Note that a tiny shell module can be exposed to test the ivshmem feature by enabling CONFIG_IVSHMEM_SHELL.

ivshmem-v2

Zephyr also supports ivshmem-v2:

This is primarily used for IPC in the Jailhouse hypervisor (e.g. eth_ivshmem_sample). It is also possible to use ivshmem-v2 without Jailhouse by building the Siemens fork of QEMU, and modifying the QEMU launch flags:
https://github.com/siemens/qemu/tree/wip/ivshmem2
API Reference

**group ivshmem**

Inter-VM Shared Memory (ivshmem) reference API.

**Defines**

IVSHMEM_V2_PROTO_UNDEFINED

IVSHMEM_V2_PROTO_NET

**Typedefs**

typedef size_t (*ivshmem_get_mem_f)(const struct device *dev, uintptr_t *memmap)

typedef uint32_t (*ivshmem_get_id_f)(const struct device *dev)

typedef uint16_t (*ivshmem_get_vectors_f)(const struct device *dev)

typedef int (*ivshmem_int_peer_f)(const struct device *dev, uint32_t peer_id, uint16_t vector)

typedef int (*ivshmem_register_handler_f)(const struct device *dev, struct k_poll_signal *signal, uint16_t vector)

**Functions**

size_t ivshmem_get_mem(const struct device *dev, uintptr_t *memmap)

Get the inter-VM shared memory.

**Parameters**

- dev – Pointer to the device structure for the driver instance
- memmap – A pointer to fill in with the memory address

**Returns**

the size of the memory mapped, or 0

uint32_t ivshmem_get_id(const struct device *dev)

Get our VM ID.

**Parameters**

- dev – Pointer to the device structure for the driver instance

**Returns**

our VM ID or 0 if we are not running on doorbell version

uint16_t ivshmem_get_vectors(const struct device *dev)

Get the number of interrupt vectors we can use.

**Parameters**

- dev – Pointer to the device structure for the driver instance
Returns
the number of available interrupt vectors

int ivshmem_int_peer(const struct device *dev, uint32_t peer_id, uint16_t vector)

Interrupt another VM.

Parameters

• dev – Pointer to the device structure for the driver instance
• peer_id – The VM ID to interrupt
• vector – The interrupt vector to use

Returns
0 on success, a negative errno otherwise

int ivshmem_register_handler(const struct device *dev, struct k_poll_signal *signal, uint16_t vector)

Register a vector notification (interrupt) handler.

Note: The returned status, if positive, to a raised signal is the vector that generated the signal. This lets the possibility to the user to have one signal for all vectors, or one per-vector.

Parameters

• dev – Pointer to the device structure for the driver instance
• signal – A pointer to a valid and ready to be signaled struct k_poll_signal. Or NULL to unregister any handler registered for the given vector.
• vector – The interrupt vector to get notification from

Returns
0 on success, a negative errno otherwise

struct ivshmem_driver_api
#include <ivshmem.h>

4.25 Retention System

The retention system provides an API which allows applications to read and write data from and to memory areas or devices that retain the data while the device is powered. This allows for sharing information between different applications or within a single application without losing state information when a device reboots. The stored data should not persist in the event of a power failure (or during some low-power modes on some devices) nor should it be stored to a non-volatile storage like Flash, Electrically Erasable Programmable Read-Only Memory (EEPROM), or battery-backed RAM.

The retention system builds on top of the retained data driver, and adds additional software-level features to it for ensuring the validity of data. Optionally, a magic header can be used to check if the front of the retained data memory section contains this specific value, and an optional checksum (1, 2, or 4-bytes in size) of the stored data can be appended to the end of the data. Additionally, the retention system API allows partitioning of the retained data sections into multiple distinct areas. For example, a 64-byte retained data area could be split up into 4 bytes for a boot mode, 16 bytes for a timestamp, 44 bytes for a last log message. All of these sections can be accessed or updated independently. The prefix and checksum can be set per-instance using devicetree.
4.25.1 Devicetree setup

To use the retention system, a retained data driver must be setup for the board you are using, there is a zephyr driver which can be used which will use some RAM as non-init for this purpose. The retention system is then initialised as a child node of this device 1 or more times - note that the memory region will need to be decremented to account for this reserved portion of RAM. See the following example (examples in this guide are based on the nrf52840dk_nrf52840 board and memory layout):

```c
/ {
    sram@2003FC00 {
        compatible = "zephyr,memory-region", "mmio-sram";
        reg = <0x2003FC00 DT_SIZE_K(1)>;
        zephyr,memory-region = "RetainedMem";
        status = "okay";

        retainedmem {
            compatible = "zephyr,retained-ram";
            status = "okay";
            #address-cells = <1>;
            #size-cells = <1>;
            /* This creates a 256-byte partition */
            retention0: retention@0 {
                compatible = "zephyr,retention";
                status = "okay";

                /* The total size of this area is 256 bytes which includes the prefix and checksum, this means that the usable data storage area is 256 - 3 = 253 bytes */
                reg = <0x0 0x100>;

                /* This is the prefix which must appear at the front of the data */
                prefix = [08 04];

                /* This uses a 1-byte checksