is scheduled, it can not be rescheduled until the work item is processed. Exceptions are made in certain cases as described below.

When IV index, Sequence Number or CDB configuration have to be stored, the work item is submitted to the workqueue without the delay. If the work item was previously scheduled, it will be rescheduled without the delay.

The Replay Protection List uses the same work item to store RPL entries. If storing of RPL entries is requested and no other configuration is pending to be stored, the delay is set to CONFIG_BT_MESH_RPL_STORE_TIMEOUT. If other stack configuration has to be stored, the delay defined by the CONFIG_BT_MESH_STORE_TIMEOUT option is less than CONFIG_BT_MESH_RPL_STORE_TIMEOUT, and the work item was scheduled by the Replay Protection List, the work item will be rescheduled.

When the work item is running, the stack will store all pending configuration, including the RPL entries.

Work item execution context  The CONFIG_BT_MESH_SETTINGS_WORKQ option configures the context from which the work item is executed. This option is enabled by default, and results in stack using a dedicated cooperative thread to process the work item. This allows the stack to process other incoming and outgoing messages, as well as other work items submitted to the system workqueue, while the stack configuration is being stored.

When this option is disabled, the work item is submitted to the system workqueue. This means that the system workqueue is blocked for the time it takes to store the stack's configuration. It is not recommended to disable this option as this will make the device non-responsive for a noticeable amount of time.

Advertisement identity  All mesh stack bearers advertise data with the `BT_ID_DEFAULT` local identity. The value is preset in the mesh stack implementation. When Bluetooth® Low Energy
(LE) and Bluetooth Mesh coexist on the same device, the application should allocate and configure another local identity for Bluetooth LE purposes before starting the communication.

**API reference**

*group bt_mesh*

Bluetooth Mesh.

**Defines**

- **BT_MESH_NET_PRIMARY**
  Primary Network Key index.

- **BT_MESH_FEAT_RELAY**
  Relay feature.

- **BT_MESH_FEAT_PROXY**
  GATT Proxy feature.

- **BT_MESH_FEAT_FRIEND**
  Friend feature.

- **BT_MESH_FEAT_LOW_POWER**
  Low Power Node feature.

- **BT_MESH_FEAT_SUPPORTED**
  Supported heartbeat publication features.

- **BT_MESH_LPN_CB_DEFINE(_name)**
  Register a callback structure for Friendship events.

  **Parameters**
  - `_name` – Name of callback structure.

- **BT_MESH_FRIEND_CB_DEFINE(_name)**
  Register a callback structure for Friendship events.

  Registers a callback structure that will be called whenever Friendship gets established or terminated.

  **Parameters**
  - `_name` – Name of callback structure.

**Functions**

- **int bt_mesh_init(const struct bt_mesh_prov *prov, const struct bt_mesh_comp *comp)**
  Initialize Mesh support.

  After calling this API, the node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

  **Parameters**
• **prov** – Node provisioning information.
• **comp** – Node Composition.

**Returns**
Zero on success or (negative) error code otherwise.

```c
void bt_mesh_reset(void)
```
Reset the state of the local Mesh node.

 Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.

 After calling this API, the node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

```c
int bt_mesh_suspend(void)
```
Suspend the Mesh network temporarily.

 This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_resume(void)
```
Resume a suspended Mesh network.

 This API resumes the local node, after it has been suspended using the `bt_mesh_suspend()` API.

**Returns**
0 on success, or (negative) error code on failure.

```c
void bt_mesh_iv_update_test(bool enable)
```
Toggle the IV Update test mode.

 This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

**Parameters**
• **enable** – true to enable IV Update test mode, false to disable it.

```c
bool bt_mesh_iv_update(void)
```
Toggle the IV Update state.

 This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

**Returns**
true if IV Update In Progress state was entered, false otherwise.

```c
int bt_mesh_lpn_set(bool enable)
```
Toggle the Low Power feature of the local device.

 Enables or disables the Low Power feature of the local device. This is exposed as a runtime feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

**Parameters**
• **enable** – true to enable LPN functionality, false to disable it.
Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_lpn_poll(void)
Send out a Friend Poll message.
Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_friend_terminate(uint16_t lpn_addr)
Terminate Friendship.
Terminated Friendship for given LPN.

Parameters
• lpn_addr – Low Power Node address.

Returns
Zero on success or (negative) error code otherwise.

void bt_mesh_rpl_pending_store(uint16_t addr)
Store pending RPL entry(ies) in the persistent storage.
This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.

Note: When flash is used as the persistent storage, calling this API too frequently may wear it out.

Parameters
• addr – Address of the node which RPL entry needs to be stored or BT_MESH_ADDR_ALL_NODES to store all pending RPL entries.

const uint8_t *bt_mesh_va_uuid_get(uint16_t addr, const uint8_t *uuid, uint16_t *retaddr)
Iterate stored Label UUIDs.
When addr is BT_MESH_ADDR_UNASSIGNED, this function iterates over all available addresses starting with uuid. In this case, use retaddr to get virtual address representation of the returned Label UUID. When addr is a virtual address, this function returns next Label UUID corresponding to the addr. When uuid is NULL, this function returns the first available UUID. If uuid is previously returned uuid, this function returns following uuid.

Parameters
• addr – Virtual address to search for, or BT_MESH_ADDR_UNASSIGNED.
• uuid – Pointer to the previously returned Label UUID or NULL.
• retaddr – Pointer to a memory where virtual address representation of the returning UUID is to be stored to.

Returns
Pointer to Label UUID, or NULL if no more entries found.

struct bt_mesh_lpn_cb
#include <main.h> Low Power Node callback functions.
Public Members

```c
void (*established)(uint16_t net_idx, uint16_t friend_addr, uint8_t queue_size,
uint8_t recv_window)
```

This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.
- **Param queue_size**
  Friend queue size.
- **Param recv_window**
  Low Power Node's listens duration for Friend response.

```c
void (*terminated)(uint16_t net_idx, uint16_t friend_addr)
```

This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.

```c
void (*polled)(uint16_t net_idx, uint16_t friend_addr, bool retry)
```

This callback notifies the application that the local node has polled the friend node.

This callback will be called before `bt_mesh_lpn_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.
- **Param retry**
  Retry or first poll request for each transaction.

```c
struct bt_mesh_friend_cb
```

```
#include <main.h> Friend Node callback functions.
```

Public Members

```c
void (*established)(uint16_t net_idx, uint16_t lpn_addr, uint8_t recv_delay, uint32_t
polltimeout)
```

This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param lpn_addr**
  Low Power Node address.
**Param recv_delay**  
Receive Delay in units of 1 millisecond.

**Param polltimeout**  
PollTimeout in units of 1 millisecond.

```c
void (*terminated)(uint16_t net_idx, uint16_t lpn_addr)
```

Friendship terminated.

This callback notifies the application that friendship has been terminated.

- **Param net_idx**  
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**  
  Low Power Node address.

```c
void (*polled)(uint16_t net_idx, uint16_t lpn_addr)
```

Friend Poll Request.

This callback notifies the application that the low power node has polled the friend node.

This callback will be called before `bt_mesh_friend_cb::established` when attempting to establish a friendship.

- **Param net_idx**  
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**  
  LPN address.

**Access layer**  
The access layer is the application's interface to the Bluetooth Mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

**Mesh models**  
The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into elements. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to `bt_mesh_init()` during initialization. The Bluetooth SIG have defined a set of foundation models (see Mesh models) and a set of models for implementing common behavior in the Bluetooth Mesh Model Specification. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the Configuration Server:

**Opcode list**  
The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special `BT_MESH_MODEL_OP_END` entry. This entry must always be present in the opcode list, unless the list is empty. In that case, `BT_MESH_MODEL_NO_OPS` should be used in place of a proper opcode list definition.
**AppKey list**  The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the `CONFIG_BT_MESH_MODEL_KEY_COUNT` configuration option. The contents of the AppKey list is managed by the **Configuration Server**.

**Subscription list**  A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the `CONFIG_BT_MESH_MODEL_GROUP_COUNT` configuration option. The contents of the subscription list is managed by the **Configuration Server**.

**Model publication**  The models may send messages in two ways:

- By specifying a set of message parameters in a `bt_mesh_msg_ctx`, and calling `bt_mesh_model_send()`.

- By setting up a `bt_mesh_model_pub` structure and calling `bt_mesh_model_publish()`.

When publishing messages with `bt_mesh_model_publish()`, the model will use the publication parameters configured by the **Configuration Server**. This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to `bt_mesh_model_pub.msg`. The Config Server may also set up period publication for the publication message. To support this, the model must populate the `bt_mesh_model_pub.update` callback. The `bt_mesh_model_pub.update` callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

By setting `bt_mesh_model_pub.retr_update` to 1, the model can configure the `bt_mesh_model_pub.update` callback to be triggered on every retransmission. This can, for example, be used by models that make use of a Delay parameter, which can be adjusted for every retransmission. The `bt_mesh_model_pub_is_retransmission()` function can be used to differentiate a first publication and a retransmission. The `BT_MESH_PUB_MSG_TOTAL` and `BT_MESH_PUB_MSG_NUM` macros can be used to return total number of transmissions and the retransmission number within one publication interval.

**Extended models**  The Bluetooth Mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an “extension tree”. All models in an extension tree share a single subscription list per element it spans.

Model extensions are done by calling `bt_mesh_model_extend()` during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.
The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with \texttt{CONFIG_BT_MESH_MODEL_EXTENSIONS} to have any effect.

**Model data storage** Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling \texttt{bt_mesh_model_data_store()}. To be able to read out the data the next time the device reboots, the model's \texttt{bt_mesh_model_cb.settings_set} callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the \texttt{read_cb} passed as a parameter to the callback. See the \texttt{Settings} module documentation for details.

When model data changes frequently, storing it on every change may lead to increased wear of flash. To reduce the wear, the model can postpone storing of data by calling \texttt{bt_mesh_model_data_store_schedule()}. The stack will schedule a work item with delay defined by the \texttt{CONFIG_BT_MESH_STORE_TIMEOUT} option. When the work item is running, the stack will call the \texttt{bt_mesh_model_cb.pending_store} callback for every model that has requested storing of data. The model can then call \texttt{bt_mesh_model_data_store()} to store the data.

If \texttt{CONFIG_BT_MESH_SETTINGS_WORKQ} is enabled, the \texttt{bt_mesh_model_cb.pending_store} callback is called from a dedicated thread. This allows the stack to process other incoming and outgoing messages while model data is being stored. It is recommended to use this option and the \texttt{bt_mesh_model_data_store_schedule()} function when large amount of data needs to be stored.

**Composition Data** The Composition Data provides information about a mesh device. A device's Composition Data holds information about the elements on the device, the models that it supports, and other features. The Composition Data is split into different pages, where each page contains specific feature information about the device. In order to access this information, the user may use the \texttt{Configuration Server} model or, if supported, the \texttt{Large Composition Data Server} model.

**Composition Data Page 0** Composition Data Page 0 provides the fundamental information about a device, and is mandatory for all mesh devices. It contains the element and model composition, the supported features, and manufacturer information.

**Composition Data Page 1** Composition Data Page 1 provides information about the relationships between models, and is mandatory for all mesh devices. A model may extend and/or correspond to one or more models. A model can extend another model by calling \texttt{bt_mesh_model_extend()}, or correspond to another model by calling \texttt{bt_mesh_model_correspond()}. \texttt{CONFIG_BT_MESH_MODEL_EXTENSION_LIST_SIZE} specifies how many model relations can be stored in the composition on a device, and this number should reflect the number of \texttt{bt_mesh_model_extend()} and \texttt{bt_mesh_model_correspond()} calls.

**Composition Data Page 2** Composition Data Page 2 provides information for supported mesh profiles. Mesh profile specifications define product requirements for devices that want to support a specific Bluetooth SIG defined profile. Currently supported profiles can be found in section 3.12 in Bluetooth SIG Assigned Numbers. Composition Data Page 2 is only mandatory for devices that claim support for one or more mesh profile(s).

**Composition Data Pages 128, 129 and 130** Composition Data Pages 128, 129 and 130 mirror Composition Data Pages 0, 1 and 2 respectively. They are used to represent the new content of the mirrored pages when the Composition Data will change after a firmware update. See Composition Data and Models Metadata for details.
**Delayable messages**  The delayable message functionality is enabled with Kconfig option `CONFIG_BT_MESH_ACCESS_DELAYABLE_MSG`. This is an optional functionality that implements specification recommendations for messages that are transmitted by a model in a response to a received message, also called response messages.

Response messages should be sent with the following random delays:

- Between 20 and 50 milliseconds if the received message was sent to a unicast address
- Between 20 and 500 milliseconds if the received message was sent to a group or virtual address

The delayable message functionality is triggered if the `bt_mesh_msg_ctx.rnd_delay` flag is set. The delayable message functionality stores messages in the local memory while they are waiting for the random delay expiration.

If the transport layer doesn't have sufficient memory to send a message at the moment the random delay expires, the message is postponed for another 10 milliseconds. If the transport layer cannot send a message for any other reason, the delayable message functionality raises the `bt_mesh_send_cb.start` callback with a transport layer error code.

If the delayable message functionality cannot find enough free memory to store an incoming message, it will send messages with delay close to expiration to free memory.

When the mesh stack is suspended or reset, messages not yet sent are removed and the `bt_mesh_send_cb.start` callback is raised with an error code.

**Note:** When a model sends several messages in a row, it may happen that the messages are not sent in the order they were passed to the access layer. This is because some messages can be delayed for a longer time than the others.

Disable the randomization by setting the `bt_mesh_msg_ctx.rnd_delay` to false, when a set of messages originated by the same model needs to be sent in a certain order.

---

**Delayable publications**  The delayable publication functionality implements the specification recommendations for message publication delays in the following cases:

- Between 20 to 500 milliseconds when the Bluetooth Mesh stack starts or when the publication is triggered by the `bt_mesh_model_publish()` function
- Between 20 to 50 milliseconds for periodically published messages

This feature is optional and enabled with the `CONFIG_BT_MESH_DELAYABLE_PUBLICATION` Kconfig option. When enabled, each model can enable or disable the delayable publication by setting the `bt_mesh_model_pub.delayable` bit field to 1 or 0 correspondingly. This bit field can be changed at any time.

Defines

**BT_MESH_ADDR_IS_UNICAST**(addr)
Check if a Bluetooth Mesh address is a unicast address.

**BT_MESH_ADDR_IS_GROUP**(addr)
Check if a Bluetooth Mesh address is a group address.

**BT_MESH_ADDR_IS_FIXED_GROUP**(addr)
Check if a Bluetooth Mesh address is a fixed group address.

**BT_MESH_ADDR_IS_VIRTUAL**(addr)
Check if a Bluetooth Mesh address is a virtual address.
BT_MESH_ADDR_IS_RFU(addr)
   Check if a Bluetooth Mesh address is an RFU address.

BT_MESH_IS_DEV_KEY(key)
   Check if a Bluetooth Mesh key is a device key.

BT_MESH_APP_SEG_SDU_MAX
   Maximum size of an access message segment (in octets).

BT_MESH_APP_UNSEG_SDU_MAX
   Maximum payload size of an unsegmented access message (in octets).

BT_MESH_RX_SEG_MAX
   Maximum number of segments supported for incoming messages.

BT_MESH_TX_SEG_MAX
   Maximum number of segments supported for outgoing messages.

BT_MESH_TX_SDU_MAX
   Maximum possible payload size of an outgoing access message (in octets).

BT_MESH_RX_SDU_MAX
   Maximum possible payload size of an incoming access message (in octets).

BT_MESH_ELEM(_loc, _mods, _vnd.mods)
   Helper to define a mesh element within an array.

   In case the element has no SIG or Vendor models the helper macro
   BT_MESH_MODEL_NONE can be given instead.

   Parameters
      • _loc – Location Descriptor.
      • _mods – Array of models.
      • _vnd.mods – Array of vendor models.

BT_MESH_MODEL_OP_1(b0)

BT_MESH_MODEL_OP_2(b0, b1)

BT_MESH_MODEL_OP_3(b0, cid)

BT_MESH_LEN_EXACT(len)
   Macro for encoding exact message length for fixed-length messages.

BT_MESH_LEN_MIN(len)
   Macro for encoding minimum message length for variable-length messages.

BT_MESH_MODEL_OP_END
   End of the opcode list.
   Must always be present.

BT_MESH_MODEL_NO_OPS
   Helper to define an empty opcode list.

   This macro uses compound literal feature of C99 standard and thus is available only
   from C, not C++.

6.1. Bluetooth
**BT_MESH_MODEL_NONE**

Helper to define an empty model array.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**BT_MESH_MODEL_CNT_CB(_id, _op, _pub, _user_data, _keys, _grps, _cb)**

Composition data SIG model entry with callback functions with specific number of keys & groups.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**Parameters**

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_keys` – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
- `_grps` – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
- `_cb` – Callback structure, or NULL to keep no callbacks.

**BT_MESH_MODEL_CNT_VND_CB(_company, _id, _op, _pub, _user_data, _keys, _grps, _cb)**

Composition data vendor model entry with callback functions with specific number of keys & groups.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**Parameters**

- `_company` – Company ID.
- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_keys` – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
- `_grps` – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
- `_cb` – Callback structure, or NULL to keep no callbacks.

**BT_MESH_MODEL_CB(_id, _op, _pub, _user_data, _cb)**

Composition data SIG model entry with callback functions.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**Parameters**

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
• \_pub – Model publish parameters.
• \_user\_data – User data for the model.
• \_cb – Callback structure, or NULL to keep no callbacks.

**BT\_MESH\_MODEL\_METADATA\_CB**(_id, \_op, \_pub, \_user\_data, \_cb, \_metadata)
Composition data SIG model entry with callback functions and metadata.
This macro uses compound model entry with callback functions and thus is available only from C, not C++.

**Parameters**

• \_id – Model ID.
• \_op – Array of model opcode handlers.
• \_pub – Model publish parameters.
• \_user\_data – User data for the model.
• \_cb – Callback structure, or NULL to keep no callbacks.
• \_metadata – Metadata structure.

**BT\_MESH\_MODEL\_VND\_CB**(_company, \_id, \_op, \_pub, \_user\_data, \_cb)
Composition data vendor model entry with callback functions.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**Parameters**

• \_company – Company ID.
• \_id – Model ID.
• \_op – Array of model opcode handlers.
• \_pub – Model publish parameters.
• \_user\_data – User data for the model.
• \_cb – Callback structure, or NULL to keep no callbacks.

**BT\_MESH\_MODEL\_VND\_METADATA\_CB**(_company, \_id, \_op, \_pub, \_user\_data, \_cb, \_metadata)
Composition data vendor model entry with callback functions and metadata.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

**Parameters**

• \_company – Company ID.
• \_id – Model ID.
• \_op – Array of model opcode handlers.
• \_pub – Model publish parameters.
• \_user\_data – User data for the model.
• \_cb – Callback structure, or NULL to keep no callbacks.
• \_metadata – Metadata structure.

**BT\_MESH\_MODEL**(_id, \_op, \_pub, \_user\_data)
Composition data SIG model entry.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.
Parameters
- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.

BT\_MESH\_MODEL\_VND(\_company, \_id, \_op, \_pub, \_user\_data)
Composition data vendor model entry.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters
- \_company – Company ID.
- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.

BT\_MESH\_TRANSMIT(count, int\_ms)
Encode transmission count & interval steps.

Parameters
- count – Number of retransmissions (first transmission is excluded).
- int\_ms – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT\_MESH\_TRANSMIT\_COUNT(transmit)
Decode transmit count from a transmit value.

Parameters
- transmit – Encoded transmit count & interval value.

Returns
Transmission count (actual transmissions is N + 1).

BT\_MESH\_TRANSMIT\_INT(transmit)
Decode transmit interval from a transmit value.

Parameters
- transmit – Encoded transmit count & interval value.

Returns
Transmission interval in milliseconds.

BT\_MESH\_PUB\_TRANSMIT(count, int\_ms)
Encode Publish Retransmit count & interval steps.

Parameters
- count – Number of retransmissions (first transmission is excluded).
- int\_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.
Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_PUB_TRANSMIT_COUNT(transmit)
Decode Publish Retransmit count from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Retransmission count (actual transmissions is N + 1).

BT_MESH_PUB_TRANSMIT_INT(transmit)
Decode Publish Retransmit interval from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Transmission interval in milliseconds.

BT_MESH_PUB_MSG_TOTAL(pub)
Get total number of messages within one publication interval including initial publication.

Parameters
• pub – Model publication context.

Returns
total number of messages.

BT_MESH_PUB_MSG_NUM(pub)
Get message number within one publication interval.
Meant to be used inside bt_mesh_model_pub::update.

Parameters
• pub – Model publication context.

Returns
message number starting from 1.

BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)
Define a model publication context.

Parameters
• _name – Variable name given to the context.
• _update – Optional message update callback (may be NULL).
• _msg_len – Length of the publication message.

BT_MESH_MODELS_METADATA_ENTRY(_len, _id, _data)
Initialize a Models Metadata entry structure in a list.

Parameters
• _len – Length of the metadata entry.
• _id – ID of the Models Metadata entry.
• _data – Pointer to a contiguous memory that contains the metadata.
B​T_MESH_MODELS_METADATA_NONE

Helper to define an empty Models metadata array.

B​T_MESH_MODELS_METADATA_END

End of the Models Metadata list.
Must always be present.

B​T_MESH_TTL_DEFAULT

Special TTL value to request using configured default TTL.

B​T_MESH_TTL_MAX

Maximum allowed TTL value.

Functions

int bt_mesh_model_send(const struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct net_buf_simple *msg, const struct bt_mesh_send_cb *cb, void *cb_data)

Send an Access Layer message.

Parameters
• model – Mesh (client) Model that the message belongs to.
• ctx – Message context, includes keys, TTL, etc.
• msg – Access Layer payload (the actual message to be sent).
• cb – Optional “message sent” callback.
• cb_data – User data to be passed to the callback.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_model_publish(const struct bt_mesh_model *model)

Send a model publication message.

Before calling this function, the user needs to ensure that the model publication message (bt_mesh_model_pub::msg) contains a valid message to be sent. Note that this API is only to be used for non-period publishing. For periodic publishing the app only needs to make sure that bt_mesh_model_pub::msg contains a valid message whenever the bt_mesh_model_pub::update callback is called.

Parameters
• model – Mesh (client) Model that’s publishing the message.

Returns
0 on success, or (negative) error code on failure.

static inline bool bt_mesh_model_pub_is_retransmission(const struct bt_mesh_model *model)

Check if a message is being retransmitted.
Meant to be used inside the bt_mesh_model_pub::update callback.

Parameters
• model – Mesh Model that supports publication.
Returns
ture if this is a retransmission, false if this is a first publication.

const struct bt_mesh_elem *bt_mesh_model_elem(const struct bt_mesh_model *mod)
Get the element that a model belongs to.

Parameters
• mod – Mesh model.

Returns
Pointer to the element that the given model belongs to.

const struct bt_mesh_model *bt_mesh_model_find(const struct bt_mesh_elem *elem, uint16_t id)
Find a SIG model.

Parameters
• elem – Element to search for the model in.
• id – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no
SIG model with the given ID exists in the given element.

const struct bt_mesh_model *bt_mesh_model_find_vnd(const struct bt_mesh_elem *elem, uint16_t company, uint16_t id)
Find a vendor model.

Parameters
• elem – Element to search for the model in.
• company – Company ID of the model.
• id – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no
vendor model with the given ID exists in the given element.

static inline bool bt_mesh_model_in_primary(const struct bt_mesh_model *mod)
Get whether the model is in the primary element of the device.

Parameters
• mod – Mesh model.

Returns
true if the model is on the primary element, false otherwise.

int bt_mesh_model_data_store(const struct bt_mesh_model *mod, bool vnd, const char *name, const void *data, size_t data_len)
Immediately store the model’s user data in persistent storage.

Parameters
• mod – Mesh model.
• vnd – This is a vendor model.
• name – Name/key of the settings item. Only SETTINGS_MAX_DIR_DEPTH
bytes will be used at most.
• data – Model data to store, or NULL to delete any model data.
• data_len – Length of the model data.
Returns

0 on success, or (negative) error code on failure.

void bt_mesh_model_data_store_schedule(const struct bt_mesh_model *mod)

Schedule the model’s user data store in persistent storage.

This function triggers the bt_mesh_model_cb::pending_store callback for the corresponding model after delay defined by CONFIG_BT_MESH_STORE_TIMEOUT.

The delay is global for all models. Once scheduled, the callback can not be re-scheduled until previous schedule completes.

Parameters

• mod – Mesh model.

int bt_mesh_model_extend(const struct bt_mesh_model *extending_mod, const struct bt_mesh_model *base_mod)

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, ie a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.

All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

If CONFIG_BT_MESH_COMP_PAGE_1 is enabled, it is not allowed to call this function before the bt_mesh_model_cb::init callback is called for both models, except if it is called as part of the final callback.

Parameters

• extending_mod – Mesh model that is extending the base model.

• base_mod – The model being extended.

Return values

0 – Successfully extended the base_mod model.

int bt_mesh_model_correspond(const struct bt_mesh_model *corresponding_mod, const struct bt_mesh_model *base_mod)

Let a model correspond to another.

Mesh models may correspond to each other, which means that if one is present, other must be present too. A Mesh model may correspond to any number of models, in any element. All models connected together via correspondence form single Correspondence Group, which has it's unique Correspondence ID. Information about Correspondence is used to construct Composition Data Page 1.

This function must be called on already initialized base_mod. Because this function is designed to be called in corresponding_mod initializer, this means that base_mod shall be initialized before corresponding_mod is.

Parameters

• corresponding_mod – Mesh model that is corresponding to the base model.

• base_mod – The model being corresponded to.

Return values

• 0 – Successfully saved correspondence to the base_mod model.

• -ENOMEM – There is no more space to save this relation.
bool bt_mesh_model_is_extended(const struct bt_mesh_model *model)
Check if model is extended by another model.

Parameters

model – The model to check.

Return values

true – If model is extended by another model, otherwise false

int bt_mesh_comp_change_prepare(void)
Indicate that the composition data will change on next bootup.

Tell the config server that the composition data is expected to change on the next bootup, and the current composition data should be backed up.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_models_metadata_change_prepare(void)
Indicate that the metadata will change on next bootup.

Tell the config server that the models metadata is expected to change on the next bootup, and the current models metadata should be backed up.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_comp2_register(const struct bt_mesh_comp2 *comp2)
Register composition data page 2 of the device.

Register Mesh Profiles information (Ref section 3.12 in Bluetooth SIG Assigned Numbers) for composition data page 2 of the device.

Note: There must be at least one record present in comp2

Parameters

comp2 – Pointer to composition data page 2.

Returns

Zero on success or (negative) error code otherwise.

struct bt_mesh_elem

#include <access.h> Abstraction that describes a Mesh Element.

Public Members

const uint16_t loc
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t model_count
The number of SIG models in this element.

const uint8_t vnd_model_count
The number of vendor models in this element.
const struct bt_mesh_model *const models
    The list of SIG models in this element.

const struct bt_mesh_model *const vnd_models
    The list of vendor models in this element.

struct bt_mesh_elem_rt_ctx
    #include <access.h> Mesh Element runtime information.

Public Members

uint16_t addr
    Unicast Address.
    Set at runtime during provisioning.

struct bt_mesh_model_op
    #include <access.h> Model opcode handler.

Public Members

const uint32_t opcode
    OpCode encoded using the BT_MESH_MODEL_OP_* macros.

const ssize_t len
    Message length.
    If the message has variable length then this value indicates minimum message
    length and should be positive. Handler function should verify precise length based
    on the contents of the message. If the message has fixed length then this value
    should be negative. Use BT_MESH_LEN_* macros when defining this value.

int (*const func)(const struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx,
    struct net_buf_simple *buf)
    Handler function for this opcode.
    
    **Param model**
    Model instance receiving the message.
    
    **Param ctx**
    Message context for the message.
    
    **Param buf**
    Message buffer containing the message payload, not including the op-
    code.
    
    **Return**
    Zero on success or (negative) error code otherwise.

struct bt_mesh_model_pub
    #include <access.h> Model publication context.
    
    The context should primarily be created using the BT_MESH_MODEL_PUB_DEFINE
    macro.
Public Members

const struct bt_mesh_model *mod
   The model the context belongs to.
   Initialized by the stack.

uint16_t addr
   Publish Address.

const uint8_t *uuid
   Label UUID if Publish Address is Virtual Address.

uint16_t key
   Publish AppKey Index.

uint16_t cred
   Friendship Credentials Flag.

uint16_t send_rel
   Force reliable sending (segment acks)

uint16_t fast_period
   Use FastPeriodDivisor.

uint16_t retr_update
   Call update callback on every retransmission.

uint8_t ttl
   Publish Time to Live.

uint8_t retransmit
   Retransmit Count & Interval Steps.

uint8_t period
   Publish Period.

uint8_t period_div
   Divisor for the Period.

uint8_t count
   Transmissions left.

uint8_t delayable
   Use random delay for publishing.

uint32_t period_start
   Start of the current period.

struct net_buf_simple *msg

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the BT_MESH_MODEL_PUB_DEFINE macro.

```
BT_MESH_MODEL_PUB_DEFINE(name, update, size);
```

int (*update)(const struct bt_mesh_model *mod)

Callback for updating the publication buffer.

When set to NULL, the model is assumed not to support periodic publishing. When set to non-NULL the callback will be called periodically and is expected to update bt_mesh_model_pub::msg with a valid publication message.

If the callback returns non-zero, the publication is skipped and will resume on the next periodic publishing interval.

When bt_mesh_model_pub::retr_update is set to 1, the callback will be called on every retransmission.

**Param mod**
The Model the Publication Context belongs to.

**Return**
Zero on success or (negative) error code otherwise.

struct k_work_delayable timer

Publish Period Timer.

Only for stack-internal use.

```
#include <access.h>
```

Models Metadata Entry struct.

The struct should primarily be created using the BT_MESH_MODELS_METADATA_ENTRY macro.

```
#include <access.h>
```

Model callback functions.

**Public Members**

int (*const settings_set)(const struct bt_mesh_model *model, const char *name, size_t len_rd, settings_read_cb read_cb, void *cb_arg)

Set value handler of user data tied to the model.

**See also:**

```
settings_handler::h_set
```

**Param model**
Model to set the persistent data of.

**Param name**
Name/key of the settings item.

**Param len_rd**
The size of the data found in the backend.
**Param read_cb**
Function provided to read the data from the backend.

**Param cb_arg**
Arguments for the read function provided by the backend.

**Return**
0 on success, error otherwise.

```c
int (*const start)(const struct bt_mesh_model *model)
```
Callback called when the mesh is started.

This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.

When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.

**Param model**
Model this callback belongs to.

**Return**
0 on success, error otherwise.

```c
int (*const init)(const struct bt_mesh_model *model)
```
Model init callback.

Called on every model instance during mesh initialization.

If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of `bt_mesh_init`.

**Param model**
Model to be initialized.

**Return**
0 on success, error otherwise.

```c
void (*const reset)(const struct bt_mesh_model *model)
```
Model reset callback.

Called when the mesh node is reset. All model data is deleted on reset, and the model should clear its state.

**Note:** If the model stores any persistent data, this needs to be erased manually.

```c
void (*const pending_store)(const struct bt_mesh_model *model)
```
Callback used to store pending model's user data.

Triggered by `bt_mesh_model_data_store_schedule`.

To store the user data, call `bt_mesh_model_data_store`.

**Param model**
Model this callback belongs to.

```c
struct bt_mesh_mod_id_vnd
```
Vendor model ID.

```c
#include <access.h>
```

**Public Members**
uint16_t company
    Vendor’s company ID.

uint16_t id
    Model ID.

struct bt_mesh_model
    #include <access.h> Abstraction that describes a Mesh Model instance.

Public Members

const uint16_t id
    SIG model ID.

const struct bt_mesh_mod_id_vnd vnd
    Vendor model ID.

struct bt_mesh_model_pub *const pub
    Model Publication.

uint16_t *const keys
    AppKey List.

uint16_t *const groups
    Subscription List (group or virtual addresses)

const uint8_t **const uuids
    List of Label UUIDs the model is subscribed to.

const struct bt_mesh_model_op *const op
    Opcode handler list.

const struct bt_mesh_model_cb *const cb
    Model callback structure.

struct bt_mesh_model_rt_ctx
    #include <access.h>

Public Members

void *user_data
    Model-specific user data.

struct bt_mesh_send_cb
    #include <access.h> Callback structure for monitoring model message sending.
Public Members

void (*start)(uint16_t duration, int err, void *cb_data)
Handler called at the start of the transmission.
  **Param duration**
  The duration of the full transmission.
  **Param err**
  Error occurring during sending.
  **Param cb_data**
  Callback data, as passed to the send API.

void (*end)(int err, void *cb_data)
Handler called at the end of the transmission.
  **Param err**
  Error occurring during sending.
  **Param cb_data**
  Callback data, as passed to the send API.

struct bt_mesh_comp
#include <access.h> Node Composition.

Public Members

uint16_t cid
Company ID.

uint16_t pid
Product ID.

uint16_t vid
Version ID.

size_t elem_count
The number of elements in this device.

const struct bt_mesh_elem *elem
List of elements.

struct bt_mesh_comp2_record
#include <access.h> Composition data page 2 record.

Public Members

uint16_t id
Mesh profile ID.

uint8_t x
Major version.
uint8_t y
    Minor version.

uint8_t z
    Z version.

struct bt_mesh_comp2_record version
    Mesh Profile Version.

uint8_t elem_offset_cnt
    Element offset count.

const uint8_t *elem_offset
    Element offset list.

uint16_t data_len
    Length of additional data.

const void *data
    Additional data.

struct bt_mesh_comp2
    #include <access.h> Node Composition data page 2.

Public Members

size_t record_cnt
    The number of Mesh Profile records on a device.

const struct bt_mesh_comp2_record *record
    List of records.

Mesh models

Foundation models   The Bluetooth Mesh specification defines foundation models that can be used by network administrators to configure and diagnose mesh nodes.

Configuration Client   The Configuration Client model is a foundation model defined by the Bluetooth Mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a Configuration Server model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have net_idx and addr as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.
The Configuration Client model is optional, and it must only be instantiated on the primary element if present in the Composition Data.

**API reference**

*group bt_mesh_cfg_cli*

Configuration Client Model.

**Defines**

`BT_MESH_MODEL_CFG_CLI(cli_data)`

Generic Configuration Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a *Configuration Client Model* instance.

`BT_MESH_PUB_PERIOD_100MS(steps)`

Helper macro to encode model publication period in units of 100ms.

**Parameters**

- `steps` – Number of 100ms steps.

**Returns**

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_SEC(steps)`

Helper macro to encode model publication period in units of 1 second.

**Parameters**

- `steps` – Number of 1 second steps.

**Returns**

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10SEC(steps)`

Helper macro to encode model publication period in units of 10 seconds.

**Parameters**

- `steps` – Number of 10 second steps.

**Returns**

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10MIN(steps)`

Helper macro to encode model publication period in units of 10 minutes.

**Parameters**

- `steps` – Number of 10 minute steps.

**Returns**

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

**Functions**
int bt_mesh_cfg_cli_node_reset(uint16_t net_idx, uint16_t addr, bool *status)
  Reset the target node and remove it from the network.

  Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
  • status – Status response parameter

  Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp, struct net_buf_simple *comp)
  Get the target node's composition data.

  If the other device does not have the given composition data page, it will return the
  largest page number it supports that is less than the requested page index. The actual
  page the device responds with is returned in rsp.

  This method can be used asynchronously by setting rsp and comp as NULL. This way
  the method will not wait for response and will return immediately after sending the
  command.

  Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
  • page – Composition data page, or 0xff to request the first available page.
  • rsp – Return parameter for the returned page number, or NULL.
  • comp – Composition data buffer to fill.

  Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
  Get the target node's network beacon state.

  This method can be used asynchronously by setting status as NULL. This way
  the method will not wait for response and will return immediately after sending the
  command.

  Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
  • status – Status response parameter, returns one of
    `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on
    success.

  Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)
  Get the target node's network key refresh phase state.

  This method can be used asynchronously by setting status and phase as NULL. This
  way the method will not wait for response and will return immediately after sending
  the command.
Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **status** – Status response parameter.
- **phase** – Pointer to the Key Refresh variable to fill.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                            uint8_t transition, uint8_t *status, uint8_t *phase)
```

Set the target node's network key refresh phase parameters.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **transition** – Transition parameter.
- **status** – Status response parameter.
- **phase** – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`.
- **status** – Status response parameter. Returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

6.1. Bluetooth
Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- ttl – TTL response buffer.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)

Set the target node's Time To Live value.

This method can be used asynchronously by setting ttl as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- val – New Time To Live value.
- ttl – TTL response buffer.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)

Get the target node's Friend feature status.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter. Returns one of BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or BT_MESH_FRIEND_NOT_SUPPORTED on success.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)

Set the target node's Friend feature state.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- val – New Friend feature state. Should be one of BT_MESH_FRIEND_DISABLED or BT_MESH_FRIEND_ENABLED.
- status – Status response parameter. Returns one of BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or BT_MESH_FRIEND_NOT_SUPPORTED on success.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
Get the target node's Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the
method will not wait for response and will return immediately after sending the com-
mand.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter. Returns one of
  BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED
  or BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
Set the target node's Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the
method will not wait for response and will return immediately after sending the com-
mand.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- val – New Proxy feature state. Must be one of
  BT_MESH_GATT_PROXY_DISABLED or
  BT_MESH_GATT_PROXY_ENABLED.
- status – Status response parameter. Returns one of
  BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED
  or BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
Get the target node's network_transmit state.

This method can be used asynchronously by setting transmit as NULL. This way the
method will not wait for response and will return immediately after sending the com-
mand.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- transmit – Network transmit response parameter. Returns the en-
coded network transmission parameters on success. Decoded with
  BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit)

Set the target node’s network transmit parameters.
This method can be used asynchronously by setting transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:

*BT_MESH_TRANSMIT*.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- val – New encoded network transmit parameters.
- transmit – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)

Get the target node’s Relay feature state.
This method can be used asynchronously by setting status and transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter. Returns one of *BT_MESH_RELAY_DISABLED*, *BT_MESH_RELAY_ENABLED* or *BT_MESH_RELAY_NOT_SUPPORTED* on success.
- transmit – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_relay_set(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit)

Set the target node’s Relay parameters.
This method can be used asynchronously by setting status and transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:

*BT_MESH_TRANSMIT*.
Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- new_relay – New relay state. Must be one of BT_MESH_RELAY_DISABLED or BT_MESH_RELAY_ENABLED.
- new_transmit – New encoded relay transmit parameters.
- status – Status response parameter. Returns one of BT_MESH_RELAY_DISABLED, BT_MESH_RELAY_ENABLED or BT_MESH_RELAY_NOT_SUPPORTED on success.
- transmit – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

Add a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index.
- net_key – Network key.
- status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_key_get(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)

Get a list of the target node's network key indexes.

This method can be used asynchronously by setting keys or key_cnt as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- keys – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
- key_cnt – Net key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned network key indexes upon success.

Returns

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)

Delete a network key from the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Add an application key to the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• key_app_idx – Application key index.
• app_key – Application key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)

Get a list of the target node’s application key indexes for a specific network key.
This method can be used asynchronously by setting status and (keys or key_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index to request the app key indexes of.
• status – Status response parameter.
• keys – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **key_cnt** – App key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, uint8_t *status)
```

Delete an application key from the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index the application key belongs to.
- **key_app_idx** – Application key index.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to bind.
- **mod_id** – Model ID.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Unbind an application from a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
• `elem_addr` – Element address the model is in.
• `mod_app_idx` – Application index to unbind.
• `mod_id` – Model ID.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Bind an application to a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `mod_app_idx` – Application index to bind.
• `mod_id` – Model ID.
• `cid` – Company ID of the model.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Unbind an application from a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `mod_app_idx` – Application index to unbind.
• `mod_id` – Model ID.
• `cid` – Company ID of the model.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```
Get a list of all applications bound to a SIG model on the target node.

This method can be used asynchronously by setting status and ( apps or app_cnt ) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **status** – Status response parameter.
- **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- **app_cnt** – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting status and ( apps or app_cnt ) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.
- **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- **app_cnt** – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.
Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- mod_id – Model ID.
- pub – Publication parameter return buffer.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)
```

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- mod_id – Model ID.
- cid – Company ID of the model.
- pub – Publication parameter return buffer.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)
```

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- mod_id – Model ID.
- pub – Publication parameters.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
Set publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **pub** – Publication parameters.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

Add a group address to a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

Add a group address to a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.

6.1. Bluetooth

1953
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Delete a group address in a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Delete a group address in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.
This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Overwrite all addresses in a vendor model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)
```

Add a virtual address to a SIG model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
• **mod_id** – Model ID.
• **virt_addr** – Virtual address response parameter.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_va_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)
```

Add a virtual address to a vendor model’s subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **label** – Virtual address label to add to the subscription list.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **virt_addr** – Virtual address response parameter.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_va_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)
```

Delete a virtual address in a SIG model’s subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **label** – Virtual address parameter to add to the subscription list.
• **mod_id** – Model ID.
• **virt_addr** – Virtual address response parameter.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.
Delete a virtual address in a vendor model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Overwrite all addresses in a SIG model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `label` – Virtual address label to add to the subscription list.
- `mod_id` – Model ID.
- `virt_addr` – Virtual address response parameter.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Overwrite all addresses in a vendor model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.
This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a SIG model on the target node.

This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.
• **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• **sub_cnt** – Subscription list element count. Should be set to the capacity of the **subs** list when calling. Will return the number of returned subscriptions upon success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Set the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – New Heartbeat subscription parameters.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Get the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting **status** and **sub** as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – Heartbeat subscription parameter return buffer.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Set the target node’s Heartbeat publication parameters.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL;

Note: The target node must already have received the specified network key.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• pub – New Heartbeat publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)

Get the target node's Heartbeat publication parameters.

This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• pub – Heartbeat publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)

Delete all group addresses in a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
Delete all group addresses in a vendor model’s subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

Update a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

Update an application key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t new_identity, uint8_t *status, uint8_t *identity)
```

Set the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_identity` – New identity state. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *identity)
```

Get the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr, int32_t *polltimeout)
```

Get the Low Power Node Polltimeout parameters.

This method can be used asynchronously by setting `polltimeout` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
• addr – Target node address.
• unicast_addr – LPN unicast address.
• polltimeout – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

int32_t bt_mesh_cfg_cli_timeout_get(void)
Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void bt_mesh_cfg_cli_timeout_set(int32_t timeout)
Set the transmission timeout value.

Parameters
• timeout – The new transmission timeout.

int bt_mesh_comp_p0_get(struct bt_mesh_comp_p0 *comp, struct net_buf_simple *buf)
Create a composition data page 0 representation from a buffer.

The composition data page object will take ownership over the buffer, which should
not be manipulated directly after this call.

This function can be used in combination with bt_mesh_cfg_cli_comp_data_get to read
out composition data page 0 from other devices:

```
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;

err = bt_mesh_cfg_cli_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
    bt_mesh_comp_p0_get(&comp, &buf);
}
```

Parameters
• buf – Network buffer containing composition data.
• comp – Composition data structure to fill.

Returns
0 on success, or (negative) error code on failure.

struct bt_mesh_comp_p0_elem *bt_mesh_comp_p0_elem_pull(const struct bt_mesh_comp_p0_elem *elem)
Pull a composition data page 0 element from a composition data page 0 instance.

Each call to this function will pull out a new element from the composition data page,
until all elements have been pulled.

Parameters
• comp – Composition data page
• elem – Element to fill.

Returns
A pointer to elem on success, or NULL if no more elements could be pulled.
uint16_t bt_mesh_comp_p0_elem_mod(struct bt_mesh_comp_p0_elem *elem, int idx)

Get a SIG model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the SIG model to read.

**Returns**
The Model ID of the SIG model at the given index, or 0xffff if the index is out of bounds.

struct bt_mesh_mod_id_vnd bt_mesh_comp_p0_elem_mod_vnd(struct bt_mesh_comp_p0_elem *elem, int idx)

Get a vendor model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the vendor model to read.

**Returns**
The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

struct bt_mesh_comp_p1_elem *bt_mesh_comp_p1_elem_pull(struct net_buf_simple *buf, struct bt_mesh_comp_p1_elem *elem)

Pull a Composition Data Page 1 Element from a composition data page 1 instance.
Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

**Parameters**
- `buf` – Composition data page 1 buffer
- `elem` – Element to fill.

**Returns**
A pointer to `elem` on success, or NULL if no more elements could be pulled.

struct bt_mesh_comp_p1_model_item *bt_mesh_comp_p1_item_pull(struct bt_mesh_comp_p1_model Item *elem, struct bt_mesh_comp_p1_model_item *item)

Pull a Composition Data Page 1 Model Item from a Composition Data Page 1 Element.
Each call to this function will pull out a new item from the Composition Data Page 1 Element, until all items have been pulled.

**Parameters**
- `elem` – Composition data page 1 Element
- `item` – Model Item to fill.

**Returns**
A pointer to `item` on success, or NULL if no more elements could be pulled.
struct bt_mesh_comp_p1_ext_item *bt_mesh_comp_p1_pull_ext_item(struct bt_mesh_comp_p1_model_item *item, struct bt_mesh_comp_p1_ext_item *ext_item)

Pull Extended Model Item contained in Model Item.
Each call to this function will pull out a new element from the Extended Model Item, until all elements have been pulled.

Parameters
- item – Model Item to pull Extended Model Items from
- ext_item – Extended Model Item to fill

Returns
A pointer to ext_item on success, or NULL if item could not be pulled

struct bt_mesh_comp_p2_record *bt_mesh_comp_p2_record_pull(struct net_buf_simple *buf, struct bt_mesh_comp_p2_record *record)

Pull a Composition Data Page 2 Record from a composition data page 2 instance.
Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters
- buf – Composition data page 2 buffer
- record – Record to fill.

Returns
A pointer to record on success, or NULL if no more elements could be pulled.

int bt_mesh_key_idx_unpack_list(struct net_buf_simple *buf, uint16_t *dst_arr, size_t *dst_cnt)

Unpack a list of key index entries from a buffer.
On success, dst_cnt is set to the amount of unpacked key index entries.

Parameters
- buf – Message buffer containing encoded AppKey or NetKey Indexes.
- dst_arr – Destination array for the unpacked list.
- dst_cnt – Size of the destination array.

Returns
0 on success.

Returns
-EMSGSIZE if dst_arr size is to small to parse full message.

struct bt_mesh_cfg_cli_cb

#include <cfg_cli.h> Mesh Configuration Client Status messages callback.

Public Members
void (*comp_data)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t page, struct net_buf_simple *buf)

Optional callback for Composition data messages.
Handles received Composition data messages from a server.

Note: For decoding buf, please refer to bt_mesh_comp_p0_get and bt_mesh_comp_p1_elem_pull.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param page**
Composition data page.

**Param buf**
Composition data buffer.

void (*mod_pub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub)

Optional callback for Model Pub status messages.
Handles received Model Pub status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status code for the message.

**Param elem_addr**
Address of the element.

**Param mod_id**
Model ID.

**Param cid**
Company ID.

**Param pub**
Publication configuration parameters.

void (*mod_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id)

Optional callback for Model Sub Status messages.
Handles received Model Sub Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param elem_addr**
The unicast address of the element.

**Param sub_addr**
The sub address.

**Param mod_id**
The model ID within the element.
void (*mod_sub_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct net_buf_simple *buf)

Optional callback for Model Sub list messages.
Handles received Model Sub list messages from a server.

**Note:** The buf parameter should be decoded using net_buf_simple_pull_le16 in iteration, as long as buf->len is greater than or equal to 2.

**Param cli**
- Client that received the status message.

**Param addr**
- Address of the sender.

**Param status**
- Status code for the message.

**Param elem_addr**
- Address of the element.

**Param mod_id**
- Model ID.

**Param cid**
- Company ID.

**Param buf**
- Message buffer containing subscription addresses.

void (*node_reset_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr)

Optional callback for Node Reset Status messages.
Handles received Node Reset Status messages from a server.

**Param cli**
- Client that received the status message.

**Param addr**
- Address of the sender.

void (*beacon_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)

Optional callback for Beacon Status messages.
Handles received Beacon Status messages from a server.

**Param cli**
- Client that received the status message.

**Param addr**
- Address of the sender.

**Param status**
- Status Code for requesting message.

void (*ttl_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)

Optional callback for Default TTL Status messages.
Handles received Default TTL Status messages from a server.

**Param cli**
- Client that received the status message.

**Param addr**
- Address of the sender.

**Param status**
- Status Code for requesting message.

void (*friend_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)

6.1. Bluetooth
Optional callback for Friend Status messages.
Handles received Friend Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

```c
void (*gatt_proxy_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
```
Optional callback for GATT Proxy Status messages.
Handles received GATT Proxy Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

```c
void (*network_transmit_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
```
Optional callback for Network Transmit Status messages.
Handles received Network Transmit Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

```c
void (*relay_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint8_t transmit)
```
Optional callback for Relay Status messages.
Handles received Relay Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param transmit**
The relay retransmit count and interval steps.

```c
void (*net_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx)
```
Optional callback for NetKey Status messages.
Handles received NetKey Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.
**Param net_idx**

The index of the NetKey.

```c
void (*net_key_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, struct net_buf_simple *buf)
```

Optional callback for Netkey list messages. Handles received Netkey list messages from a server.

**Note:** The `buf` parameter should be decoded using the `bt_mesh_key_idx_unpack_list` helper function.

**Param cli**

Client that received the status message.

**Param addr**

Address of the sender.

**Param buf**

Message buffer containing key indexes.

```c
void (*app_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint16_t app_idx)
```

Optional callback for AppKey Status messages. Handles received AppKey Status messages from a server.

**Param cli**

Client that received the status message.

**Param addr**

Address of the sender.

**Param status**

Status Code for requesting message.

**Param net_idx**

The index of the NetKey.

**Param app_idx**

The index of the AppKey.

```c
void (*app_key_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, struct net_buf_simple *buf)
```

Optional callback for Appkey list messages. Handles received Appkey list messages from a server.

**Note:** The `buf` parameter should be decoded using the `bt_mesh_key_idx_unpack_list` helper function.

**Param cli**

Client that received the status message.

**Param addr**

Address of the sender.

**Param status**

Status code for the message.

**Param net_idx**

The index of the NetKey.

**Param buf**

Message buffer containing key indexes.

```c
void (*mod_app_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t app_idx, uint32_t mod_id)
```

6.1. Bluetooth
Optional callback for Model App Status messages.
Handles received Model App Status messages from a server.

```
Param cli
  Client that received the status message.
Param addr
  Address of the sender.
Param status
  Status Code for requesting message.
Param elem_addr
  The unicast address of the element.
Param app_idx
  The sub address.
Param mod_id
  The model ID within the element.
```

`void (*mod_app_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct net_buf_simple *buf)`

Optional callback for Model App list messages.
Handles received Model App list messages from a server.

```
void (*node_identity_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t identity)
```

Optional callback for Node Identity Status messages.
Handles received Node Identity Status messages from a server.

```
Param cli
  Client that received the status message.
Param addr
  Address of the sender.
Param status
  Status Code for requesting message.
Param elem_addr
  Address of the element.
Param mod_id
  Model ID.
Param cid
  Company ID.
Param buf
  Message buffer containing key indexes.
```

Note: The buf parameter should be decoded using the `bt_mesh_key_idx_unpack_list` helper function.
void (*lpn_timeout_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint16_t elem_addr, uint32_t timeout)

Optional callback for LPN PollTimeout Status messages. Handles received LPN PollTimeout Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param elem_addr**
The unicast address of the LPN.

**Param timeout**
Current value of PollTimeout timer of the LPN.

void (*krp_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t phase)

Optional callback for Key Refresh Phase status messages. Handles received Key Refresh Phase status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status code for the message.

**Param net_idx**
The index of the NetKey.

**Param phase**
Phase of the KRP.

void (*hb_pub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, struct bt_mesh_cfg_cli_hb_pub *pub)

Optional callback for Heartbeat pub status messages. Handles received Heartbeat pub status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status code for the message.

**Param pub**
HB publication configuration parameters.

void (*hb_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, struct bt_mesh_cfg_cli_hb_sub *sub)

Optional callback for Heartbeat Sub status messages. Handles received Heartbeat Sub status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status code for the message.

**Param sub**
HB subscription configuration parameters.

6.1. Bluetooth
struct bt_mesh_cfg_cli
#include <cfg_cli.h> Mesh Configuration Client Model Context.

**Public Members**

const struct bt_mesh_model *model
Composition data model entry pointer.

const struct bt_mesh_cfg_cli_cb *cb
Optional callback for Mesh Configuration Client Status messages.

struct bt_mesh_cfg_cli_mod_pub
#include <cfg_cli.h> Model publication configuration parameters.

**Public Members**

uint16_t addr
Publication destination address.

const uint8_t *uuid
Virtual address UUID, or NULL if this is not a virtual address.

uint16_t app_idx
Application index to publish with.

bool cred_flag
Friendship credential flag.

uint8_t ttl
Time To Live to publish with.

uint8_t period
Encoded publish period.

**See also:**
BT_MESH_PUB_PERIOD_100MS, BT_MESH_PUB_PERIOD_SEC,
BT_MESH_PUB_PERIOD_10SEC, BT_MESH_PUB_PERIOD_10MIN

uint8_t transmit
Encoded transmit parameters.

BT_MESH_TRANSMIT

struct bt_mesh_cfg_cli_hb_sub
#include <cfg_cli.h> Heartbeat subscription configuration parameters.
Public Members

```c
uint16_t src
    Source address to receive Heartbeat messages from.

uint16_t dst
    Destination address to receive Heartbeat messages on.

uint8_t period
    Logarithmic subscription period to keep listening for.
    The decoded subscription period is \((1 \ll (\text{period} - 1))\) seconds, or 0 seconds if period is 0.

uint8_t count
    Logarithmic Heartbeat subscription receive count.
    The decoded Heartbeat count is \((1 \ll (\text{count} - 1))\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.
    Ignored in Heartbeat subscription set.

type
    Logarithmic Heartbeat subscription receive count.
    The decoded Heartbeat count is \((1 \ll (\text{count} - 1))\) if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.
    Ignored in Heartbeat subscription set.
```

```c
uint8_t min
    Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node.
    A Heartbeat received from an immediate neighbor has hop count = 1.
    Ignored in Heartbeat subscription set.

uint8_t max
    Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node.
    A Heartbeat received from an immediate neighbor has hop count = 1.
    Ignored in Heartbeat subscription set.
```

```c
struct bt_mesh_cfg_cli_hb_pub
    #include <cfg_cli.h> Heartbeat publication configuration parameters.
```

Public Members

```c
uint16_t dst
    Heartbeat destination address.

uint8_t count
    Logarithmic Heartbeat count.
    Decoded as \((1 \ll (\text{count} - 1))\) if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.
    When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.
    When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.
```
uint8_t period
   Logarithmic Heartbeat publication transmit interval in seconds.
   Decoded as (1 « (period - 1)) if period is between 1 and 0x11. If period is 0, Heartbeat
   publication is disabled.

uint8_t ttl
   Publication message Time To Live value.

uint16_t feat
   Bitmap of features that trigger Heartbeat publications.
   Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY,
   BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER

uint16_t net_idx
   Network index to publish with.

struct bt_mesh_comp_p0
   #include <cfg_cli.h> Parsed Composition data page 0 representation.
   Should be pulled from the return buffer passed to bt_mesh_cfg_cli_comp_data_get using
   bt_mesh_comp_p0_get.

Public Members

uint16_t cid
   Company ID.

uint16_t pid
   Product ID.

uint16_t vid
   Version ID.

uint16_t crpl
   Replay protection list size.

uint16_t feat
   Supported features, see BT_MESH_FEAT_SUPPORTED.

struct bt_mesh_comp_p0_elem
   #include <cfg_cli.h> Composition data page 0 element representation.

Public Members

uint16_t loc
   Element location.
size_t nsig
   The number of SIG models in this element.

size_t nvnd
   The number of vendor models in this element.

struct bt_mesh_comp_p1_elem
   #include <cfg_cli.h> Composition data page 1 element representation.

   Public Members

   size_t nsig
      The number of SIG models in this element.

   size_t nvnd
      The number of vendor models in this element.

struct bt_mesh_comp_p1_model_item
   #include <cfg_cli.h> Composition data page 1 model item representation.

   Public Members

   bool cor_present
      Corresponding_Group_ID field indicator.

   bool format
      Determines the format of Extended Model Item.

   uint8_t ext_item_cnt
      Number of items in Extended Model Items.

   uint8_t cor_id
      Buffer containing Extended Model Items.
      If cor_present is set to 1 it starts with Corresponding_Group_ID

struct bt_mesh_comp_p1_item_short
   #include <cfg_cli.h> Extended Model Item in short representation.

   Public Members

   uint8_t elem_offset
      Element address modifier.

   uint8_t mod_item_idx
      Model Index.
struct bt_mesh_comp_p1_item_long
#include <cfg_cli.h> Extended Model Item in long representation.

Public Members

uint8_t elem_offset
Element address modifier.

uint8_t mod_item_idx
Model Index.

struct bt_mesh_comp_p1_ext_item
#include <cfg_cli.h> Extended Model Item.

Public Members

struct bt_mesh_comp_p1_item_short short_item
Item in short representation.

struct bt_mesh_comp_p1_item_long long_item
Item in long representation.

struct bt_mesh_comp_p2_record
#include <cfg_cli.h> Composition data page 2 record parsing structure.

Public Members

uint16_t id
Mesh profile ID.

uint8_t x
Major version.

uint8_t y
Minor version.

uint8_t z
Z version.

struct bt_mesh_comp_p2_record version
Mesh Profile Version.

struct net_buf_simple *elem_buf
Element offset buffer.

struct net_buf_simple *data_buf
Additional data buffer.
**Configuration Server**  The Configuration Server model is a foundation model defined by the Bluetooth Mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a *Configuration Client* to control it.

*Note:* The `bt_mesh_cfg_srv` structure has been deprecated. The initial values of the Relay, Beacon, Friend, Network transmit and Relay retransmit should be set through Kconfig, and the Heartbeat feature should be controlled through the *Heartbeat* API.

The Configuration Server model is mandatory on all Bluetooth Mesh nodes, and must only be instantiated on the primary element.

**API reference**

*group* `bt_mesh_cfg_srv`

Configuration Server Model.

**Defines**

`BT_MESH_MODEL_CFG_SRV`

Generic Configuration Server model composition data entry.

**Health Client**  The Health Client model interacts with a Health Server model to read out diagnostics and control the node’s attention state.

All message passing functions in the Health Client API have `cli` as their first parameter. This is a pointer to the client model instance to be used in this function call. The second parameter is the `ctx` or message context. Message context contains netkey index, appkey index and unicast address that the target node uses.

The Health Client model is optional, and may be instantiated on any element. However, if a Health Client model is instantiated on an element other than the primary, an instance must also be present on the primary element.

See *Health faults* for a list of specification defined fault values.

**API reference**

*group* `bt_mesh_health_cli`

Health Client Model.

**Defines**

`BT_MESH_MODEL_HEALTH_CLI(cli_data)`

Generic Health Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a *Health Client Model* instance.
Functions

```c
int bt_mesh_health_cli_fault_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
```

Get the registered fault state for the given Company ID.

This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:

**Health faults**

### Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to get the registered faults of.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.
- **fault_count** – Fault count response buffer.

### Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
```

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:

**Health faults**

### Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to clear the registered faults for.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.
fault_count – Fault count response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid)
```

Clear the registered faults for the given Company ID (unacked).

**See also:**
Health faults

**Parameters**
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- cid – Company ID to clear the registered faults for.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)
```

Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting faults or fault_count as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli struct`.

**Parameters**
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- cid – Company ID to invoke the test for.
- test_id – Test ID response buffer.
- faults – Fault array response buffer.
- fault_count – Fault count response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id)
```

Invoke a self-test procedure for the given Company ID (unacked).

**Parameters**
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
• **cid** – Company ID to invoke the test for.
• **test_id** – Test ID response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *divisor)
```

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 \times \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting `divisor` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `period_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
• `cli` – Client model to send on.
• `ctx` – Message context, or NULL to use the configured publish parameters.
• `divisor` – Health period divisor response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor, uint8_t *updated_divisor)
```

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 \times \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting `updated_divisor` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `period_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
• `cli` – Client model to send on.
• `ctx` – Message context, or NULL to use the configured publish parameters.
• `divisor` – New Health period divisor.
• `updated_divisor` – Health period divisor response buffer.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_period_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor)

Set the target node's Health fast period divisor (unacknowledged).
This is an unacknowledged version of this API.

Parameters
• cli – Client model to send on.
• ctx – Message context, or NULL to use the configured publish parameters.
• divisor – New Health period divisor.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_attention_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *attention)

Get the current attention timer value.
This method can be used asynchronously by setting attention as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status callback in bt_mesh_health_cli struct.

Parameters
• cli – Client model to send on.
• ctx – Message context, or NULL to use the configured publish parameters.
• attention – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_attention_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention, uint8_t *updated_attention)

Set the attention timer.
This method can be used asynchronously by setting updated_attention as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status callback in bt_mesh_health_cli struct.

Parameters
• cli – Client model to send on.
• ctx – Message context, or NULL to use the configured publish parameters.
• attention – New attention timer time, in seconds.
• updated_attention – Attention timer response buffer, measured in seconds.
Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_health_cli_attention_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention)
```

Set the attention timer (unacknowledged).

Parameters
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `attention` – New attention timer time, in seconds.

Returns
0 on success, or (negative) error code on failure.

```
int32_t bt_mesh_health_cli_timeout_get(void)
```

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

```
void bt_mesh_health_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

Parameters
- `timeout` – The new transmission timeout.

```
#include <health_cli.h> Health Client Model Context.
```

Public Members

- `const struct bt_mesh_model *model`  
  Composition data model entry pointer.

- `struct bt_mesh_model_pub pub`  
  Publication structure instance.

- `struct net_buf_simple pub_buf`  
  Publication buffer.

- `uint8_t pub_data[BT_MESH_MODEL_BUF_LEN(BT_MESH_MODEL_OP_2(0x80, 0x32), 3)]`  
  Publication data.

- `void (*period_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t divisor)`  
  Optional callback for Health Period Status messages.

  Handles received Health Period Status messages from a Health server. The divisor param represents the period divisor value.

  **Param cli**  
  Health client that received the status message.

  **Param addr**  
  Address of the sender.
Param divisor
Health Period Divisor value.

```c
void (*attention_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t attention)
```
Optional callback for Health Attention Status messages.
Handles received Health Attention Status messages from a Health server. The attention param represents the current attention value.

- **Param cli**
  Health client that received the status message.

- **Param addr**
  Address of the sender.

- **Param attention**
  Current attention value.

```c
void (*fault_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)
```
Optional callback for Health Fault Status messages.
Handles received Health Fault Status messages from a Health server. The fault array represents all faults that are currently present in the server's element.

See also:

**Health faults**

- **Param cli**
  Health client that received the status message.

- **Param addr**
  Address of the sender.

- **Param test_id**
  Identifier of a most recently performed test.

- **Param cid**
  Company Identifier of the node.

- **Param faults**
  Array of faults.

- **Param fault_count**
  Number of faults in the fault array.

```c
void (*current_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)
```
Optional callback for Health Current Status messages.
Handles received Health Current Status messages from a Health server. The fault array represents all faults that are currently present in the server's element.

See also:

**Health faults**

- **Param cli**
  Health client that received the status message.

- **Param addr**
  Address of the sender.

- **Param test_id**
  Identifier of a most recently performed test.
Param cid

Company Identifier of the node.

Param faults

Array of faults.

Param fault_count

Number of faults in the fault array.

Health Server  The Health Server model provides attention callbacks and node diagnostics for Health Client models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

If present, the Health Server model must be instantiated on the primary element.

Faults  The Health Server model may report a list of faults that have occurred in the device's lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node’s design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values 0x01 to 0x7f are reserved for the Bluetooth Mesh specification, and the full list of specification defined faults are available in Health faults. Fault values 0x80 to 0xff are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

Attention state  The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they’re provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: bt_mesh_health_srv_cb.attn_on is called at the beginning of the attention period, bt_mesh_health_srv_cb.attn_off is called at the end.

The remaining time for the attention period may be queried through bt_mesh_health_srv.attn_timer.

API reference

group bt_mesh_health_srv

Health Server Model.

Defines

BT_MESH_HEALTH_PUB_DEFINE(_name, _max_faults)

A helper to define a health publication context.

Parameters

• _name – Name given to the publication context variable.
• _max_faults – Maximum number of faults the element can have.
BT_MESH_MODEL_HEALTH_SRV(srv, pub)
Define a new health server model.

Note that this API needs to be repeated for each element that the application wants to have a health server model on. Each instance also needs a unique bt_mesh_health_srv and bt_mesh_model_pub context.

Parameters
• srv – Pointer to a unique struct bt_mesh_health_srv.
• pub – Pointer to a unique struct bt_mesh_model_pub.

Returns
New mesh model instance.

BT_MESH_HEALTH_TEST_INFO_METADATA_ID
Health Test Information Metadata ID.

BT_MESH_HEALTH_TEST_INFO_METADATA(tests)
BT_MESH_HEALTH_TEST_INFO(cid, tests...)
Define a Health Test Info Metadata array.

Parameters
• cid – Company ID of the Health Test suite.
• tests – A comma separated list of tests.

Returns
A comma separated list of values that make Health Test Info Metadata

Functions

int bt_mesh_health_srv_fault_update(const struct bt_mesh_elem *elem)
Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

Parameters
• elem – Element to update the fault state of.

Returns
0 on success, or (negative) error code otherwise.

struct bt_mesh_health_srv_cb
#include <health_srv.h> Callback function for the Health Server model.

Public Members

int (*fault_get_cur)(const struct bt_mesh_model *model, uint8_t *test_id, uint16_t *company_id, uint8_t *faults, uint8_t *fault_count)
Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.
All faults shall be associated with at least one Company ID, representing the device vendor or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated with one of them at the time. To report faults for multiple Company IDs, interleave which Company ID is reported for each call.

**Param model**
Health Server model instance to get faults of.

**Param test_id**
Test ID response buffer.

**Param company_id**
Company ID response buffer.

**Param faults**
Array to fill with current faults.

**Param fault_count**
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_get_reg)(const struct bt_mesh_model *model, uint16_t company_id, uint8_t *test_id, uint8_t *faults, uint8_t *fault_count)
```

Callback for fetching all registered faults.

Registered faults are all past and current faults since the last call to **fault_clear**. Only faults associated with the given Company ID should be reported.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

**Param model**
Health Server model instance to get faults of.

**Param company_id**
Company ID to get faults for.

**Param test_id**
Test ID response buffer.

**Param faults**
Array to fill with registered faults.

**Param fault_count**
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_clear)(const struct bt_mesh_model *model, uint16_t company_id)
```

Clear all registered faults associated with the given Company ID.

**Param model**
Health Server model instance to clear faults of.

**Param company_id**
Company ID to clear faults for.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_test)(const struct bt_mesh_model *model, uint8_t test_id, uint16_t company_id)
```

Run a self-test.
The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

**Param model**
Health Server model instance to run test for.

**Param test_id**
Test ID to run.

**Param company_id**
Company ID to run test for.

**Return**
0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn’t start.

```c
void (*attn_on)(const struct bt_mesh_model *model)
```
Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the `attn_off` callback is called.

**Param model**
Health Server model to start the attention state of.

```c
void (*attn_off)(const struct bt_mesh_model *model)
```
Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

**Param model**

```c
struct bt_mesh_health_srv
#include <health_srv.h> Mesh Health Server Model Context.
```

**Public Members**

```c
const struct bt_mesh_model *model
Composition data model entry pointer.
```

```c
const struct bt_mesh_health_srv_cb *cb
Optional callback struct.
```

```c
struct k_work_delayable attn_timer
Attention Timer state.
```

**Health faults** Fault values defined by the Bluetooth Mesh specification.

```c
#group bt_mesh_health_faults
List of specification defined Health fault values.
```
Defines

BT_MESH_HEALTH_FAULT_NO_FAULT
   No fault has occurred.

Large Composition Data Client  The Large Composition Data Client model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_LARGE_COMP_DATA_CLI option.

The Large Composition Data Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of reading pages of Composition Data that do not fit in a Config Composition Data Status message and reading the metadata of the model instances on a node that supports the Large Composition Data Server model.

The Large Composition Data Client model communicates with a Large Composition Data Server model using the device key of the node containing the target Large Composition Data Server model instance.

If present, the Large Composition Data Client model must only be instantiated on the primary element.

API reference

group bt_mesh_large_comp_data_cli

Defines

BT_MESH_MODEL_LARGE_COMP_DATA_CLI(cli_data)
  Large Composition Data Client model Composition Data entry.

Parameters

  - cli_data – Pointer to a Large Composition Data Client model instance.
**Functions**

```c
int bt_mesh_large_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct bt_mesh_large_comp_data_rsp *rsp)
```

Send Large Composition Data Get message.

This API is used to read a portion of a Composition Data Page.

This API can be used asynchronously by setting `rsp` as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When `rsp` is set, the user is responsible for providing a buffer for the Composition Data in `bt_mesh_large_comp_data_rsp::data`. If a buffer is not provided, the metadata won't be copied.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node element address.
- `page` – Composition Data Page to read.
- `offset` – Offset within the Composition Data Page.
- `rsp` – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_models_metadata_get(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct bt_mesh_large_comp_data_rsp *rsp)
```

Send Models Metadata Get message.

This API is used to read a portion of a Models Metadata Page.

This API can be used asynchronously by setting `rsp` as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When `rsp` is set, a user is responsible for providing a buffer for metadata in `bt_mesh_large_comp_data_rsp::data`. If a buffer is not provided, the metadata won't be copied.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node element address.
- `page` – Models Metadata Page to read.
- `offset` – Offset within the Models Metadata Page.
- `rsp` – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

**Returns**

0 on success, or (negative) error code on failure.
uint8_t page
    Page number.

uint16_t offset
    Offset within the page.

uint16_t total_size
    Total size of the page.

struct net_buf_simple *data
    Pointer to allocated buffer for storing received data.

struct bt_mesh_large_comp_data_cli_cb
    #include <large_comp_data_cli.h> Large Composition Data Status messages callbacks.

Public Members

void (*large_comp_data_status)(struct bt_mesh_large_comp_data_cli *cli, uint16_t addr, struct bt_mesh_large_comp_data_rsp *rsp)
    Optional callback for Large Composition Data Status message.
    Handles received Large Composition Data Status messages from a Large Composition Data Server.
    If the content of rsp is needed after exiting this callback, a user should deep copy it.
    
    Param cli
        Large Composition Data Client context.
    
    Param addr
        Address of the sender.
    
    Param rsp
        Response received from the server.

void (*models_metadata_status)(struct bt_mesh_large_comp_data_cli *cli, uint16_t addr, struct bt_mesh_large_comp_data_rsp *rsp)
    Optional callback for Models Metadata Status message.
    Handles received Models Metadata Status messages from a Large Composition Data Server.
    If the content of rsp is needed after exiting this callback, a user should deep copy it.
    
    Param cli
        Large Composition Data Client context.
    
    Param addr
        Address of the sender.
    
    Param rsp
        Response received from the server.

struct bt_mesh_large_comp_data_cli
    #include <large_comp_data_cli.h> Large Composition Data Client model context.
Public Members

const struct bt_mesh_model *model
Model entry pointer.

struct bt_mesh_msg_ack_ctx ack_ctx
Internal parameters for tracking message responses.

const struct bt_mesh_large_comp_data_cli_cb *cb
Optional callback for Large Composition Data Status messages.

Large Composition Data Server  The Large Composition Data Server model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_LARGE_COMP_DATA_SRV option.

The Large Composition Data Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of exposing pages of Composition Data that do not fit in a Config Composition Data Status message and to expose metadata of the model instances.

The Large Composition Data Server does not have an API of its own and relies on a Large Composition Data Client to control it. The model only accepts messages encrypted with the node's device key.

If present, the Large Composition Data Server model must only be instantiated on the primary element.

Models metadata  The Large Composition Data Server model allows each model to have a list of model's specific metadata that can be read by the Large Composition Data Client model. The metadata list can be associated with the bt_mesh_model through the bt_mesh_model.metadata field. The metadata list consists of one or more entries defined by the bt_mesh_models_metadata_entry structure. Each entry contains the length and ID of the metadata, and a pointer to the raw data. Entries can be created using the BT_MESH_MODELS_METADATA_ENTRY macro. The BT_MESH_MODELS_METADATA_END macro marks the end of the metadata list and must always be present. If the model has no metadata, the helper macro BT_MESH_MODELS_METADATA_NONE can be used instead.

Defines

BT_MESH_MODEL_LARGE_COMP_DATA_SRV
Large Composition Data Server model composition data entry.

On-Demand Private Proxy Client  The On-Demand Private Proxy Client model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled with the CONFIG_BT_MESH_OD_PRIV_PROXY_CLI option.

The On-Demand Private Proxy Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to set and retrieve the On-Demand Private GATT Proxy state. The
state defines how long a node will advertise Mesh Proxy Service with Private Network Identity type after it receives a Solicitation PDU.

The On-Demand Private Proxy Client model communicates with an On-Demand Private Proxy Server model using the device key of the node containing the target On-Demand Private Proxy Server model instance.

If present, the On-Demand Private Proxy Client model must only be instantiated on the primary element.

**Configurations** The On-Demand Private Proxy Client model behavior can be configured with the transmission timeout option \texttt{CONFIG\_BT\_MESH\_OD\_PRIV\_PROXY\_CLI\_TIMEOUT}. The \texttt{CONFIG\_BT\_MESH\_OD\_PRIV\_PROXY\_CLI\_TIMEOUT} controls how long the Client waits for a state response message to arrive in milliseconds. This value can be changed at runtime using \texttt{bt\_mesh\_od\_priv\_proxy\_cli\_timeout\_set()}. 

**API reference**

\texttt{group} \texttt{bt\_mesh\_od\_priv\_proxy\_cli}

\textbf{Defines}

\texttt{BT\_MESH\_MODEL\_OD\_PRIV\_PROXY\_CLI(cli\_data)}

On-Demand Private Proxy Client model composition data entry.

\textbf{Functions}

\texttt{int bt\_mesh\_od\_priv\_proxy\_cli\_get(uint16\_t net\_idx, uint16\_t addr, uint8\_t *val\_rsp)}

Get the target's On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting \texttt{val\_rsp} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \texttt{od\_status} callback in \texttt{bt\_mesh\_od\_priv\_proxy\_cli} struct.

\textbf{Parameters}

- \texttt{net\_idx} – Network index to encrypt with.
- \texttt{addr} – Target node address.
- \texttt{val\_rsp} – Response buffer for On-Demand Private GATT Proxy value.

\textbf{Returns}

0 on success, or (negative) error code otherwise.

\texttt{int bt\_mesh\_od\_priv\_proxy\_cli\_set(uint16\_t net\_idx, uint16\_t addr, uint8\_t val, uint8\_t *val\_rsp)}

Set the target's On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting \texttt{val\_rsp} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \texttt{od\_status} callback in \texttt{bt\_mesh\_od\_priv\_proxy\_cli} struct.

\textbf{Parameters}
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – On-Demand Private GATT Proxy state to be set
• val_rsp – Response buffer for On-Demand Private GATT Proxy value.

Returns
0 on success, or (negative) error code otherwise.

```c
void bt_mesh_od_priv_proxy_cli_timeout_set(int32_t timeout)
```
Set the transmission timeout value.

Parameters
• timeout – The new transmission timeout in milliseconds.

```c
struct bt_mesh_od_priv_proxy_cli
```
#include <od_priv_proxy_cli.h> On-Demand Private Proxy Client Model Context.

Public Members

```c
const struct bt_mesh_model *model
```
Solicitation PDU RPL model entry pointer.

```c
void (*od_status)(struct bt_mesh_od_priv_proxy_cli *cli, uint16_t addr, uint8_t state)
```
Optional callback for On-Demand Private Proxy Status messages.

Handles received On-Demand Private Proxy Status messages from an On-Demand Private Proxy server. The `state` param represents state of On-Demand Private Proxy server.

Param cli
On-Demand Private Proxy client that received the status message.

Param addr
Address of the sender.

Param state
State value.

**On-Demand Private Proxy Server** The On-Demand Private Proxy Server model is a foundation model defined by the Bluetooth Mesh specification. It is enabled with the `CONFIG_BT_MESH_OD_PRIV_PROXY_SRV` option.

The On-Demand Private Proxy Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the configuration of advertising with Private Network Identity type of a node that is a recipient of Solicitation PDUs by managing its On-Demand Private GATT Proxy state.

When enabled, the **Solicitation PDU RPL Configuration Server** is also enabled. The On-Demand Private Proxy Server is dependent on the **Private Beacon Server** to be present on the node.

The On-Demand Private Proxy Server does not have an API of its own, and relies on an **On-Demand Private Proxy Client** to control it. The On-Demand Private Proxy Server model only accepts messages encrypted with the node’s device key.

If present, the On-Demand Private Proxy Server model must only be instantiated on the primary element.

6.1. Bluetooth
Opcodes Aggregator Client  The Opcodes Aggregator Client model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_OP_AGG_CLI option.

The Opcodes Aggregator Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the Opcodes Aggregator Server model.

The Opcodes Aggregator Client model communicates with an Opcodes Aggregator Server model using the device key of the target node or the application keys configured by the Configuration Client.

If present, the Opcodes Aggregator Client model must only be instantiated on the primary element.

The Opcodes Aggregator Client model is implicitly bound to the device key on initialization. It should be bound to the same application keys as the client models that are used to produce the sequence of messages.

To be able to aggregate a message from a client model, it should support an asynchronous API, for example through callbacks.

API reference

group bt_mesh_op_agg_cli

Defines

BT_MESH_MODEL_OP_AGG_CLI
Opcodes Aggregator Client model composition data entry.

API reference

bt_mesh_op_agg_cli_seq_start( uint16_t net_idx, uint16_t app_idx, uint16_t dst, uint16_t elem_addr)

Configure Opcodes Aggregator context.

Parameters

• net_idx – NetKey index to encrypt with.
• app_idx – AppKey index to encrypt with.
• dst – Target Opcodes Aggregator Server address.
• elem_addr – Target node element address for the sequence message.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_op_agg_cli_seq_send(void)
Opcodes Aggregator message send.
Uses previously configured context and sends aggregated message to target node.

Returns
0 on success, or (negative) error code on failure.

void bt_mesh_op_agg_cli_seq_abort(void)
Abort Opcodes Aggregator context.

bool bt_mesh_op_agg_cli_seq_is_started(void)
Check if Opcodes Aggregator Sequence context is started.

Returns
ture if it is started, otherwise false.

size_t bt_mesh_op_agg_cli_seq_tailroom(void)
Get Opcodes Aggregator context tailroom.

Returns
Remaning tailroom of Opcodes Aggregator SDU.

int32_t bt_mesh_op_agg_cli_timeout_get(void)
Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void bt_mesh_op_agg_cli_timeout_set(int32_t timeout)
Set the transmission timeout value.

Parameters
• timeout – The new transmission timeout.

Opcodes Aggregator Server The Opcodes Aggregator Server model is a foundation model defined by the Bluetooth mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_OP_AGG_SRV option.

The Opcodes Aggregator Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of processing a sequence of access layer messages.

The Opcodes Aggregator Server model accepts messages encrypted with the node’s device key or the application keys.

If present, the Opcodes Aggregator Server model must only be instantiated on the primary element.

The targeted server models should be bound to the same application key that is used to encrypt the sequence of access layer messages sent to the Opcodes Aggregator Server.

The Opcodes Aggregator Server handles aggregated messages and dispatches them to the respective models and their message handlers. Current implementation assumes that responses are sent from the same execution context as the received message and doesn't allow to send a postponed response, for example from a work queue.

API reference

`group bt_mesh_op_agg_srv`
Defines

**BT_MESH_MODEL_OP_AGG_SRV**

Opcodes Aggregator Server model composition data entry.

**Note:** The Opcodes Aggregator Server handles aggregated messages and dispatches them to the respective models and their message handlers. Current implementation assumes that responses are sent from the same execution context as the received message and doesn't allow to send a postponed response, e.g. from workqueue.

**Private Beacon Client**  The Private Beacon Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_PRIV_BEACON_CLI` option.

The Private Beacon Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and provides functionality for configuring the **Private Beacon Server** models.

The Private Beacons feature adds privacy to the different Bluetooth Mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network's IV index, IV update and the Key Refresh state.

The Private Beacon Client model communicates with a **Private Beacon Server** model using the device key of the target node. The Private Beacon Client model may communicate with servers on other nodes or self-configure through the local Private Beacon Server model.

All configuration functions in the Private Beacon Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and the primary unicast address the target node was provisioned with.

If present, the Private Beacon Client model must only be instantiated on the primary element.

**API reference**

*group* `bt_mesh_priv_beacon_cli`

**Defines**

**BT_MESH_MODEL_PRIV_BEACON_CLI(cli_data)**

Private Beacon Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a **Bluetooth Mesh Private Beacon Client** instance.

**Functions**

```c
int bt_mesh_priv_beacon_cli_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_beacon *val, struct bt_mesh_priv_beacon *rsp)
```

Set the target's Private Beacon state.

This method can be used asynchronously by setting `rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
• **addr** – Target node address.
• **val** – New Private Beacon value.
• **rsp** – If set, returns response status on success.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_beacon *val)
```

Get the target’s Private Beacon state.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **val** – Response buffer for Private Beacon value.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *rsp)
```

Set the target’s Private GATT Proxy state.

This method can be used asynchronously by setting *rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **val** – New Private GATT Proxy value.
• **rsp** – If set, returns response status on success.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *val)
```

Get the target’s Private GATT Proxy state.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **val** – Response buffer for Private GATT Proxy value.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_node_id_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_node_id *val, struct bt_mesh_priv_node_id *rsp)
```

Set the target’s Private Node Identity state.

This method can be used asynchronously by setting *rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.
• `addr` – Target node address.
• `val` – New Private Node Identity value.
• `rsp` – If set, returns response status on success.

**Returns**
0 on success, or (negative) error code otherwise.

```c
#include <priv_beacon_cli.h>

int bt_mesh_priv_beacon_cli_node_id_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, struct bt_mesh_priv_node_id *val)
```

Get the target's Private Node Identity state.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network index to get the Private Node Identity state of.

**Returns**
0 on success, or (negative) error code otherwise.

```c
#include <priv_beacon_cli.h>

struct bt_mesh_priv_beacon
```

Private Beacon.

**Public Members**
- `uint8_t enabled`
  Private beacon is enabled.
- `uint8_t rand_interval`
  Random refresh interval (in 10 second steps), or 0 to keep current value.

```c
#include <priv_beacon_cli.h>

struct bt_mesh_priv_node_id
```

Private Node Identity.

**Public Members**
- `uint16_t net_idx`
  Index of the NetKey.
- `uint8_t state`
  Private Node Identity state.
- `uint8_t status`
  Response status code.

```c
#include <priv_beacon_cli.h>

struct bt_mesh_priv_beacon_cli_cb
```

Private Beacon Client Status messages callbacks.
Public Members

void (*priv_beacon_status)(struct bt_mesh_priv_beacon_cli *cli, uint16_t addr, struct bt_mesh_priv_beacon *priv_beacon)
Optional callback for Private Beacon Status message.
Handles received Private Beacon Status messages from a Private Beacon server.
   Param cli  
      Private Beacon client context.
   Param addr  
      Address of the sender.
   Param priv_beacon  
      Mesh Private Beacon state received from the server.

void (*priv_gatt_proxy_status)(struct bt_mesh_priv_beacon_cli *cli, uint16_t addr, uint8_t gatt_proxy)
Optional callback for Private GATT Proxy Status message.
Handles received Private GATT Proxy Status messages from a Private Beacon server.
   Param cli  
      Private Beacon client context.
   Param addr  
      Address of the sender.
   Param gatt_proxy  
      Private GATT Proxy state received from the server.

void (*priv_node_id_status)(struct bt_mesh_priv_beacon_cli *cli, uint16_t addr, struct bt_mesh_priv_node_id *priv_node_id)
Optional callback for Private Node Identity Status message.
Handles received Private Node Identity Status messages from a Private Beacon server.
   Param cli  
      Private Beacon client context.
   Param addr  
      Address of the sender.
   Param priv_node_id  
      Private Node Identity state received from the server.

struct bt_mesh_priv_beacon_cli
#include <priv_beacon_cli.h> Mesh Private Beacon Client model.

Public Members

const struct bt_mesh_priv_beacon_cli_cb *cb  
Optional callback for Private Beacon Client Status messages.

Private Beacon Server  The Private Beacon Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with CONFIG_BT_MESH_PRIV_BEACON_SRV option.
The Private Beacon Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and controls the mesh node's Private Beacon state, Private GATT Proxy state and Private Node Identity state.
The Private Beacons feature adds privacy to the different Bluetooth Mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network's IV index, IV update and the Key Refresh state. The Private Beacon Server must be instantiated for the device to support sending of the private beacons, but the node will process received private beacons without it.

The Private Beacon Server does not have an API of its own, but relies on a Private Beacon Client to control it. The Private Beacon Server model only accepts messages encrypted with the node's device key.

The application can configure the initial parameters of the Private Beacon Server model through the `bt_mesh_priv_beacon_srv` instance passed to `BT_MESH_MODEL_PRIV_BEACON_SRV`. Note that if the mesh node stored changes to this configuration in the settings subsystem, the initial values may be overwritten upon loading.

If present, the Private Beacon Server model must only be instantiated on the primary element.

**API reference**

```c
struct bt_mesh_priv_beacon_srv

Defines

BT_MESH_MODEL_PRIV_BEACON_SRV

Private Beacon Server model composition data entry.
```

**Remote Provisioning Client** The Remote Provisioning Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_RPR_CLI` option.

The Remote Provisioning Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1. This model provides functionality to remotely provision devices into a mesh network, and perform Node Provisioning Protocol Interface procedures by interacting with mesh nodes that support the Remote Provisioning Server model.

The Remote Provisioning Client model communicates with a Remote Provisioning Server model using the device key of the node containing the target Remote Provisioning Server model instance.

If present, the Remote Provisioning Client model must be instantiated on the primary element.

**Scanning** The scanning procedure is used to scan for unprovisioned devices located nearby the Remote Provisioning Server. The Remote Provisioning Client starts a scan procedure by using the `bt_mesh_rpr_scan_start()` call:

```c
static void rpr_scan_report(struct bt_mesh_rpr_cli *cli,
    const struct bt_mesh_rpr_node *srv,
    struct bt_mesh_rpr_unprov *unprov,
    struct net_buf_simple *adv_data)
{

}

struct bt_mesh_rpr_cli rpr_cli = {
    .scan_report = rpr_scan_report,
};

const struct bt_mesh_rpr_node srv = {
```

(continues on next page)
The above example shows pseudo code for starting a scan procedure on the target Remote Provisioning Server node. This procedure will start a ten-second, multiple-device scanning where the generated scan report will contain a maximum of three unprovisioned devices. If the UUID argument was specified, the same procedure would only scan for the device with the corresponding UUID. After the procedure completes, the server sends the scan report that will be handled in the client's `bt_mesh_rpr_cli.scan_report` callback.

Additionally, the Remote Provisioning Client model also supports extended scanning with the `bt_mesh_rpr_scan_start_ext()` call. Extended scanning supplements regular scanning by allowing the Remote Provisioning Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device if it is supported by the unprovisioned device.

**Provisioning**  The Remote Provisioning Client starts a provisioning procedure by using the `bt_mesh_provision_remote()` call:

```c
struct bt_mesh_rpr_cli rpr_cli;

const struct bt_mesh_rpr_node srv = {
   .addr = 0x0004,
   .net_idx = 0,
   .ttl = BT_MESH_TTL_DEFAULT,
};

uint8_t uuid[16] = { 0xaa };
uint16_t addr = 0x0006;
uint16_t net_idx = 0;

bt_mesh_provision_remote(&rpr_cli, &srv, uuid, addr);
```

The above example shows pseudo code for remotely provisioning a device through a Remote Provisioning Server node. This procedure will attempt to provision the device with the corresponding UUID, and assign the address 0x0006 to its primary element using the network key located at index zero.

**Note:** During the remote provisioning, the same `bt_mesh_prov` callbacks are triggered as for ordinary provisioning. See section **Provisioning** for further details.

**Re-provisioning**  In addition to scanning and provisioning functionality, the Remote Provisioning Client also provides means to reconfigure node addresses, device keys and Composition Data on devices that support the Remote Provisioning Server model. This is provided through the Node Provisioning Protocol Interface (NPPI) which supports the following three procedures:

- Device Key Refresh procedure: Used to change the device key of the Target node without a need to reconfigure the node.
• Node Address Refresh procedure: Used to change the node’s device key and unicast address.
• Node Composition Refresh procedure: Used to change the device key of the node, and to add or delete models or features of the node.

The three NPPI procedures can be initiated with the `bt_mesh_reprovision_remote()` call:

```c
struct bt_mesh_rpr_cli rpr_cli;
struct bt_mesh_rpr_node srv = {
    .addr = 0x0006,
    .net_idx = 0,
    .ttl = BT_MESH_TTL_DEFAULT,
};
bool composition_changed = false;
uint16_t new_addr = 0x0009;
bt_mesh_reprovision_remote(&rpr_cli, &srv, new_addr, composition_changed);
```

The above example shows pseudo code for triggering a Node Address Refresh procedure on the Target node. The specific procedure is not chosen directly, but rather through the other parameters that are inputted. In the example we can see that the current unicast address of the Target is 0x0006, while the new address is set to 0x0009. If the two addresses were the same, and the `composition_changed` flag was set to true, this code would instead trigger a Node Composition Refresh procedure. If the two addresses were the same, and the `composition_changed` flag was set to false, this code would trigger a Device Key Refresh procedure.

**group** bt_mesh_rpr_cli

#### Defines

**BT_MESH_RPR_SCAN_MAX_DEVS_ANY**

Special value for the `max_devs` parameter of `bt_mesh_rpr_scan_start`.

Tells the Remote Provisioning Server not to put restrictions on the max number of devices reported to the Client.

**BT_MESH_MODEL_RPR_CLI(_cli)**

Remote Provisioning Client model composition data entry.

**Parameters**

- `_cli` – Pointer to a Remote Provisioning Client model instance.

#### Functions

**int bt_mesh_rpr_scan_caps_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_caps *caps)**

Get scanning capabilities of Remote Provisioning Server.

**Parameters**

- `cli` – Remote Provisioning Client.
- `caps` – Capabilities response buffer.
Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_rpr_scan_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_scan_status *status)

Get current scanning state of Remote Provisioning Server.

Parameters
• cli – Remote Provisioning Client.
• srv – Remote Provisioning Server.
• status – Scan status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_rpr_scan_start(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, uint8_t max_devs, struct bt_mesh_rpr_scan_status *status)

Start scanning for unprovisioned devices.

Tells the Remote Provisioning Server to start scanning for unprovisioned devices. The Server will report back the results through the bt_mesh_rpr_cli::scan_report callback.

Use the uuid parameter to scan for a specific device, or leave it as NULL to report all unprovisioned devices.

The Server will ignore duplicates, and report up to max_devs number of devices. Requesting a max_devs number that's higher than the Server's capability will result in an error.

Parameters
• cli – Remote Provisioning Client.
• srv – Remote Provisioning Server.
• uuid – Device UUID to scan for, or NULL to report all devices.
• timeout – Scan timeout in seconds. Must be at least 1 second.
• max_devs – Max number of devices to report, or 0 to report as many as possible.
• status – Scan status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_rpr_scan_start_ext(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, const uint8_t *ad_types, size_t ad_count)

Start extended scanning for unprovisioned devices.

Extended scanning supplements regular unprovisioned scanning, by allowing the Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device, if supported. If no UUID is provided, the Server will report a scan on its own OOB information and advertising data.

Use the ad_types array to specify which AD types to include in the scan report. Some AD types invoke special behavior:
• BT_DATA_NAME_COMPLETE Will report both the complete and the shortened name.
• **BT_DATA_URI** If the unprovisioned beacon contains a URI hash, the Server will extend the scanning to include packets other than the scan response, to look for URIs matching the URI hash. Only matching URIs will be reported.

The following AD types should not be used:

• **BT_DATA_NAME_SHORTENED**
• **BT_DATA_UUID16_SOME**
• **BT_DATA_UUID32_SOME**
• **BT_DATA_UUID128_SOME**

Additionally, each AD type should only occur once.

**Parameters**

• *cli* – Remote Provisioning Client.
• *srv* – Remote Provisioning Server.
• *uuid* – Device UUID to start extended scanning for, or NULL to scan the remote server.
• *timeout* – Scan timeout in seconds. Valid values from `BT_MESH_RPR_EXT_SCAN_TIME_MIN` to `BT_MESH_RPR_EXT_SCAN_TIME_MAX`. Ignored if UUID is NULL.
• *ad_types* – List of AD types to include in the scan report. Must contain 1 to `CONFIG_BT_MESH_RPR_AD_TYPES_MAX` entries.
• *ad_count* – Number of AD types in *ad_types*.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_rpr_scan_stop(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_scan_status *status)
```

Stop any ongoing scanning on the Remote Provisioning Server.

**Parameters**

• *cli* – Remote Provisioning Client.
• *srv* – Remote Provisioning Server.
• *status* – Scan status response buffer.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_rpr_link_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)
```

Get the current link status of the Remote Provisioning Server.

**Parameters**

• *cli* – Remote Provisioning Client.
• *srv* – Remote Provisioning Server.
• *rsp* – Link status response buffer.

**Returns**

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_rpr_link_close(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)
```

Close any open link on the Remote Provisioning Server.
Parameters

- `cli` – Remote Provisioning Client.
- `rsp` – Link status response buffer.

Returns

0 on success, or (negative) error code otherwise.

```c
int32_t bt_mesh_rpr_cli_timeout_get(void)
```

Get the current transmission timeout value.

Returns

The configured transmission timeout in milliseconds.

```c
void bt_mesh_rpr_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

The transmission timeout controls the amount of time the Remote Provisioning Client models will wait for a response from the Server.

Parameters

- `timeout` – The new transmission timeout.

```c
struct bt_mesh_rpr_scan_status
```

Include `<rpr_cli.h>` Scan status response.

Public Members

```c
enum bt_mesh_rpr_status
```

Current scan status.

```c
enum bt_mesh_rpr_scan
```

Current scan state.

```c
uint8_t max_devs
```

Max number of devices to report in current scan.

```c
uint8_t timeout
```

Seconds remaining of the scan.

```c
struct bt_mesh_rpr_caps
```

Include `<rpr_cli.h>` Remote Provisioning Server scanning capabilities.

Public Members

```c
uint8_t max_devs
```

Max number of scannable devices.

```c
bool active_scan
```

Supports active scan.
struct bt_mesh_rpr_cli
   #include <rpr_cli.h> Remote Provisioning Client model instance.

Public Members

void (*scan_report)(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const struct bt_mesh_rpr_unprov *unprov, struct net_buf_simple *adv_data)
   Scan report callback.
   Param cli
      Remote Provisioning Client.
   Param srv
      Remote Provisioning Server.
   Param unprov
      Unprovisioned device.
   Param adv_data
      Advertisement data for the unprovisioned device, or NULL if extended scanning hasn’t been enabled. An empty buffer indicates that the extended scanning finished without collecting additional information.

Remote Provisioning Server  The Remote Provisioning Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the CONFIG_BT_MESH_RPR_SRV option.

The Remote Provisioning Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of remotely provisioning devices into a mesh network.

The Remote Provisioning Server does not have an API of its own, but relies on a Remote Provisioning Client to control it. The Remote Provisioning Server model only accepts messages encrypted with the node’s device key.

If present, the Remote Provisioning Server model must be instantiated on the primary element.

Note that after refreshing the device key, node address or Composition Data through a Node Provisioning Protocol Interface (NPPI) procedure, the bt_mesh_prov.reprovisioned callback is triggered. See section Remote Provisioning Client for further details.

Limitations  The following limitations apply to Remote Provisioning Server model:
   • Provisioning of unprovisioned device using PB-GATT is not supported.
   • All Node Provisioning Protocol Interface (NPPI) procedures are supported. However, if the composition data of a device gets changed after device firmware update (see firmware effect), it is not possible for the device to remain provisioned. The device should be unprovisioned if its composition data is expected to change.

API reference

group bt_mesh_rpr_srv

Defines
BT_MESH_MODEL_RPR_SRV

Remote Provisioning Server model composition data entry.

**SAR Configuration Client**  The SAR Configuration Client model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_SAR_CFG_CLI configuration option.

The SAR Configuration Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and it supports the configuration of the lower transport layer behavior of a node that supports the **SAR Configuration Server** model.

The model can send messages to query or change the states supported by the SAR Configuration Server (SAR Transmitter and SAR Receiver) using SAR Configuration messages.

The SAR Transmitter procedure is used to determine and configure the SAR Transmitter state of a SAR Configuration Server. Function calls \texttt{bt\_mesh\_sar\_cfg\_cli\_transmitter\_get()} and \texttt{bt\_mesh\_sar\_cfg\_cli\_transmitter\_set()} are used to get and set the SAR Transmitter state of the Target node respectively.

The SAR Receiver procedure is used to determine and configure the SAR Receiver state of a SAR Configuration Server. Function calls \texttt{bt\_mesh\_sar\_cfg\_cli\_receiver\_get()} and \texttt{bt\_mesh\_sar\_cfg\_cli\_receiver\_set()} are used to get and set the SAR Receiver state of the Target node respectively.

For more information about the two states, see **SAR states**.

An element can send any SAR Configuration Client message at any time to query or change the states supported by the SAR Configuration Server model of a peer node. The SAR Configuration Client model only accepts messages encrypted with the device key of the node supporting the SAR Configuration Server model.

If present, the SAR Configuration Client model must only be instantiated on the primary element.

**API reference**

\texttt{group bt\_mesh\_sar\_cfg\_cli}

Bluetooth Mesh.

**Defines**

\texttt{BT\__MESH\_MODEL\_SAR\_CFG\_CLI(_cli)}

SAR Configuration Client model composition data entry.

**Parameters**

- \texttt{cli} – [in] Pointer to a **Bluetooth Mesh SAR Configuration Client Model** instance.

**Functions**

\texttt{int bt\_mesh\_sar\_cfg\_cli\_transmitter\_get(uint16_t net\_idx, uint16_t addr, struct bt\_mesh\_sar\_tx *rsp)}

Get the SAR Transmitter state of the target node.

**Parameters**

- \texttt{net\_idx} – Network index to encrypt with.
• \texttt{addr} – Target node address.
• \texttt{rsp} – Status response parameter.

\textbf{Returns}
0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_sar_cfg_cli_transmitter_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_sar_tx *set, struct bt_mesh_sar_tx *rsp)
\end{verbatim}

Set the SAR Transmitter state of the target node.

\textbf{Parameters}
• \texttt{net_idx} – Network index to encrypt with.
• \texttt{addr} – Target node address.
• \texttt{set} – New SAR Transmitter state to set on the target node.
• \texttt{rsp} – Status response parameter.

\textbf{Returns}
0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_sar_cfg_cli_receiver_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_sar_rx *rsp)
\end{verbatim}

Get the SAR Receiver state of the target node.

\textbf{Parameters}
• \texttt{net_idx} – Network index to encrypt with.
• \texttt{addr} – Target node address.
• \texttt{rsp} – Status response parameter.

\textbf{Returns}
0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_sar_cfg_cli_receiver_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_sar_rx *set, struct bt_mesh_sar_rx *rsp)
\end{verbatim}

Set the SAR Receiver state of the target node.

\textbf{Parameters}
• \texttt{net_idx} – Network index to encrypt with.
• \texttt{addr} – Target node address.
• \texttt{set} – New SAR Receiver state to set on the target node.
• \texttt{rsp} – Status response parameter.

\textbf{Returns}
0 on success, or (negative) error code on failure.

\begin{verbatim}
int32_t bt_mesh_sar_cfg_cli_timeout_get(void)
\end{verbatim}

Get the current transmission timeout value.

\textbf{Returns}
The configured transmission timeout in milliseconds.

\begin{verbatim}
void bt_mesh_sar_cfg_cli_timeout_set(int32_t timeout)
\end{verbatim}

Set the transmission timeout value.

\textbf{Parameters}
• \texttt{timeout} – The new transmission timeout.
struct bt_mesh_sar_cfg_cli

#include <sar_cfg_cli.h> Mesh SAR Configuration Client Model Context.

**Public Members**

const struct bt_mesh_model *model

Access model pointer.

**SAR Configuration Server** The SAR Configuration Server model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_SAR_CFG_SRV configuration option.

The SAR Configuration Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and it supports the configuration of the segmentation and reassembly (SAR) behavior of a Bluetooth Mesh node. The model defines a set of states and messages for the SAR configuration.

The SAR Configuration Server model defines two states, SAR Transmitter state and SAR Receiver state. For more information about the two states, see **SAR states**.

The model also supports the SAR Transmitter and SAR Receiver get and set messages.

The SAR Configuration Server model does not have an API of its own, but relies on a **SAR Configuration Client** to control it. The SAR Configuration Server model only accepts messages encrypted with the node's device key.

If present, the SAR Configuration Server model must only be instantiated on the primary element.

**API reference**

*group bt_mesh_sar_cfg_srv*

Bluetooth Mesh.

**Defines**

**BT_MESH_MODEL_SAR_CFG_SRV**

Transport SAR Configuration Server model composition data entry.

**Solicitation PDU RPL Configuration Client** The Solicitation PDU RPL Configuration Client model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_SOL_PDU_RPL_CLI option.

The Solicitation PDU RPL Configuration Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of removing addresses from the solicitation replay protection list (SRPL) of a node that supports the Solicitation PDU RPL Configuration Server model.

The Solicitation PDU RPL Configuration Client model communicates with a Solicitation PDU RPL Configuration Server model using the application keys configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Client model must only be instantiated on the primary element.
Configurations  The Solicitation PDU RPL Configuration Client model behavior can be configured with the transmission timeout option CONFIG_BT_MESH_SOL_PDU_RPL_CLI_TIMEOUT. The CONFIG_BT_MESH_SOL_PDU_RPL_CLI_TIMEOUT controls how long the Solicitation PDU RPL Configuration Client waits for a response message to arrive in milliseconds. This value can be changed at runtime using bt_mesh_sol_pdu_rpl_cli_timeout_set().

API reference

group bt_mesh_sol_pdu_rpl_cli

Defines

BT_MESH_MODEL_SOL_PDU_RPL_CLI(cli_data)
Solicitation PDU RPL Client model composition data entry.

Functions

int bt_mesh_sol_pdu_rpl_clear(struct bt_mesh_msg_ctx *ctx, uint16_t range_start,
                               uint8_t range_len, uint16_t *start_rsp, uint8_t *len_rsp)
Remove entries from Solicitation PDU RPL of addresses in given range.
This method can be used asynchronously by setting start_rsp or len_rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the srpl_status callback in bt_mesh_sol_pdu_rpl_cli struct.

Parameters

• ctx – Message context for the message.
• range_start – Start of Unicast address range.
• range_len – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.
• start_rsp – Range start response buffer.
• len_rsp – Range length response buffer.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_sol_pdu_rpl_clear_unack(struct bt_mesh_msg_ctx *ctx, uint16_t range_start,
                                     uint8_t range_len)
Remove entries from Solicitation PDU RPL of addresses in given range (unacked).

Parameters

• ctx – Message context for the message.
• range_start – Start of Unicast address range.
• range_len – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.

Returns

0 on success, or (negative) error code otherwise.
void bt_mesh_sol_pdu_rpl_cli_timeout_set(int32_t timeout)
  Set the transmission timeout value.

  **Parameters**
  
  • **timeout** – The new transmission timeout in milliseconds.

struct bt_mesh_sol_pdu_rpl_cli
#include <sol_pdu_rpl_cli.h> Solicitation PDU RPL Client Model Context.

**Public Members**

const struct bt_mesh_model *model
Solicitation PDU RPL model entry pointer.

void (*srpl_status)(struct bt_mesh_sol_pdu_rpl_cli *cli, uint16_t addr, uint16_t range_start, uint8_t range_length)
Optional callback for Solicitation PDU RPL Status messages.
Handles received Solicitation PDU RPL Status messages from a Solicitation PDU RPL server. The start param represents the start of range that server has cleared. The length param represents length of range cleared by server.

  **Param cli**
  Solicitation PDU RPL client that received the status message.

  **Param addr**
  Address of the sender.

  **Param range_start**
  Range start value.

  **Param range_length**
  Range length value.

**Solicitation PDU RPL Configuration Server** The Solicitation PDU RPL Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The model is enabled if the node has the **On-Demand Private Proxy Server** enabled.

The Solicitation PDU RPL Configuration Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and manages the Solicitation Replay Protection List (SRPL) saved on the device. The SRPL is used to reject Solicitation PDUs that are already processed by a node. When a valid Solicitation PDU message is successfully processed by a node, the SSRC field and SSEQ field of the message are stored in the node's SRPL.

The Solicitation PDU RPL Configuration Server does not have an API of its own, and relies on a **Solicitation PDU RPL Configuration Client** to control it. The model only accepts messages encrypted with an application key as configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Server model must only be instantiated on the primary element.

**Configurations** For the Solicitation PDU RPL Configuration Server model, the `CONFIG_BT_MESH_PROXY_SRPL_SIZE` option can be configured to set the size of the SRPL.

**API reference**

`group bt_mesh_sol_pdu_rpl_srv`
Defines

BT_MESH_MODEL_SOL_PDU_RPL_SRV
Solicitation PDU RPL Server model composition data entry.

Model specification models In addition to the foundation models defined in the Bluetooth Mesh specification, the Bluetooth Mesh Model Specification defines several models, some of which are implemented in Zephyr:

BLOB Transfer models The Binary Large Object (BLOB) Transfer models implement the Bluetooth Mesh Binary Large Object Transfer Model specification version 1.0 and provide functionality for sending large binary objects from a single source to many Target nodes over the Bluetooth Mesh network. It is the underlying transport method for the Device Firmware Update (DFU), but may be used for other object transfer purposes. The implementation is in experimental state.

The BLOB Transfer models support transfers of continuous binary objects of up to 4 GB (2^{32} bytes). The BLOB transfer protocol has built-in recovery procedures for packet losses, and sets up checkpoints to ensure that all targets have received all the data before moving on. Data transfer order is not guaranteed.

BLOB transfers are constrained by the transfer speed and reliability of the underlying mesh network. Under ideal conditions, the BLOBs can be transferred at a rate of up to 1 kbps, allowing a 100 kB BLOB to be transferred in 10-15 minutes. However, network conditions, transfer capabilities and other limiting factors can easily degrade the data rate by several orders of magnitude. Tuning the parameters of the transfer according to the application and network configuration, as well as scheduling it to periods with low network traffic, will offer significant improvements on the speed and reliability of the protocol. However, achieving transfer rates close to the ideal rate is unlikely in actual deployments.

There are two BLOB Transfer models:

BLOB Transfer Server The Binary Large Object (BLOB) Transfer Server model implements reliable receiving of large binary objects. It serves as the backend of the Firmware Update Server, but can also be used for receiving other binary images.

BLOBs As described in BLOB Transfer models, the binary objects transferred by the BLOB Transfer models are divided into blocks, which are divided into chunks. As the transfer is controlled by the BLOB Transfer Client model, the BLOB Transfer Server must allow blocks to come in any order. The chunks within a block may also come in any order, but all chunks in a block must be received before the next block is started.

The BLOB Transfer Server keeps track of the received blocks and chunks, and will process each block and chunk only once. The BLOB Transfer Server also ensures that any missing chunks are resent by the BLOB Transfer Client.

Usage The BLOB Transfer Server is instantiated on an element with a set of event handler callbacks:

```c
static const struct bt_mesh_blob_srv_cb blob_cb = {
    /* Callbacks */
};

static struct bt_mesh_blob_srv blob_srv = {
    .cb = &blob_cb,
};
```

(continues on next page)
A BLOB Transfer Server is capable of receiving a single BLOB transfer at a time. Before the BLOB Transfer Server can receive a transfer, it must be prepared by the user. The transfer ID must be passed to the BLOB Transfer Server through the `bt_mesh_blob_srv_recv()` function before the transfer is started by the BLOB Transfer Client. The ID must be shared between the BLOB Transfer Client and the BLOB Transfer Server through some higher level procedure, like a vendor specific transfer management model.

Once the transfer has been set up on the BLOB Transfer Server, it’s ready for receiving the BLOB. The application is notified of the transfer progress through the event handler callbacks, and the BLOB data is sent to the BLOB stream.

The interaction between the BLOB Transfer Server, BLOB stream and application is shown below:
The BLOB Transfer Server notifies the user of the suspension by calling the `suspended` callback. If the BLOB Transfer Server is in the middle of receiving a block, this block is discarded.

The BLOB Transfer Client may resume a suspended transfer by starting a new block transfer. The BLOB Transfer Server notifies the user by calling the `resume` callback.

**Transfer recovery** The state of the BLOB transfer is stored persistently. If a reboot occurs, the BLOB Transfer Server will attempt to recover the transfer. When the Bluetooth Mesh subsystem is started (for instance by calling `bt_mesh_init()`), the BLOB Transfer Server will check for aborted transfers, and call the `recover` callback if there is any. In the recover callback, the user must provide a BLOB stream to use for the rest of the transfer. If the recover callback doesn’t return successfully or does not provide a BLOB stream, the transfer is abandoned. If no recover callback is implemented, transfers are always abandoned after a reboot.

After a transfer is successfully recovered, the BLOB Transfer Server enters the suspended state. It will stay suspended until the BLOB Transfer Client resumes the transfer, or the user cancels it.

**Note:** The BLOB Transfer Client sending the transfer must support transfer recovery for the transfer to complete. If the BLOB Transfer Client has already given up the transfer, the BLOB Transfer Server will stay suspended until the application calls `bt_mesh_blob_srv_cancel()`.

---

**API reference**

```group bt_mesh_blob_srv```

### Defines

```BT_MESH_BLOB_BLOCKS_MAX```

Max number of blocks in a single transfer.

```BT_MESH_MODEL_BLOB_SRV(_srv)```

BLOB Transfer Server model composition data entry.

**Parameters**

- `_srv` – Pointer to a Bluetooth Mesh BLOB Transfer Server model API instance.

### Functions

```int bt_mesh_blob_srv_recv(struct bt_mesh_blob_srv *srv, uint64_t id, const struct bt_mesh_blob_io *io, uint8_t ttl, uint16_t timeout_base)```

Prepare BLOB Transfer Server for an incoming transfer.

Before a BLOB Transfer Server can receive a transfer, the transfer must be prepared through some application level mechanism. The BLOB Transfer Server will only accept incoming transfers with a matching BLOB ID.

**Parameters**

- `srv` – BLOB Transfer Server instance.
- `id` – BLOB ID to accept.
- `io` – BLOB stream to write the incoming BLOB to.
• **ttl** – Time to live value to use in responses to the BLOB Transfer Client.
• **timeout_base** – Extra time for the Client to respond in addition to the base 10 seconds, in 10-second increments.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_blob_srv_cancel(struct bt_mesh_blob_srv *srv)
```

Cancel the current BLOB transfer.

Tells the BLOB Transfer Client to drop this device from the list of Targets for the current transfer. Note that the client may continue sending the transfer to other Targets.

**Parameters**
• **srv** – BLOB Transfer Server instance.

**Returns**
0 on success, or (negative) error code on failure.

```c
bool bt_mesh_blob_srv_is_busy(const struct bt_mesh_blob_srv *srv)
```

Get the current state of the BLOB Transfer Server.

**Parameters**
• **srv** – BLOB Transfer Server instance.

**Returns**
true if the BLOB Transfer Server is currently participating in a transfer, false otherwise.

```c
uint8_t bt_mesh_blob_srv_progress(const struct bt_mesh_blob_srv *srv)
```

Get the current progress of the active transfer in percent.

**Parameters**
• **srv** – BLOB Transfer Server instance.

**Returns**
The current transfer progress, or 0 if no transfer is active.

```c
struct bt_mesh_blob_srv_cb

#include <blob_srv.h> BLOB Transfer Server model event handlers.
All callbacks are optional.

**Public Members**

```c
int (*start)(struct bt_mesh_blob_srv *srv, struct bt_mesh_msg_ctx *ctx, struct bt_mesh_blob_xfer *xfer)
```

Transfer start callback.

Called when the transfer has started with the prepared BLOB ID.

**Param** **srv**
BLOB Transfer Server instance.

**Param** **ctx**
Message context for the incoming start message. The entire transfer will be sent from the same source address.

**Param** **xfer**
Transfer parameters.

**Return**
0 on success, or (negative) error code to reject the transfer.
void (*end)(struct bt_mesh_blob_srv *srv, uint64_t id, bool success)
Transfer end callback.
Called when the transfer ends, either because it was cancelled, or because it finished successfully. A new transfer may be prepared.

**Note:** The transfer may end before it's started if the start parameters are invalid.

**Param srv**
BLOB Transfer Server instance.

**Param id**
BLOB ID of the cancelled transfer.

**Param success**
Whether the transfer was successful.

void (*suspended)(struct bt_mesh_blob_srv *srv)
Transfer suspended callback.
Called if the Server timed out while waiting for a transfer packet. A suspended transfer may resume later from the start of the current block. Any received chunks in the current block should be discarded, they will be received again if the transfer resumes.
The transfer will call resumed again when resuming.

**Note:** The BLOB Transfer Server does not run a timer in the suspended state, and it's up to the application to determine whether the transfer should be permanently cancelled. Without interaction, the transfer will be suspended indefinitely, and the BLOB Transfer Server will not accept any new transfers.

**Param srv**
BLOB Transfer Server instance.

void (*resume)(struct bt_mesh_blob_srv *srv)
Transfer resume callback.
Called if the transfer is resumed after being suspended.

**Param srv**
BLOB Transfer Server instance.

int (*recover)(struct bt_mesh_blob_srv *srv, struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_io **io)
Transfer recovery callback.
Called when the Bluetooth Mesh subsystem is started if the device is rebooted in the middle of a transfer.
Transfers will not be resumed after a reboot if this callback is not defined.

**Param srv**
BLOB Transfer Server instance.

**Param xfer**
Transfer to resume.

**Param io**
BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**
0 on success, or (negative) error code to abandon the transfer.
struct bt_mesh_blob_srv
   #include <blob_srv.h> BLOB Transfer Server instance.

Public Members

const struct bt_mesh_blob_srv_cb *cb
   Event handler callbacks.

struct bt_mesh_blob_srv_state
   #include <blob_srv.h>

BLOB Transfer Client The Binary Large Object (BLOB) Transfer Client is the sender of the BLOB transfer. It supports sending BLOBs of any size to any number of Target nodes, in both Push BLOB Transfer Mode and Pull BLOB Transfer Mode.

Usage

Initialization The BLOB Transfer Client is instantiated on an element with a set of event handler callbacks:

```c
static const struct bt_mesh_blob_cli_cb blob_cb = {
   /* Callbacks */
};
static struct bt_mesh_blob_cli blob_cli = {
   .cb = &blob_cb,
};
static const struct bt_mesh_model models[] = {
   BT_MESH_MODEL_BLOB_CLI(&blob_cli),
};
```

Transfer context Both the transfer capabilities retrieval procedure and the BLOB transfer uses an instance of a bt_mesh_blob_cli_inputs to determine how to perform the transfer. The BLOB Transfer Client Inputs structure must at least be initialized with a list of targets, an application key and a time to live (TTL) value before it is used in a procedure:

```c
static struct bt_mesh_blob_target targets[3] = {
   { .addr = 0x0001 },
   { .addr = 0x0002 },
   { .addr = 0x0003 },
};
static struct bt_mesh_blob_cli_inputs inputs = {
   .app_idx = MY_APP_IDX,
   .ttl = BT_MESH_TTL_DEFAULT,
};
sys_slist_init(&inputs.targets);
sys_slist_append(&inputs.targets, &targets[0].n);
sys_slist_append(&inputs.targets, &targets[1].n);
sys_slist_append(&inputs.targets, &targets[2].n);
```

Note that all BLOB Transfer Servers in the transfer must be bound to the chosen application key.

6.1. Bluetooth
Group address  The application may additionally specify a group address in the context structure. If the group is not \texttt{BT_MESH_ADDR_UNASSIGNED}, the messages in the transfer will be sent to the group address, instead of being sent individually to each Target node. Mesh Manager must ensure that all Target nodes having the BLOB Transfer Server model subscribe to this group address.

Using group addresses for transferring the BLOBs can generally increase the transfer speed, as the BLOB Transfer Client sends each message to all Target nodes at the same time. However, sending large, segmented messages to group addresses in Bluetooth Mesh is generally less reliable than sending them to unicast addresses, as there is no transport layer acknowledgment mechanism for groups. This can lead to longer recovery periods at the end of each block, and increases the risk of losing Target nodes. Using group addresses for BLOB transfers will generally only pay off if the list of Target nodes is extensive, and the effectiveness of each addressing strategy will vary heavily between different deployments and the size of the chunks.

Transfer timeout  If a Target node fails to respond to an acknowledged message within the BLOB Transfer Client's time limit, the Target node is dropped from the transfer. The application can reduce the chances of this by giving the BLOB Transfer Client extra time through the context structure. The extra time may be set in 10-second increments, up to 182 hours, in addition to the base time of 20 seconds. The wait time scales automatically with the transfer TTL.

Note that the BLOB Transfer Client only moves forward with the transfer in following cases:

- All Target nodes have responded.
- A node has been removed from the list of Target nodes.
- The BLOB Transfer Client times out.

Increasing the wait time will increase this delay.

BLOB transfer capabilities retrieval  It is generally recommended to retrieve BLOB transfer capabilities before starting a transfer. The procedure populates the transfer capabilities from all Target nodes with the most liberal set of parameters that allows all Target nodes to participate in the transfer. Any Target nodes that fail to respond, or respond with incompatible transfer parameters, will be dropped.

Target nodes are prioritized according to their order in the list of Target nodes. If a Target node is found to be incompatible with any of the previous Target nodes, for instance by reporting a non-overlapping block size range, it will be dropped. Lost Target nodes will be reported through the \texttt{lost_target} callback.

The end of the procedure is signalled through the \texttt{caps} callback, and the resulting capabilities can be used to determine the block and chunk sizes required for the BLOB transfer.

BLOB transfer  The BLOB transfer is started by calling \texttt{bt_mesh_blob_cli_send() function}, which (in addition to the aforementioned transfer inputs) requires a set of transfer parameters and a BLOB stream instance. The transfer parameters include the 64-bit BLOB ID, the BLOB size, the transfer mode, the block size in logarithmic representation and the chunk size. The BLOB ID is application defined, but must match the BLOB ID the BLOB Transfer Servers have been started with.

The transfer runs until it either completes successfully for at least one Target node, or it is cancelled. The end of the transfer is communicated to the application through the \texttt{end} callback. Lost Target nodes will be reported through the \texttt{lost_target} callback.

API reference

\texttt{group bt_mesh_blob_cli}
Defines

\texttt{BT\_MESH\_MODEL\_BLOB\_CLI(_cli)}
  BLOB Transfer Client model Composition Data entry.

\textbf{Parameters}

- \texttt{_cli} – Pointer to a Bluetooth Mesh BLOB Transfer Client model API instance.

Enums

\textbf{enum \texttt{bt\_mesh\_blob\_cli\_state}}
  BLOB Transfer Client state.

\textit{Values}:

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_NONE}  
  No transfer is active.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_CAPS\_GET}  
  Retrieving transfer capabilities.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_START}  
  Sending transfer start.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_BLOCK\_START}  
  Sending block start.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_BLOCK\_SEND}  
  Sending block chunks.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_BLOCK\_CHECK}  
  Checking block status.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_XFER\_CHECK}  
  Checking transfer status.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_CANCEL}  
  Cancelling transfer.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_SUSPENDED}  
  Transfer is suspended.

- \texttt{BT\_MESH\_BLOB\_CLI\_STATE\_XFER\_PROGRESS\_GET}  
  Checking transfer progress.

Functions
int bt_mesh_blob_cli_caps_get(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs)

Retrieve transfer capabilities for a list of Target nodes.

Queries the availability and capabilities of all Target nodes, producing a cumulative set of transfer capabilities for the Target nodes, and returning it through the `bt_mesh_blob_cli_cb::caps` callback.

Retrieving the capabilities may take several seconds, depending on the number of Target nodes and mesh network performance. The end of the procedure is indicated through the `bt_mesh_blob_cli_cb::caps` callback.

This procedure is not required, but strongly recommended as a preparation for a transfer to maximize performance and the chances of success.

**Parameters**

- `cli` – BLOB Transfer Client instance.
- `inputs` – Statically allocated BLOB Transfer Client transfer inputs.

**Returns**

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_send(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_io *io)

Perform a BLOB transfer.

Starts sending the transfer to the Target nodes. Only Target nodes with a status of `BT_MESH_BLOB_SUCCESS` will be considered.

The transfer will keep going either until all Target nodes have been dropped, or the full BLOB has been sent.

The BLOB transfer may take several minutes, depending on the number of Target nodes, size of the BLOB and mesh network performance. The end of the transfer is indicated through the `bt_mesh_blob_cli_cb::end` callback.

A Client only supports one transfer at the time.

**Parameters**

- `cli` – BLOB Transfer Client instance.
- `inputs` – Statically allocated BLOB Transfer Client transfer inputs.
- `xfer` – Statically allocated transfer parameters.
- `io` – BLOB stream to read the transfer from.

**Returns**

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_suspend(struct bt_mesh_blob_cli *cli)

Suspend the active transfer.

**Parameters**

- `cli` – BLOB Transfer Client instance.

**Returns**

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_resume(struct bt_mesh_blob_cli *cli)

Resume the suspended transfer.

**Parameters**
Zephyr Project Documentation, Release 3.6.99

- cli – BLOB Transfer Client instance.

**Returns**
0 on success, or (negative) error code otherwise.

```c
void bt_mesh_blob_cli_cancel(struct bt_mesh_blob_cli *cli)
```

Cancel an ongoing transfer.

**Parameters**
- cli – BLOB Transfer Client instance.

```c
int bt_mesh_blob_cli_xfer_progress_get(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs)
```

Get the progress of BLOB transfer.

This function can only be used if the BLOB Transfer Client is currently not performing a BLOB transfer. To get progress of the active BLOB transfer, use the `bt_mesh_blob_cli_xfer_progress_active_get` function.

**Parameters**
- cli – BLOB Transfer Client instance.
- inputs – Statically allocated BLOB Transfer Client transfer inputs.

**Returns**
0 on success, or (negative) error code otherwise.

```c
uint8_t bt_mesh_blob_cli_xfer_progress_active_get(struct bt_mesh_blob_cli *cli)
```

Get the current progress of the active transfer in percent.

**Parameters**
- cli – BLOB Transfer Client instance.

**Returns**
The current transfer progress, or 0 if no transfer is active.

```c
bool bt_mesh_blob_cli_is_busy(struct bt_mesh_blob_cli *cli)
```

Get the current state of the BLOB Transfer Client.

**Parameters**
- cli – BLOB Transfer Client instance.

**Returns**
true if the BLOB Transfer Client is currently participating in a transfer or retrieving the capabilities and false otherwise.

```c
struct bt_mesh_blob_target_pull
#include <blob_cli.h> Target node’s Pull mode (Pull BLOB Transfer Mode) context used while sending chunks to the Target node.
```

**Public Members**

```c
int64_t block_report_timestamp
```

Timestamp when the Block Report Timeout Timer expires for this Target node.

```c
uint8_t missing[DIV_ROUND_UP(CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX, 8)]
```

Missing chunks reported by this Target node.
struct bt_mesh_blob_target
#include <blob_cli.h> BLOB Transfer Client Target node.

**Public Members**

*sys_sn*ode_t n
Linked list node.

uint16_t addr
Target node address.

struct bt_mesh_blob_target_pull *pull
Target node's Pull mode context.
Needs to be initialized when sending a BLOB in Pull mode.

uint8_t status
BLOB transfer status, see *bt_mesh_blob_status*.

struct bt_mesh_blob_xfer_info
#include <blob_cli.h> BLOB transfer information.
If phase is *BT_MESH_BLOB_XFER_PHASE_INACTIVE*, the fields below phase are not initialized. If phase is *BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START*, the fields below id are not initialized.

**Public Members**

enum *bt_mesh_blob_status* status
BLOB transfer status.

enum *bt_mesh_blob_xfer_mode* mode
BLOB transfer mode.

enum *bt_mesh_blob_xfer_phase* phase
BLOB transfer phase.

uint64_t id
BLOB ID.

uint32_t size
BLOB size in octets.

uint8_t block_size_log
Logarithmic representation of the block size.

uint16_t mtu_size
MTU size in octets.
const uint8_t *missing_blocks
    Bit field indicating blocks that were not received.

struct bt_mesh_blob_cli_inputs
    #include <blob_cli.h> BLOB Transfer Client transfer inputs.

Public Members

sys_slist_t targets
    Linked list of Target nodes.
    Each node should point to bt_mesh_blob_target::n.

uint16_t app_idx
    AppKey index to send with.

uint16_t group
    Group address destination for the BLOB transfer, or
    BT_MESH_ADDR_UNASSIGNED to send every message to each Target node
    individually.

uint8_t ttl
    Time to live value of BLOB transfer messages.

uint16_t timeout_base
    Additional response time for the Target nodes, in 10-second increments.
    The extra time can be used to give the Target nodes more time to respond to mes-
    sages from the Client. The actual timeout will be calculated according to the fol-
    lowing formula:

* timeout = 20 seconds + (10 seconds * timeout_base) + (100 ms * TTL)
*

If a Target node fails to respond to a message from the Client within the configured
transfer timeout, the Target node is dropped.

struct bt_mesh_blob_cli_caps
    #include <blob_cli.h> Transfer capabilities of a Target node.

Public Members

size_t max_size
    Max BLOB size.

uint8_t min_block_size_log
    Logarithmic representation of the minimum block size.

uint8_t max_block_size_log
    Logarithmic representation of the maximum block size.
uint16_t max_chunks
    Max number of chunks per block.

uint16_t max_chunk_size
    Max chunk size.

uint16_t mtu_size
    Max MTU size.

enum bt_mesh_blob_xfer_mode modes
    Supported transfer modes.

struct bt_mesh_blob_cli_cb
    #include <blob_cli.h> Event handler callbacks for the BLOB Transfer Client model.
    All handlers are optional.

Public Members

void (*caps)(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_caps *caps)
    Capabilities retrieval completion callback.
    Called when the capabilities retrieval procedure completes, indicating that a
    common set of acceptable transfer parameters have been established for the
    given list of Target nodes. All compatible Target nodes have status code
    BT_MESH_BLOB_SUCCESS.
    Param cli
        BLOB Transfer Client instance.
    Param caps
        Safe transfer capabilities if the transfer capabilities of at least one Target
        node has satisfied the Client, or NULL otherwise.

void (*lost_target)(struct bt_mesh_blob_cli *cli, struct bt_mesh_blob_target *target,
    enum bt_mesh_blob_status reason)
    Target node loss callback.
    Called whenever a Target node has been lost due to some error in the transfer.
    Losing a Target node is not considered a fatal error for the Client until all Target
    nodes have been lost.
    Param cli
        BLOB Transfer Client instance.
    Param target
        Target node that was lost.
    Param reason
        Reason for the Target node loss.

void (*suspended)(struct bt_mesh_blob_cli *cli)
    Transfer is suspended.
    Called when the transfer is suspended due to response timeout from all Target
    nodes.
    Param cli
        BLOB Transfer Client instance.
void (*end)(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_xfer *xfer, bool success)
    Transfer end callback.
    Called when the transfer ends.
    Param cli
        BLOB Transfer Client instance.
    Param xfer
        Completed transfer.
    Param success
        Status of the transfer. Is true if at least one Target node received the whole transfer.

void (*xfer_progress)(struct bt_mesh_blob_cli *cli, struct bt_mesh_blob_target *target,
    const struct bt_mesh_blob_xfer_info *info)
    Transfer progress callback.
    The content of info is invalidated upon exit from the callback. Therefore it needs to be copied if it is planned to be used later.
    Param cli
        BLOB Transfer Client instance.
    Param target
        Target node that responded to the request.
    Param info
        BLOB transfer information.

void (*xfer_progress_complete)(struct bt_mesh_blob_cli *cli)
    End of Get Transfer Progress procedure.
    Called when all Target nodes have responded or the procedure timed-out.
    Param cli
        BLOB Transfer Client instance.

struct bt_mesh_blob_cli
    #include <blob_cli.h> BLOB Transfer Client model instance.

Public Members

const struct bt_mesh_blob_cli_cb *cb
    Event handler callbacks.
    The BLOB Transfer Client is instantiated on the sender node, and the BLOB Transfer Server is instantiated on the receiver nodes.

Concepts  The BLOB transfer protocol introduces several new concepts to implement the BLOB transfer.

BLOBs  BLOBs are binary objects up to 4 GB in size, that can contain any data the application would like to transfer through the mesh network. The BLOBs are continuous data objects, divided into blocks and chunks to make the transfers reliable and easy to process. No limitations are put on the contents or structure of the BLOB, and applications are free to define any encoding or compression they'd like on the data itself.

The BLOB transfer protocol does not provide any built-in integrity checks, encryption or authentication of the BLOB data. However, the underlying encryption of the Bluetooth Mesh protocol
provides data integrity checks and protects the contents of the BLOB from third parties using network and application level encryption.

**Blocks**  The binary objects are divided into blocks, typically from a few hundred to several thousand bytes in size. Each block is transmitted separately, and the BLOB Transfer Client ensures that all BLOB Transfer Servers have received the full block before moving on to the next. The block size is determined by the transfer's `block_size_log` parameter, and is the same for all blocks in the transfer except the last, which may be smaller. For a BLOB stored in flash memory, the block size is typically a multiple of the flash page size of the Target devices.

**Chunks**  Each block is divided into chunks. A chunk is the smallest data unit in the BLOB transfer, and must fit inside a single Bluetooth Mesh access message excluding the opcode (379 bytes or less). The mechanism for transferring chunks depends on the transfer mode.

When operating in Push BLOB Transfer Mode, the chunks are sent as unacknowledged packets from the BLOB Transfer Client to all targeted BLOB Transfer Servers. Once all chunks in a block have been sent, the BLOB Transfer Client asks each BLOB Transfer Server if they're missing any chunks, and resends them. This is repeated until all BLOB Transfer Servers have received all chunks, or the BLOB Transfer Client gives up.

When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request a small number of chunks from the BLOB Transfer Client at a time, and wait for the BLOB Transfer Client to send them before requesting more chunks. This repeats until all chunks have been transferred, or the BLOB Transfer Server gives up.

Read more about the transfer modes in [Transfer modes](#) section.

**BLOB streams**  In the BLOB Transfer models’ APIs, the BLOB data handling is separated from the high-level transfer handling. This split allows reuse of different BLOB storage and transfer strategies for different applications. While the high level transfer is controlled directly by the application, the BLOB data itself is accessed through a BLOB stream.

The BLOB stream is comparable to a standard library file stream. Through opening, closing, reading and writing, the BLOB Transfer model gets full access to the BLOB data, whether it’s kept in flash, RAM, or on a peripheral. The BLOB stream is opened with an access mode (read or write) before it's used, and the BLOB Transfer models will move around inside the BLOB's data in blocks and chunks, using the BLOB stream as an interface.

**Interaction**  Before the BLOB is read or written, the stream is opened by calling its `open` callback. When used with a BLOB Transfer Server, the BLOB stream is always opened in write mode, and when used with a BLOB Transfer Client, it’s always opened in read mode.

For each block in the BLOB, the BLOB Transfer model starts by calling `block_start`. Then, depending on the access mode, the BLOB stream’s `wr` or `rd` callback is called repeatedly to move data to or from the BLOB. When the model is done processing the block, it calls `block_end`. When the transfer is complete, the BLOB stream is closed by calling `close`.

**Implementations**  The application may implement their own BLOB stream, or use the implementations provided by Zephyr:

**BLOB Flash**  The BLOB Flash Readers and Writers implement BLOB reading to and writing from flash partitions defined in the `flash map`.
**BLOB Flash Reader**  The BLOB Flash Reader interacts with the BLOB Transfer Client to read BLOB data directly from flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Client. Each BLOB Flash Reader only supports one transfer at the time.

**BLOB Flash Writer**  The BLOB Flash Writer interacts with the BLOB Transfer Server to write BLOB data directly to flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Server. Each BLOB Flash Writer only supports one transfer at the time, and requires a block size that is a multiple of the flash page size. If a transfer is started with a block size lower than the flash page size, the transfer will be rejected.

The BLOB Flash Writer copies chunk data into a buffer to accommodate chunks that are unaligned with the flash write block size. The buffer data is padded with `0xff` if either the start or length of the chunk is unaligned.

**API Reference**

*group* bt_mesh_blob_io_flash

**Functions**

```c
int bt_mesh_blob_io_flash_init(struct bt_mesh_blob_io_flash *flash, uint8_t area_id, off_t offset)
```

Initialize a flash stream.

**Parameters**

- `flash` – Flash stream.
- `area_id` – Flash partition identifier. See `flash_area_open`.
- `offset` – Offset into the flash area, in bytes.

**Returns**

0 on success or (negative) error code otherwise.

```c
struct bt_mesh_blob_io_flash
#include <blob_io_flash.h> BLOB flash stream.
```

**Public Members**

```c
uint8_t area_id
```

Flash area ID to write the BLOB to.

```c
enum bt_mesh_blob_io_mode mode
```

Active stream mode.

```c
off_t offset
```

Offset into the flash area to place the BLOB at (in bytes).
Transfer capabilities Each BLOB Transfer Server may have different transfer capabilities. The transfer capabilities of each device are controlled through the following configuration options:

- CONFIG_BT_MESH_BLOB_SIZE_MAX
- CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MIN
- CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MAX
- CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX

The CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX option is also used by the BLOB Transfer Client and affects memory consumption by the BLOB Transfer Client model structure.

To ensure that the transfer can be received by as many servers as possible, the BLOB Transfer Client can retrieve the capabilities of each BLOB Transfer Server before starting the transfer. The client will transfer the BLOB with the highest possible block and chunk size.

Transfer modes BLOBs can be transferred using two transfer modes, Push BLOB Transfer Mode and Pull BLOB Transfer Mode. In most cases, the transfer should be conducted in Push BLOB Transfer Mode.

In Push BLOB Transfer Mode, the send rate is controlled by the BLOB Transfer Client, which will push all the chunks of each block without any high level flow control. Push BLOB Transfer Mode supports any number of Target nodes, and should be the default transfer mode.

In Pull BLOB Transfer Mode, the BLOB Transfer Server will “pull” the chunks from the BLOB Transfer Client at its own rate. Pull BLOB Transfer Mode can be conducted with multiple Target nodes, and is intended for transferring BLOBs to Target nodes acting as Low Power Node. When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request chunks from the BLOB Transfer Client in small batches, and wait for them all to arrive before requesting more chunks. This process is repeated until the BLOB Transfer Server has received all chunks in a block. Then, the BLOB Transfer Client starts the next block, and the BLOB Transfer Server requests all chunks of that block.

Transfer timeout The timeout of the BLOB transfer is based on a Timeout Base value. Both client and server use the same Timeout Base value, but they calculate timeout differently.

The BLOB Transfer Server uses the following formula to calculate the BLOB transfer timeout:

\[ 10 \times (\text{Timeout Base} + 1) \text{ seconds} \]

For the BLOB Transfer Client, the following formula is used:

\[ (10000 \times (\text{Timeout Base} + 2)) + (100 \times \text{TTL}) \text{ milliseconds} \]

where TTL is time to live value set in the transfer.

API reference This section contains types and defines common to the BLOB Transfer models.

\[ \text{group} \ bt\_mesh\_blob \]

Defines

\[ \text{CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX} \]
 Enums

define bt_mesh_blob_xfer_mode
  BLOB transfer mode.
  Values:

  enumerator BT_MESH_BLOB_XFER_MODE_NONE
    No valid transfer mode.

  enumerator BT_MESH_BLOB_XFER_MODE_PUSH
    Push mode (Push BLOB Transfer Mode).

  enumerator BT_MESH_BLOB_XFER_MODE_PULL
    Pull mode (Pull BLOB Transfer Mode).

  enumerator BT_MESH_BLOB_XFER_MODE_ALL
    Both modes are valid.

define bt_mesh_blob_xfer_phase
  Transfer phase.
  Values:

  enumerator BT_MESH_BLOB_XFER_PHASE_INACTIVE
    The BLOB Transfer Server is awaiting configuration.

  enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START
    The BLOB Transfer Server is ready to receive a BLOB transfer.

  enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_BLOCK
    The BLOB Transfer Server is waiting for the next block of data.

  enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_CHUNK
    The BLOB Transfer Server is waiting for the next chunk of data.

  enumerator BT_MESH_BLOB_XFER_PHASE_COMPLETE
    The BLOB was transferred successfully.

  enumerator BT_MESH_BLOB_XFER_PHASE_SUSPENDED
    The BLOB transfer is paused.

define bt_mesh_blob_status
  BLOB model status codes.
  Values:

  enumerator BT_MESH_BLOB_SUCCESS
    The message was processed successfully.
enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_NUM
   The Block Number field value is not within the range of blocks being transferred.

enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_SIZE
   The block size is smaller than the size indicated by the Min Block Size Log state or is larger than the size indicated by the Max Block Size Log state.

enumerator BT_MESH_BLOB_ERR_INVALID_CHUNK_SIZE
   The chunk size exceeds the size indicated by the Max Chunk Size state, or the number of chunks exceeds the number specified by the Max Total Chunks state.

enumerator BT_MESH_BLOB_ERR_WRONG_PHASE
   The operation cannot be performed while the server is in the current phase.

enumerator BT_MESH_BLOB_ERR_INVALID_PARAM
   A parameter value in the message cannot be accepted.

enumerator BT_MESH_BLOB_ERR_WRONG_BLOB_ID
   The message contains a BLOB ID value that is not expected.

enumerator BT_MESH_BLOB_ERR_BLOB_TOO_LARGE
   There is not enough space available in memory to receive the BLOB.

enumerator BT_MESH_BLOB_ERR_UNSUPPORTED_MODE
   The transfer mode is not supported by the BLOB Transfer Server model.

enumerator BT_MESH_BLOB_ERR_INTERNAL
   An internal error occurred on the node.

enumerator BT_MESH_BLOB_ERR_INFO_UNAVAILABLE
   The requested information cannot be provided while the server is in the current phase.

defined bt_mesh_blob_io_mode
   BLOB stream interaction mode.

   Values:

   enumerator BT_MESH_BLOB_READ
      Read data from the stream.

   enumerator BT_MESH_BLOB_WRITE
      Write data to the stream.

struct bt_mesh_blob_block
   #include <blob.h> BLOB transfer data block.

Public Members
size_t size
Block size in bytes.

off_t offset
Offset in bytes from the start of the BLOB.

uint16_t number
Block number.

uint16_t chunk_count
Number of chunks in block.

uint8_t missing[DIV_ROUND_UP(0, 8)]
Bitmap of missing chunks.

struct bt_mesh_blob_chunk
#include <blob.h> BLOB data chunk.

Public Members

off_t offset
Offset of the chunk data from the start of the block.

size_t size
Chunk data size.

uint8_t *data
Chunk data.

struct bt_mesh_blob_xfer
#include <blob.h> BLOB transfer.

Public Members

uint64_t id
BLOB ID.

size_t size
Total BLOB size in bytes.

enum bt_mesh_blob_xfer_mode mode
BLOB transfer mode.

uint16_t chunk_size
Base chunk size.
May be smaller for the last chunk.
struct bt_mesh_blob_io
#include <blob.h> BLOB stream.

Public Members

int (*open)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, enum bt_mesh_blob_io_mode mode)
Open callback.
Called when the reader is opened for reading.
    Param io BLOB stream.
    Param xfer BLOB transfer.
    Param mode Direction of the stream (read/write).
    Return 0 on success, or (negative) error code otherwise.

void (*close)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer)
Close callback.
Called when the reader is closed.
    Param io BLOB stream.
    Param xfer BLOB transfer.

int (*block_start)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block)
Block start callback.
Called when a new block is opened for sending. Each block is only sent once, and
are always sent in increasing order. The data chunks inside a single block may be
requested out of order and multiple times.
    Param io BLOB stream.
    Param xfer BLOB transfer.
    Param block Block that was started.

void (*block_end)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block)
Block end callback.
Called when the current block has been transmitted in full. No data from this block
will be requested again, and the application data associated with this block may
be discarded.
    Param io BLOB stream.
    Param xfer BLOB transfer.
    Param block Block that finished sending.
int (*wr)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block, const struct bt_mesh_blob_chunk *chunk)

Chunk data write callback.

Used by the BLOB Transfer Server on incoming data.

Each block is divided into chunks of data. This callback is called when a new chunk of data is received. Chunks may be received in any order within their block.

If the callback returns successfully, this chunk will be marked as received, and will not be received again unless the block is restarted due to a transfer suspension.

If the callback returns a non-zero value, the chunk remains unreceived, and the BLOB Transfer Client will attempt to resend it later.

Note that the Client will only perform a limited number of attempts at delivering a chunk before dropping a Target node from the transfer. The number of retries performed by the Client is implementation specific.

**Param io**

BLOB stream.

**Param xfer**

BLOB transfer.

**Param block**

Block the chunk is part of.

**Param chunk**

Received chunk.

**Return**

0 on success, or (negative) error code otherwise.

int (*rd)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block, const struct bt_mesh_blob_chunk *chunk)

Chunk data read callback.

Used by the BLOB Transfer Client to fetch outgoing data.

The Client calls the chunk data request callback to populate a chunk message going out to the Target nodes. The data request callback may be called out of order and multiple times for each offset, and cannot be used as an indication of progress.

Returning a non-zero status code on the chunk data request callback results in termination of the transfer.

**Param io**

BLOB stream.

**Param xfer**

BLOB transfer.

**Param block**

Block the chunk is part of.

**Param chunk**

Chunk to get the data of. The buffer pointer to by the `data` member should be filled by the callback.

**Return**

0 on success, or (negative) error code otherwise.

**Device Firmware Update (DFU)** Bluetooth Mesh supports the distribution of firmware images across a mesh network. The Bluetooth mesh DFU subsystem implements the Bluetooth Mesh Device Firmware Update Model specification version 1.0. The implementation is in experimental state.

Bluetooth Mesh DFU implements a distribution mechanism for firmware images, and does not put any restrictions on the size, format or usage of the images. The primary design goal of the
The Bluetooth Mesh DFU specification is implemented in the Zephyr Bluetooth Mesh DFU subsystem as three separate models:

**Firmware Update Server**  The Firmware Update Server model implements the Target node functionality of the Device Firmware Update (DFU) subsystem. It extends the BLOB Transfer Server, which it uses to receive the firmware image binary from the Distributor node.

Together with the extended BLOB Transfer Server model, the Firmware Update Server model implements all the required functionality for receiving firmware updates over the mesh network, but does not provide any functionality for storing, applying or verifying the images.

**Firmware images**  The Firmware Update Server holds a list of all the updatable firmware images on the device. The full list shall be passed to the server through the `_imgs` parameter in `BT_MESH_DFU_SRV_INIT`, and must be populated before the Bluetooth Mesh subsystem is started. Each firmware image in the image list must be independently updatable, and should have its own firmware ID.

For instance, a device with an upgradable bootloader, an application and a peripheral chip with firmware update capabilities could have three entries in the firmware image list, each with their own separate firmware ID.

**Receiving transfers**  The Firmware Update Server model uses a BLOB Transfer Server model on the same element to transfer the binary image. The interaction between the Firmware Update Server, BLOB Transfer Server and application is described below:

**Transfer check**  The transfer check is an optional pre-transfer check the application can perform on incoming firmware image metadata. The Firmware Update Server performs the transfer check by calling the `check` callback.

The result of the transfer check is a pass/fail status return and the expected `bt_mesh_dfu_effect`. The DFU effect return parameter will be communicated back to the Distributor, and should indicate what effect the firmware update will have on the mesh state of the device.

**Composition Data and Models Metadata**  If the transfer will cause the device to change its Composition Data or become unprovisioned, this should be communicated through the effect parameter of the metadata check.

When the transfer will cause the Composition Data to change, and the Remote Provisioning Server is supported, the Composition Data of the new firmware image will be represented by Composition Data Pages 128, 129, and 130. The Models Metadata of the new firmware image will be represented by Models Metadata Page 128. Composition Data Pages 0, 1 and 2, and Models Metadata Page 0, will represent the Composition Data and the Models Metadata of the old firmware image until the device is reprovisioned with Node Provisioning Protocol Interface (NPPI) procedures using the Remote Provisioning Client.

The application must call functions `bt_mesh_comp_change_prepare()` and `bt_mesh_models_metadata_change_prepare()` to store the existing Composition Data and Models Metadata pages before booting into the firmware with the updated Composition Data and Models Metadata. The old Composition Data will then be loaded into Composition Data Pages 0, 1 and 2, while the Composition Data in the new firmware will be loaded into Composition Data Pages 128, 129 and 130. The Models Metadata for the old image will be loaded into Models Metadata Page 0, and the Models Metadata for the new image will be loaded into Models Metadata Page 128.
Fig. 9: Bluetooth Mesh Firmware Update Server transfer
Limitation:

- It is not possible to change the Composition Data of the device and keep the device provisioned and working with the old firmware after the new firmware image is applied.

Start  The Start procedure prepares the application for the incoming transfer. It will contain information about which image is being updated, as well as the update metadata.

The Firmware Update Server `start` callback must return a pointer to the BLOB Writer the BLOB Transfer Server will send the BLOB to.

BLOB transfer  After the setup stage, the Firmware Update Server prepares the BLOB Transfer Server for the incoming transfer. The entire firmware image is transferred to the BLOB Transfer Server, which passes the image to its assigned BLOB Writer.

At the end of the BLOB transfer, the Firmware Update Server calls its `end` callback.

Image verification  After the BLOB transfer has finished, the application should verify the image in any way it can to ensure that it is ready for being applied. Once the image has been verified, the application calls `bt_mesh_dfu_srv_verified()`.

If the image can’t be verified, the application calls `bt_mesh_dfu_srv_rejected()`.

Applying the image  Finally, if the image was verified, the Distributor may instruct the Firmware Update Server to apply the transfer. This is communicated to the application through the `apply` callback. The application should swap the image and start running with the new firmware. The firmware image table should be updated to reflect the new firmware ID of the updated image.

When the transfer applies to the mesh application itself, the device might have to reboot as part of the swap. This restart can be performed from inside the apply callback, or done asynchronously. After booting up with the new firmware, the firmware image table should be updated before the Bluetooth Mesh subsystem is started.

The Distributor will read out the firmware image table to confirm that the transfer was successfully applied. If the metadata check indicated that the device would become unprovisioned, the Target node is not required to respond to this check.

API reference

`group bt_mesh_dfu_srv`

API for the Bluetooth Mesh Firmware Update Server model.

Defines

`BT_MESH_DFU_SRV_INIT(_handlers, _imgs, _img_count)`

Initialization parameters for Firmware Update Server model.

Parameters

- `_handlers` – DFU handler function structure.
- `_imgs` – List of `bt_mesh_dfu_img` managed by this Server.
- `_img_count` – Number of DFU images managed by this Server.
BT_MESH_MODEL_DFU_SRV(_srv)
Firmware Update Server model entry.

Parameters
• _srv – Pointer to a Firmware Update Server model instance.

Functions

void bt_mesh_dfu_srv_verified(struct bt_mesh_dfu_srv *srv)
Accept the received DFU transfer.
Should be called at the end of a successful DFU transfer.
If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if the image is ready to be applied.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_rejected(struct bt_mesh_dfu_srv *srv)
Reject the received DFU transfer.
Should be called at the end of a successful DFU transfer.
If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if one of the checks fail.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_cancel(struct bt_mesh_dfu_srv *srv)
Cancel the ongoing DFU transfer.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_applied(struct bt_mesh_dfu_srv *srv)
Confirm that the received DFU transfer was applied.
Should be called as a result of the bt_mesh_dfu_srv_cb::apply callback.

Parameters
• srv – Firmware Update Server instance.

bool bt_mesh_dfu_srv_is_busy(const struct bt_mesh_dfu_srv *srv)
Check if the Firmware Update Server is busy processing a transfer.

Parameters
• srv – Firmware Update Server instance.

Returns
true if a DFU procedure is in progress, false otherwise.

uint8_t bt_mesh_dfu_srv_progress(const struct bt_mesh_dfu_srv *srv)
Get the progress of the current DFU procedure, in percent.

Parameters
• srv – Firmware Update Server instance.
Returns

The current transfer progress in percent.

```c
struct bt_mesh_dfu_srv_cb
#include <dfu_srv.h> Firmware Update Server event callbacks.
```

Public Members

```c
int (*check)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, struct net_buf_simple *metadata, enum bt_mesh_dfu_effect *effect)
Transfer check callback.

The transfer check can be used to validate the incoming transfer before it starts. The contents of the metadata is implementation specific, and should contain all the information the application needs to determine whether this image should be accepted, and what the effect of the transfer would be.

If applying the image will have an effect on the provisioning state of the mesh stack, this can be communicated through the `effect` return parameter.

The metadata check can be performed both as part of starting a new transfer and as a separate procedure.

This handler is optional.
```

### Param `srv`
Firmware Update Server instance.

### Param `img`
DFU image the metadata check is performed on.

### Param `metadata`
Image metadata.

### Param `effect`
Return parameter for the image effect on the provisioning state of the mesh stack.

```c
Return
0 on success, or (negative) error code otherwise.
```

```c
int (*start)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, struct net_buf_simple *metadata, const struct bt_mesh_blob_io **io)
Transfer start callback.

Called when the Firmware Update Server is ready to start a new DFU transfer. The application must provide an initialized BLOB stream to be used during the DFU transfer.

The following error codes are treated specially, and should be used to communicate these issues:
- `-ENOMEM`: The device cannot fit this image.
- `-EBUSY`: The application is temporarily unable to accept the transfer.
- `-EALREADY`: The device has already received and verified this image, and there's no need to transfer it again. The Firmware Update model will skip the transfer phase, and mark the image as verified.

This handler is mandatory.
```

### Param `srv`
Firmware Update Server instance.

### Param `img`
DFU image being updated.

### Param `metadata`
Image metadata.
**Param io**

BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**

0 on success, or (negative) error code otherwise. Return codes -ENOMEM, -EBUSY -EALREADY will be passed to the updater, other error codes are reported as internal errors.

```c
void (*end)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, bool success)
```

Transfer end callback.

This handler is optional.

If the transfer is successful, the application should verify the firmware image, and call either `bt_mesh_dfu_srv_verified` or `bt_mesh_dfu_srv_rejected` depending on the outcome.

If the transfer fails, the Firmware Update Server will be available for new transfers immediately after this function returns.

**Param srv**

Firmware Update Server instance.

**Param img**

DFU image that failed the update.

**Param success**

Whether the DFU transfer was successful.

```c
int (*recover)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, const struct bt_mesh_blob_io **io)
```

Transfer recovery callback.

If the device reboots in the middle of a transfer, the Firmware Update Server calls this function when the Bluetooth Mesh subsystem is started.

This callback is optional, but transfers will not be recovered after a reboot without it.

**Param srv**

Firmware Update Server instance.

**Param img**

DFU image being updated.

**Param io**

BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**

0 on success, or (negative) error code to abandon the transfer.

```c
int (*apply)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img)
```

Transfer apply callback.

Called after a transfer has been validated, and the updater sends an apply message to the Target nodes.

This handler is optional.

**Param srv**

Firmware Update Server instance.

**Param img**

DFU image that should be applied.

**Return**

0 on success, or (negative) error code otherwise.
struct bt_mesh_dfu_srv
#include <dfu_srv.h> Firmware Update Server instance.
Should be initialized with BT_MESH_DFU_SRV_INIT.

Public Members

struct bt_mesh_blob_srv blob
Underlying BLOB Transfer Server.

const struct bt_mesh_dfu_srv_cb *cb
Callback structure.

const struct bt_mesh_dfu_img *imgs
List of updatable images.

size_t img_count
Number of updatable images.

Firmware Update Client The Firmware Update Client is responsible for distributing firmware updates through the mesh network. The Firmware Update Client uses the BLOB Transfer Client as a transport for its transfers.

API reference

group bt_mesh_dfu_cli
API for the Bluetooth Mesh Firmware Update Client model.

Defines

BT_MESH_DFU_CLI_INIT(_handlers)
Initialization parameters for the Firmware Update Client model.

See also:
bt_mesh_dfu_cli_cb.

Parameters

• _handlers – Handler callback structure.

BT_MESH_MODEL_DFU_CLI(_cli)
Firmware Update Client model Composition Data entry.

Parameters

• _cli – Pointer to a Firmware Update Client model instance.
**Typedefs**

typedef enum bt_mesh_dfu_iter (*bt_mesh_dfu_img_cb_t)(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t idx, uint8_t total, const struct bt_mesh_dfu_img *img, void *cb_data)

DFU image callback.

The image callback is called for every DFU image on the Target node when calling `bt_mesh_dfu_cli_imgs_get`.

**Param cli**
Firmware Update Client model instance.

**Param ctx**
Message context of the received message.

**Param idx**
Image index.

**Param total**
Total number of images on the Target node.

**Param img**
Image information for the given image index.

**Param cb_data**
Callback data.

**Retval BT_MESH_DFU_ITER_STOP**
Stop iterating through the image list and return from `bt_mesh_dfu_cli_imgs_get`.

**Retval BT_MESH_DFU_ITER_CONTINUE**
Continue iterating through the image list if any images remain.

**Functions**

```c
int bt_mesh_dfu_cli_send(struct bt_mesh_dfu_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs, const struct bt_mesh_blob_io *io, const struct bt_mesh_dfu_cli_xfer *xfer)
```

Start distributing a DFU.

Starts distribution of the firmware in the given slot to the list of DFU Target nodes in `ctx`. The transfer runs in the background, and its end is signalled through the `bt_mesh_dfu_cli_cb::ended` callback.

**Note:** The BLOB Transfer Client transfer inputs `targets` list must point to a list of `bt_mesh_dfu_target` nodes.

**Parameters**

- `cli` – Firmware Update Client model instance.
- `inputs` – BLOB Transfer Client transfer inputs.
- `io` – BLOB stream to read BLOB from.
- `xfer` – Firmware Update Client transfer parameters.

**Returns**

0 on success, or (negative) error code otherwise.
int bt_mesh_dfu_cli_suspend(struct bt_mesh_dfu_cli *cli)
Suspend a DFU transfer.

Parameters
• cli – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_resume(struct bt_mesh_dfu_cli *cli)
Resume the suspended transfer.

Parameters
• cli – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_cancel(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx)
Cancel a DFU transfer.

Will cancel the ongoing DFU transfer, or the transfer on a specific Target node if ctx is valid.

Parameters
• cli – Firmware Update Client model instance.
• ctx – Message context, or NULL to cancel the ongoing DFU transfer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_apply(struct bt_mesh_dfu_cli *cli)
Apply the completed DFU transfer.

A transfer can only be applied after it has ended successfully. The Firmware Update Client’s applied callback is called at the end of the apply procedure.

Parameters
• cli – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_confirm(struct bt_mesh_dfu_cli *cli)
Confirm that the active transfer has been applied on the Target nodes.

A transfer can only be confirmed after it has been applied. The Firmware Update Client’s confirmed callback is called at the end of the confirm procedure.

Target nodes that have reported the effect as BT_MESH_DFU_EFFECT_UNPROV are expected to not respond to the query, and will fail if they do.

Parameters
• cli – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

uint8_t bt_mesh_dfu_cli_progress(struct bt_mesh_dfu_cli *cli)
Get progress as a percentage of completion.

Parameters
• cli – Firmware Update Client model instance.
**Returns**
The progress of the current transfer in percent, or 0 if no transfer is active.

```c
bool bt_mesh_dfu_cli_is_busy(struct bt_mesh_dfu_cli *cli)
```
Check whether a DFU transfer is in progress.

**Parameters**
- `cli` – Firmware Update Client model instance.

**Returns**
true if the BLOB Transfer Client is currently participating in a transfer, false otherwise.

```c
int bt_mesh_dfu_cli_imgs_get(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, bt_mesh_dfu_img_cb_t cb, void *cb_data, uint8_t max_count)
```
Perform a DFU image list request.
Requests the full list of DFU images on a Target node, and iterates through them, calling the `cb` for every image.

The DFU image list request can be used to determine which image index the Target node holds its different firmwares in.
Waits for a response until the procedure timeout expires.

**Parameters**
- `cli` – Firmware Update Client model instance.
- `ctx` – Message context.
- `cb` – Callback to call for each image index.
- `cb_data` – Callback data to pass to `cb`.
- `max_count` – Max number of images to return.

**Returns**
0 on success, or (negative) error code otherwise.

```c
int bt_mesh_dfu_cli_metadata_check(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t img_idx, const struct bt_mesh_dfu_slot *slot, struct bt_mesh_dfu_metadata_status *rsp)
```
Perform a metadata check for the given DFU image slot.
The metadata check procedure allows the Firmware Update Client to check if a Target node will accept a transfer of this DFU image slot, and what the effect would be.
Waits for a response until the procedure timeout expires.

**Parameters**
- `cli` – Firmware Update Client model instance.
- `ctx` – Message context.
- `img_idx` – Target node’s image index to check.
- `slot` – DFU image slot to check for.
- `rsp` – Metadata status response buffer.

**Returns**
0 on success, or (negative) error code otherwise.
int bt_mesh_dfu_cli_status_get(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, struct bt_mesh_dfu_target_status *rsp)

Get the status of a Target node.

**Parameters**
- cli – Firmware Update Client model instance.
- ctx – Message context.
- rsp – Response data buffer.

**Returns**
0 on success, or (negative) error code otherwise.

int32_t bt_mesh_dfu_cli_timeout_get(void)

Get the current procedure timeout value.

**Returns**
The configured procedure timeout.

void bt_mesh_dfu_cli_timeout_set(int32_t timeout)

Set the procedure timeout value.

**Parameters**
- timeout – The new procedure timeout.

struct bt_mesh_dfu_target

```
#include <dfu_cli.h> DFU Target node.
```

**Public Members**

struct bt_mesh_blob_target blob

BLOB Target node.

uint8_t img_idx

Image index on the Target node.

uint8_t effect

Expected DFU effect, see bt_mesh_dfu_effect.

uint8_t status

Current DFU status, see bt_mesh_dfu_status.

uint8_t phase

Current DFU phase, see bt_mesh_dfu_phase.

struct bt_mesh_dfu_metadata_status

```
#include <dfu_cli.h> Metadata status response.
```

**Public Members**

uint8_t idx

Image index.
enum `bt_mesh_dfu_status` status
    Status code.

define `bt_mesh_dfu_effect` effect
    Effect of transfer.

struct `bt_mesh_dfu_target_status`
    #include `<dfu_cli.h>` DFU Target node status parameters.

Public Members

enum `bt_mesh_dfu_status` status
    Status of the previous operation.

define `bt_mesh_dfu_phase` phase
    Phase of the current DFU transfer.

define `bt_mesh_dfu_effect` effect
    The effect the update will have on the Target device's state.

uint64_t blob_id
    BLOB ID used in the transfer.

uint8_t img_idx
    Image index to transfer.

uint8_t ttl
    TTL used in the transfer.

uint16_t timeout_base
    Additional response time for the Target nodes, in 10-second increments.
    The extra time can be used to give the Target nodes more time to respond to messages from the Client. The actual timeout will be calculated according to the following formula:

    \[ \text{timeout} = 20 \text{ seconds} + (10 \text{ seconds} \times \text{timeout}_\text{base}) + (100 \text{ ms} \times \text{TTL}) \]

    If a Target node fails to respond to a message from the Client within the configured transfer timeout, the Target node is dropped.

struct `bt_mesh_dfu_cli_cb`
    #include `<dfu_cli.h>` Firmware Update Client event callbacks.

Public Members

6.1. Bluetooth
void (*suspended)(struct bt_mesh_dfu_cli *cli)
    BLOB transfer is suspended.
    Called when the BLOB transfer is suspended due to response timeout from all Target nodes.
    **Param cli**
    Firmware Update Client model instance.

void (*ended)(struct bt_mesh_dfu_cli *cli, enum bt_mesh_dfu_status reason)
    DFU ended.
    Called when the DFU transfer ends, either because all Target nodes were lost or because the transfer was completed successfully.
    **Param cli**
    Firmware Update Client model instance.
    **Param reason**
    Reason for ending.

void (*applied)(struct bt_mesh_dfu_cli *cli)
    DFU transfer applied on all active Target nodes.
    Called at the end of the apply procedure started by `bt_mesh_dfu_cli_apply`.
    **Param cli**
    Firmware Update Client model instance.

void (*confirmed)(struct bt_mesh_dfu_cli *cli)
    DFU transfer confirmed on all active Target nodes.
    Called at the end of the apply procedure started by `bt_mesh_dfu_cli_confirm`.
    **Param cli**
    Firmware Update Client model instance.

void (*lost_target)(struct bt_mesh_dfu_cli *cli, struct bt_mesh_dfu_target *target)
    DFU Target node was lost.
    A DFU Target node was dropped from the receivers list. The Target node’s status is set to reflect the reason for the failure.
    **Param cli**
    Firmware Update Client model instance.
    **Param target**
    DFU Target node that was lost.

struct bt_mesh_dfu_cli
    #include <dfu_cli.h> Firmware Update Client model instance.
    Should be initialized with `BT_MESH_DFU_CLI_INIT`.

**Public Members**

const struct bt_mesh_dfu_cli_cb *cb
    Callback structure.

struct bt_mesh_blob_cli blob
    Underlying BLOB Transfer Client.
struct bt_mesh_dfu_cli_xfer_blob_params
#include <dfu_cli.h> BLOB parameters for Firmware Update Client transfer:

Public Members

uint16_t chunk_size
Base chunk size.
May be smaller for the last chunk.

struct bt_mesh_dfu_cli_xfer
#include <dfu_cli.h> Firmware Update Client transfer parameters:

Public Members

uint64_t blob_id
BLOB ID to use for this transfer, or 0 to set it randomly.

const struct bt_mesh_dfu_slot *slot
DFU image slot to transfer.

enum bt_mesh_blob_xfer_mode mode
Transfer mode (Push (Push BLOB Transfer Mode) or Pull (Pull BLOB Transfer Mode))

const struct bt_mesh_dfu_cli_xfer_blob_params *blob_params
BLOB parameters to be used for the transfer, or NULL to retrieve Target nodes’ capabilities before sending a firmware.

Firmware Distribution Server  The Firmware Distribution Server model implements the Distributor role for the Device Firmware Update (DFU) subsystem. It extends the BLOB Transfer Server, which it uses to receive the firmware image binary from the Initiator node. It also instantiates a Firmware Update Client, which it uses to distribute firmware updates throughout the mesh network.

Note:  Currently, the Firmware Distribution Server supports out-of-band (OOB) retrieval of firmware images over SMP service only.

The Firmware Distribution Server does not have an API of its own, but relies on a Firmware Distribution Client model on a different device to give it information and trigger image distribution and upload.

Firmware slots  The Firmware Distribution Server is capable of storing multiple firmware images for distribution. Each slot contains a separate firmware image with metadata, and can be distributed to other mesh nodes in the network in any order. The contents, format and size of the firmware images are vendor specific, and may contain data from other vendors. The application should never attempt to execute or modify them.
The slots are managed remotely by a Firmware Distribution Client, which can both upload new slots and delete old ones. The application is notified of changes to the slots through the Firmware Distribution Server’s callbacks (bt_mesh_fd_srv_cb). While the metadata for each firmware slot is stored internally, the application must provide a BLOB streams for reading and writing the firmware image.

API reference

**group bt_mesh_dfd_srv**

API for the Firmware Distribution Server model.

**Defines**

```c
CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX
CONFIG_BT_MESH_DFD_SRV_SLOT_MAX_SIZE
CONFIG_BT_MESH_DFD_SRV_SLOT_SPACE
BT_MESH_DFD_SRV_INIT(_cb)
```

Initialization parameters for the Firmware Distribution Server model.

**Parameters**

- `_cb` — [in] Pointer to a bt_mesh_dfd_srv_cb instance.

```
BT_MESH_MODEL_DFD_SRV(_srv)
```

Firmware Distribution Server model Composition Data entry.

**Parameters**

- `_srv` — Pointer to a Firmware Distribution Server model instance.

**Public Members**

```c
#include <dfd_srv.h>
```

Firmware Distribution Server callbacks:

```c
int (*recv)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot, const struct bt_mesh_blob_io **io)
```

Slot receive callback.

Called at the start of an upload procedure. The callback must fill `io` with a pointer to a writable BLOB stream for the Firmware Distribution Server to write the firmware image to.

**Param srv**

Firmware Distribution Server model instance.

**Param slot**

DFU image slot being received.

**Param io**

BLOB stream response pointer.

**Return**

0 on success, or (negative) error code otherwise.
void (*del)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot)
    Slot delete callback.
    Called when the Firmware Distribution Server is about to delete a DFU image slot. All allocated data associated with the firmware slot should be deleted.
    **Param srv**
    Firmware Update Server instance.
    **Param slot**
    DFU image slot being deleted.

int (*send)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot, const struct bt_mesh_blob_io **io)
    Slot send callback.
    Called at the start of a distribution procedure. The callback must fill io with a pointer to a readable BLOB stream for the Firmware Distribution Server to read the firmware image from.
    **Param srv**
    Firmware Distribution Server model instance.
    **Param slot**
    DFU image slot being sent.
    **Param io**
    BLOB stream response pointer.
    **Return**
    0 on success, or (negative) error code otherwise.

void (*phase)(struct bt_mesh_dfd_srv *srv, enum bt_mesh_dfd_phase phase)
    Phase change callback (Optional).
    Called whenever the phase of the Firmware Distribution Server changes.
    **Param srv**
    Firmware Distribution Server model instance.
    **Param phase**
    New Firmware Distribution phase.

struct bt_mesh_dfd_srv
    #include <dfd_srv.h> Firmware Distribution Server instance.

Overview

**DFU roles** The Bluetooth Mesh DFU subsystem defines three different roles the mesh nodes have to assume in the distribution of firmware images:

**Target node**
Target node is the receiver and user of the transferred firmware images. All its functionality is implemented by the Firmware Update Server model. A transfer may be targeting any number of Target nodes, and they will all be updated concurrently.

**Distributor**
The Distributor role serves two purposes in the DFU process. First, it's acting as the Target node in the Upload Firmware procedure, then it distributes the uploaded image to other Target nodes as the Distributor. The Distributor does not select the parameters of the transfer, but relies on an Initiator to give it a list of Target nodes and transfer parameters. The Distributor functionality is implemented in two models, Firmware Distribution Server and Firmware Update Client. The Firmware Distribution Server is responsible for communicating with the Initiator, and the Firmware Update Client is responsible for distributing the image to the Target nodes.
**Initiator**

The Initiator role is typically implemented by the same device that implements the Bluetooth Mesh *Provisioner* and *Configurator* roles. The Initiator needs a full overview of the potential Target nodes and their firmware, and will control (and initiate) all firmware updates. The Initiator role is not implemented in the Zephyr Bluetooth Mesh DFU subsystem.

Fig. 10: DFU roles and the associated Bluetooth Mesh models

Bluetooth Mesh applications may combine the DFU roles in any way they’d like, and even take on multiple instances of the same role by instantiating the models on separate elements. For instance, the Distributor and Initiator role can be combined by instantiating the *Firmware Update Client* on the Initiator node and calling its API directly.

It’s also possible to combine the Initiator and Distributor devices into a single device, and replace the Firmware Distribution Server model with a proprietary mechanism that will access the Firmware Update Client model directly, e.g. over a serial protocol.

**Note:** All DFU models instantiate one or more *BLOB Transfer models*, and may need to be spread over multiple elements for certain role combinations.

**Stages** The Bluetooth Mesh DFU process is designed to act in three stages:

**Upload stage**

First, the image is uploaded to a Distributor in a mesh network by an external entity, such as a phone or gateway (the Initiator). During the Upload stage, the Initiator transfers the firmware image and all its metadata to the Distributor node inside the mesh network. The Distributor stores the firmware image and its metadata persistently, and awaits further instructions from the Initiator. The time required to complete the upload process depends on the size of the image. After the upload completes, the Initiator can disconnect from the network during the much more time-consuming Distribution stage. Once the firmware has been uploaded to the Distributor, the Initiator may trigger the Distribution stage at any time.
Firmware Capability Check stage (optional)
Before starting the Distribution stage, the Initiator may optionally check if Target nodes can accept the new firmware. Nodes that do not respond, or respond that they can’t receive the new firmware, are excluded from the firmware distribution process.

Distribution stage
Before the firmware image can be distributed, the Initiator transfers the list of Target nodes and their designated firmware image index to the Distributor. Next, it tells the Distributor to start the firmware distribution process, which runs in the background while the Initiator and the mesh network perform other duties. Once the firmware image has been transferred to the Target nodes, the Distributor may ask them to apply the firmware image immediately and report back with their status and new firmware IDs.

Firmware images
All updatable parts of a mesh node’s firmware should be represented as a firmware image. Each Target node holds a list of firmware images, each of which should be independently updatable and identifiable.

Firmware images are represented as a BLOB (the firmware itself) with the following additional information attached to it:

Firmware ID
The firmware ID is used to identify a firmware image. The Initiator node may ask the Target nodes for a list of its current firmware IDs to determine whether a newer version of the firmware is available. The format of the firmware ID is vendor specific, but generally, it should include enough information for an Initiator node with knowledge of the format to determine the type of image as well as its version. The firmware ID is optional, and its max length is determined by CONFIG_BT_MESH_DFU_FWID_MAXLEN.

Firmware metadata
The firmware metadata is used by the Target node to determine whether it should accept an incoming firmware update, and what the effect of the update would be. The metadata format is vendor specific, and should contain all information the Target node needs to verify the image, as well as any preparation the Target node has to make before the image is applied. Typical metadata information can be image signatures, changes to the node’s Composition Data and the format of the BLOB. The Target node may perform a metadata check before accepting incoming transfers to determine whether the transfer should be started. The firmware metadata can be discarded by the Target node after the metadata check, as other nodes will never request the metadata from the Target node. The firmware metadata is optional, and its maximum length is determined by CONFIG_BT_MESH_DFU_METADATA_MAXLEN.

The Bluetooth Mesh DFU subsystem in Zephyr provides its own metadata format (bt_mesh_dfu_metadata) together with a set of related functions that can be used by an end product. The support for it is enabled using the CONFIG_BT_MESH_DFU_METADATA option. The format of the metadata is presented in the table below.
<table>
<thead>
<tr>
<th>Field</th>
<th>Size (Bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New firmware version</td>
<td>8 B</td>
<td>1 B: Major version 1 B: Minor version 2 B: Revision 4 B: Build number</td>

<td>Application-specific data for new firmware</td>
<td>&lt;variable&gt; (Optional)</td>
<td>Application-specific data to allow application to execute some vendor-specific behaviors using this data before it can respond with a status message.</td>
</tr>
</tbody>
</table>

**Firmware URI**

The firmware URI gives the Initiator information about where firmware updates for the image can be found. The URI points to an online resource the Initiator can interact with to get new versions of the firmware. This allows Initiators to perform updates for any node in the mesh network by interacting with the web server pointed to in the URI. The URI must point to a resource using the http or https schemes, and the targeted web server must behave according to the Firmware Check Over HTTPS procedure defined by the specification. The firmware URI is optional, and its max length is determined by CONFIG_BT_MESH_DFU_URI_MAXLEN.

*Note:* The out-of-band distribution mechanism is not supported.

**Firmware effect**  A new image may have the Composition Data Page 0 different from the one allocated on a Target node. This may have an effect on the provisioning data of the node and how the Distributor finalizes the DFU. Depending on the availability of the Remote Provisioning Server model on the old and new image, the device may either boot up unprovisioned after applying the new firmware or require to be re-provisioned. The complete list of available options is defined in bt_mesh_dfu_effect:

- **BT_MESH_DFU_EFFECT_NONE**  The device stays provisioned after the new firmware is programmed. This effect is chosen if the composition data of the new firmware doesn’t change.

- **BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR**  This effect is chosen when the composition data changes and the device doesn’t support the remote provisioning. The new composition data takes place only after re-provisioning.

- **BT_MESH_DFU_EFFECT_COMP_CHANGE**  This effect is chosen when the composition data changes and the device supports the remote provisioning. In this case, the device stays provisioned and the new composition data takes place after re-provisioning using the Remote Provisioning models.

- **BT_MESH_DFU_EFFECT_UNPROV**  This effect is chosen if the composition data in the new firmware changes, the device doesn’t support the remote provisioning, and the new composition data takes effect after applying the firmware.
When the Target node receives the Firmware Update Firmware Metadata Check message, the Firmware Update Server model calls the `bt_mesh_dfu_srv_cb.check` callback, the application can then process the metadata and provide the effect value. If the effect is `BT_MESH_DFU_EFFECT_COMP_CHANGE`, the application must call functions `bt_mesh_comp_change_prepare()` and `bt_mesh_models_metadata_change_prepare()` to prepare the Composition Data Page and Models Metadata Page contents before applying the new firmware image. See *Composition Data and Models Metadata* for more information.

**DFU procedures** The DFU protocol is implemented as a set of procedures that must be performed in a certain order:

The Initiator controls the Upload stage of the DFU protocol, and all Distributor side handling of the upload subprocedures is implemented in the Firmware Distribution Server.

The Distribution stage is controlled by the Distributor, as implemented by the Firmware Update Client. The Target node implements all handling of these procedures in the Firmware Update Server, and notifies the application through a set of callbacks.

**Uploading the firmware** The Upload Firmware procedure uses the BLOB Transfer models to transfer the firmware image from the Initiator to the Distributor. The Upload Firmware procedure works in two steps:

1. The Initiator generates a BLOB ID, and sends it to the Distributor’s Firmware Distribution Server along with the firmware information and other input parameters of the BLOB transfer. The Firmware Distribution Server stores the information, and prepares its BLOB Transfer Server for the incoming transfer before it responds with a status message to the Initiator.

2. The Initiator's BLOB Transfer Client model transfers the firmware image to the Distributor’s BLOB Transfer Server, which stores the image in a predetermined flash partition.

When the BLOB transfer finishes, the firmware image is ready for distribution. The Initiator may upload several firmware images to the Distributor, and ask it to distribute them in any order or at any time. Additional procedures are available for querying and deleting firmware images from the Distributor.

The following Distributor’s capabilities related to firmware images can be configured using the configuration options:

- `CONFIG_BT_MESH_DFU_SLOT_CNT`: Amount of image slots available on the device.
- `CONFIG_BT_MESH_DFD_SRV_SLOT_MAX_SIZE`: Maximum allowed size for each image.
- `CONFIG_BT_MESH_DFD_SRV_SLOT_SPACE`: Available space for all images.

**Populating the Distributor’s receivers list** Before the Distributor can start distributing the firmware image, it needs a list of Target nodes to send the image to. The Initiator gets the full list of Target nodes either by querying the potential targets directly, or through some external authority. The Initiator uses this information to populate the Distributor’s receivers list with the address and relevant firmware image index of each Target node. The Initiator may send one or more Firmware Distribution Receivers Add messages to build the Distributor’s receivers list, and a Firmware Distribution Receivers Delete All message to clear it.

The maximum number of receivers that can be added to the Distributor is configured through the `CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX` configuration option.

**Initiating the distribution** Once the Distributor has stored a firmware image and received a list of Target nodes, the Initiator may initiate the distribution procedure. The BLOB transfer parameters for the distribution are passed to the Distributor along with an update policy. The update policy decides whether the Distributor should request that the firmware is applied on
Fig. 11: DFU stages and procedures as seen from the Distributor
the Target nodes or not. The Distributor stores the transfer parameters and starts distributing
the firmware image to its list of Target nodes.

Firmware distribution  The Distributor's Firmware Update Client model uses its BLOB Trans-
fer Client model's broadcast subsystem to communicate with all Target nodes. The firmware
distribution is performed with the following steps:

1. The Distributor's Firmware Update Client model generates a BLOB ID and sends it to each
Target node's Firmware Update Server model, along with the other BLOB transfer parame-
ters, the Target node firmware image index and the firmware image metadata. Each Target
node performs a metadata check and prepares their BLOB Transfer Server model for the
transfer, before sending a status response to the Firmware Update Client, indicating if the
firmware update will have any effect on the Bluetooth Mesh state of the node.

2. The Distributor's BLOB Transfer Client model transfers the firmware image to all Target
nodes.

3. Once the BLOB transfer has been received, the Target nodes' applications verify that the
firmware is valid by performing checks such as signature verification or image checksums
against the image metadata.

4. The Distributor's Firmware Update Client model queries all Target nodes to ensure that
they've all verified the firmware image.

If the distribution procedure completed with at least one Target node reporting that the image
has been received and verified, the distribution procedure is considered successful.

Note:  The firmware distribution procedure only fails if all Target nodes are lost. It is up to
the Initiator to request a list of failed Target nodes from the Distributor and initiate additional
attempts to update the lost Target nodes after the current attempt is finished.

Suspending the distribution  The Initiator can also request the Distributor to suspend the
firmware distribution. In this case, the Distributor will stop sending any messages to Target
nodes. When the firmware distribution is resumed, the Distributor will continue sending the
firmware from the last successfully transferred block.

Applying the firmware image  If the Initiator requested it, the Distributor can initiate the Ap-
ply Firmware on Target Node procedure on all Target nodes that successfully received and ver-
ified the firmware image. The Apply Firmware on Target Node procedure takes no parameters,
and to avoid ambiguity, it should be performed before a new transfer is initiated. The Apply
Firmware on Target Node procedure consists of the following steps:

1. The Distributor's Firmware Update Client model instructs all Target nodes that have ver-
ified the firmware image to apply it. The Target nodes' Firmware Update Server models
respond with a status message before calling their application's apply callback.

2. The Target node's application performs any preparations needed before applying the trans-
fer, such as storing a snapshot of the Composition Data or clearing its configuration.

3. The Target node's application swaps the current firmware with the new image and updates
its firmware image list with the new firmware ID.

4. The Distributor's Firmware Update Client model requests the full list of firmware images
from each Target node, and scans through the list to make sure that the new firmware ID
has replaced the old.

Note:  During the metadata check in the distribution procedure, the Target node may have
reported that it will become unprovisioned after the firmware image is applied. In this case, the

6.1. Bluetooth
Distributor’s Firmware Update Client model will send a request for the full firmware image list, and expect no response.

**Cancelling the distribution** The firmware distribution can be cancelled at any time by the Initiator. In this case, the Distributor starts the cancelling procedure by sending a cancelling message to all Target nodes. The Distributor waits for the response from all Target nodes. Once all Target nodes have replied, or the request has timed out, the distribution procedure is cancelled. After this the distribution procedure can be started again from the Firmware distribution section.

**API reference** This section lists the types common to the Device Firmware Update mesh models.

*group bt_mesh_dfd*

**Enums**

`enum bt_mesh_dfd_status`

Firmware distribution status.

*Values:*

- `BT_MESH_DFD_SUCCESS` The message was processed successfully.
- `BT_MESH_DFD_ERR_INSUFFICIENT_RESOURCES` Insufficient resources on the node.
- `BT_MESH_DFD_ERR_WRONG_PHASE` The operation cannot be performed while the Server is in the current phase.
- `BT_MESH_DFD_ERR_INTERNAL` An internal error occurred on the node.
- `BT_MESH_DFD_ERR_FW_NOT_FOUND` The requested firmware image is not stored on the Distributor.
- `BT_MESH_DFD_ERR_INVALID_APPKEY_INDEX` The AppKey identified by the AppKey Index is not known to the node.
- `BT_MESH_DFD_ERR_RECEIVERS_LIST_EMPTY` There are no Target nodes in the Distribution Receivers List state.
- `BT_MESH_DFD_ERR_BUSY_WITH_DISTRIBUTION` Another firmware image distribution is in progress.
- `BT_MESH_DFD_ERR_BUSY_WITH_UPLOAD` Another upload is in progress.
enumerator BT_MESH_DFD_ERR_URI_NOT_SUPPORTED
   The URI scheme name indicated by the Update URI is not supported.

enumerator BT_MESH_DFD_ERR_URI_MALFORMED
   The format of the Update URI is invalid.

enumerator BT_MESH_DFD_ERR_URI_UNREACHABLE
   The URI is currently unreachable.

enumerator BT_MESH_DFD_ERR_NEW_FW_NOTAVAILABLE
   The Check Firmware OOB procedure did not find any new firmware.

enumerator BT_MESH_DFD_ERR_SUSPEND_FAILED
   The suspension of the Distribute Firmware procedure failed.

enum bt_mesh_dfd_phase
   Firmware distribution phases.
   Values:

   enumerator BT_MESH_DFD_PHASE_IDLE
      No firmware distribution is in progress.

   enumerator BT_MESH_DFD_PHASE_TRANSFER_ACTIVE
      Firmware distribution is in progress.

   enumerator BT_MESH_DFD_PHASE_TRANSFER_SUCCESS
      The Transfer BLOB procedure has completed successfully.

   enumerator BT_MESH_DFD_PHASE_APPLYING_UPDATE
      The Apply Firmware on Target Nodes procedure is being executed.

   enumerator BT_MESH_DFD_PHASE_COMPLETED
      The Distribute Firmware procedure has completed successfully.

   enumerator BT_MESH_DFD_PHASE_FAILED
      The Distribute Firmware procedure has failed.

   enumerator BT_MESH_DFD_PHASE_CANCELLING_UPDATE
      The Cancel Firmware Update procedure is being executed.

   enumerator BT_MESH_DFD_PHASE_TRANSFER_SUSPENDED
      The Transfer BLOB procedure is suspended.

enum bt_mesh_dfd_upload_phase
   Firmware upload phases.
   Values:
enumerator BT_MESH_DFD_UPLOAD_PHASE_IDLE
   No firmware upload is in progress.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_ACTIVE
   The Store Firmware procedure is being executed.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_ERROR
   The Store Firmware procedure or Store Firmware OOB procedure failed.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_SUCCESS
   The Store Firmware procedure or the Store Firmware OOB procedure completed successfully.

**group bt_mesh_dfu**

**Defines**

- CONFIG_BT_MESH_DFU_FWID_MAXLEN
- CONFIG_BT_MESH_DFU_METADATA_MAXLEN
- CONFIG_BT_MESH_DFU_URI_MAXLEN
- CONFIG_BT_MESH_DFU_SLOT_CNT

**Enums**

**enum bt_mesh_dfu_phase**

DFU transfer phase.

*Values:*

enumerator BT_MESH_DFU_PHASE_IDLE
   Ready to start a Receive Firmware procedure.

enumerator BT_MESH_DFU_PHASE_TRANSFER_ERR
   The Transfer BLOB procedure failed.

enumerator BT_MESH_DFU_PHASE_TRANSFER_ACTIVE
   The Receive Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY
   The Verify Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY_OK
   The Verify Firmware procedure completed successfully.
enumerator BT_MESH_DFU_PHASE_VERIFY_FAIL
The Verify Firmware procedure failed.

enumerator BT_MESH_DFU_PHASE_APPLYING
The Apply New Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_TRANSFER_CANCELED
Firmware transfer has been canceled.

enumerator BT_MESH_DFU_PHASE_APPLY_SUCCESS
Firmware applying succeeded.

enumerator BT_MESH_DFU_PHASE_APPLY_FAIL
Firmware applying failed.

enumerator BT_MESH_DFU_PHASE_UNKNOWN
Phase of a node was not yet retrieved.

enum bt_mesh_dfu_status
DFU status.
Values:

enumerator BT_MESH_DFU_SUCCESS
The message was processed successfully.

enumerator BT_MESH_DFU_ERR_RESOURCES
Insufficient resources on the node.

enumerator BT_MESH_DFU_ERR_WRONG_PHASE
The operation cannot be performed while the Server is in the current phase.

enumerator BT_MESH_DFU_ERR_INTERNAL
An internal error occurred on the node.

enumerator BT_MESH_DFU_ERR_FWIDX
The message contains a firmware index value that is not expected.

enumerator BT_MESH_DFU_ERR_METADATA
The metadata check failed.

enumerator BT_MESH_DFU_ERR_TEMPORARILY_UNAVAILABLE
The Server cannot start a firmware update.

enumerator BT_MESH_DFU_ERR_BLOB_XFER_BUSY
Another BLOB transfer is in progress.

enum bt_mesh_dfu_effect
Expected effect of a DFU transfer.
Values:
enumerator BT_MESH_DFU_EFFECT_NONE
No changes to node Composition Data.

enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR
Node Composition Data changed and the node does not support remote provisioning.

enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE
Node Composition Data changed, and remote provisioning is supported.
The node supports remote provisioning and Composition Data Page 0x80. Page 0x80 contains different Composition Data than Page 0x0.

enumerator BT_MESH_DFU_EFFECT_UNPROV
Node will be unprovisioned after the update.

enum bt_mesh_dfu_iter
Action for DFU iteration callbacks.
Values:

enumerator BT_MESH_DFU_ITER_STOP
Stop iterating.

enumerator BT_MESH_DFU_ITER_CONTINUE
Continue iterating.

struct bt_mesh_dfu_img
#include <dfu.h> DFU image instance.
Each DFU image represents a single updatable firmware image.

Public Members

const void *fwid
Firmware ID.

size_t fwid_len
Length of the firmware ID.

const char *uri
Update URI, or NULL.

struct bt_mesh_dfu_slot
#include <dfu.h> DFU image slot for DFU distribution.

Public Members
size_t size
Size of the firmware in bytes.

size_t fwid_len
Length of the firmware ID.

size_t metadata_len
Length of the metadata.

uint8_t fwid[0]
Firmware ID.

uint8_t metadata[0]
Metadata.

group bt_mesh_dfu_metadata
Common types and functions for the Bluetooth Mesh DFU metadata.

Enums

enum bt_mesh_dfu_metadata_fw_core_type
Firmware core type.
Values:

enumerator BT_MESH_DFU_FW_CORE_TYPE_APP = BIT(0)
Application core.

enumerator BT_MESH_DFU_FW_CORE_TYPE_NETWORK = BIT(1)
Network core.

enumerator BT_MESH_DFU_FW_CORE_TYPE_APP_SPECIFIC_BLOB = BIT(2)
Application-specific BLOB.

Functions

int bt_mesh_dfu_metadata_decode(struct net_buf_simple *buf, struct bt_mesh_dfu_metadata *metadata)
Decode a firmware metadata from a network buffer.

Parameters

- buf – Buffer containing a raw metadata to be decoded.
- metadata – Pointer to a metadata structure to be filled.

Returns
0 on success, or (negative) error code otherwise.
int bt_mesh_dfu_metadata_encode(const struct bt_mesh_dfu_metadata *metadata, struct net_buf_simple *buf)

Encode a firmware metadata into a network buffer.

**Parameters**
- `metadata` – Firmware metadata to be encoded.
- `buf` – Buffer to store the encoded metadata.

**Returns**
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_metadata_comp_hash_get(struct net_buf_simple *buf, uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data state.

The format of the Composition Data is defined in MshPRTv1.1: 4.2.2.1.

**Parameters**
- `buf` – Pointer to buffer holding Composition Data.
- `key` – 128-bit key to be used in the hash computation.
- `hash` – Pointer to a memory location to which the hash will be stored.

**Returns**
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_metadata_comp_hash_local_get(uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data Page 0 of this device.

**Parameters**
- `key` – 128-bit key to be used in the hash computation.
- `hash` – Pointer to a memory location to which the hash will be stored.

**Returns**
0 on success, or (negative) error code otherwise.

struct bt_mesh_dfu_metadata_fw_ver

#include <dfu_metadata.h> Firmware version.

**Public Members**

uint8_t major
Firmware major version.

uint8_t minor
Firmware minor version.

uint16_t revision
Firmware revision.

uint32_t build_num
Firmware build number.

struct bt_mesh_dfu_metadata

#include <dfu_metadata.h> Firmware metadata.
Public Members

struct \texttt{bt\_mesh\_dfu\_metadata\_fw\_ver} \texttt{fw\_ver}
    New firmware version.

uint32\_t \texttt{fw\_size}
    New firmware size.

defined \texttt{bt\_mesh\_dfu\_metadata\_fw\_core\_type} \texttt{fw\_core\_type}
    New firmware core type.

uint32\_t \texttt{comp\_hash}
    Hash of incoming Composition Data.

uint16\_t \texttt{elems}
    New number of node elements.

uint8\_t * \texttt{user\_data}
    Application-specific data for new firmware.
    This field is optional.

uint32\_t \texttt{user\_data\_len}
    Length of the application-specific field.

Message The Bluetooth Mesh message provides set of structures, macros and functions used for preparing message buffers, managing message and acknowledged message contexts.

API reference
group \texttt{bt\_mesh\_msg}
    Message.

Defines

\texttt{BT\_MESH\_MIC\_SHORT}
    Length of a short Mesh MIC.

\texttt{BT\_MESH\_MIC\_LONG}
    Length of a long Mesh MIC.

\texttt{BT\_MESH\_MODEL\_OP\_LEN(_op)}
    Helper to determine the length of an opcode.

Parameters
    \begin{itemize}
    \item \texttt{_op} – Opcode.
BT_MESH_MODEL_BUF_LEN(_op, _payload_len)
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

Parameters

• _op – Opcode of the message.
• _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_LEN_LONG_MIC(_op, _payload_len)
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

Parameters

• _op – Opcode of the message.
• _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_DEFINE(_buf, _op, _payload_len)
Define a Mesh model message buffer using NET_BUF_SIMPLE_DEFINE.

Parameters

• _buf – Buffer name.
• _op – Opcode of the message.
• _payload_len – Length of the model message payload.

BT_MESH_MSG_CTX_INIT(net_key_idx, app_key_idx, dst, ttl)
Helper for bt_mesh_msg_ctx structure initialization.

Parameters

• net_key_idx – NetKey Index of the subnet to send the message on. Only used if app_key_idx points to devkey.
• app_key_idx – AppKey Index to encrypt the message with.
• dst – Remote addr.
• ttl – Time To Live.

BT_MESH_MSG_CTX_INIT_APP(app_key_idx, dst)
Helper for bt_mesh_msg_ctx structure initialization secured with Application Key.

Parameters

• app_key_idx – AppKey Index to encrypt the message with.
• dst – Remote addr.

BT_MESH_MSG_CTX_INIT_DEV(net_key_idx, dst)
Helper for bt_mesh_msg_ctx structure initialization secured with Device Key of a remote device.

Parameters

• net_key_idx – NetKey Index of the subnet to send the message on.
• `dst` – Remote addr.

`BT_MESH_MSG_CTX_INIT_PUB(pub)`

Helper for `bt_mesh_msg_ctx` structure initialization using Model Publication context.

**Parameters**

• `pub` – Pointer to a model publication context.

**Functions**

```c
void bt_mesh_model_msg_init(struct net_buf_simple *msg, uint32_t opcode)
```

Initialize a model message.

Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

**Parameters**

• `msg` – Message buffer.

• `opcode` – Opcode to encode.

```c
static inline void bt_mesh_msg_ack_ctx_init(struct bt_mesh_msg_ack_ctx *ack)
```

Initialize an acknowledged message context.

Initializes semaphore used for synchronization between `bt_mesh_msg_ack_ctx_wait` and `bt_mesh_msg_ack_ctx_rx` calls. Call this function before using `bt_mesh_msg_ack_ctx`.

**Parameters**

• `ack` – Acknowledged message context to initialize.

```c
static inline void bt_mesh_msg_ack_ctx_reset(struct bt_mesh_msg_ack_ctx *ack)
```

Reset the synchronization semaphore in an acknowledged message context.

This function aborts call to `bt_mesh_msg_ack_ctx_wait`.

**Parameters**

• `ack` – Acknowledged message context to be reset.

```c
void bt_mesh_msg_ack_ctx_clear(struct bt_mesh_msg_ack_ctx *ack)
```

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by `bt_mesh_msg_ack_ctx_prepare`.

**Parameters**

• `ack` – Acknowledged message context to be cleared.

```c
int bt_mesh_msg_ack_ctx_prepare(struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t dst, void *user_data)
```

Prepare an acknowledged message context for the incoming message to wait.

This function sets the opcode, remote address of the incoming message and stores the user data. Use this function before calling `bt_mesh_msg_ack_ctx_wait`.

**Parameters**

• `ack` – Acknowledged message context to prepare.

• `dst` – Destination address of the message.
• **user_data** – User data for the acknowledged message context.

**Returns**
0 on success, or (negative) error code on failure.

```c
static inline bool bt_mesh_msg_ack_ctx_busy(struct bt_mesh_msg_ack_ctx *ack) {
    // Check if the acknowledged message context is initialized with an opcode.
}
```

**Parameters**
• **ack** – Acknowledged message context.

**Returns**
true if the acknowledged message context is initialized with an opcode, false otherwise.

```c
int bt_mesh_msg_ack_ctx_wait(struct bt_mesh_msg_ack_ctx *ack, k_timeout_t timeout) {
    // Wait for a message acknowledge.
    This function blocks execution until bt_mesh_msg_ack_ctx_rx is called or by timeout.
}
```

**Parameters**
• **ack** – Acknowledged message context of the message to wait for.
• **timeout** – Wait timeout.

**Returns**
0 on success, or (negative) error code on failure.

```c
static inline void bt_mesh_msg_ack_ctx_rx(struct bt_mesh_msg_ack_ctx *ack) {
    // Mark a message as acknowledged.
    This function unblocks call to bt_mesh_msg_ack_ctx_wait.
}
```

**Parameters**
• **ack** – Context of a message to be acknowledged.

```c
bool bt_mesh_msg_ack_ctx_match(const struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t addr, void **user_data) {
    // Check if an opcode and address of a message matches the expected one.
}
```

**Parameters**
• **ack** – Acknowledged message context to be checked.
• **op** – OpCode of the incoming message.
• **addr** – Source address of the incoming message.
• **user_data** – If not NULL, returns a user data stored in the acknowledged message context by bt_mesh_msg_ack_ctx_prepare.

**Returns**
true if the incoming message matches the expected one, false otherwise.

```c
struct bt_mesh_msg_ctx
#include <msg.h> Message sending context.
```

**Public Members**

```c
uint16_t net_idx
    // NetKey Index of the subnet to send the message on.
```
uint16_t app_idx
    AppKey Index to encrypt the message with.

uint16_t addr
    Remote address.

uint16_t recv_dst
    Destination address of a received message.
    Not used for sending.

const uint8_t *uuid
    Label UUID if Remote address is Virtual address, or NULL otherwise.

int8_t recv_rssi
    RSSI of received packet.
    Not used for sending.

uint8_t recv_ttl
    Received TTL value.
    Not used for sending.

bool send_rel
    Force sending reliably by using segment acknowledgment.

bool rnd_delay
    Send message with a random delay according to the Access layer transmitting rules.

uint8_t send_ttl
    TTL, or BT_MESH_TTL_DEFAULT for default TTL.

struct bt_mesh_msg_ack_ctx
    #include <msg.h> Acknowledged message context for tracking the status of model messages pending a response.

Public Members

struct k_sem sem
    Sync semaphore.

uint32_t op
    Opcode we're waiting for.

uint16_t dst
    Address of the node that should respond.

void *user_data
    User specific parameter.
Segmentation and reassembly (SAR)  Segmentation and reassembly (SAR) provides a way of handling larger upper transport layer messages in a mesh network, with a purpose of enhancing the Bluetooth Mesh throughput. The segmentation and reassembly mechanism is used by the lower transport layer.

The lower transport layer defines how the upper transport layer PDUs are segmented and reassembled into multiple Lower Transport PDUs, and sends them to the lower transport layer on a peer device. If the Upper Transport PDU fits, it is sent in a single Lower Transport PDU. For longer packets, which do not fit into a single Lower Transport PDU, the lower transport layer performs segmentation, splitting the Upper Transport PDU into multiple segments.

The lower transport layer on the receiving device reassembles the segments into a single Upper Transport PDU before passing it up the stack. Delivery of a segmented message is acknowledged by the lower transport layer of the receiving node, while an unsegmented message delivery is not acknowledged. However, an Upper Transport PDU that fits into one Lower Transport PDU can also be sent as a single-segment segmented message when acknowledgment by the lower transport layer is required. Set the send rel flag (see `bt_mesh_msg_ctx`) to use the reliable message transmission and acknowledge single-segment segmented messages.

The transport layer is able to transport up to 32 segments with its SAR mechanism, with a maximum message (PDU) size of 384 octets. To configure message size for the Bluetooth Mesh stack, use the following Kconfig options:

- `CONFIG_BT_MESH_RX_SEG_MAX` to set the maximum number of segments in an incoming message.
- `CONFIG_BT_MESH_TX_SEG_MAX` to set the maximum number of segments in an outgoing message.

The Kconfig options `CONFIG_BT_MESH_TX_SEG_MSG_COUNT` and `CONFIG_BT_MESH_RX_SEG_MSG_COUNT` define how many outgoing and incoming segmented messages can be processed simultaneously. When more than one segmented message is sent to the same destination, the messages are queued and sent one at a time.

Incoming and outgoing segmented messages share the same pool for allocation of their segments. This pool size is configured through the `CONFIG_BT_MESH_SEG_BUFS` Kconfig option. Both incoming and outgoing messages allocate segments at the start of the transaction. The outgoing segmented message releases its segments one by one as soon as they are acknowledged by the receiver, while the incoming message releases the segments first after the message is fully received. Keep this in mind when defining the size of the buffers.

SAR does not impose extra overhead on the access layer payload per segment.

Segmentation and reassembly (SAR) Configuration models  With Bluetooth Mesh Protocol Specification version 1.1, it became possible to configure SAR behavior, such as intervals, timers and retransmission counters, over a mesh network using SAR Configuration models:

- `SAR Configuration Client`
- `SAR Configuration Server`

The following SAR behavior applies regardless of the presence of a SAR Configuration Server on a node.

Transmission of segments is separated by a segment transmission interval (see the `SAR Segment Interval Step` state). Other configurable time intervals and delays available for the segmentation and reassembly are:

- Interval between unicast retransmissions (see the states `SAR Unicast Retransmissions Interval Step` and `SAR Unicast Retransmissions Interval Increment`).
- Interval between multicast retransmissions (see the `SAR Multicast Retransmissions Interval Step` state).
- Segment reception interval (see the `SAR Receiver Segment Interval Step` state).
• Acknowledgment delay increment (see the **SAR Acknowledgment Delay Increment** state).

When the last segment marked as unacknowledged is transmitted, the lower transport layer starts a retransmissions timer. The initial value of the SAR Unicast Retransmissions timer depends on the value of the TTL field of the message. If the TTL field value is greater than 0, the initial value for the timer is set according to the following formula:

\[
\text{unicast retransmissions interval step} + \text{unicast retransmissions interval increment} \times (\text{TTL} - 1)
\]

If the TTL field value is 0, the initial value of the timer is set to the unicast retransmissions interval step.

The initial value of the SAR Multicast Retransmissions timer is set to the multicast retransmissions interval.

When the lower transport layer receives a message segment, it starts a SAR Discard timer. The discard timer tells how long the lower transport layer waits before discarding the segmented message the segment belongs to. The initial value of the SAR Discard timer is the discard timeout value indicated by the **SAR Discard Timeout** state.

SAR Acknowledgment timer holds the time before a Segment Acknowledgment message is sent for a received segment. The initial value of the SAR Acknowledgment timer is calculated using the following formula:

\[
\min(\text{SegN} + 0.5, \text{acknowledgment delay increment}) \times \text{segment reception interval}
\]

The SegN field value identifies the total number of segments the Upper Transport PDU is segmented into.

Four counters are related to SAR behavior:

- Two unicast retransmissions counts (see **SAR Unicast Retransmissions Count** state and **SAR Unicast Retransmissions Without Progress Count** state)
- Multicast retransmissions count (see **SAR Multicast Retransmissions Count** state)
- Acknowledgment retransmissions count (see **SAR Acknowledgment Retransmissions Count** state)

If the number of segments in the transmission is higher than the value of the **SAR Segments Threshold** state, Segment Acknowledgment messages are retransmitted using the value of the **SAR Acknowledgment Retransmissions Count** state.

**SAR states** There are two states defined related to segmentation and reassembly:

- SAR Transmitter state
- SAR Receiver state

The SAR Transmitter state is a composite state that controls the number and timing of transmissions of segmented messages. It includes the following states:

- SAR Segment Interval Step
- SAR Unicast Retransmissions Count
- SAR Unicast Retransmissions Without Progress Count
- SAR Unicast Retransmissions Interval Step
- SAR Unicast Retransmissions Interval Increment
- SAR Multicast Retransmissions Count
- SAR Multicast Retransmissions Interval Step
The SAR Receiver state is a composite state that controls the number and timing of Segment Acknowledgment transmissions and the discarding of reassembly of a segmented message. It includes the following states:

- SAR Segments Threshold
- SAR Discard Timeout
- SAR Acknowledgment Delay Increment
- SAR Acknowledgment Retransmissions Count
- SAR Receiver Segment Interval Step

**SAR Segment Interval Step**  
SAR Segment Interval Step state holds a value that controls the interval between transmissions of segments of a segmented message. The interval is measured in milliseconds.

Use the `CONFIG_BT_MESH_SAR_TX_SEG_INT_STEP` Kconfig option to set the default value. Segment transmission interval is then calculated using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_TX_SEG_INT_STEP} + 1) \times 10 \text{ ms}\]

**SAR Unicast Retransmissions Count**  
SAR Unicast Retransmissions Count holds a value that defines the maximum number of retransmissions of a segmented message to a unicast destination. Use the `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_COUNT` Kconfig option to set the default value for this state.

**SAR Unicast Retransmissions Without Progress Count**  
This state holds a value that defines the maximum number of retransmissions of a segmented message to a unicast address that will be sent if no acknowledgment was received during the timeout, or if an acknowledgment with already confirmed segments was received. Use the Kconfig option `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_WITHOUT_PROG_COUNT` to set the maximum number of retransmissions.

**SAR Unicast Retransmissions Interval Step**  
The value of this state controls the interval step used for delaying the retransmissions of unacknowledged segments of a segmented message to a unicast address. The interval step is measured in milliseconds.

Use the `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_STEP` Kconfig option to set the default value. This value is then used to calculate the interval step using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_STEP} + 1) \times 25 \text{ ms}\]

**SAR Unicast Retransmissions Interval Increment**  
SAR Unicast Retransmissions Interval Increment holds a value that controls the interval increment used for delaying the retransmissions of unacknowledged segments of a segmented message to a unicast address. The increment is measured in milliseconds.

Use the Kconfig option `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_INC` to set the default value. The Kconfig option value is used to calculate the increment using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_INC} + 1) \times 25 \text{ ms}\]

**SAR Multicast Retransmissions Count**  
The state holds a value that controls the total number of retransmissions of a segmented message to a multicast address. Use the Kconfig option `CONFIG_BT_MESH_SAR_TX_MULTICAST_RETRANS_COUNT` to set the total number of retransmissions.
SAR Multicast Retransmissions Interval Step  This state holds a value that controls the interval between retransmissions of all segments in a segmented message to a multicast address. The interval is measured in milliseconds.

Use the Kconfig option CONFIG_BT_MESH_SAR_TX_MULTICAST_RETRANS_INT to set the default value that is used to calculate the interval using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_TX_MULTICAST_RETRANS_INT} + 1) \times 25 \text{ ms}\]

SAR Discard Timeout  The value of this state defines the time in seconds that the lower transport layer waits after receiving segments of a segmented message before discarding that segmented message. Use the Kconfig option CONFIG_BT_MESH_SAR_RX_DISCARD_TIMEOUT to set the default value. The discard timeout will be calculated using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_RX_DISCARD_TIMEOUT} + 1) \times 5 \text{ seconds}\]

SAR Acknowledgment Delay Increment  This state holds a value that controls the delay increment of an interval used for delaying the transmission of an acknowledgment message after receiving a new segment. The increment is measured in segments.

Use the Kconfig option CONFIG_BT_MESH_SAR_RX_ACK_DELAY_INC to set the default value. The increment value is calculated to be CONFIG_BT_MESH_SAR_RX_ACK_DELAY_INC + 1.5.

SAR Segments Threshold  SAR Segments Threshold state holds a value that defines a threshold in number of segments of a segmented message for acknowledgment retransmissions. Use the Kconfig option CONFIG_BT_MESH_SAR_RX_SEG_THRESHOLD to set the threshold.

When the number of segments of a segmented message is above this threshold, the stack will additionally retransmit every acknowledgment message the number of times given by the value of CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT.

SAR Acknowledgment Retransmissions Count  The SAR Acknowledgment Retransmissions Count state controls the number of retransmissions of Segment Acknowledgment messages sent by the lower transport layer. It gives the total number of retransmissions of an acknowledgment message that the stack will additionally send when the size of segments in a segmented message is above the CONFIG_BT_MESH_SAR_RX_SEG_THRESHOLD value.

Use the Kconfig option CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT to set the default value for this state. The maximum number of transmissions of a Segment Acknowledgment message is CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT + 1.

SAR Receiver Segment Interval Step  The SAR Receiver Segment Interval Step defines the segments reception interval step used for delaying the transmission of an acknowledgment message after receiving a new segment. The interval is measured in milliseconds.

Use the Kconfig option CONFIG_BT_MESH_SAR_RX_SEG_INT_STEP to set the default value and calculate the interval using the following formula:

\[(\text{CONFIG_BT_MESH_SAR_RX_SEG_INT_STEP} + 1) \times 10 \text{ ms}\]

Provisioning  Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The provisioner represents the network owner, and is responsible for adding new nodes to the mesh network.
• The **provisionee** is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an **unprovisioned device**.

The Provisioning module in the Zephyr Bluetooth Mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

**The Provisioning process**  All Bluetooth Mesh nodes must be provisioned before they can participate in a Bluetooth Mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconing
- Invitation
- Public key exchange
- Authentication
- Provisioning data transfer

**Beaconing**  To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call `bt_mesh_prov_enable()`. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the OOB information field, as specified in the prov parameter passed to `bt_mesh_init()`. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

**Uniform Resource Identifier**  The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special none scheme, encoded as 0x01. The available schemes are listed on the Bluetooth website.

Examples of encoded URIs:

<table>
<thead>
<tr>
<th>URI</th>
<th>Encoded</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://example.com">http://example.com</a></td>
<td>\x16//example.com</td>
</tr>
<tr>
<td><a href="https://www.zephyrproject.org/">https://www.zephyrproject.org/</a></td>
<td>\x17//www.zephyrproject.org/</td>
</tr>
<tr>
<td>just a string</td>
<td>\x01just a string</td>
</tr>
</tbody>
</table>

**Provisioning invitation**  The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server **Attention state**, if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods and algorithms.

**Public key exchange**  Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.
If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can’t retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to bt_mesh_prov.public_key_be and bt_mesh_prov.private_key_be. The keys needs to be provided in big-endian bytes order.

To provide the device's public key obtained via OOB, call bt_mesh_prov_remote_pub_key_set() on the provisioner side.

**Authentication** After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB:** An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.

- **Input OOB:** The user inputs the authentication value. The available input actions are listed in bt_mesh_input_action_t.

- **Output OOB:** Show the user the authentication value. The available output actions are listed in bt_mesh_output_action_t.

The application must provide callbacks for the supported authentication methods in bt_mesh_prov, as well as enabling the supported actions in bt_mesh_prov.output_actions and bt_mesh_prov.input_actions.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the bt_mesh_prov.input_complete or bt_mesh_prov.complete callback is called. If the action is blink, beep or vibrate, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the bt_mesh_prov.input callback. The user response should be fed back to the Provisioning API through bt_mesh_input_string() or bt_mesh_input_number(). If no user response is recorded within 60 seconds, the Provisioning process is aborted.

If Provisionee wants to mandate OOB authentication, it is mandatory to use the BT_MESH_ECDH_P256_HMAC_SHA256_AES_CCM algorithm.

**Data transfer** After the device has been successfully authenticated, the provisioner transfers the Provisioning data:

- Unicast address
- A network key
- IV index
- Network flags
  - Key refresh
  - IV update

6.1. Bluetooth
Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning `bt_mesh_prov.complete` callback gets called.

**Provisioning security** Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI disclosed a set of vulnerabilities in the Bluetooth Mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Bluetooth Mesh Profile Specification v1.0.1 erratum 16350, as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

**API reference**

`group bt_mesh_prov`

Provisioning.

**Enums**

Available authentication algorithms.

- `enumerator BT_MESH_PROV_AUTH_CMAC_AES128_AES_CCM`
- `enumerator BT_MESH_PROV_AUTH_HMAC_SHA256_AES_CCM`

OOB Type field values.

- `enumerator BT_MESH_STATIC_OOB_AVAILABLE = BIT(0)`
  - Static OOB information available.
- `enumerator BT_MESH_OOB_AUTH_REQUIRED = BIT(1)`
  - OOB authentication required.

`enum bt_mesh_output_action_t`

Available Provisioning output authentication actions.

- `enumerator BT_MESH_NO_OUTPUT = 0`
- `enumerator BT_MESH_BLINK = BIT(0)`
  - Blink.
enumerator BT_MESH_BEEP = \textit{BIT}(1)
    Beep.

enumerator BT_MESH_VIBRATE = \textit{BIT}(2)
    Vibrate.

enumerator BT_MESH_DISPLAY_NUMBER = \textit{BIT}(3)
    Output numeric.

enumerator BT_MESH_DISPLAY_STRING = \textit{BIT}(4)
    Output alphanumeric.

\begin{verbatim}
enum bt_mesh_input_action_t
    Available Provisioning input authentication actions.
    Values:

    enumerator BT_MESH_NO_INPUT = 0

    enumerator BT_MESH_PUSH = \textit{BIT}(0)
        Push.

    enumerator BT_MESH_TWIST = \textit{BIT}(1)
        Twist.

    enumerator BT_MESH_ENTER_NUMBER = \textit{BIT}(2)
        Input number.

    enumerator BT_MESH_ENTER_STRING = \textit{BIT}(3)
        Input alphanumeric.
\end{verbatim}

\begin{verbatim}
enum bt_mesh_prov_bearer_t
    Available Provisioning bearers.
    Values:

    enumerator BT_MESH_PROV_ADV = \textit{BIT}(0)
        PB-ADV bearer.

    enumerator BT_MESH_PROV_GATT = \textit{BIT}(1)
        PB-GATT bearer.

    enumerator BT_MESH_PROV_REMOTE = \textit{BIT}(2)
        PB-Remote bearer.
\end{verbatim}

\begin{verbatim}
enum bt_mesh_prov_oob_info_t
    Out of Band information location.
    Values:
\end{verbatim}

6.1. Bluetooth
enumerator BT_MESH_PROV_OOB_OTHER = BIT(0)
   Other.

enumerator BT_MESH_PROV_OOB_URI = BIT(1)
   Electronic / URI.

enumerator BT_MESH_PROV_OOB_2D_CODE = BIT(2)
   2D machine-readable code

enumerator BT_MESH_PROV_OOB_BAR_CODE = BIT(3)
   Bar Code.

enumerator BT_MESH_PROV_OOB_NFC = BIT(4)
   Near Field Communication (NFC)

enumerator BT_MESH_PROV_OOB_NUMBER = BIT(5)
   Number.

enumerator BT_MESH_PROV_OOB_STRING = BIT(6)
   String.

enumerator BT_MESH_PROV_OOB_CERTIFICATE = BIT(7)
   Support for certificate-based provisioning.

enumerator BT_MESH_PROV_OOB_RECORDS = BIT(8)
   Support for provisioning records.

enumerator BT_MESH_PROV_OOB_ON_BOX = BIT(11)
   On box.

enumerator BT_MESH_PROV_OOB_IN_BOX = BIT(12)
   Inside box.

enumerator BT_MESH_PROV_OOB_ON_PAPER = BIT(13)
   On piece of paper.

enumerator BT_MESH_PROV_OOB_IN_MANUAL = BIT(14)
   Inside manual.

enumerator BT_MESH_PROV_OOB_ON_DEV = BIT(15)
   On device.

**Functions**

```c
int bt_mesh_input_string(const char *str)

Provide provisioning input OOB string.

This is intended to be called after the bt_mesh_prov input callback has been called with BT_MESH_ENTER_STRING as the action.
```
Parameters
- str – String.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_input_number(uint32_t num)
Provide provisioning input OOB number.

This is intended to be called after the bt_mesh_prov input callback has been called with BT_MESH_ENTER_NUMBER as the action.

Parameters
- num – Number.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_prov_remote_pub_key_set(const uint8_t public_key[64])
Provide Device public key.

Parameters
- public_key – Device public key in big-endian.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_input(bt_mesh_input_action_t action, uint8_t size)
Use Input OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Input OOB authentication action. When using BT_MESH_PUSH, BT_MESH_TWIST or BT_MESH_ENTER_NUMBER, the bt_mesh_prov::output_number callback is called with a random number that has to be entered on the unprovisioned device.

When using BT_MESH_ENTER_STRING, the bt_mesh_prov::output_string callback is called with a random string that has to be entered on the unprovisioned device.

Parameters
- action – Authentication action used by the unprovisioned device.
- size – Authentication size.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_output(bt_mesh_output_action_t action, uint8_t size)
Use Output OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Output OOB authentication action. The bt_mesh_prov::input callback will be called.

When using BT_MESH_BLINK, BT_MESH_BEEP, BT_MESH_VIBRATE or BT_MESH_DISPLAY_NUMBER, and the application has to call bt_mesh_input_number with the random number indicated by the unprovisioned device.

When using BT_MESHDISPLAY_STRING, the application has to call bt_mesh_input_string with the random string displayed by the unprovisioned device.

Parameters
- **action** – Authentication action used by the unprovisioned device.
- **size** – Authentication size.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_static(const uint8_t *static_val, uint8_t size)
```

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

**Parameters**
- **static_val** – Static OOB value.
- **size** – Static OOB value size.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_none(void)
```

Don't use OOB authentication.

Provisioner only.

Don't use any authentication when provisioning new devices. This is the default behavior.

**Warning:** Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_enable(bt_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

**Parameters**
- **bearers** – Bit-wise or of provisioning bearers.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_disable(bt_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

**Parameters**
- **bearers** – Bit-wise or of provisioning bearers.

**Returns**
Zero on success or (negative) error code otherwise.
int bt_mesh_provision(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t iv_index, uint16_t addr, const uint8_t dev_key[16])

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

Parameters
- **net_key** – Network Key
- **net_idx** – Network Key Index
- **flags** – Provisioning Flags
- **iv_index** – IV Index
- **addr** – Primary element address
- **dev_key** – Device Key

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_provision_adv(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)

Provision a Mesh Node using PB-ADV.

Parameters
- **uuid** – UUID
- **net_idx** – Network Key Index
- **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **attention_duration** – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_provision_gatt(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)

Provision a Mesh Node using PB-GATT.

Parameters
- **uuid** – UUID
- **net_idx** – Network Key Index
- **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **attention_duration** – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_provision_remote(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint16_t net_idx, uint16_t addr)

Provision a Mesh Node using PB-Remote.

Parameters
- **cli** – Remote Provisioning Client Model to provision with.
Reprovisioning can be used to change the device key, unicast address and composition data of another device. The reprovisioning procedure uses the same protocol as normal provisioning, with the same level of security.

There are three tiers of reprovisioning:

a. Refreshing the device key

b. Refreshing the device key and node address. Composition data may change, including the number of elements.

c. Refreshing the device key and composition data, in case the composition data of the target node changed due to a firmware update or a similar procedure.

The target node indicates that its composition data changed by instantiating its composition data page 128. If the number of elements have changed, it may be necessary to move the unicast address of the target node as well, to avoid overlapping addresses.

Note: Changing the unicast addresses of the target node requires changes to all nodes that publish directly to any of the target node's models.

Parameters

- `cli` – Remote Provisioning Client Model to provision on
- `srv` – Remote Provisioning Server to reprovision
- `addr` – Address to assign to remote device. If `addr` is 0, the lowest available address will be chosen.
- `comp_change` – The target node has indicated that its composition data has changed. Note that the target node will reject the update if this isn't true.

Returns

Zero on success or (negative) error code otherwise.
struct bt_mesh_dev_capabilities
#include <main.h> Device Capabilities.

Public Members

uint8_t elem_count
Number of elements supported by the device.

uint16_t algorithms
Supported algorithms and other capabilities.

uint8_t pub_key_type
Supported public key types.

uint8_t oob_type
Supported OOB Types.

bt_mesh_output_action_t output_actions
Supported Output OOB Actions.

bt_mesh_input_action_t input_actions
Supported Input OOB Actions.

uint8_t output_size
Maximum size of Output OOB supported.

uint8_t input_size
Maximum size in octets of Input OOB supported.

struct bt_mesh_prov
#include <main.h> Provisioning properties & capabilities.

Public Members

const uint8_t *uuid
The UUID that’s used when advertising as unprovisioned.

const char *uri
Optional URI.
This will be advertised separately from the unprovisioned beacon, however the unprovisioned beacon will contain a hash of it so the two can be associated by the provisioner.

bt_mesh_prov_oob_info_t oob_info
Out of Band information field.

6.1. Bluetooth
const uint8_t *public_key_be
  Pointer to Public Key in big-endian for OOB public key type support.
  Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this
  parameter.
  Must be used together with bt_mesh_prov::private_key_be.

const uint8_t *private_key_be
  Pointer to Private Key in big-endian for OOB public key type support.
  Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this
  parameter.
  Must be used together with bt_mesh_prov::public_key_be.

const uint8_t *static_val
  Static OOB value.

uint8_t static_val_len
  Static OOB value length.

uint8_t output_size
  Maximum size of Output OOB supported.

uint16_t output_actions
  Supported Output OOB Actions.

uint8_t input_size
  Maximum size of Input OOB supported.

uint16_t input_actions
  Supported Input OOB Actions.

void (*capabilities)(const struct bt_mesh_dev_capabilities *cap)
  Provisioning Capabilities.
  This callback notifies the application that the provisioning capabilities of the un-
  provisioned device has been received.
  The application can consequently call bt_mesh_auth_method_set_<*> to select suit-
  able provisioning oob authentication method.
  When this callback returns, the provisioner will start authentication with the cho-
  sen method.
  Param cap
    capabilities supported by device.

int (*output_number)(bt_mesh_output_action_t act, uint32_t num)
  Output of a number is requested.
  This callback notifies the application that it should output the given number using
  the given action.
  Param act
    Action for outputting the number.
  Param num
    Number to be outputted.
Return
Zero on success or negative error code otherwise

int (*output_string)(const char *str)
Output of a string is requested.
This callback notifies the application that it should display the given string to the user.

Param str
String to be displayed.

Return
Zero on success or negative error code otherwise

int (*input)(bt_mesh_input_action_t act, uint8_t size)
Input is requested.
This callback notifies the application that it should request input from the user using the given action. The requested input will either be a string or a number, and the application needs to consequently call the `bt_mesh_input_string()` or `bt_mesh_input_number()` functions once the data has been acquired from the user.

Param act
Action for inputting data.

Param num
Maximum size of the inputted data.

Return
Zero on success or negative error code otherwise

void (*input_complete)(void)
The other device finished their OOB input.
This callback notifies the application that it should stop displaying its output OOB value, as the other party finished their OOB input.

void (*unprovisioned_beacon)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info, uint32_t *uri_hash)
Unprovisioned beacon has been received.
This callback notifies the application that an unprovisioned beacon has been received.

Param uuid
UUID

Param oob_info
OOB Information

Param uri_hash
Pointer to URI Hash value. NULL if no hash was present in the beacon.

void (*unprovisioned_beacon_gatt)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info)
PB-GATT Unprovisioned Advertising has been received.
This callback notifies the application that an PB-GATT unprovisioned Advertising has been received.

Param uuid
UUID

Param oob_info
OOB Information

void (*link_open)(bt_mesh_prov_bearer_t bearer)
Provisioning link has been opened.
This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

**Param bearer**
Provisioning bearer.

```c
void (*link_close)(bt_mesh_prov_bearer_t bearer)
```
Provisioning link has been closed.
This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

**Param bearer**
Provisioning bearer.

```c
void (*complete)(uint16_t net_idx, uint16_t addr)
```
Provisioning is complete.
This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param addr**
Primary element address.

```c
void (*reprovisioned)(uint16_t addr)
```
Local node has been reprovisioned.
This callback notifies the application that reprovisioning has been successfully completed.

**Param addr**
New primary element address.

```c
void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)
```
A new node has been added to the provisioning database.
This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param uuid**
UUID of the added node

**Param addr**
Primary element address.

**Param num_elem**
Number of elements that this node has.

```c
void (*reset)(void)
```
Node has been reset.
This callback notifies the application that the local node has been reset and needs to be provisioned again. The node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.
Proxy  The Proxy feature allows legacy devices like phones to access the Bluetooth Mesh network through GATT. The Proxy feature is only compiled in if the CONFIG_BT_MESH_GATT_PROXY option is set. The Proxy feature state is controlled by the Configuration Server, and the initial value can be set with bt_mesh_cfg_srv.gatt_proxy.

Nodes with the Proxy feature enabled can advertise with Network Identity and Node Identity, which is controlled by the Configuration Client.

The GATT Proxy state indicates if the Proxy feature is supported.

Private Proxy  A node supporting the Proxy feature and the Private Beacon Server model can advertise with Private Network Identity and Private Node Identity types, which is controlled by the Private Beacon Client. By advertising with this set of identification types, the node allows the legacy device to connect to the network over GATT while maintaining the privacy of the network.

The Private GATT Proxy state indicates whether the Private Proxy functionality is supported.

Proxy Solicitation  In the case where both GATT Proxy and Private GATT Proxy states are disabled on a node, a legacy device cannot connect to it. A node supporting the On-Demand Private Proxy Server may however be solicited to advertise connectable advertising events without enabling the Private GATT Proxy state. To solicit the node, the legacy device can send a Solicitation PDU by calling the bt_mesh_proxy_solicit() function. To enable this feature, the device must be compiled with the CONFIG_BT_MESH_PROXY_SOLICITATION option set.

Solicitation PDUs are non-mesh, non-connectable, undirected advertising messages containing Proxy Solicitation UUID, encrypted with the network key of the subnet that the legacy device wants to connect to. The PDU contains the source address of the legacy device and a sequence number. The sequence number is maintained by the legacy device and is incremented for every new Solicitation PDU sent.

Each node supporting the Solicitation PDU reception holds its own Solicitation Replay Protection List (SRPL). The SRPL protects the solicitation mechanism from replay attacks by storing solicitation sequence number (SSEQ) and solicitation source (SSRC) pairs of valid Solicitation PDUs processed by the node. The delay between updating the SRPL and storing the change to the persistent storage is defined by CONFIG_BT_MESH_RPL_STORE_TIMEOUT.

The Solicitation PDU RPL Configuration models, Solicitation PDU RPL Configuration Client and Solicitation PDU RPL Configuration Server, provide the functionality of saving and clearing SRPL entries. A node that supports the Solicitation PDU RPL Configuration Client model can clear a section of the SRPL on the target by calling the bt_mesh_sol_pdu_rpl_clear() function. Communication between the Solicitation PDU RPL Configuration Client and Server is encrypted using the application key, therefore, the Solicitation PDU RPL Configuration Client can be instantiated on any device in the network.

When the node receives the Solicitation PDU and successfully authenticates it, it will start advertising connectable advertisements with the Private Network Identity type. The duration of the advertisement can be configured by the On-Demand Private Proxy Client model.

API reference

group bt_mesh_proxy

    Proxy.

    Defines
**BT_MESH_PROXY_CB_DEFINE(_name)**

Register a callback structure for Proxy events.

Registers a structure with callback functions that gets called on various Proxy events.

**Parameters**

- `_name` – Name of callback structure.

---

**Functions**

```
int bt_mesh_proxy_identity_enable(void)
Enable advertising with Node Identity.
This API requires that GATT Proxy support has been enabled. Once called each subnet
will start advertising using Node Identity for the next 60 seconds.

**Returns**

- 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_private_identity_enable(void)
Enable advertising with Private Node Identity.
This API requires that GATT Proxy support has been enabled. Once called each subnet
will start advertising using Private Node Identity for the next 60 seconds.

**Returns**

- 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_connect(uint16_t net_idx)
Allow Proxy Client to auto connect to a network.
This API allows a proxy client to auto-connect a given network.

**Parameters**

- `net_idx` – Network Key Index

**Returns**

- 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_disconnect(uint16_t net_idx)
Disallow Proxy Client to auto connect to a network.
This API disallows a proxy client to connect a given network.

**Parameters**

- `net_idx` – Network Key Index

**Returns**

- 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_solicit(uint16_t net_idx)
Schedule advertising of Solicitation PDUs.
Once called, the device will schedule advertising Solicitation PDUs for the amount of
time defined by `adv_int * (CONFIG_BT_MESH_SOL_ADV_XMIT + 1)`, where `adv_int` is 20ms
for Bluetooth v5.0 or higher, or 100ms otherwise.
If the number of advertised Solicitation PDUs reached 0xFFFFFFFF, the advertisements
will no longer be started until the node is reprovisioned.

**Parameters**

- `net_idx` – Network Key Index
Returns
0 on success, or (negative) error code on failure.

struct bt_mesh_proxy_cb
#include <proxy.h> Callbacks for the Proxy feature.
Should be instantiated with BT_MESH_PROXY_CB_DEFINE.

Public Members

void (*identity_enabled)(uint16_t net_idx)
Started sending Node Identity beacons on the given subnet.
Param net_idx
Network index the Node Identity beacons are running on.

void (*identity_disabled)(uint16_t net_idx)
Stopped sending Node Identity beacons on the given subnet.
Param net_idx
Network index the Node Identity beacons were running on.

Heartbeat feature
The Heartbeat feature provides functionality for monitoring Bluetooth Mesh nodes and determining the distance between nodes.
The Heartbeat feature is configured through the Configuration Server model.

Heartbeat messages
Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.
Available Heartbeat feature flags:
- BT_MESH_FEAT_RELAY
- BT_MESH_FEAT_PROXY
- BT_MESH_FEAT_FRIEND
- BT_MESH_FEAT_LOW_POWER

Heartbeat publication
Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:
Periodic publication
The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

Triggered publication
The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.
The two publication types can be combined.
Heartbeat subscription  A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the bt_mesh_hb_cb::recv event handler.

When the Heartbeat subscription period ends, the bt_mesh_hb_cb::sub_end callback gets called.

API reference

**group** bt_mesh_heartbeat

Heartbeat.

**Defines**

BT_MESH_CB_DEFINE(_name)

Register a callback structure for Heartbeat events.

Registers a callback structure that will be called whenever Heartbeat events occur

**Parameters**

- _name – Name of callback structure.

**Functions**

void bt_mesh_hb_pub_get(struct bt_mesh_hb_pub *get)

Get the current Heartbeat publication parameters.

**Parameters**

- get – Heartbeat publication parameters return buffer.

void bt_mesh_hb_sub_get(struct bt_mesh_hb_sub *get)

Get the current Heartbeat subscription parameters.

**Parameters**

- get – Heartbeat subscription parameters return buffer.

struct bt_mesh_hb_pub

#include <heartbeat.h> Heartbeat Publication parameters.

**Public Members**

uint16_t dst

Destination address.

uint16_t count

Remaining publish count.
uint8_t ttl
    Time To Live value.

uint16_t feat
    Bitmap of features that trigger a Heartbeat publication if they change.
    Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY,
    BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER.

uint16_t net_idx
    Network index used for publishing.

uint32_t period
    Publication period in seconds.

struct bt_mesh_hb_sub
    #include <heartbeat.h> Heartbeat Subscription parameters.

**Public Members**

uint32_t period
    Subscription period in seconds.

uint32_t remaining
    Remaining subscription time in seconds.

uint16_t src
    Source address to receive Heartbeats from.

uint16_t dst
    Destination address to received Heartbeats on.

uint16_t count
    The number of received Heartbeat messages so far.

uint8_t min_hops
    Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node.
    A Heartbeat received from an immediate neighbor has hop count = 1.

uint8_t max_hops
    Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node.
    A Heartbeat received from an immediate neighbor has hop count = 1.

struct bt_mesh_hb_cb
    #include <heartbeat.h> Heartbeat callback structure.
Public Members

void (*recv)(const struct bt_mesh_hb_sub *sub, uint8_t hops, uint16_t feat)
Receive callback for heartbeats.

Gets called on every received Heartbeat that matches the current Heartbeat subscription parameters.

**Param sub**
Current Heartbeat subscription parameters.

**Param hops**
The number of hops the Heartbeat was received with.

**Param feat**
The feature set of the publishing node. The value is a bitmap of `BT_MESH_FEAT_RELAY`, `BT_MESH_FEAT_PROXY`, `BT_MESH_FEAT_FRIEND` and `BT_MESH_FEAT_LOW_POWER`.

void (*sub_end)(const struct bt_mesh_hb_sub *sub)
Subscription end callback for heartbeats.

Gets called when the subscription period ends, providing a summary of the received heartbeat messages.

**Param sub**
Current Heartbeat subscription parameters.

void (*pub_sent)(const struct bt_mesh_hb_pub *pub)
Publication sent callback for heartbeats.

Gets called when the heartbeat is successfully published.

**Param pub**
Current Heartbeat publication parameters.

Runtime Configuration  The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth Mesh nodes should generally be configured by a central network configurator device with a Configuration Client model. Each mesh node instantiates a Configuration Server model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can’t rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

**Note:** Runtime configuration changes before the node is provisioned will not be stored in the persistent storage.

API reference

*group* bt_mesh_cfg
Runtime Configuration.

**Defines**

`BT_MESH_KR_NORMAL`
BT_MESH_KR_PHASE_1
BT_MESH_KR_PHASE_2
BT_MESH_KR_PHASE_3

BT_MESH_PRIV_GATT_PROXY_ENABLED
BT_MESH_PRIV_GATT_PROXY_NOT_SUPPORTED
BT_MESH_FRIEND_DISABLED
BT_MESH_FRIEND_ENABLED
BT_MESH_FRIEND_NOT_SUPPORTED
BT_MESH_NODE_IDENTITY_STOPPED
BT_MESH_NODE_IDENTITY_RUNNING
BT_MESH_NODE_IDENTITY_NOT_SUPPORTED
Enums

enum bt_mesh_feat_state
    Bluetooth Mesh feature states.

Values:

enumerator BT_MESH_FEATURE_DISABLED
    Feature is supported, but disabled.

enumerator BT_MESH_FEATURE_ENABLED
    Feature is supported and enabled.

enumerator BT_MESH_FEATURE_NOT_SUPPORTED
    Feature is not supported, and cannot be enabled.

Functions

void bt_mesh_beacon_set(bool beacon)
    Enable or disable sending of the Secure Network Beacon.

Parameters

• beacon – New Secure Network Beacon state.

bool bt_mesh_beacon_enabled(void)
    Get the current Secure Network Beacon state.

Returns

Whether the Secure Network Beacon feature is enabled.

int bt_mesh_priv_beacon_set(enum bt_mesh_feat_state priv_beacon)
    Enable or disable sending of the Mesh Private beacon.

Support for the Private beacon state must be enabled with CONFIG_BT_MESH_PRIV_BEACONS.

Parameters

• priv_beacon – New Mesh Private beacon state. Must be one of BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.

Return values

• 0 – Successfully changed the Mesh Private beacon feature state.
• -ENOTSUP – The Mesh Private beacon feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_priv_beacon_get(void)
    Get the current Mesh Private beacon state.

Returns

The Mesh Private beacon feature state.
void bt_mesh_priv_beacon_update_interval_set(uint8_t interval)

Set the current Mesh Private beacon update interval.

The Mesh Private beacon's randomization value is updated regularly to maintain the node's privacy. The update interval controls how often the beacon is updated, in 10 second increments.

Parameters

- `interval` – Private beacon update interval in 10 second steps, or 0 to update on every beacon transmission.

uint8_t bt_mesh_priv_beacon_update_interval_get(void)

Get the current Mesh Private beacon update interval.

The Mesh Private beacon's randomization value is updated regularly to maintain the node's privacy. The update interval controls how often the beacon is updated, in 10 second increments.

Returns

The Private beacon update interval in 10 second steps, or 0 if the beacon is updated every time it's transmitted.

int bt_mesh_default_ttl_set(uint8_t default_ttl)

Set the default TTL value.

The default TTL value is used when no explicit TTL value is set. Models will use the default TTL value when `bt_mesh_msg_ctx::send_ttl` is `BT_MESH_TTL_DEFAULT`.

Parameters

- `default_ttl` – The new default TTL value. Valid values are 0x00 and 0x02 to `BT_MESH_TTL_MAX`.

Return values

- 0 – Successfully set the default TTL value.
- -EINVAL – Invalid TTL value.

uint8_t bt_mesh_default_ttl_get(void)

Get the current default TTL value.

Returns

The current default TTL value.

int bt_mesh_od_priv_proxy_get(void)

Get the current Mesh On-Demand Private Proxy state.

Return values

- 0 – or positive value represents On-Demand Private Proxy feature state
- -ENOTSUP – The On-Demand Private Proxy feature is not supported.

int bt_mesh_od_priv_proxy_set(uint8_t on_demand_proxy)

Set state of Mesh On-Demand Private Proxy.

Support for the On-Demand Private Proxy state must be enabled with `BT_MESH_OD_PRIV_PROXY_SRV`.

Parameters

- `on_demand_proxy` – New Mesh On-Demand Private Proxy state. Value of 0x00 means that advertising with Private Network Identity cannot be enabled on demand. Values in range 0x01 - 0xFF set interval of this advertising after valid Solicitation PDU is received or client disconnects.

Return values
• 0 – Successfully changed the Mesh On-Demand Private Proxy feature state.
• -ENOTSUP – The On-Demand Private Proxy feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already in the given state.

void *bt_mesh_net_transmit_set(uint8_t xmit)
Set the Network Transmit parameters.
The Network Transmit parameters determine the parameters local messages are transmitted with.

See also:

BT_MESH_TRANSMIT

Parameters
• xmit – New Network Transmit parameters. Use BT_MESH_TRANSMIT for encoding.

uint8_t *bt_mesh_net_transmit_get(void)
Get the current Network Transmit parameters.
The BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT macros can be used to decode the Network Transmit parameters.

Returns
The current Network Transmit parameters.

int *bt_mesh_relay_set(enum bt_mesh_feat_state relay, uint8_t xmit)
Configure the Relay feature.
Enable or disable the Relay feature, and configure the parameters to transmit relayed messages with.
Support for the Relay feature must be enabled through the CONFIG_BT_MESH_RELAY configuration option.

See also:

BT_MESH_TRANSMIT

Parameters
• relay – New Relay feature state. Must be one of BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.
• xmit – New Relay retransmit parameters. Use BT_MESH_TRANSMIT for encoding.

Return values
• 0 – Successfully changed the Relay configuration.
• -ENOTSUP – The Relay feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already using the given parameters.
enum `bt_mesh_feat_state` `bt_mesh_relay_get`(void)
Get the current Relay feature state.

**Returns**
The Relay feature state.

uint8_t `bt_mesh_relay_retransmit_get`(void)
Get the current Relay Retransmit parameters.

The `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT` macros can be used to decode the Relay Retransmit parameters.

**Returns**
The current Relay Retransmit parameters, or 0 if relay is not supported.

int `bt_mesh_gatt_proxy_set`(enum `bt_mesh_feat_state` gatt_proxy)
Enable or disable the GATT Proxy feature.

Support for the GATT Proxy feature must be enabled through the `CONFIG_BT_MESH_GATT_PROXY` configuration option.

**Parameters**
• `gatt_proxy` – New GATT Proxy state. Must be one of `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
• 0 – Successfully changed the GATT Proxy feature state.
• -ENOTSUP – The GATT Proxy feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already in the given state.

enum `bt_mesh_feat_state` `bt_mesh_gatt_proxy_get`(void)
Get the current GATT Proxy state.

**Returns**
The GATT Proxy feature state.

int `bt_mesh_priv_gatt_proxy_set`(enum `bt_mesh_feat_state` priv_gatt_proxy)
Enable or disable the Private GATT Proxy feature.

Support for the Private GATT Proxy feature must be enabled through the `CONFIG_BT_MESH_PRIV_BEACONS` and `CONFIG_BT_MESH_GATT_PROXY` configuration options.

**Parameters**
• `priv_gatt_proxy` – New Private GATT Proxy state. Must be one of `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
• 0 – Successfully changed the Private GATT Proxy feature state.
• -ENOTSUP – The Private GATT Proxy feature is not supported.
• -EINVAL – Invalid parameter.
enum bt_mesh_feat_state bt_mesh_priv_gatt_proxy_get(void)
Get the current Private GATT Proxy state.

Returns
The Private GATT Proxy feature state.

int bt_mesh_friend_set(enum bt_mesh_feat_state friendship)
Enable or disable the Friend feature.
Any active friendships will be terminated immediately if the Friend feature is disabled.
Support for the Friend feature must be enabled through the CONFIG_BT_MESH_FRIEND
configuration option.

Parameters
• friendship – New Friend feature state. Must be one of
  BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.

Return values
• 0 – Successfully changed the Friend feature state.
• -ENOTSUP – The Friend feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_friend_get(void)
Get the current Friend state.

Returns
The Friend feature state.

Frame statistic The frame statistic API allows monitoring the number of received frames over
different interfaces, and the number of planned and succeeded transmission and relaying at-
tems.
The API helps the user to estimate the efficiency of the advertiser configuration parameters and
the scanning ability of the device. The number of the monitored parameters can be easily ex-
tended by customer values.
An application can read out and clean up statistics at any time.

API reference

Functions

void bt_mesh_stat_get(struct bt_mesh_statistic *st)
Get mesh frame handling statistic.

Parameters
• st – BLE mesh statistic.

void bt_mesh_stat_reset(void)
Reset mesh frame handling statistic.
struct bt_mesh_statistic
    #include <statistic.h> The structure that keeps statistics of mesh frames handling.

Public Members

uint32_t rx_adv
    All received frames passed basic validation and decryption.
    Received frames over advertiser.

uint32_t rx_loopback
    Received frames over loopback.

uint32_t rx_proxy
    Received frames over proxy.

uint32_t rx_unknown
    Received over unknown interface.

uint32_t tx_adv_relay_planned
    Counter of frames that were initiated to relay over advertiser bearer.

uint32_t tx_adv_relay_succeeded
    Counter of frames that succeeded relaying over advertiser bearer.

uint32_t tx_local_planned
    Counter of frames that were initiated to send over advertiser bearer locally.

uint32_t tx_local_succeeded
    Counter of frames that succeeded to send over advertiser bearer locally.

uint32_t tx_friend_planned
    Counter of frames that were initiated to send over friend bearer.

uint32_t tx_friend_succeeded
    Counter of frames that succeeded to send over friend bearer.

Bluetooth Mesh Shell  The Bluetooth Mesh shell subsystem provides a set of Bluetooth Mesh shell commands for the Shell module. It allows for testing and exploring the Bluetooth Mesh API through an interactive interface, without having to write an application.

The Bluetooth Mesh shell interface provides access to most Bluetooth Mesh features, including provisioning, configuration, and message sending.

Prerequisites  The Bluetooth Mesh shell subsystem depends on the application to create the composition data and do the mesh initialization.

6.1. Bluetooth  2099
**Application**  The Bluetooth Mesh shell subsystem is most easily used through the Bluetooth Mesh shell application under `tests/bluetooth/mesh_shell`. See *Shell* for information on how to connect and interact with the Bluetooth Mesh shell application.

**Basic usage**  The Bluetooth Mesh shell subsystem adds a single `mesh` command, which holds a set of sub-commands. Every time the device boots up, make sure to call `mesh init` before any of the other Bluetooth Mesh shell commands can be called:

```
uart:~$ mesh init
```

This is done to ensure that all available log will be printed to the shell output.

**Provisioning**  The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To do this the user must provision the device with the default network key and address `0x0001`, execute:

```
uart:~$ mesh prov local 0 0x0001
```

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they’re assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with `mesh prov pb-adv on` or `mesh prov pb-gatt on`. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call `mesh target dst <Addr>`.
- To set the network key index, call `mesh target net <NetKeyIdx>`.
- To set the application key index, call `mesh target app <AppKeyIdx>`.

By default, the transmission parameters are set to send messages to the provisioned address and network key.

**Configuration**  By setting the destination address to the local unicast address (`0x0001` in the `mesh prov local` command above), we can perform self-configuration through any of the *Models* commands.

A good first step is to read out the node’s own composition data:

```
uart:~$ mesh models cfg get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it’s a good idea to add one:

```
uart:~$ mesh models cfg appkey add 0 0
```

**Message sending**  With an application key added (see above), the mesh node’s transition parameters are all valid, and the Bluetooth Mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:
 uart:~$ mesh test net-send 82020100

**Note:** All multibyte fields model messages are in little endian, except the opcode.

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

 uart:~$ mesh target dst 0xffff

With the destination address set to 0xffff, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

**Note:** To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth Mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in subsys/bluetooth/mesh/shell.c, and print the incoming message to the shell in the handler callback.

**Parameter formats**  The Bluetooth Mesh shell commands are parsed with a variety of formats:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integers</td>
<td>The default format unless something else is specified. Can be either decimal or hexadecimal.</td>
<td>1234, 0xabcd01234</td>
</tr>
<tr>
<td>Hexstrings</td>
<td>For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.</td>
<td>deadbeef01234</td>
</tr>
<tr>
<td>Booleans</td>
<td>Boolean values are denoted in the API documentation as <code>&lt;val(off, on)&gt;</code>.</td>
<td>on, off, enabled, disabled, 1, 0</td>
</tr>
</tbody>
</table>

**Commands**  The Bluetooth Mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, `mesh lpn set <value: off, on>`. Mandatory parameters are marked with angle brackets (e.g. `<NetKeyId>`), and optional parameters are marked with square brackets (e.g. `[DstAddr]`).

The Bluetooth Mesh shell commands are divided into the following groups:

- **General configuration**
- **Target**
- **Low Power Node**
- **Testing**
- **Provisioning**
Note: Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling `mesh` without any arguments.

General configuration

`mesh init`  
Initialize the mesh shell. This command must be run before any other mesh command.

`mesh reset-local`  
Reset the local mesh node to its initial unprovisioned state. This command will also clear the Configuration Database (CDB) if present.

Target  
The target commands enables the user to monitor and set the target destination address, network index and application index for the shell. These parameters are used by several commands, like provisioning, Configuration Client, etc.

`mesh target dst [DstAddr]`  
Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell's control.

- `DstAddr`: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

`mesh target net [NetKeyIdx]`  
Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The network key must already be added to the device, either through provisioning or by a Configuration Client.

- `NetKeyIdx`: If present, sets the new network index. If omitted, the current network index is printed.

`mesh target app [AppKeyIdx]`  
Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.
• AppKeyIdx: If present, sets the new application index. If omitted, the current application index is printed.

Low Power Node

mesh lpn set <Val(off, on)>
Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes.
• Val: Sets whether Low Power operation is enabled.

mesh lpn poll
Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

Testing

mesh test net-send <HexString>
Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.
• HexString: Raw hexadecimal representation of the message to send.

mesh test iv-update
Force an IV update.

mesh test iv-update-test <Val(off, on)>
Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.
• Val: Enable or disable the IV update test mode.

mesh test rpl-clear
Clear the replay protection list, forcing the node to forget all received messages.

Warning: Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

Health Server Test

mesh test health-srv add-fault <FaultID>
Register a new Health Server Fault for the Linux Foundation Company ID.
• FaultID: ID of the fault to register (0x0001 to 0xFFFF)
mesh test health-srv del-fault [FaultID]

Remove registered Health Server faults for the Linux Foundation Company ID.

• FaultID: If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

Provisioning To allow a device to broadcast connectable unprovisioned beacons, the CONFIG_BT_MESH_PROVISIONEE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_GATT option.

mesh prov pb-gatt <Val(off, on)>

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.

• Val: Enable or disable provisioning with GATT

To allow a device to broadcast unprovisioned beacons, the CONFIG_BT_MESH_PROVISIONEE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_ADV option.

mesh prov pb-adv <Val(off, on)>

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.

• Val: Enable or disable provisioning with advertiser

To allow a device to provision devices, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_ADV configuration options must be enabled.

mesh prov remote-adv <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.

• UUID: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
• NetKeyIdx: Index of the network key to pass to the device.
• Addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
• AttDur: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

To allow a device to provision devices over GATT, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_GATT_CLIENT configuration options must be enabled.

mesh prov remote-gatt <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>

Provision a nearby device into the mesh. The mesh node starts scanning for connectable advertising for PB-GATT with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.
• **UUID**: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.

• **NetKeyIdx**: Index of the network key to pass to the device.

• **Addr**: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.

• **AttDur**: The duration in seconds the unprovisioned device will identify itself for, if supported. See *Attention state* for details.

```bash
mesh prov uuid [UUID(1-16 hex)]
```

Get or set the mesh node's UUID, used in the unprovisioned beacons.

• **UUID**: If present, new 128-bit UUID value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the current UUID will be printed. To enable this command, the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

```bash
mesh prov input-num <Number>
```

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

• **Number**: Decimal authentication number.

```bash
mesh prov input-str <String>
```

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

• **String**: Unquoted alphanumeric authentication string.

```bash
mesh prov static-oob [Val(1-32 hex)]
```

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning. To enable this command, the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

• **Val**: If present, indicates the new hexadecimal value of the static OOB. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the static OOB value is cleared.

```bash
mesh prov local <NetKeyIdx> <Addr> [IVI]
```

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

• **NetKeyIdx**: Index of the network key to provision.

• **Addr**: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.

• **IVI**: Indicates the current network IV index. Defaults to 0 if omitted.

6.1. Bluetooth
mesh prov beacon-listen <Val(off, on)>
   Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner
device to detect nearby unprovisioned devices and provision them. To enable this
command, the CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.
   • Val: Whether to enable the unprovisioned beacon printing.

mesh prov remote-pub-key <PubKey>
   Provide Device public key.
   • PubKey - Device public key in big-endian.

mesh prov auth-method input <Action> <Size>
   From the provisioner device, instruct the unprovisioned device to use the specified
Input OOB authentication action.
   • Action - Input action. Allowed values:
     – 0 - No input action.
     – 1 - Push action set.
     – 2 - Twist action set.
     – 4 - Enter number action set.
     – 8 - Enter String action set.
   • Size - Authentication size.

mesh prov auth-method output <Action> <Size>
   From the provisioner device, instruct the unprovisioned device to use the specified
Output OOB authentication action.
   • Action - Output action. Allowed values:
     – 0 - No output action.
     – 1 - Blink action set.
     – 2 - Vibrate action set.
     – 4 - Display number action set.
     – 8 - Display String action set.
   • Size - Authentication size.

mesh prov auth-method static <Val(1-16 hex)>
   From the provisioner device, instruct the unprovisioned device to use static OOB au-
thentication, and use the given static authentication value when provisioning.
   • Val - Static OOB value. Providing a hex-string shorter than 32 bytes will populate
the N most significant bytes of the array and zero-pad the rest.

mesh prov auth-method none
   From the provisioner device, don't use any authentication when provisioning new
devices. This is the default behavior.
Proxy  The Proxy Server module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_GATT_PROXY configuration option.

```
mesh proxy identity-enable
  Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.
```

The Proxy Client module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_PROXY_CLIENT configuration option.

```
mesh proxy connect <NetKeyIdx>
  Auto-Connect a nearby proxy server into the mesh.
  • NetKeyIdx: Index of the network key to connect.

mesh proxy disconnect <NetKeyIdx>
  Disconnect the existing proxy connection.
  • NetKeyIdx: Index of the network key to disconnect.

mesh proxy solicit <NetKeyIdx>
  Begin Proxy Solicitation of a subnet. Support of this feature can be enabled through the CONFIG_BT_MESH_PROXY_SOLICITATION configuration option.
  • NetKeyIdx: Index of the network key to send Solicitation PDUs to.
```

Models

**Configuration Client**  The Configuration Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_CFG_CLI configuration option. This is implemented as a separate module (mesh models cfg) inside the mesh models subcommand list. This module will work on any instance of the Configuration Client model if the mentioned shell configuration options is enabled, and as long as the Configuration Client model is present in the model composition of the application. This shell module can be used for configuring itself and other nodes in the mesh network.

The Configuration Client uses general message parameters set by `mesh target dst` and `mesh target net` to target specific nodes. When the Bluetooth Mesh shell node is provisioned, given that the CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE option is enabled with the shell provisioning context initialized, the Configuration Client model targets itself by default. Similarly, when another node has been provisioned by the Bluetooth Mesh shell, the Configuration Client model targets the new node. In most common use-cases, the Configuration Client is depending on the provisioning features and the Configuration database to be fully functional. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and the mesh nodes it provisioned. The following steps are an example of how you can set up a device to start using the Configuration Client commands:

- Initialize the client node (`mesh init`).
- Create the CDB (`mesh cdb create`).
- Provision the local device (`mesh prov local`).
- The shell module should now target itself.
• Monitor the composition data of the local node (mesh models cfg get-comp).
• Configure the local node as desired with the Configuration Client commands.
• Provision other devices (mesh prov beacon-listen) (mesh prov remote-adv) (mesh prov remote-gatt).
• The shell module should now target the newly added node.
• Monitor the newly provisioned nodes and their addresses (mesh cdb show).
• Monitor the composition data of the target device (mesh models cfg get-comp).
• Configure the node as desired with the Configuration Client commands.

mesh models cfg target get
Get the target Configuration server for the Configuration Client model.

mesh models cfg help
Print information for the Configuration Client shell module.

mesh models cfg reset
Reset the target device.

mesh models cfg timeout [Timeout(s)]
Get and set the Config Client model timeout used during message sending.
  • Timeout: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

mesh models cfg get-comp [Page]
Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.
  • Page: The composition data page to request. Defaults to 0 if omitted.

mesh models cfg beacon [Val(off, on)]
Get or set the network beacon transmission.
  • Val: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

mesh models cfg ttl [TTL]
Get or set the default TTL value.
  • TTL: If present, sets the new default TTL value. Legal TTL values are 0x00 and 0x02-0x7f. If omitted, the current default TTL value is printed.
mesh models cfg friend [Val(off, on)]
Get or set the Friend feature.
  • Val: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
    – 0x00: The feature is supported, but disabled.
    – 0x01: The feature is enabled.
    – 0x02: The feature is not supported.

mesh models cfg gatt-proxy [Val(off, on)]
Get or set the GATT Proxy feature.
  • Val: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
    – 0x00: The feature is supported, but disabled.
    – 0x01: The feature is enabled.
    – 0x02: The feature is not supported.

mesh models cfg relay [<Val(off, on)> [<Count> [Int(ms)]]]
Get or set the Relay feature and its parameters.
  • Val: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
    – 0x00: The feature is supported, but disabled.
    – 0x01: The feature is enabled.
    – 0x02: The feature is not supported.
  • Count: Sets the new relay retransmit count if val is on. Ignored if val is off. Legal retransmit count is 0-7. Defaults to 2 if omitted.
  • Int: Sets the new relay retransmit interval in milliseconds if val is on. Legal interval range is 10-320 milliseconds. Ignored if val is off. Defaults to 20 if omitted.

mesh models cfg node-id <NetKeyIdx> [Identity]
Get or set of current Node Identity state of a subnet.
  • NetKeyIdx: The network key index to Get/Set.
  • Identity: If present, sets the identity of Node Identity state.

mesh models cfg polltimeout-get <LPNAddr>
Get current value of the PollTimeout timer of the LPN within a Friend node.
  • LPNAddr Address of Low Power node.
mesh models cfg net-transmit-param [Count <Int(ms)>]

Get or set the network transmit parameters.

• Count: Sets the number of additional network transmits for every sent message. Legal retransmit count is 0-7.
• Int: Sets the new network retransmit interval in milliseconds. Legal interval range is 10-320 milliseconds.

mesh models cfg netkey add <NetKeyIdx> [Key(1-16 hex)]

Add a network key to the target node. Adds the key to the Configuration Database if enabled.

• NetKeyIdx: The network key index to add.
• Key: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

mesh models cfg netkey upd <NetKeyIdx> [Key(1-16 hex)]

Update a network key to the target node.

• NetKeyIdx: The network key index to updated.
• Key: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.

mesh models cfg netkey get

Get a list of known network key indexes.

mesh models cfg netkey del <NetKeyIdx>

Delete a network key from the target node.

• NetKeyIdx: The network key index to delete.

mesh models cfg appkey add <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]

Add an application key to the target node. Adds the key to the Configuration Database if enabled.

• NetKeyIdx: The network key index the application key is bound to.
• AppKeyIdx: The application key index to add.
• Key: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.
**mesh models cfg appkey upd <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]**

Update an application key to the target node.

- **NetKeyIdx**: The network key index the application key is bound to.
- **AppKeyIdx**: The application key index to update.
- **Key**: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.

**mesh models cfg appkey get <NetKeyIdx>**

Get a list of known application key indexes bound to the given network key index.

- **NetKeyIdx**: Network key indexes to get a list of application key indexes from.

**mesh models cfg appkey del <NetKeyIdx> <AppKeyIdx>**

Delete an application key from the target node.

- **NetKeyIdx**: The network key index the application key is bound to.
- **AppKeyIdx**: The application key index to delete.

**mesh models cfg model app-bind <Addr> <AppKeyIdx> <MID> [CID]**

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- **Addr**: Address of the element the model is on.
- **AppKeyIdx**: The application key to bind to the model.
- **MID**: The model ID of the model to bind the key to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg model app-unbind <Addr> <AppKeyIdx> <MID> [CID]**

Unbind an application key from a model.

- **Addr**: Address of the element the model is on.
- **AppKeyIdx**: The application key to unbind from the model.
- **MID**: The model ID of the model to unbind the key from.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg model app-get <ElemAddr> <MID> [CID]**

Get a list of application keys bound to a model.

- **ElemAddr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the bound keys of.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

---

6.1. Bluetooth
mesh models cfg model pub <Addr> <MID> [CID] [<PubAddr> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)>]

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- **Addr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the bound keys of.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- **PubAddr**: The destination address to publish to.
- **AppKeyIdx**: The application key index to publish with.
- **Cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **TTL**: TTL value to publish with (0x00 to 0x07f).
- **PerRes**: Resolution of the publication period steps:
  - 0x00: The Step Resolution is 100 milliseconds
  - 0x01: The Step Resolution is 1 second
  - 0x02: The Step Resolution is 10 seconds
  - 0x03: The Step Resolution is 10 minutes
- **PerSteps**: Number of publication period steps, or 0 to disable periodic publication.
- **Count**: Number of retransmission for each published message (0 to 7).
- **Int**: The interval between each retransmission, in milliseconds. Must be a multiple of 50.

mesh models cfg model pub-va <Addr> <UUID(1-16 hex)> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)> <MID> [CID]

Set the publication parameters of a model.

- **Addr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the bound keys of.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- **UUID**: The destination virtual address to publish to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **AppKeyIdx**: The application key index to publish with.
- **Cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **TTL**: TTL value to publish with (0x00 to 0x07f).
- **PerRes**: Resolution of the publication period steps:
  - 0x00: The Step Resolution is 100 milliseconds

– 0x01: The Step Resolution is 1 second
– 0x02: The Step Resolution is 10 seconds
– 0x03: The Step Resolution is 10 minutes

• PerSteps: Number of publication period steps, or 0 to disable periodic publication.
• Count: Number of retransmission for each published message (0 to 7).
• Int The interval between each retransmission, in milliseconds. Must be a multiple of 50.

**mesh models cfg model sub-add <ElemAddr> <SubAddr> <MID> [CID]**

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

• ElemAddr: Address of the element the model is on.
• SubAddr: 16-bit group address the model should subscribe to (0xc000 to 0xFEFF).
• MID: The model ID of the model to add the subscription to.
• CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg model sub-del <ElemAddr> <SubAddr> <MID> [CID]**

Unsubscribe a model from a group address.

• ElemAddr: Address of the element the model is on.
• SubAddr: 16-bit group address the model should remove from its subscription list (0xc000 to 0xFEFF).
• MID: The model ID of the model to add the subscription to.
• CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg model sub-add-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]**

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

• ElemAddr: Address of the element the model is on.
• LabelUUID: 128-bit label UUID of the virtual address to subscribe to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
• MID: The model ID of the model to add the subscription to.
• CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.
mesh models cfg model sub-del-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]
Unsubscribe a model from a virtual address.
- **ElemAddr**: Address of the element the model is on.
- **LabelUUID**: 128-bit label UUID of the virtual address to remove the subscription of. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-ow <ElemAddr> <SubAddr> <MID> [CID]
Overwrite all model subscriptions with a single new group address.
- **ElemAddr**: Address of the element the model is on.
- **SubAddr**: 16-bit group address the model should added to the subscription list (0xc000 to 0xFEFF).
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-ow-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]
Overwrite all model subscriptions with a single new virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.
- **ElemAddr**: Address of the element the model is on.
- **LabelUUID**: 128-bit label UUID of the virtual address as the new Address to be added to the subscription list. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del-all <ElemAddr> <MID> [CID]
Remove all group and virtual address subscriptions from of a model.
- **ElemAddr**: Address of the element the model is on.
- **MID**: The model ID of the model to Unsubscribe all.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-get <ElemAddr> <MID> [CID]
Get a list of addresses the model subscribes to.
- **ElemAddr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the subscription list of.
• **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg krp <NetKeyIdx> [Phase]**

Get or set the key refresh phase of a subnet.

- **NetKeyIdx**: The identified network key used to Get/Set the current Key Refresh Phase state.
- **Phase**: New Key Refresh Phase. Valid phases are:
  - 0x00: Normal operation; Key Refresh procedure is not active
  - 0x01: First phase of Key Refresh procedure
  - 0x02: Second phase of Key Refresh procedure

**mesh models cfg hb-sub [<Src> <Dst> <Per>]**

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- **Src**: Unicast source address to receive Heartbeat messages from.
- **Dst**: Destination address to receive Heartbeat messages on.
- **Per**: Logarithmic representation of the Heartbeat subscription period:
  - 0: Heartbeat subscription will be disabled.
  - 1 to 17: The node will subscribe to Heartbeat messages for \(2^{(\text{period} - 1)}\) seconds.

**mesh models cfg hb-pub [<Dst> <Count> <Per> <TTL> <Features> <NetKeyIdx>]**

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- **Dst**: Destination address to publish Heartbeat messages to.
- **Count**: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will periodically publish \(2^{(\text{count} - 1)}\) Heartbeat messages.
  - 255: Heartbeat messages will be published periodically indefinitely.
- **Per**: Logarithmic representation of the Heartbeat publication period:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will publish Heartbeat messages every \(2^{(\text{period} - 1)}\) seconds.
- **TTL**: The TTL value to publish Heartbeat messages with (0x00 to 0x7f).
- **Features**: Bitfield of features that should trigger a Heartbeat publication when changed:
  - Bit 0: Relay feature.
  - Bit 1: Proxy feature.
  - Bit 2: Friend feature.
– Bit 3: Low Power feature.
  • NetKeyIdx: Index of the network key to publish Heartbeat messages with.

**Health Client** The Health Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_HEALTH_CLI` configuration option. This is implemented as a separate module (`mesh models health`) inside the `mesh models subcommand list`. This module will work on any instance of the Health Client model if the mentioned shell configuration options is enabled, and as long as one or more Health Client model(s) is present in the model composition of the application. This shell module can be used to trigger interaction between Health Clients and Servers on devices in a Mesh network.

By default, the module will choose the first Health Client instance in the model composition when using the Health Client commands. To choose a specific Health Client instance the user can utilize the commands `mesh models health instance set` and `mesh models health instance get-all`.

The Health Client may use the general messages parameters set by `mesh target dst`, `mesh target net` and `mesh target app` to target specific nodes. If the shell target destination address is set to zero, the targeted Health Client will attempt to publish messages using its configured publication parameters.

```bash
mesh models health instance set <ElemIdx>
```
Set the Health Client model instance to use.
  • `<ElemIdx>`: Element index of Health Client model.

```bash
mesh models health instance get-all
```
Prints all available Health Client model instances on the device.

```bash
mesh models health fault-get <CID>
```
Get a list of registered faults for a Company ID.
  • `<CID>`: Company ID to get faults for.

```bash
mesh models health fault-clear <CID>
```
Clear the list of faults for a Company ID.
  • `<CID>`: Company ID to clear the faults for.

```bash
mesh models health fault-clear-unack <CID>
```
Clear the list of faults for a Company ID without requesting a response.
  • `<CID>`: Company ID to clear the faults for.

```bash
mesh models health fault-test <CID> <TestID>
```
Invoke a self-test procedure, and show a list of triggered faults.
  • `<CID>`: Company ID to perform self-tests for.
  • `<TestID>`: Test to perform.
mesh models health fault-test-unack <CID> <TestID>
Invoke a self-test procedure without requesting a response.
  • CID: Company ID to perform self-tests for.
  • TestID: Test to perform.

mesh models health period-get
Get the current Health Server publish period divisor.

mesh models health period-set <Divisor>
Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{Divisor}}$.
  • Divisor: The new Health Server publish period divisor.

mesh models health period-set-unack <Divisor>
Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{Divisor}}$.
  • Divisor: The new Health Server publish period divisor.

mesh models health attention-get
Get the current Health Server attention state.

mesh models health attention-set <Time(s)>
Enable the Health Server attention state for some time.
  • Time: Duration of the attention state, in seconds (0 to 255)

mesh models health attention-set-unack <Time(s)>
Enable the Health Server attention state for some time without requesting a response.
  • Time: Duration of the attention state, in seconds (0 to 255)

**Binary Large Object (BLOB) Transfer Client model**
The BLOB Transfer Client can be added to the mesh shell by enabling the CONFIG_BT_MESH_BLOB_CLI option, and disabling the CONFIG_BT_MESH_DFU_CLI option.

mesh models blob cli target <Addr>
Add a Target node for the next BLOB transfer.
  • Addr: Unicast address of the Target node’s BLOB Transfer Server model.
mesh models blob cli bounds [Group]

Get the total boundary parameters of all Target nodes.

- **Group**: Optional group address to use when communicating with Target nodes. If omitted, the BLOB Transfer Client will address each Target node individually.

mesh models blob cli tx <Id> <Size> <BlockSizeLog> <ChunkSize> [Group [Mode(push, pull)]]

Perform a BLOB transfer to Target nodes. The BLOB Transfer Client will send a dummy BLOB to all Target nodes, then post a message when the transfer is completed. Note that all Target nodes must first be configured to receive the transfer using the `mesh models blob srv rx` command.

- **Id**: 64-bit BLOB transfer ID.
- **Size**: Size of the BLOB in bytes.
- **BlockSizeLog**: Logarithmic representation of the BLOB’s block size. The final block size will be \(1^{\leq} \text{block size log}\) bytes.
- **ChunkSize**: Chunk size in bytes.
- **Group**: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.
- **Mode**: BLOB transfer mode to use. Must be either push (Push BLOB Transfer Mode) or pull (Pull BLOB Transfer Mode). If omitted, push will be used by default.

mesh models blob cli tx-cancel

Cancel an ongoing BLOB transfer.

mesh models blob cli tx-get [Group]

Determine the progress of a previously running BLOB transfer. Can be used when not performing a BLOB transfer.

- **Group**: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.

mesh models blob cli tx-suspend

Suspend the ongoing BLOB transfer.

mesh models blob cli tx-resume

Resume the suspended BLOB transfer.

mesh models blob cli instance-set <ElemIdx>

Use the BLOB Transfer Client model instance on the specified element when using the other BLOB Transfer Client model commands.

- **ElemIdx**: The element on which to find the BLOB Transfer Client model instance to use.
mesh models blob cli instance-get-all

Get a list of all BLOB Transfer Client model instances on the node.

**BLOB Transfer Server model**  The BLOB Transfer Server can be added to the mesh shell by enabling the `CONFIG_BT_MESH_BLOB_SRV` option. The BLOB Transfer Server model is capable of receiving any BLOB data, but the implementation in the mesh shell will discard the incoming data.

**mesh models blob srv rx <ID> [TimeoutBase(10s steps)>]**

Prepare to receive a BLOB transfer.

- **ID**: 64-bit BLOB transfer ID to receive.
- **TimeoutBase**: Optional additional time to wait for client messages, in 10-second increments.

**mesh models blob srv rx-cancel**

Cancel an ongoing BLOB transfer.

**mesh models blob srv instance-set <ElemIdx>**

Use the BLOB Transfer Server model instance on the specified element when using the other BLOB Transfer Server model commands.

- **ElemIdx**: The element on which to find the BLOB Transfer Server model instance to use.

**mesh models blob srv instance-get-all**

Get a list of all BLOB Transfer Server model instances on the node.

**Firmware Update Client model**  The Firmware Update Client model can be added to the mesh shell by enabling configuration options `CONFIG_BT_MESH_BLOB_CLI` and `CONFIG_BT_MESH_DFU_CLI`. The Firmware Update Client demonstrates the firmware update Distributor role by transferring a dummy firmware update to a set of Target nodes.

**mesh models dfu slot add <Size> <FwID> [Metadata]**

Add a virtual DFU image slot that can be transferred as a DFU image. The image slot will be assigned an image slot index, which is printed as a response, and can be used to reference the slot in other commands. To update the image slot, remove it using the `mesh models dfu slot del` shell command and then add it again.

- **Size**: DFU image slot size in bytes.
- **FwID**: Firmware ID, formatted as a hexstring.
- **Metadata**: Optional firmware metadata, formatted as a hexstring.

**mesh models dfu slot del <SlotIdx>**

Delete the DFU image slot at the given index.

- **SlotIdx**: Index of the slot to delete.
mesh models dfu slot get <SlotIdx>

Get all available information about a DFU image slot.

- SlotIdx: Index of the slot to get.

mesh models dfu cli target <Addr> <ImgIdx>

Add a Target node.

- Addr: Unicast address of the Target node.
- ImgIdx: Image index to address on the Target node.

mesh models dfu cli target-state

Check the DFU Target state of the device at the configured destination address.

mesh models dfu cli target-imgs [<MaxCount>]

Get a list of DFU images on the device at the configured destination address.

- MaxCount: Optional maximum number of images to return. If omitted, there's no limit on the number of returned images.

mesh models dfu cli target-check <SlotIdx> <TargetImgIdx>

Check whether the device at the configured destination address will accept a DFU transfer from the given DFU image slot to the Target node's DFU image at the given index, and what the effect would be.

- SlotIdx: Index of the local DFU image slot to check.
- TargetImgIdx: Index of the Target node's DFU image to check.

mesh models dfu cli send <SlotIdx> [<Group>]

Start a DFU transfer to all added Target nodes.

- SlotIdx: Index of the local DFU image slot to send.
- Group: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Update Client will address each Target node individually.

mesh models dfu cli cancel [<Addr>]

Cancel the DFU procedure at any state on a specific Target node or on all Target nodes. When a Target node address is provided, the Firmware Update Client model will try to cancel the DFU procedure on the provided Target node. Otherwise, the Firmware Update Client model will try to cancel the ongoing DFU procedure on all Target nodes.

- Addr: Optional unicast address of a Target node on which to cancel the DFU procedure.

mesh models dfu cli apply

Apply the most recent DFU transfer on all Target nodes. Can only be called after a DFU transfer is completed.
mesh models dfu cli confirm

Confirm that the most recent DFU transfer was successfully applied on all Target nodes. Can only be called after a DFU transfer is completed and applied.

mesh models dfu cli suspend

Suspend the ongoing DFU transfer.

mesh models dfu cli resume

Resume the suspended DFU transfer.

mesh models dfu cli progress

Check the progress of the current transfer.

mesh models dfu cli instance-set <ElemIdx>

Use the Firmware Update Client model instance on the specified element when using the other Firmware Update Client model commands.

- **ElemIdx**: The element on which to find the Firmware Update Client model instance to use.

mesh models dfu cli instance-get-all

Get a list of all Firmware Update Client model instances on the node.

**Firmware Update Server model** The Firmware Update Server model can be added to the mesh shell by enabling configuration options `CONFIG_BT_MESH_BLOB_SRV` and `CONFIG_BT_MESH_DFU_SRV`. The Firmware Update Server demonstrates the firmware update Target role by accepting any firmware update. The mesh shell Firmware Update Server will discard the incoming firmware data, but otherwise behave as a proper firmware update Target node.

mesh models dfu srv applied

Mark the most recent DFU transfer as applied. Can only be called after a DFU transfer is completed, and the Distributor has requested that the transfer is applied.

As the mesh shell Firmware Update Server doesn't actually apply the incoming firmware image, this command can be used to emulate an applied status, to notify the Distributor that the transfer was successful.

mesh models dfu srv progress

Check the progress of the current transfer.

mesh models dfu srv rx-cancel

Cancel incoming DFU transfer.
mesh models dfu srv instance-set <ElemIdx>

Use the Firmware Update Server model instance on the specified element when using
the other Firmware Update Server model commands.

- **ElemIdx**: The element on which to find the Firmware Update Server model in-
  stance to use.

mesh models dfu srv instance-get-all

Get a list of all Firmware Update Server model instances on the node.

**Firmware Distribution Server model**  The Firmware Distribution Server model commands
can be added to the mesh shell by enabling the CONFIG_BT_MESH_DFD_SRV configuration option.
The shell commands for this model mirror the messages sent to the server by a Firmware Distri-
bution Client model. To use these commands, a Firmware Distribution Server must be instanti-
ated by the application.

mesh models dfd receivers-add <Addr>,<FwIdx>[;<Addr>,<FwIdx>]...  

Add receivers to the Firmware Distribution Server. Supply receivers as a list of
comma-separated addr,fw_idx pairs, separated by semicolons, for example, 0x0001,
0;0x0002,0;0x0004,1. Do not use spaces in the receiver list. Repeated calls to
this command will continue populating the receivers list until mesh models dfd
receivers-delete-all is called.

- **Addr**: Address of the receiving node(s).
- **FwIdx**: Index of the firmware slot to send to Addr.

mesh models dfd receivers-delete-all

Delete all receivers from the server.

mesh models dfd receivers-get <First> <Count>

Get a list of info about firmware receivers.

- **First**: Index of the first receiver to get from the receiver list.
- **Count**: The number of receivers for which to get info.

mesh models dfd capabilities-get

Get the capabilities of the server.

mesh models dfd get

Get information about the current distribution state, phase and the transfer parame-
ters.
Start the firmware distribution.

- **AppKeyIdx**: Application index to use for sending. The common application key should be bound to the Firmware Update and BLOB Transfer models on the Distributor and Target nodes.
- **SlotIdx**: Index of the local image slot to send.
- **Group**: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Distribution Server will address each Target node individually. To keep addressing each Target node individually while changing other arguments, set this argument value to 0.
- **PolicyApply**: Optional field that corresponds to the update policy. Setting this to true will make the Firmware Distribution Server apply the image immediately after the transfer is completed.
- **TTL**: Optional. TTL value to use when sending. Defaults to configured default TTL.
- **TimeoutBase**: Optional additional value used to calculate timeout values in the firmware distribution process, in 10-second increments. See Transfer timeout for information about how timeout_base is used to calculate the transfer timeout. Defaults to 0.
- **XferMode**: Optional BLOB transfer mode. 1 = Push mode (Push BLOB Transfer Mode), 2 = Pull mode (Pull BLOB Transfer Mode). Defaults to Push mode.

**mesh models dfd suspend**

Suspends the ongoing distribution.

**mesh models dfd cancel**

Cancel the ongoing distribution.

**mesh models dfd apply**

Apply the distributed firmware.

**mesh models dfd fw-get <FwID>**

Get information about the firmware image uploaded to the server.

- **FwID**: Firmware ID of the image to get.

**mesh models dfd fw-get-by-idx <Idx>**

Get information about the firmware image uploaded to the server in a specific slot.

- **Idx**: Index of the slot to get the image from.

**mesh models dfd fw-delete <FwID>**

Delete a firmware image from the server.

- **FwID**: Firmware ID of the image to delete.

### 6.1. Bluetooth

2123
mesh models dfd fw-delete-all
   Delete all firmware images from the server.

mesh models dfd instance-set <ElemIdx>
   Use the Firmware Distribution Server model instance on the specified element when
   using the other Firmware Distribution Server model commands.
   • ElemIdx: The element on which to find the Firmware Distribution Server model
     instance to use.

mesh models dfd instance-get-all
   Get a list of all Firmware Distribution Server model instances on the node.

DFU metadata  The DFU metadata commands allow generating metadata that can be used by a
Target node to check the firmware before accepting it. The commands are enabled through the
CONFIG_BT_MESH_DFU_METADATA configuration option.

mesh models dfu metadata comp-clear
   Clear the stored composition data to be used for the Target node.

mesh models dfu metadata comp-add <CID> <ProductID> <VendorID> <Crpl> <Features>
   Create a header of the Composition Data Page 0.
   • CID: Company identifier assigned by Bluetooth SIG.
   • ProductID: Vendor-assigned product identifier.
   • VendorID: Vendor-assigned version identifier.
   • Crpl: The size of the replay protection list.
   • Features: Features supported by the node in bit field format:
     – 0: Relay.
     – 1: Proxy.
     – 2: Friend.
     – 3: Low Power.

mesh models dfu metadata comp-elem-add <Loc> <NumS> <NumV> {<SigMID>|<VndCID> <VndMID>}
   Add element description of the Target node.
   • Loc: Element location.
   • NumS: Number of SIG models instantiated on the element.
   • NumV: Number of vendor models instantiated on the element.
   • SigMID: SIG Model ID.
   • VndCID: Vendor model company identifier.
   • VndMID: Vendor model identifier.
mesh models dfu metadata comp-hash-get [<Key(16 hex)>]

Generate a hash of the stored Composition Data to be used in metadata.

- Key: Optional 128-bit key to be used to generate the hash. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.

mesh models dfu metadata encode <Major> <Minor> <Rev> <BuildNum> <Size> <CoreType> <Hash> <Elems> [<UserData>]

Encode metadata for the DFU.

- Major: Major version of the firmware.
- Minor: Minor version of the firmware.
- Rev: Revision number of the firmware.
- BuildNum: Build number.
- Size: Size of the signed bin file.
- CoreType: New firmware core type:
  - 1: Application core.
  - 2: Network core.
  - 4: Applications specific BLOB.
- Hash: Hash of the composition data generated using mesh models dfu metadata comp-hash-get command.
- Elems: Number of elements on the new firmware.
- UserData: User data supplied with the metadata.

Segmentation and Reassembly (SAR) Configuration Client  The SAR Configuration client is an optional mesh model that can be enabled through the CONFIG_BT_MESH_SAR_CFG_CLI configuration option. The SAR Configuration Client model is used to support the functionality of configuring the behavior of the lower transport layer of a node that supports the SAR Configuration Server model.

mesh models sar tx-get

Send SAR Configuration Transmitter Get message.

mesh models sar tx-set <SegIntStep> <UniRetransCnt> <UniRetransWithoutProgCnt> <UniRetransIntStep> <UniRetransIntInc> <MultiRetransCnt> <MultiRetransInt>

Send SAR Configuration Transmitter Set message.

- SegIntStep: SAR Segment Interval Step state.
- UniRetransCnt: SAR Unicast Retransmissions Count state.
- UniRetransWithoutProgCnt: SAR Unicast Retransmissions Without Progress Count state.
- UniRetransIntStep: SAR Unicast Retransmissions Interval Step state.
- UniRetransIntInc: SAR Unicast Retransmissions Interval Increment state.
- MultiRetransCnt: SAR Multicast Retransmissions Count state.
- MultiRetransInt: SAR Multicast Retransmissions Interval state.
mesh models sar rx-get

Send SAR Configuration Receiver Get message.

mesh models sar rx-set <SegThresh> <AckDelayInc> <DiscardTimeout> <RxSegIntStep> <AckRetransCount>

Send SAR Configuration Receiver Set message.
- SegThresh: SAR Segments Threshold state.
- AckDelayInc: SAR Acknowledgment Delay Increment state.
- DiscardTimeout: SAR Discard Timeout state.
- RxSegIntStep: SAR Receiver Segment Interval Step state.
- AckRetransCount: SAR Acknowledgment Retransmissions Count state.

**Private Beacon Client**  The Private Beacon Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_PRIV_BEACON_CLI` configuration option.

mesh models prb priv-beacon-get

Get the target's Private Beacon state. Possible values:
- 0x00: The node doesn't broadcast Private beacons.
- 0x01: The node broadcasts Private beacons.

mesh models prb priv-beacon-set <Val(off, on)> <RandInt(10s steps)>

Set the target's Private Beacon state.
- Val: Control Private Beacon state.
- RandInt: Random refresh interval (in 10-second steps), or 0 to keep current value.

mesh models prb priv-gatt-proxy-get

Get the target's Private GATT Proxy state. Possible values:
- 0x00: The Private Proxy functionality is supported, but disabled.
- 0x01: The Private Proxy functionality is enabled.
- 0x02: The Private Proxy functionality is not supported.

mesh models prb priv-gatt-proxy-set <Val(off, on)>

Set the target's Private GATT Proxy state.
- Val: New Private GATT Proxy value:
  - 0x00: Disable the Private Proxy functionality.
  - 0x01: Enable the Private Proxy functionality.
mesh models prb priv-node-id-get <NetKeyIdx>

Get the target's Private Node Identity state. Possible values:

- 0x00: The node does not advertise with the Private Node Identity.
- 0x01: The node advertises with the Private Node Identity.
- 0x02: The node doesn't support advertising with the Private Node Identity.
- NetKeyIdx: Network index to get the Private Node Identity state of.

mesh models prb priv-node-id-set <NetKeyIdx> <State>

Set the target's Private Node Identity state.

- NetKeyIdx: Network index to set the Private Node Identity state of.
- State: New Private Node Identity value:
  - 0x00: Stop advertising with the Private Node Identity.
  - 0x01: Start advertising with the Private Node Identity.

Opcodes Aggregator Client

The Opcodes Aggregator client is an optional Bluetooth Mesh model that can be enabled through the CONFIG_BT_MESH_OP_AGG_CLI configuration option. The Opcodes Aggregator Client model is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the Opcodes Aggregator Server model.

mesh models opagg seq-start <ElemAddr>

Start the Opcodes Aggregator Sequence message. This command initiates the context for aggregating messages and sets the destination address for next shell commands to elem_addr.

- ElemAddr: Element address that will process the aggregated opcodes.

mesh models opagg seq-send

Send the Opcodes Aggregator Sequence message. This command completes the procedure, sends the aggregated sequence message to the target node and clears the context.

mesh models opagg seq-abort

Abort the Opcodes Aggregator Sequence message. This command clears the Opcodes Aggregator Client context.

Remote Provisioning Client

The Remote Provisioning Client is an optional Bluetooth Mesh model enabled through the CONFIG_BT_MESH_RPR_CLI configuration option. The Remote Provisioning Client model provides support for remote provisioning of devices into a mesh network by using the Remote Provisioning Server model.

This shell module can be used to trigger interaction between Remote Provisioning Clients and Remote Provisioning Servers on devices in a mesh network.

6.1. Bluetooth
mesh models rpr scan <Timeout(s)> [<UUID(1-16 hex)>]
Start scanning for unprovisioned devices.
  • Timeout: Scan timeout in seconds. Must be at least 1 second.
  • UUID: Device UUID to scan for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, all devices will be reported.

mesh models rpr scan-ext <Timeout(s)> <UUID(1-16 hex)> [<ADType> ... ]
Start the extended scanning for unprovisioned devices.
  • Timeout: Scan timeout in seconds. Valid values from BT_MESH_RPR_EXT_SCAN_TIME_MIN to BT_MESH_RPR_EXT_SCAN_TIME_MAX.
  • UUID: Device UUID to start extended scanning for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
  • ADType: List of AD types to include in the scan report. Must contain 1 to CONFIG_BT_MESH_RPR_AD_TYPES_MAX entries.

mesh models rpr scan-srv [<ADType> ... ]
Start the extended scanning for the Remote Provisioning Server.
  • ADType: List of AD types to include in the scan report. Must contain 1 to CONFIG_BT_MESH_RPR_AD_TYPES_MAX entries.

mesh models rpr scan-caps
Get the scanning capabilities of the Remote Provisioning Server.

mesh models rpr scan-get
Get the current scanning state of the Remote Provisioning Server.

mesh models rpr scan-stop
Stop any ongoing scanning on the Remote Provisioning Server.

mesh models rpr link-get
Get the current link status of the Remote Provisioning Server.

mesh models rpr link-close
Close any open links on the Remote Provisioning Server.
mesh models rpr provision-remote <UUID(1-16 hex)> <NetKeyIdx> <Addr>

Provision a mesh node using the PB-Remote provisioning bearer.

- **UUID**: UUID of the unprovisioned node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **NetKeyIdx**: Network Key Index to give to the unprovisioned node.
- **Addr**: Address to assign to remote device. If addr is 0, the lowest available address will be chosen.

mesh models rpr reprovision-remote <Addr> [::<CompChanged(false, true)>]

Reprovision a mesh node using the PB-Remote provisioning bearer.

- **Addr**: Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **CompChanged**: The Target node has indicated that its Composition Data has changed. Defaults to false.

mesh models rpr instance-set <ElemIdx>

Use the Remote Provisioning Client model instance on the specified element when using the other Remote Provisioning Client model commands.

- **ElemIdx**: The element on which to find the Remote Provisioning Client model instance to use.

mesh models rpr instance-get-all

Get a list of all Remote Provisioning Client model instances on the node.

**Configuration database**

The Configuration database is an optional mesh subsystem that can be enabled through the **CONFIG_BT_MESH_CDB** configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

mesh cdb create [::NetKey(1-16 hex)]

Create a Configuration database.

- **NetKey**: Optional network key value of the primary network key (NetKeyIndex=0). Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Defaults to the default key value if omitted.

mesh cdb clear

Clear all data from the Configuration database.

mesh cdb show

Show all data in the Configuration database.

6.1. Bluetooth
`mesh cdb node-add <UUID(1-16 hex)> <Addr> <ElemCnt> <NetKeyIdx> [DevKey(1-16 hex)]`

Manually add a mesh node to the configuration database. Note that devices provisioned with `mesh provision` and `mesh provision-adv` will be added automatically if the Configuration Database is enabled and created.

- **UUID**: 128-bit hexadecimal UUID of the node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **Addr**: Unicast address of the node, or 0 to automatically choose the lowest available address.
- **ElemCnt**: Number of elements on the node.
- **NetKeyIdx**: The network key the node was provisioned with.
- **DevKey**: Optional 128-bit device key value for the device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

`mesh cdb node-del <Addr>`

Delete a mesh node from the Configuration database. If possible, the node should be reset with `mesh reset` before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- **Addr**: Address of the node to delete.

`mesh cdb subnet-add <NetKeyIdx> [<NetKey(1-16 hex)>]`

Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node’s list of known network keys.

- **NetKeyIdx**: Key index of the network key to add.
- **NetKey**: Optional 128-bit network key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

`mesh cdb subnet-del <NetKeyIdx>`

Delete a network key from the Configuration database.

- **NetKeyIdx**: Key index of the network key to delete.

`mesh cdb app-key-add <NetKeyIdx> <AppKeyIdx> [<AppKey(1-16 hex)>]`

Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node’s list of known application keys.

- **NetKeyIdx**: Network key index the application key is bound to.
- **AppKeyIdx**: Key index of the application key to add.
- **AppKey**: Optional 128-bit application key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.
mesh cdb app-key-del <AppKeyIdx>

Delete an application key from the Configuration database.

- AppKeyIdx: Key index of the application key to delete.

On-Demand Private GATT Proxy Client The On-Demand Private GATT Proxy Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_OD_PRIV_PROXY_CLI configuration option.

mesh models od_priv_proxy od-priv-gatt-proxy [Dur(s)]

Set the On-Demand Private GATT Proxy state on active target, or fetch the value of this state from it.

- Dur: If given, set the state of On-Demand Private GATT Proxy to this value in seconds. Fetch this value otherwise.

Solicitation PDU RPL Client The Solicitation PDU RPL Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_SOL_PDU_RPL_CLI configuration option.

mesh models sol_pdu_rpl sol-pdu-rpl-clear <RngStart> <Ackd> [RngLen]

Clear active target’s solicitation replay protection list (SRPL) in given range of solicitation source (SSRC) addresses.

- RngStart: Start address of the SSRC range.
- Ackd: This argument decides on whether an acknowledged or unacknowledged message will be sent.
- RngLen: Range length for the SSRC addresses to be cleared from the solicitation RPL list. This parameter is optional; if absent, only a single SSRC address will be cleared.

Frame statistic

mesh stat get

Get the frame statistic. The command prints numbers of received frames, as well as numbers of planned and succeeded transmission attempts.

mesh stat clear

Clear all statistics collected before.

Bluetooth Microphone Control

API Reference

group bt_gatt_micp

Microphone Control Profile (MICP)

[Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

**BT_MICP_MIC_DEV_AICS_CNT**

**BT_MICP_ERR_MUTE_DISABLED**
Application error codes.

**BT_MICP_MUTE_UNMUTED**
Microphone Control Profile mute states.

**BT_MICP_MUTE_MUTED**

**BT_MICP_MUTE_DISABLED**

Functions

```c
int bt_micp_mic_dev_register(struct bt_micp_mic_dev_register_param *param)
```
Initialize the Microphone Control Profile Microphone Device.
This will enable the Microphone Control Service instance and make it discoverable by Microphone Controllers.

**Parameters**
- `param` – Pointer to an initialization structure.

**Returns**
0 if success, errno on failure.

```c
int bt_micp_mic_dev_included_get(struct bt_micp_included *included)
```
Get Microphone Device included services.
Returns a pointer to a struct that contains information about the Microphone Device included Audio Input Control Service instances.
Requires that `CONFIG_BT_MICP_MIC_DEV_AICS` is enabled.

**Parameters**
- `included` – Pointer to store the result in.

**Returns**
0 if success, errno on failure.

```c
int bt_micp_mic_dev_unmute(void)
```
Unmute the Microphone Device.

**Returns**
0 on success, GATT error value on fail.

```c
int bt_micp_mic_dev_mute(void)
```
Mute the Microphone Device.

**Returns**
0 on success, GATT error value on fail.

```c
int bt_micp_mic_dev_mute_disable(void)
```
Disable the mute functionality on the Microphone Device.
Can be reenabled by called `bt_micp_mic_dev_mute` or `bt_micp_mic_dev_unmute`. 

2132 Chapter 6. Connectivity
Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_get(void)
Read the mute state on the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_included_get(struct bt_micp_mic_ctlr *mic_ctlr, struct bt_micp_included *included)
Get Microphone Control Profile included services.
Returns a pointer to a struct that contains information about the Microphone Control Profile included services instances, such as pointers to the Audio Input Control Service instances.
Requires that CONFIG_BT_MICP_MIC_CTLR_AICS is enabled.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• included – [out] Pointer to store the result in.

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_conn_get(const struct bt_micp_mic_ctlr *mic_ctlr, struct bt_conn **conn)
Get the connection pointer of a Microphone Controller instance.
Get the Bluetooth connection pointer of a Microphone Controller instance.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• conn – Connection pointer.

Returns
0 if success, errno on failure.

struct bt_micp_mic_ctlr *bt_micp_mic_ctlr_get_by_conn(const struct bt_conn *conn)
Get the volume controller from a connection pointer.
Get the Volume Control Profile Volume Controller pointer from a connection pointer. Only volume controllers that have been initiated via bt_micp_mic_ctlr_discover() can be retrieved.

Parameters
• conn – Connection pointer.

Return values
• Pointer – to a Microphone Control Profile Microphone Controller instance
• NULL – if conn is NULL or if the connection has not done discovery yet

int bt_micp_mic_ctlr_discover(struct bt_conn *conn, struct bt_micp_mic_ctlr **mic_ctlr)
Discover Microphone Control Service.

This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the bt_micp_mic_ctlr_cb::discover callback will notify when it is possible to start remote operations.
Parameters

• conn – The connection to initialize the profile for.
• mic_ctlr – [out] Valid remote instance object on success.

Returns

0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_unmute(struct bt_micp_mic_ctlr *mic_ctlr)
Unmute a remote Microphone Device.

Parameters

• mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_mute(struct bt_micp_mic_ctlr *mic_ctlr)
Mute a remote Microphone Device.

Parameters

• mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_mute_get(struct bt_micp_mic_ctlr *mic_ctlr)
Read the mute state of a remote Microphone Device.

Parameters

• mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_cb_register(struct bt_micp_mic_ctlr_cb *cb)
Registers the callbacks used by Microphone Controller.
This can only be done as the client.

Parameters

• cb – The callback structure.

Returns

0 if success, errno on failure.

struct bt_micp_mic_dev_register_param
#include <micp.h> Register parameters structure for Microphone Control Service.

Public Members

struct bt_micp_mic_dev_cb *cb
Microphone Control Profile callback structure.
struct bt_micp_included

#include <micp.h> Microphone Control Profile included services.

Used for to represent the Microphone Control Profile included service instances, for either a Microphone Controller or a Microphone Device. The instance pointers either represent local service instances, or remote service instances.

### Public Members

- **uint8_t aics_cnt**
  - Number of Audio Input Control Service instances.

- **struct bt_aics **aics**
  - Array of pointers to Audio Input Control Service instances.

struct bt_micp_mic_dev_cb

#include <micp.h>

### Public Members

- **void (*mute)(uint8_t mute)**
  - Callback function for Microphone Device mute.
  - Called when the value is read with `bt_micp_mic_dev_mute_get()`, or if the value is changed by either the Microphone Device or a Microphone Controller.
    - **Param mute**
      - The mute setting of the Microphone Control Service.

struct bt_micp_mic_ctlr_cb

#include <micp.h>

### Public Members

- **void (*mute)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t mute)**
  - Callback function for Microphone Control Profile mute.
  - Called when the value is read, or if the value is changed by either the Microphone Device or a Microphone Controller.
    - **Param mic_ctlr**
      - Microphone Controller instance pointer.
    - **Param err**
      - Error value. 0 on success, GATT error or errno on fail. For notifications, this will always be 0.
    - **Param mute**
      - The mute setting of the Microphone Control Service.

- **void (*discover)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t aics_count)**
  - Callback function for `bt_micp_mic_ctlr_discover()`.
    - **Param mic_ctlr**
      - Microphone Controller instance pointer.
**Param err**  
Error value. 0 on success, GATT error or errno on fail.

**Param aics_count**  
Number of Audio Input Control Service instances on peer device.

```c
void (*mute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
Callback function for Microphone Control Profile mute/unmute.

**Param mic_ctlr**  
Microphone Controller instance pointer.

**Param err**  
Error value. 0 on success, GATT error or errno on fail.

```c
void (*unmute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
Callback function for Microphone Control Profile mute/unmute.

**Param mic_ctlr**  
Microphone Controller instance pointer.

**Param err**  
Error value. 0 on success, GATT error or errno on fail.

---

**Serial Port Emulation (RFCOMM)**

**API Reference**

*group bt_rfcomm*

RFCOMM.

**Typedefs**

typedef enum **bt_rfcomm_role** **bt_rfcomm_role_t**

Role of RFCOMM session and dlc.

Used only by internal APIs

**Enums**

**Values:**

- enumerator **BT_RFCOMM_CHAN_HFP_HF** = 1
- enumerator **BT_RFCOMM_CHAN_HFP_AG**
- enumerator **BT_RFCOMM_CHAN_HSP_AG**
- enumerator **BT_RFCOMM_CHAN_HSP_HS**
- enumerator **BT_RFCOMM_CHAN_SPP**
enum bt_rfcomm_role
    Role of RFCOMM session and dlc.
    Used only by internal APIs
    Values:
    enumerator BT_RFCOMM_ROLE_ACCEPTOR
    enumerator BT_RFCOMM_ROLE_INITIATOR

Functions

int bt_rfcomm_server_register(struct bt_rfcomm_server *server)
    Register RFCOMM server.
    Register RFCOMM server for a channel, each new connection is authorized using the
    accept() callback which in case of success shall allocate the dlc structure to be used by
    the new connection.
    Parameters
    • server – Server structure.
    Returns
    0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_connect(struct bt_conn *conn, struct bt_rfcomm_dlc *dlc, uint8_t
    channel)
    Connect RFCOMM channel.
    Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.
    Parameters
    • conn – Connection object.
    • dlc – Dlc object.
    • channel – Server channel to connect to.
    Returns
    0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_send(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
    Send data to RFCOMM.
    Send data from buffer to the dlc. Length should be less than or equal to mtu.
    Parameters
    • dlc – Dlc object.
    • buf – Data buffer.
    Returns
    Bytes sent in case of success or negative value in case of error.

int bt_rfcomm_dlc_disconnect(struct bt_rfcomm_dlc *dlc)
    Disconnect RFCOMM dlc.
    Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result
    the dlc disconnected() callback is called.
Parameters

- dlc – Dlc object.

Returns

0 in case of success or negative value in case of error.

struct net_buf *bt_rfcomm_create_pdu(struct net_buf_pool *pool)

Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

Parameters

- pool – Which pool to take the buffer from.

Returns

New buffer.

struct bt_rfcomm_dlc_ops

#include <rfcomm.h> RFCOMM DLC operations structure.

Public Members

void (*connected)(struct bt_rfcomm_dlc *dlc)

DLC connected callback.

If this callback is provided it will be called whenever the connection completes.

Param dlc

The dlc that has been connected

void (*disconnected)(struct bt_rfcomm_dlc *dlc)

DLC disconnected callback.

If this callback is provided it will be called whenever the dlc is disconnected, including when a connection gets rejected or cancelled (both incoming and outgoing)

Param dlc

The dlc that has been Disconnected

void (*recv)(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)

DLC recv callback.

Param dlc

The dlc receiving data.

Param buf

Buffer containing incoming data.

struct bt_rfcomm_dlc

#include <rfcomm.h> RFCOMM DLC structure.

struct bt_rfcomm_server

#include <rfcomm.h>

Public Members

uint8_t channel

Server Channel.
int (*accept)(struct bt_conn *conn, struct bt_rfcomm_dlc **dlc)
Server accept callback.
This callback is called whenever a new incoming connection requires authorization.

**Param conn**
The connection that is requesting authorization

**Param dlc**
Pointer to received the allocated dlc

**Return**
0 in case of success or negative value in case of error.

**Bluetooth standard services**

**Battery Service**

**group bt_bas**
Battery Service (BAS)
[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

uint8_t bt_bas_get_battery_level(void)
Read battery level value.
Read the characteristic value of the battery level

**Returns**
The battery level in percent.

int bt_bas_set_battery_level(uint8_t level)
Update battery level value.
Update the characteristic value of the battery level This will send a GATT notification to all current subscribers.

**Parameters**
- **level** – The battery level in percent.

**Returns**
Zero in case of success and error code in case of error.

**Heart Rate Service**

**group bt_hrs**
Heart Rate Service (HRS)
[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**
int bt_hrs_cb_register(struct bt_hrs_cb *cb)
Heart rate service callback register.
This function will register callbacks that will be called in certain events related to Heart
rate service.

Parameters
• cb – Pointer to callbacks structure. Must point to memory that remains
valid until unregistered.

Returns
0 on success

Returns
-EINVAL in case cb is NULL

int bt_hrs_cb_unregister(struct bt_hrs_cb *cb)
Heart rate service callback unregister.
This function will unregister callback from Heart rate service.

Parameters
• cb – Pointer to callbacks structure

Returns
0 on success

Returns
-EINVAL in case cb is NULL

Returns
-ENOENT in case the cb was not found in registered callbacks

int bt_hrs_notify(uint16_t heartrate)
Notify heart rate measurement.
This will send a GATT notification to all current subscribers.

Parameters
• heartrate – The heartrate measurement in beats per minute.

Returns
Zero in case of success and error code in case of error.

struct bt_hrs_cb
#include <hrs.h> Heart rate service callback structure.

Public Members

void (*ntf_changed)(bool enabled)
Heart rate notifications changed.

Param enabled
Flag that is true if notifications were enabled, false if they were disabled.

Immediate Alert Service
Immediate Alert Service (IAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

`BT_IAS_CB_DEFINE(_name)`
Register a callback structure for immediate alert events.

**Parameters**

- `_name` – Name of callback structure.

** Enums **

enum `bt_ias_alert_lvl`

**Values:**

- enumerator `BT_IAS_ALERT_LVL_NO_ALERT`
  No alerting should be done on device.

- enumerator `BT_IAS_ALERT_LVL_MILD_ALERT`
  Device shall alert.

- enumerator `BT_IAS_ALERT_LVL_HIGH_ALERT`
  Device should alert in strongest possible way.

**Functions**

int `bt_iias_local_alert_stop(void)`
Method for stopping alert locally.

**Returns**

Zero in case of success and error code in case of error.

int `bt_iias_client_alert_write(struct bt_conn *conn, enum bt_ias_alert_lvl)`
Set alert level.

**Parameters**

- `conn` – Bluetooth connection object
- `bt_ias_alert_lvl` – Level of alert to write

**Returns**

Zero in case of success and error code in case of error.

int `bt_iias_discover(struct bt_conn *conn)`
Discover Immediate Alert Service.

**Parameters**

- `conn` – Bluetooth connection object
**Returns**  
Zero in case of success and error code in case of error.

```c
int bt_ias_client_cb_register(const struct bt_ias_client_cb *cb)
```

Register Immediate Alert Client callbacks.

**Parameters**

- `cb` – The callback structure

**Returns**  
Zero in case of success and error code in case of error.

```c
struct bt_ias_cb
```

`#include <ias.h>` Immediate Alert Service callback structure.

**Public Members**

```c
void (*no_alert)(void)
```

Callback function to stop alert.  
This callback is called when peer commands to disable alert.

```c
void (*mild_alert)(void)
```

Callback function for alert level value.  
This callback is called when peer commands to alert.

```c
void (*high_alert)(void)
```

Callback function for alert level value.  
This callback is called when peer commands to alert in the strongest possible way.

```c
struct bt_ias_client_cb
```

`#include <ias.h>`

**Public Members**

```c
void (*discover)(struct bt_conn *conn, int err)
```

Callback function for `bt_ias_discover`.  
This callback is called when discovery procedure is complete.

- **Param conn**  
  Bluetooth connection object.

- **Param err**  
  0 on success, ATT error or negative errno otherwise

---

**Object Transfer Service**

*group bt_ots*  
Object Transfer Service (OTS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

**BT_OTS_OBJ_ID_SIZE**
Size of OTS object ID (in bytes).

**BT_OTS_OBJ_ID_MIN**
Minimum allowed value for object ID (except ID for directory listing)

**BT_OTS_OBJ_ID_MAX**
Maximum allowed value for object ID (except ID for directory listing)

**OTS_OBJ_ID_DIR_LIST**
ID of the Directory Listing Object.

**BT_OTS_OBJ_ID_MASK**
Mask for OTS object IDs, preserving the 48 bits.

**BT_OTS_OBJ_ID_STR_LEN**
Length of OTS object ID string (in bytes).

**BT_OTS_OBJ_SET_PROP_DELETE**(prop)
Set **BT_OTS_OBJ_PROP_DELETE** property.

**Parameters**
- prop – Object properties.

**BT_OTS_OBJ_SET_PROP_EXECUTE**(prop)
Set **BT_OTS_OBJ_PROP_EXECUTE** property.

**Parameters**
- prop – Object properties.

**BT_OTS_OBJ_SET_PROP_READ**(prop)
Set **BT_OTS_OBJ_PROP_READ** property.

**Parameters**
- prop – Object properties.

**BT_OTS_OBJ_SET_PROP_WRITE**(prop)
Set **BT_OTS_OBJ_PROP_WRITE** property.

**Parameters**
- prop – Object properties.

**BT_OTS_OBJ_SET_PROP_APPEND**(prop)
Set **BT_OTS_OBJ_PROP_APPEND** property.

**Parameters**
- prop – Object properties.

**BT_OTS_OBJ_SET_PROP_TRUNCATE**(prop)
Set **BT_OTS_OBJ_PROP_TRUNCATE** property.

**Parameters**
- prop – Object properties.
SET BT_OTS_OBJ_PROP_PATCH(prop)
Set $BT_OTS_OBJ_PROP_PATCH$ property.

Parameters
• prop – Object properties.

SET BT_OTS_OBJ_PROP_MARKED(prop)
Set $BT_OTS_OBJ_SET_PROP_MARKED$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_DELETE(prop)
Get $BT_OTS_OBJ_PROP_DELETE$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_EXECUTE(prop)
Get $BT_OTS_OBJ_PROP_EXECUTE$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_READ(prop)
Get $BT_OTS_OBJ_PROP_READ$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_WRITE(prop)
Get $BT_OTS_OBJ_PROP_WRITE$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_APPEND(prop)
Get $BT_OTS_OBJ_PROP_APPEND$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_TRUNCATE(prop)
Get $BT_OTS_OBJ_PROP_TRUNCATE$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_PATCH(prop)
Get $BT_OTS_OBJ_PROP_PATCH$ property.

Parameters
• prop – Object properties.

GET BT_OTS_OBJ_PROP_MARKED(prop)
Get $BT_OTS_OBJ_PROP_MARKED$ property.

Parameters
• prop – Object properties.
BT_OTS_OACP_SET_FEAT_CREATE(feat)
Set \textit{BT\_OTS\_OACP\_SET\_FEAT\_CREATE} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_DELETE(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_DELETE} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_CHECKSUM(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_CHECKSUM} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_EXECUTE(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_EXECUTE} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_READ(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_READ} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_WRITE(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_WRITE} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_APPEND(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_APPEND} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_TRUNCATE(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_TRUNCATE} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_PATCH(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_PATCH} feature.

Parameters
- \texttt{feat} – OTS features.

BT_OTS_OACP_SET_FEAT_ABORT(feat)
Set \textit{BT\_OTS\_OACP\_FEAT\_ABORT} feature.

Parameters
- \texttt{feat} – OTS features.
BT_OTS_OACP_GET_FEAT_CREATE(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_CREATE} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_DELETE(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_DELETE} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_CHECKSUM(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_CHECKSUM} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_EXECUTE(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_EXECUTE} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_READ(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_READ} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_WRITE(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_WRITE} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_APPEND(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_APPEND} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_TRUNCATE(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_TRUNCATE} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_PATCH(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_PATCH} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_GET_FEAT_ABORT(\textit{feat})
Get \textit{BT_OTS_OACP_FEAT_ABORT} feature.

Parameters
\begin{itemize}
  \item \textit{feat} – OTS features.
\end{itemize}
BT_OTS_OLP_SET_FEAT_GO_TO(\texttt{feat})
Set \texttt{BT\_OTS\_OLCP\_FEAT\_GO\_TO} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_SET_FEAT_ORDER(\texttt{feat})
Set \texttt{BT\_OTS\_OLCP\_FEAT\_ORDER} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_SET_FEAT_NUM_REQ(\texttt{feat})
Set \texttt{BT\_OTS\_OLCP\_FEAT\_NUM\_REQ} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_SET_FEAT_CLEAR(\texttt{feat})
Set \texttt{BT\_OTS\_OLCP\_FEAT\_CLEAR} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_GET_FEAT_GO_TO(\texttt{feat})
Get \texttt{BT\_OTS\_OLCP\_GET\_FEAT\_GO\_TO} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_GET_FEAT_ORDER(\texttt{feat})
Get \texttt{BT\_OTS\_OLCP\_GET\_FEAT\_ORDER} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_GET_FEAT_NUM_REQ(\texttt{feat})
Get \texttt{BT\_OTS\_OLCP\_GET\_FEAT\_NUM\_REQ} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OLP_GET_FEAT_CLEAR(\texttt{feat})
Get \texttt{BT\_OTS\_OLCP\_GET\_FEAT\_CLEAR} feature.

\textbf{Parameters}
\begin{itemize}
    \item \texttt{feat} – OTS features.
\end{itemize}

\texttt{BT\_OTS\_DATE\_TIME\_FIELD\_SIZE}

\texttt{BT\_OTS\_STOP}

\texttt{BT\_OTS\_CONTINUE}
Typedefs

typedef int (*bt_ots_client_dirlisting_cb)(struct bt_ots_obj_metadata *meta)

Directory listing object metadata callback.

If a directory listing is decoded using `bt_ots_client_decode_dirlisting()`, this callback will be called for each object in the directory listing.

**Param meta**
The metadata of the decoded object

**Return**
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop the decoding.

Enums

Properties of an OTS object.

**Values:**

enumerator BT_OTS_OBJ_PROP_DELETE = 0
Bit 0 Deletion of this object is permitted.

enumerator BT_OTS_OBJ_PROP_EXECUTE = 1
Bit 1 Execution of this object is permitted.

enumerator BT_OTS_OBJ_PROP_READ = 2
Bit 2 Reading this object is permitted.

enumerator BT_OTS_OBJ_PROP_WRITE = 3
Bit 3 Writing data to this object is permitted.

enumerator BT_OTS_OBJ_PROP_APPEND = 4
Bit 4 Appending data to this object is permitted.

Appending data increases its Allocated Size.

enumerator BT_OTS_OBJ_PROP_TRUNCATE = 5
Bit 5 Truncation of this object is permitted.

enumerator BT_OTS_OBJ_PROP_PATCH = 6
Bit 6 Patching this object is permitted.

Patching this object overwrites some of the object's existing contents.

enumerator BT_OTS_OBJ_PROP_MARKED = 7
Bit 7 This object is a marked object.
Object Action Control Point Feature bits.

Values:

enumerator BTOTS_OACP_FEAT_CREATE = 0
   Bit 0 OACP Create Op Code Supported.

enumerator BTOTS_OACP_FEAT_DELETE = 1
   Bit 1 OACP Delete Op Code Supported

enumerator BTOTS_OACP_FEAT_CHECKSUM = 2
   Bit 2 OACP Calculate Checksum Op Code Supported.

enumerator BTOTS_OACP_FEAT_EXECUTE = 3
   Bit 3 OACP Execute Op Code Supported.

enumerator BTOTS_OACP_FEAT_READ = 4
   Bit 4 OACP Read Op Code Supported.

enumerator BTOTS_OACP_FEAT_WRITE = 5
   Bit 5 OACP Write Op Code Supported.

enumerator BTOTS_OACP_FEAT_APPEND = 6
   Bit 6 Appending Additional Data to Objects Supported

enumerator BTOTS_OACP_FEAT_TRUNCATE = 7
   Bit 7 Truncation of Objects Supported.

enumerator BTOTS_OACP_FEAT_PATCH = 8
   Bit 8 Patching of Objects Supported

enumerator BTOTS_OACP_FEAT_ABORT = 9
   Bit 9 OACP Abort Op Code Supported.

enum bt_ots_oacp_write_op_mode

  Values:

  enumerator BTOTS_OACP_WRITE_OP_MODE_NONE = 0

  enumerator BTOTS_OACP_WRITE_OP_MODE_TRUNCATE = BIT(1)

Object List Control Point Feature bits.

Values:

enumerator BTOTS_OLCP_FEAT_GO_TO = 0
   Bit 0 OLCP Go To Op Code Supported.
enumerator BT_OTSOLER = 1
   Bit 1 OLCP Order Op Code Supported.

enumerator BT_OTS_OLCP_FEAT_NUM_REQ = 2
   Bit 2 OLCP Request Number of Objects Op Code Supported.

enumerator BT_OTS_OLCP_FEAT_CLEAR = 3
   Bit 3 OLCP Clear Marking Op Code Supported.

Object metadata request bit field values.

Values:

enumerator BT_OTS_METADATA_REQ_NAME = BIT(0)
   Request object name.

enumerator BT_OTS_METADATA_REQ_TYPE = BIT(1)
   Request object type.

enumerator BT_OTS_METADATA_REQ_SIZE = BIT(2)
   Request object size.

enumerator BT_OTS_METADATA_REQ_CREATED = BIT(3)
   Request object first created time.

enumerator BT_OTS_METADATA_REQ_MODIFIED = BIT(4)
   Request object last modified time.

enumerator BT_OTS_METADATA_REQ_ID = BIT(5)
   Request object ID.

enumerator BT_OTS_METADATA_REQ_PROPS = BIT(6)
   Request object properties.

enumerator BT_OTS_METADATA_REQ_ALL = 0x7F
   Request all object metadata.

Functions

int bt_ots_obj_add(struct bt_ots *ots, const struct bt_ots_obj_add_param *param)
Add an object to the OTS instance.

This function adds an object to the OTS database. When the object is being added, a
callback obj_created() is called to notify the user about a new object ID.

Parameters

• ots – OTS instance.
• param – Object addition parameters.
Returns
ID of created object in case of success.

Returns
negative value in case of error.

int bt_ots_obj_delete(struct bt_ots *ots, uint64_t id)
Delete an object from the OTS instance.

This function deletes an object from the OTS database. When the object is deleted a
callback obj_deleted() is called to notify the user about this event. At this point, it is
possible to free allocated buffer for object data.

Parameters
• ots – OTS instance.
• id – ID of the object to be deleted (uint48).

Returns
0 in case of success or negative value in case of error.

void *bt_ots_svc_decl_get(struct bt_ots *ots)
Get the service declaration attribute.

This function is enabled for CONFIG_BT_OTS_SECONDARY_SVC configuration. The first
service attribute can be included in any other GATT service.

Parameters
• ots – OTS instance.

Returns
The first OTS attribute instance.

int bt_ots_init(struct bt_ots *ots, struct bt_ots_init_param *ots_init)
Initialize the OTS instance.

Parameters
• ots – OTS instance.
• ots_init – OTS initialization descriptor.

Returns
0 in case of success or negative value in case of error.

struct bt_ots *bt_ots_free_instance_get(void)
Get a free instance of OTS from the pool.

Returns
OTS instance in case of success or NULL in case of error.

int bt_ots_client_register(struct bt_ots_client *ots_inst)
Register an Object Transfer Service Instance.

Register an Object Transfer Service instance discovered on the peer. Call this function
when an OTS instance is discovered (discovery is to be handled by the higher layer).

Parameters

Returns
int 0 if success, ERRNO on failure.
int bt_ots_client_unregister(uint8_t index)
Unregister an Object Transfer Service Instance.

Unregister an Object Transfer Service instance when disconnect from the peer. Call
this function when an ACL using OTS instance is disconnected.

Parameters
• index – [in] Index of OTS instance.

Returns
int 0 if success, ERRNO on failure.

uint8_t bt_ots_client_indicate_handler(struct bt_conn *conn, struct
  bt_gatt_subscribe_params *params, const void
  *data, uint16_t length)

OTS Indicate Handler function.
Set this function as callback for indicate handler when discovering OTS.

Parameters
• conn – Connection object. May be NULL, indicating that the peer is being
  unpaired.
• params – Subscription parameters.
• data – Attribute value data. If NULL then subscription was removed.
• length – Attribute value length.

int bt_ots_client_read_feature(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Read the OTS feature characteristic.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_id(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint64_t
  obj_id)
Select an object by its Object ID.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• obj_id – Object’s ID.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_first(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the first object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.
int bt_ots_client_select_last(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the last object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_next(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the next object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_prev(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the previous object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_metadata(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint8_t metadata)
Read the metadata of the current object.
The metadata are returned in the obj_metadata_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• metadata – Bitfield (BT_OTS_METADATA_REQ_*) of the metadata to read.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Read the data of the current selected object.
This will trigger an OACP read operation for the current size of the object with a 0 offset
and then expect receiving the content via the L2CAP CoC.
The data of the object are returned in the obj_data_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.
int bt_ots_client_write_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn, const void *buf, size_t len, off_t offset, enum bt_ots_oacp_write_op_mode mode)

Write the data of the current selected object.
This will trigger an OACP write operation for the current object with a specified offset and then expect transferring the content via the L2CAP CoC.
The length of the data written to object is returned in the obj_data_written() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• buf – Pointer to the data buffer to be written.
• len – Size of data.
• offset – Offset to write, usually 0.
• mode – Mode Parameter for OACP Write Op Code. See bt_ots_oacp_write_op_mode.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_get_object_checksum(struct bt_ots_client *otc_inst, struct bt_conn *conn, off_t offset, size_t len)

Get the checksum of the current selected object.
This will trigger an OACP calculate checksum operation for the current object with a specified offset and length.
The checksum goes to OACP IND and obj_checksum_calculated() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• offset – Offset to calculate, usually 0.
• len – Len of data to calculate checksum for. May be less than the current object’s size, but shall not be larger.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_decode_dirlisting(uint8_t *data, uint16_t length, bt_ots_client_dirlisting_cb cb)

Decode Directory Listing object into object metadata.
If the Directory Listing object contains multiple objects, then the callback will be called for each of them.

Parameters
• data – The data received for the directory listing object.
• length – Length of the data.
• cb – The callback that will be called for each object.

static inline int bt_ots_obj_id_to_str(uint64_t obj_id, char *str, size_t len)

Converts binary OTS Object ID to string.

Parameters
• **obj_id** – Object ID.

• **str** – Address of user buffer with enough room to store formatted string containing binary Object ID.

• **len** – Length of data to be copied to user string buffer. Refer to BT_OTS_OBJ_ID_STR_LEN about recommended value.

**Returns**
Number of successfully formatted bytes from binary ID.

```c
void bt_ots_metadata_display(struct bt_ots_obj_metadata *metadata, uint16_t count)
```
Displays one or more object metadata as text with LOG_INF.

**Parameters**

• **metadata** – Pointer to the first (or only) metadata in an array.

• **count** – Number of metadata objects to display information of.

```c
struct bt_ots_obj_type
#include <ots.h> Type of an OTS object.
```

```c
struct bt_ots_obj_size
#include <ots.h> Descriptor for OTS Object Size parameter.
```

**Public Members**

```c
uint32_t cur
Current Size.
```

```c
uint32_t alloc
Allocated Size.
```

```c
struct bt_ots_feat
#include <ots.h> Features of the OTS.
```

```c
struct bt_ots_date_time
#include <ots.h> Date and Time structure.
```

```c
struct bt_ots_obj_metadata
#include <ots.h> Metadata of an OTS object.
```
Used by the server as a descriptor for OTS object initialization. Used by the client to present object metadata to the application.

**Public Members**

```c
struct bt_ots_obj_type type
Object Type.
```

```c
struct bt_ots_obj_size size
Object Size.
```
uint32_t props
   Object Properties.

struct bt_ots_obj_add_param
   
   #include <ots.h> Descriptor for OTS object addition.

Public Members

uint32_t size
   Object size to allocate.

struct bt_ots_obj_type type
   Object type.

struct bt_ots_obj_created_desc
   
   #include <ots.h> Descriptor for OTS created object.

   Descriptor for OTS object created by the application. This descriptor is returned by
   bt_ots_cb::obj_created callback which contains further documentation on distinguishing
   between server and client object creation.

Public Members

char *name
   Object name.
   The object name as a NULL terminated string.
   When the server creates a new object the name shall be > 0 and <=
   BT_OTS_OBJ_MAX_NAME_LEN When the client creates a new object the name shall
   be an empty string

struct bt_ots_obj_size size
   Object size.
   bt_ots_obj_size::alloc shall be >= bt_ots_obj_add_param::size
   When the server creates a new object bt_ots_obj_size::cur shall be
   <= bt_ots_obj_add_param::size When the client creates a new object
   bt_ots_obj_size::cur shall be 0

uint32_t props
   Object properties.

struct bt_ots_cb
   
   #include <ots.h> OTS callback structure.

Public Members
int (*obj_created)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const struct bt_ots_obj_add_param *add_param, struct bt_ots_obj_created_desc *created_desc)

Object created callback.

This callback is called whenever a new object is created. Application can reject this request by returning an error when it does not have necessary resources to hold this new object. This callback is also triggered when the server creates a new object with `bt_ots_obj_add()` API.

- **Param ots**
  - OTS instance.
- **Param conn**
  - The connection that is requesting object creation or NULL if object is created by `bt_ots_obj_add()`.
- **Param id**
  - Object ID.
- **Param add_param**
  - Object creation requested parameters.
- **Param created_desc**
  - Created object descriptor that shall be filled by the receiver of this callback.

Return

- 0 in case of success or negative value in case of error.

Return

- `EINVAL` if an invalid parameter is provided
- other negative values are treated as a generic operation failure

int (*obj_deleted)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object deleted callback.

This callback is called whenever an object is deleted. It is also triggered when the server deletes an object with `bt_ots_obj_delete()` API.

- **Param ots**
  - OTS instance.
- **Param conn**
  - The connection that deleted the object or NULL if this request came from the server.
- **Param id**
  - Object ID.

Return

- `EBUSY` if the object is locked. This is generally not expected to be returned by the application as the OTS layer tracks object accesses. An object locked status is returned to the client.
- other negative values in case of error. A generic operation failed status is returned to the client.

void (*obj_selected)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)
Object selected callback.
This callback is called on successful object selection.

**Param ots**
OTS instance.

**Param conn**
The connection that selected new object.

**Param id**
Object ID.

```c
ssize_t (*obj_read)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, void **data, size_t len, off_t offset)
```

Object read callback.
This callback is called multiple times during the Object read operation. OTS module will keep requesting successive Object fragments from the application until the read operation is completed. The end of read operation is indicated by NULL data parameter.

**Param ots**
OTS instance.

**Param conn**
The connection that read object.

**Param id**
Object ID.

**Param data**
In: NULL once the read operations is completed. Out: Next chunk of data to be sent.

**Param len**
Remaining length requested by the client.

**Param offset**
Object data offset.

**Return**
Data length to be sent via data parameter. This value shall be smaller or equal to the len parameter.

**Return**
Negative value in case of an error.

```c
ssize_t (*obj_write)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const void *data, size_t len, off_t offset, size_t rem)
```

Object write callback.
This callback is called multiple times during the Object write operation. OTS module will keep providing successive Object fragments to the application until the write operation is completed. The offset and length of each write fragment is validated by the OTS module to be within the allocated size of the object. The remaining length indicates data length remaining to be written and will decrease each write iteration until it reaches 0 in the last write fragment.

**Param ots**
OTS instance.

**Param conn**
The connection that wrote object.

**Param id**
Object ID.

**Param data**
Next chunk of data to be written.

**Param len**
Length of the current chunk of data in the buffer.

**Param offset**
Object data offset.
Param rem
   Remaining length in the write operation.

Return
   Number of bytes written in case of success, if the number of bytes written
do not match len, -EIO is returned to the L2CAP layer.

Return
   A negative value in case of an error.

Return
   -EINPROGRESS has a special meaning and is unsupported at the moment.
   It should not be returned.

void (*obj_name_written)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const
char *cur_name, const char *new_name)
   Object name written callback.
   This callback is called when the object name is written. This is a notification to the
application that the object name will be updated by the OTS service implementa-
tion.

   Param ots
      OTS instance.

   Param conn
      The connection that wrote object name.

   Param id
      Object ID.

   Param cur_name
      Current object name.

   Param new_name
      New object name.

int (*obj_cal_checksum)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, off_t
offset, size_t len, void **data)
   Object Calculate checksum callback.
   This callback is called when the OACP Calculate Checksum procedure is performed.
   Because object data is opaque to OTS, the application is the only one who knows
where data is and should return pointer of actual object data.

   Param ots
      [in] OTS instance.

   Param conn
      [in] The connection that wrote object.

   Param id
      [in] Object ID.

   Param offset
      [in] The first octet of the object contents need to be calculated.

   Param len
      [in] The length number of octets object name.

   Param data
      [out] Pointer of actual object data.

   Return
      0 to accept, or any negative value to reject.

struct bt_ots_init_param
   #include <ots.h> Descriptor for OTS initialization.

struct bt_ots_client
   #include <ots.h> OTS client instance.
struct bt_ots_client_cb
#include <ots.h> OTS client callback structure.

Public Members

void (*obj_selected)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err)
Callback function when a new object is selected.
Called when the a new object is selected and the current object has changed. The cur_object in ots_inst will have been reset, and metadata should be read again with bt_ots_client_read_object_metadata().

  Param ots_inst
    Pointer to the OTC instance.
  Param conn
    The connection to the peer device.
  Param err
    Error code (bt_ots_olcp_res_code).

int (*obj_data_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, uint32_t offset, uint32_t len, uint8_t *data_p, bool is_complete)
Callback function for the data of the selected object.
Called when the data of the selected object are read using bt_ots_client_read_object_data().

  Param ots_inst
    Pointer to the OTC instance.
  Param conn
    The connection to the peer device.
  Param offset
    Offset of the received data.
  Param len
    Length of the received data.
  Param data_p
    Pointer to the received data.
  Param is_complete
    Indicate if the whole object has been received.

Return
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop reading.

void (*obj_metadata_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err, uint8_t metadata_read)
Callback function for metadata of the selected object.
Called when metadata of the selected object are read using bt_ots_client_read_object_metadata(). Not all of the metadata may have been initialized.

  Param ots_inst
    Pointer to the OTC instance.
  Param conn
    The connection to the peer device.
  Param err
    Error value. 0 on success, GATT error or ERRNO on fail.
  Param metadata_read
    Bitfield of the metadata that was successfully read.
void (*obj_data_written)(struct bt_ots_client *ots_inst, struct bt_conn *conn, size_t len)

Callback function for the data of the write object.
Called when the data of the selected object is written using bt_ots_client_write_object_data().

- **Param ots_inst**: Pointer to the OTC instance.
- **Param conn**: The connection to the peer device.
- **Param len**: Length of the written data.

void (*obj_checksum_calculated)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err, uint32_t checksum)

Callback function when checksum indication is received.
Called when the oacp_ind_handler received response of OP BT_GATT_OTS_OACP_PROC_CHECKSUM_CALC.

- **Param ots_inst**: Pointer to the OTC instance.
- **Param conn**: The connection to the peer device.
- **Param err**: Error code (bt_gatt_ots_oacp_res_code).
- **Param checksum**: Checksum if error code is BT_GATT_OTS_OACP_RES_SUCCESS, otherwise 0.

   Supported Data Stores List.

BT_SDP_ATTR_DATA_EXCHANGE_SPEC
   Data Exchange Specification.

BT_SDP_ATTR_NETWORK
   Network.

BT_SDP_ATTR_FAX_CLASS1_SUPPORT
   Fax Class 1 Support.

BT_SDP_ATTR_REMOTE_AUDIO_VOLUME_CONTROL
   Remote Audio Volume Control.

BT_SDP_ATTR_MCAP_SUPPORTED_PROCEDURES
   MCAP Supported Procedures.

BT_SDP_ATTR_FAX_CLASS20_SUPPORT
   Fax Class 2.0 Support.

BT_SDP_ATTR_SUPPORTED_FORMATS_LIST
   Supported Formats List.

BT_SDP_ATTR_FAX_CLASS2_SUPPORT
   Fax Class 2 Support (vendor-specific)

BT_SDP_ATTR_AUDIO_FEEDBACK_SUPPORT
   Audio Feedback Support.

BT_SDP_ATTR_NETWORK_ADDRESS
   Network Address.

BT_SDP_ATTR_WAP_GATEWAY
   WAP Gateway.

BT_SDP_ATTR_HOME_PAGE_URL
   Homepage URL.
BT_SDP_ATTR_WAP_STACK_TYPE
  WAP Stack Type.

BT_SDP_ATTR_SECURITY_DESC
  Security Description.

BT_SDP_ATTR_NET_ACCESS_TYPE
  Net Access Type.

BT_SDP_ATTR_MAX_NET_ACCESSRATE
  Max Net Access Rate.

BT_SDP_ATTR_IP4_SUBNET
  IPv4 Subnet.

BT_SDP_ATTR_IP6_SUBNET
  IPv6 Subnet.

BT_SDP_ATTR_SUPPORTED_CAPABILITIES
  BIP Supported Capabilities.

BT_SDP_ATTR_SUPPORTED_FEATURES
  BIP Supported Features.

BT_SDP_ATTR_SUPPORTED_FUNCTIONS
  BIP Supported Functions.

BT_SDP_ATTR_TOTAL_IMAGING_DATA_CAPACITY
  BIP Total Imaging Data Capacity.

BT_SDP_ATTR_SUPPORTED_REPOSITORIES
  Supported Repositories.

BT_SDP_ATTR_MAS_INSTANCE_ID
  MAS Instance ID.

BT_SDP_ATTR_SUPPORTED_MESSAGE_TYPES
  Supported Message Types.

BT_SDP_ATTR_PBAP_SUPPORTED_FEATURES
  PBAP Supported Features.

BT_SDP_ATTR_MAP_SUPPORTED_FEATURES
  MAP Supported Features.

BT_SDP_ATTR_SPECIFICATION_ID
  Specification ID.

</table>
The Data representation in SDP PDUs (pps 339, 340 of BT SDP Spec)

These are the exact data type+size descriptor values that go into the PDU buffer.
The datatype (leading 5bits) + size descriptor (last 3 bits) is 8 bits. The size descriptor is critical to extract the right number of bytes for the data value from the PDU.

For most basic types, the datatype+size descriptor is straightforward. However for constructed types and strings, the size of the data is in the next “n” bytes following the 8 bits (datatype+size) descriptor. Exactly what the “n” is specified in the 3 bits of the data size descriptor.

TextString and URLString can be of size $2^{8, 16, 32}$ bytes DataSequence and DataSequenceAlternates can be of size $2^{8, 16, 32}$ The size are computed post-facto in the API and are not known apriori.

BT_SDP_DATA_NIL
   Nil, the null type.

BT_SDP_UINT8
   Unsigned 8-bit integer.

BT_SDP_UINT16
   Unsigned 16-bit integer.

BT_SDP_UINT32
   Unsigned 32-bit integer.

BT_SDP_UINT64
   Unsigned 64-bit integer.

BT_SDP_UINT128
   Unsigned 128-bit integer.

BT_SDP_INT8
   Signed 8-bit integer.

BT_SDP_INT16
   Signed 16-bit integer.
BT_SDP_INT32
   Signed 32-bit integer.

BT_SDP_INT64
   Signed 64-bit integer.

BT_SDP_INT128
   Signed 128-bit integer.

BT_SDP_UUID_UNSPEC
   UUID, unspecified size.

BT_SDP_UUID16
   UUID, 16-bit.

BT_SDP_UUID32
   UUID, 32-bit.

BT_SDP_UUID128
   UUID, 128-bit.

BT_SDP_TEXT_STR_UNSPEC
   Text string, unspecified size.

BT_SDP_TEXT_STR8
   Text string, 8-bit length.

BT_SDP_TEXT_STR16
   Text string, 16-bit length.

BT_SDP_TEXT_STR32
   Text string, 32-bit length.

BT_SDP_BOOL
   Boolean.

BT_SDP_SEQ_UNSPEC
   Data element sequence, unspecified size.

BT_SDP_SEQ8
   Data element sequence, 8-bit length.

BT_SDP_SEQ16
   Data element sequence, 16-bit length.

BT_SDP_SEQ32
   Data element sequence, 32-bit length.
BT_SDP_ALT_UNSPEC
Data element alternative, unspecified size.

BT_SDP_ALT8
Data element alternative, 8-bit length.

BT_SDP_ALT16
Data element alternative, 16-bit length.

BT_SDP_ALT32
Data element alternative, 32-bit length.

BT_SDP_URL_STR_UNSPEC
URL string, unspecified size.

BT_SDP_URL_STR8
URL string, 8-bit length.

BT_SDP_URL_STR16
URL string, 16-bit length.

BT_SDP_URL_STR32
URL string, 32-bit length.

BT_SDP_ARRAY_16(...)
Declare an array of 16-bit elements in an attribute.
BT_SDP_ARRAY_32(...)  
Declare an array of 32-bit elements in an attribute.

BT_SDP_TYPE_SIZE(_type)  
Declare a fixed-size data element header.

Parameters
• _type – Data element header containing type and size descriptors.

BT_SDP_TYPE_SIZE_VAR(_type, _size)  
Declare a variable-size data element header.

Parameters
• _type – Data element header containing type and size descriptors.
• _size – The actual size of the data.

BT_SDP_DATA_ELEM_LIST(...)  
Declare a list of data elements.

BT_SDP_NEW_SERVICE  
SDP New Service Record Declaration Macro.
Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

BT_SDP_LIST(_att_id, _type_size, _data_elem_seq)  
Generic SDP List Attribute Declaration Macro.
Helper macro to declare a list attribute.

Parameters
• _att_id – List Attribute ID.
• _data_elem_seq – Data element sequence for the list.
• _type_size – SDP type and size descriptor.

BT_SDP_SERVICE_ID(_uuid)  
SDP Service ID Attribute Declaration Macro.
Helper macro to declare a service ID attribute.

Parameters
• _uuid – Service ID 16bit UUID.

BT_SDP_SERVICE_NAME(_name)  
SDP Name Attribute Declaration Macro.
Helper macro to declare a service name attribute.

Parameters
• _name – Service name as a string (up to 256 chars).

BT_SDP_SUPPORTED_FEATURES(_features)  
SDP Supported Features Attribute Declaration Macro.
Helper macro to declare supported features of a profile/protocol.

Parameters
• _features – Feature mask as 16bit unsigned integer.
BT_SDP_RECORD(_attrs)

SDP Service Declaration Macro.

Helper macro to declare a service.

**Parameters**

- _attrs – List of attributes for the service record.

**Typedefs**

typedef uint8_t (*bt_sdp_discover_func_t)(struct bt_conn *conn, struct bt_sdp_client_result *result)

Callback type reporting to user that there is a resolved result on remote for given UUID and the result record buffer can be used by user for further inspection.

A function of this type is given by the user to the bt_sdp_discover_params object. It'll be called on each valid record discovery completion for given UUID. When UUID resolution gives back no records then NULL is passed to the user. Otherwise user can get valid record(s) and then the internal hint ‘next record’ is set to false saying the UUID resolution is complete or the hint can be set by caller to true meaning that next record is available for given UUID. The returned function value allows the user to control retrieving follow-up resolved records if any. If the user doesn't want to read more resolved records for given UUID since current record data fulfills its requirements then should return BT_SDP_DISCOVER_UUID_STOP. Otherwise returned value means more subcall iterations are allowable.

**Param conn**

Connection object identifying connection to queried remote.

**Param result**

Object pointing to logical unparsed SDP record collected on base of response driven by given UUID.

**Return**

BT_SDP_DISCOVER_UUID_STOP in case of no more need to read next record data and continue discovery for given UUID. By returning BT_SDP_DISCOVER_UUID_CONTINUE user allows this discovery continuation.

**Enums**

Helper enum to be used as return value of bt_sdp_discover_func_t.

The value informs the caller to perform further pending actions or stop them.

**Values**:

enumerator BT_SDP_DISCOVER_UUID_STOP = 0

eumerator BT_SDP_DISCOVER_UUID_CONTINUE

eenum bt_sdp_proto

Protocols to be asked about specific parameters.

**Values**:
enumerator BT_SDP_PROTO_RFCOMM = 0x0003
enumerator BT_SDP_PROTO_L2CAP = 0x0100

Functions

int bt_sdp_register_service(struct bt_sdp_record *service)
Register a Service Record.

Register a Service Record. Applications can make use of macros such as BT_SDP_DECLARE_SERVICE, BT_SDP_LIST, BT_SDP_SERVICE_ID, BT_SDP_SERVICE_NAME, etc. A service declaration must start with BT_SDP_NEW_SERVICE.

Parameters

• service – Service record declared using BT_SDP_DECLARE_SERVICE.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_discover(struct bt_conn *conn, const struct bt_sdp_discover_params *params)
Allows user to start SDP discovery session.

The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

Parameters

• conn – Object identifying connection to remote.
• params – SDP discovery parameters.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_discover_cancel(struct bt_conn *conn, const struct bt_sdp_discover_params *params)
Release waiting SDP discovery request.

It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

Parameters

• conn – Object identifying connection to remote.
• params – SDP discovery parameters.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_get_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint16_t *param)
Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

Parameters
• **buf** – Original buffered raw record data.
• **proto** – Known protocol to be checked like RFCOMM or L2CAP.
• **param** – On success populated by found parameter value.

Returns
0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.

```c
int bt_sdp_get_addl_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto,
                                 uint8_t param_index, uint16_t *param)
```

Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

Parameters
• **buf** – Original buffered raw record data.
• **proto** – Known protocol to be checked like RFCOMM or L2CAP.
• **param_index** – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It’s value is from 0, 0 means the first matched result, 1 means the second matched result.
• **param** – [out] On success populated by found parameter value.

Returns
0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

```c
int bt_sdp_get_profile_version(const struct net_buf *buf, uint16_t profile, uint16_t *version)
```

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

Parameters
• **buf** – Original buffered raw record data.
• **profile** – Profile family identifier the profile belongs.
• **version** – On success populated by found version number.

Returns
0 on success, negative value if error occurred during processing.

```c
int bt_sdp_get_features(const struct net_buf *buf, uint16_t *features)
```

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

Parameters
• **buf** – Buffer holding original raw record data from remote.
• **features** – On success object to be populated with SupportedFeature mask.

Returns
0 on success if feature found and valid, negative in case any error
struct bt_sdp_data_elem
#include <sdp.h> SDP Generic Data Element Value.

Public Members

uint8_t type
Type of the data element.

uint32_t data_size
Size of the data element.

uint32_t total_size
Total size of the data element.

struct bt_sdp_attribute
#include <sdp.h> SDP Attribute Value.

Public Members

uint16_t id
Attribute ID.

struct bt_sdp_data_elem val
Attribute data.

struct bt_sdp_record
#include <sdp.h> SDP Service Record Value.

Public Members

uint32_t handle
Redundant, for quick ref.

struct bt_sdp_attribute *attrs
Base addr of attr array.

size_t attr_count
Number of attributes.

uint8_t index
Index of the record in LL.

struct bt_sdp_record *next
Next service record.

struct bt_sdp_client_result
#include <sdp.h> Generic SDP Client Query Result data holder.
Public Members

struct net_buf *resp_buf
    buffer containing unparsed SDP record result for given UUID

bool next_record_hint
    flag pointing that there are more result chunks for given UUID

const struct bt_uuid *uuid
    Reference to UUID object on behalf one discovery was started.

struct bt_sdp_discover_params
    #include <sdp.h> Main user structure used in SDP discovery of remote.

Public Members

const struct bt_uuid *uuid
    UUID (service) to be discovered on remote SDP entity.

bt_sdp_discover_func_t func
    Discover callback to be called on resolved SDP record.

struct net_buf_pool *pool
    Memory buffer enabled by user for SDP query results

Bluetooth Audio Volume Control

API Reference

group bt_gatt_vcp
    Volume Control Profile (VCP)
    [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_VCP_VOL_REND_VOCS_CNT

BT_VCP_VOL_REND_AICS_CNT

BT_VCP_ERR_INVALID_COUNTER
    Volume Control Service Error codes.

BT_VCP_ERR_OP_NOT_SUPPORTED
Functions

int bt_vcp_vol_rend_included_get(struct bt_vcp_included *included)
Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

Parameters
  • included – [out] Pointer to store the result in.

Returns
  0 if success, errno on failure.

int bt_vcp_vol_rend_register(struct bt_vcp_vol_rend_register_param *param)
Register the Volume Control Service.

This will register and enable the service and make it discoverable by clients.

Parameters
  • param – Volume Control Service register parameters.

Returns
  0 if success, errno on failure.

int bt_vcp_vol_rend_set_step(uint8_t volume_step)
Set the Volume Control Service volume step size.

Set the value that the volume changes, when changed relatively with e.g. `bt_vcp_vol_rend_vol_down` or `bt_vcp_vol_rend_vol_up`.

This can only be done as the server.

Parameters
  • volume_step – The volume step size (1-255).

Returns
  0 if success, errno on failure.

int bt_vcp_vol_rend_get_state(void)
Get the Volume Control Service volume state.

Returns
  0 if success, errno on failure.

int bt_vcp_vol_rend_get_flags(void)
Get the Volume Control Service flags.

Returns
  0 if success, errno on failure.

int bt_vcp_vol_rend_vol_down(void)
Turn the volume down by one step on the server.

Returns
  0 if success, errno on failure.
int bt_vcp_vol_rend_vol_up(void)
   Turn the volume up by one step on the server.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_down(void)
   Turn the volume down and unmute the server.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_up(void)
   Turn the volume up and unmute the server.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_rend_set_vol(uint8_t volume)
   Set the volume on the server.

   **Parameters**
   • volume – The absolute volume to set.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_rend_unmute(void)
   Unmute the server.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_rend_mute(void)
   Mute the server.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_ctlr_cb_register(struct bt_vcp_vol_ctlr_cb *cb)
   Registers the callbacks used by the Volume Controller.

   **Parameters**
   • cb – The callback structure.

   **Return values**
   • 0 – on success
   • -EINVAL – if cb is NULL
   • -EALREADY – if cb was already registered

int bt_vcp_vol_ctlr_cb_unregister(struct bt_vcp_vol_ctlr_cb *cb)
   Unregisters the callbacks used by the Volume Controller.

   **Parameters**
   • cb – The callback structure.

   **Return values**
   • 0 – on success
   • -EINVAL – if cb is NULL
   • -EALREADY – if cb was not registered
int bt_vcp_vol_ctlr_discover(struct bt_conn *conn, struct bt_vcp_vol_ctlr **vol_ctlr)
   Discover Volume Control Service and included services.

   This will start a GATT discovery and setup handles and subscriptions. This shall be
called once before any other actions can be executed for the peer device, and the
bt_vcp_vol_ctlr_cb::discover callback will notify when it is possible to start remote op-
erations.

   This shall only be done as the client,

   **Parameters**
   • conn – The connection to discover Volume Control Service for.
   • vol_ctlr – [out] Valid remote instance object on success.

   **Returns**
   0 if success, errno on failure.

struct bt_vcp_vol_ctlr *bt_vcp_vol_ctlr_get_by_conn(const struct bt_conn *conn)
   Get the volume controller from a connection pointer.

   Get the Volume Control Profile Volume Controller pointer from a connection pointer.
   Only volume controllers that have been initiated via bt_vcp_vol_ctlr_discover() can be
   retrieved.

   **Parameters**
   • conn – Connection pointer.

   **Return values**
   • Pointer – to a Volume Control Profile Volume Controller instance
   • NULL – if conn is NULL or if the connection has not done discovery yet

int bt_vcp_vol_ctlr_conn_get(const struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_conn **conn)
   Get the connection pointer of a client instance.

   Get the Bluetooth connection pointer of a Volume Control Service client instance.

   **Parameters**
   • vol_ctlr – Volume Controller instance pointer.
   • conn – [out] Connection pointer.

   **Returns**
   0 if success, errno on failure.

int bt_vcp_vol_ctlr_included_get(struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_vcp_included *included)
   Get Volume Control Service included services.

   Returns a pointer to a struct that contains information about the Volume Control Ser-
vie included service instances, such as pointers to the Volume Offset Control Service
(Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

   Requires that CONFIG_BT_VCP_VOL_CTLR_VOCS or CONFIG_BT_VCP_VOL_CTLR_AICS is en-
abled.

   **Parameters**
   • vol_ctlr – Volume Controller instance pointer.
   • included – [out] Pointer to store the result in.

   **Returns**
   0 if success, errno on failure.
int bt_vcp_vol_ctlr_read_state(struct bt_vcp_vol_ctlr *vol_ctlr)

Read the volume state of a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_read_flags(struct bt_vcp_vol_ctlr *vol_ctlr)

Read the volume flags of a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume down one step on a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume up one step on a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume down one step and unmute on a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume up one step and unmute on a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

Returns

0 if success, errno on failure.

int bt_vcp_vol_ctlr_set_vol(struct bt_vcp_vol_ctlr *vol_ctlr, uint8_t volume)

Set the absolute volume on a remote Volume Renderer.

Parameters

• vol_ctlr – Volume Controller instance pointer.

• volume – The absolute volume to set.

Returns

0 if success, errno on failure.
int bt_vcp_vol_ctlr_unmute(struct bt_vcp_vol_ctlr *vol_ctlr)
Unmute a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_mute(struct bt_vcp_vol_ctlr *vol_ctlr)
Mute a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

struct bt_vcp_vol_rend_register_param
#include <vcp.h> Register structure for Volume Control Service.

Public Members

uint8_t step
Initial step size (1-255)

uint8_t mute
Initial mute state (0-1)

uint8_t volume
Initial volume level (0-255)

struct bt_vocs_register_param vocs_param[0]
Register parameters for Volume Offset Control Services.

struct bt_aics_register_param aics_param[0]
Register parameters for Audio Input Control Services.

struct bt_vcp_vol_rend_cb *cb
Volume Control Service callback structure.

struct bt_vcp_included
#include <vcp.h> Volume Control Service included services.

Used for to represent the Volume Control Service included service instances, for either a client or a server. The instance pointers either represent local server instances, or remote service instances.

Public Members

uint8_t vocs_cnt
Number of Volume Offset Control Service instances.
struct bt_vocs **vocs
    Array of pointers to Volume Offset Control Service instances.

uint8_t aics_cnt
    Number of Audio Input Control Service instances.

struct bt_aics **aics
    Array of pointers to Audio Input Control Service instances.

struct bt_vcp_vol_rend_cb
    #include <vcp.h>

Public Members

void (*state)(int err, uint8_t volume, uint8_t mute)
    Callback function for Volume Control Service volume state.
    Called when the value is locally read with bt_vcp_vol_rend_get_state(), or if the state
    is changed by either the Volume Renderer or a remote Volume Controller.
    
    Param err
        Error value. 0 on success, GATT error on positive value or errno on neg-
        ative value.
    
    Param volume
        The volume of the Volume Control Service server.
    
    Param mute
        The mute setting of the Volume Control Service server.

void (*flags)(int err, uint8_t flags)
    Callback function for Volume Control Service flags.
    Called when the value is locally read as the server. Called when the value is re-
    motely read as the client. Called if the value is changed by either the server or
    client.
    
    Param err
        Error value. 0 on success, GATT error on positive value or errno on neg-
        ative value.
    
    Param flags
        The flags of the Volume Control Service server.

struct bt_vcp_vol_ctlr_cb
    #include <vcp.h>

Public Members

void (*state)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t volume, uint8_t mute)
    Callback function for Volume Control Profile volume state.
    Called when the value is remotely read as the Volume Controller. Called if the value
    is changed by either the Volume Renderer or Volume Controller, and notified to the
    to Volume Controller.
    
    Param vol_ctlr
        Volume Controller instance pointer.
**Param err**  
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param volume**  
The volume of the Volume Renderer.

**Param mute**  
The mute setting of the Volume Renderer.

```c
void (*flags)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t flags)
```

Callback function for Volume Control Profile volume flags.

Called when the value is remotely read as the Volume Controller. Called if the value is changed by the Volume Renderer.

A non-zero value indicates the the volume has been changed on the Volume Renderer since it was booted.

- **Param vol_ctlr**  
  Volume Controller instance pointer.

- **Param err**  
  Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param flags**  
  The flags of the Volume Renderer.

```c
void (*discover)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t vocs_count, uint8_t aics_count)
```

Callback function for `bt_vcp_vol_ctlr_discover()`.

This callback is called once the discovery procedure is completed.

- **Param vol_ctlr**  
  Volume Controller instance pointer.

- **Param err**  
  Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param vocs_count**  
  Number of Volume Offset Control Service instances on the remote Volume Renderer.

- **Param aics_count**  
  Number of Audio Input Control Service instances on the remote Volume Renderer.

```c
void (*vol_down)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_down()`.

Called when the volume down procedure is completed.

- **Param vol_ctlr**  
  Volume Controller instance pointer.

- **Param err**  
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_up)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_up()`.

Called when the volume up procedure is completed.

- **Param vol_ctlr**  
  Volume Controller instance pointer.
**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*\texttt{mute})(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
Callback function for \texttt{bt_vcp_vol_ctlr_mute()}. Called when the mute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*\texttt{unmute})(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
Callback function for \texttt{bt_vcp_vol_ctlr_unmute()}. Called when the unmute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*\texttt{vol_down_unmute})(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
Callback function for \texttt{bt_vcp_vol_ctlr_vol_down_unmute()}. Called when the volume down and unmute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*\texttt{vol_up_unmute})(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
Callback function for \texttt{bt_vcp_vol_ctlr_vol_up_unmute()}. Called when the volume up and unmute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*\texttt{vol_set})(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
Callback function for \texttt{bt_vcp_vol_ctlr_vol_set()}. Called when the set absolute volume procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

**Universal Unique Identifiers (UUIDs)**

**API Reference**

6.1. Bluetooth
group bt_uuid

UUIDs.

Defines

BT_UUID_SIZE_16
Size in octets of a 16-bit UUID.

BT_UUID_SIZE_32
Size in octets of a 32-bit UUID.

BT_UUID_SIZE_128
Size in octets of a 128-bit UUID.

BT_UUID_INIT_16(value)
Initialize a 16-bit UUID.

Parameters
• value – 16-bit UUID value in host endianness.

BT_UUID_INIT_32(value)
Initialize a 32-bit UUID.

Parameters
• value – 32-bit UUID value in host endianness.

BT_UUID_INIT_128(value...)
Initialize a 128-bit UUID.

Parameters
• value – 128-bit UUID array values in little-endian format. Can be combined with BT_UUID_128_ENCODE to initialize a UUID from the readable form of UUIDs.

BT_UUID_DECLARE_16(value)
Helper to declare a 16-bit UUID inline.

Parameters
• value – 16-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_32(value)
Helper to declare a 32-bit UUID inline.

Parameters
• value – 32-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_128(value...)
Helper to declare a 128-bit UUID inline.

Parameters
• **value** – 128-bit UUID array values in little-endian format. Can be combined with `BT_UUID_128_ENCODE` to declare a UUID from the readable form of UUIDs.

**Returns**

- Pointer to a generic UUID.

`BT_UUID_16(__u)`
- Helper macro to access the 16-bit UUID from a generic UUID.

`BT_UUID_32(__u)`
- Helper macro to access the 32-bit UUID from a generic UUID.

`BT_UUID_128(__u)`
- Helper macro to access the 128-bit UUID from a generic UUID.

`BT_UUID_128_ENCODE(w32, w1, w2, w3, w48)`
- Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data. Can be combined with `BT_UUID_DECLARE_128` to declare a 128-bit UUID.

Example of how to declare the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E

```
BT_UUID_DECLARE_128(
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Example of how to encode the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID128_ALL,
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Just replace the hyphen by the comma and add `0x` prefixes.

**Parameters**

- `w32` – First part of the UUID (32 bits)
- `w1` – Second part of the UUID (16 bits)
- `w2` – Third part of the UUID (16 bits)
- `w3` – Fourth part of the UUID (16 bits)
- `w48` – Fifth part of the UUID (48 bits)

**Returns**

The comma separated values for UUID 128 initializer that may be used directly as an argument for `BT_UUID_INIT_128` or `BT_UUID_DECLARE_128`.

`BT_UUID_16_ENCODE(w16)`
- Encode 16-bit UUID into array values in little-endian format.

Helper macro to encode 16-bit UUID values into advertising data.

Example of how to encode the UUID 0x180a into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID16_ALL, BT_UUID_16_ENCODE(0x180a))
```

**Parameters**

- `w16` – UUID value (16-bits)
**Returns**

The comma separated values for UUID 16 value that may be used directly as an argument for `BT_DATA_BYTES`.

**BT_UUID_32_ENCODE(w32)**

Encode 32-bit UUID into array values in little-endian format.

Example of how to encode the UUID `0x180a01af` into advertising data.

```c
BT_DATA_BYTES(BT_DATA_UUID32_ALL, BT_UUID_32_ENCODE(0x180a01af))
```

**Parameters**

- `w32` – UUID value (32-bits)

**Returns**

The comma separated values for UUID 32 value that may be used directly as an argument for `BT_DATA_BYTES`.

**BT_UUID_STR_LEN**

Recommended length of user string buffer for Bluetooth UUID.

The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

**BT_UUID_GAP_VAL**

Generic Access UUID value.

**BT_UUID_GAP**

Generic Access.

**BT_UUID_GATT_VAL**

Generic attribute UUID value.

**BT_UUID_GATT**

Generic Attribute.

**BT_UUID_IAS_VAL**

Immediate Alert Service UUID value.

**BT_UUID_IAS**

Immediate Alert Service.

**BT_UUID_LLS_VAL**

Link Loss Service UUID value.

**BT_UUID_LLS**

Link Loss Service.

**BT_UUID_TPS_VAL**

Tx Power Service UUID value.
BT_UUID_TPS
  Tx Power Service.

BT_UUID_CTS_VAL
  Current Time Service UUID value.

BT_UUID_CTS
  Current Time Service.

BT_UUID_RTUS_VAL
  Reference Time Update Service UUID value.

BT_UUID_RTUS
  Reference Time Update Service.

BT_UUID_NDSTS_VAL
  Next DST Change Service UUID value.

BT_UUID_NDSTS
  Next DST Change Service.

BT_UUID_GS_VAL
  Glucose Service UUID value.

BT_UUID_GS
  Glucose Service.

BT_UUID_HTS_VAL
  Health Thermometer Service UUID value.

BT_UUID_HTS
  Health Thermometer Service.

BT_UUID_DIS_VAL
  Device Information Service UUID value.

BT_UUID_DIS
  Device Information Service.

BT_UUID_NAS_VAL
  Network Availability Service UUID value.

BT_UUID_NAS
  Network Availability Service.

BT_UUID_WDS_VAL
  Watchdog Service UUID value.
Zephyr Project Documentation, Release 3.6.99

BT_UUID_WDS
Watchdog Service.

BT_UUID_HRS_VAL
Heart Rate Service UUID value.

BT_UUID_HRS
Heart Rate Service.

BT_UUID_PAS_VAL
Phone Alert Service UUID value.

BT_UUID_PAS
Phone Alert Service.

BT_UUID_BAS_VAL
Battery Service UUID value.

BT_UUID_BAS
Battery Service.

BT_UUID_BPS_VAL
Blood Pressure Service UUID value.

BT_UUID_BPS
Blood Pressure Service.

BT_UUID_ANS_VAL
Alert Notification Service UUID value.

BT_UUID_ANS
Alert Notification Service.

BT_UUID_HIDS_VAL
HID Service UUID value.

BT_UUID_HIDS
HID Service.

BT_UUID_SPS_VAL
Scan Parameters Service UUID value.

BT_UUID_SPS
Scan Parameters Service.

BT_UUID_RSCS_VAL
Running Speed and Cadence Service UUID value.
BT_UUID_RSCS
	Running Speed and Cadence Service.

BT_UUID_AIOS_VAL
	Automation IO Service UUID value.

BT_UUID_AIOS
	Automation IO Service.

BT_UUID_CSC_VAL
	Cycling Speed and Cadence Service UUID value.

BT_UUID_CSC
	Cycling Speed and Cadence Service.

BT_UUID_CPS_VAL
	Cycling Power Service UUID value.

BT_UUID_CPS
	Cycling Power Service.

BT_UUID_LNS_VAL
	Location and Navigation Service UUID value.

BT_UUID_LNS
	Location and Navigation Service.

BT_UUID_ESS_VAL
	Environmental Sensing Service UUID value.

BT_UUID_ESS
	Environmental Sensing Service.

BT_UUID_BCS_VAL
	Body Composition Service UUID value.

BT_UUID_BCS
	Body Composition Service.

BT_UUID_UDS_VAL
	User Data Service UUID value.

BT_UUID_UDS
	User Data Service.

BT_UUID_WSS_VAL
	Weight Scale Service UUID value.
**BT_UUID_WSS**
Weight Scale Service.

**BT_UUID_BMS_VAL**
Bond Management Service UUID value.

**BT_UUID_BMS**
Bond Management Service.
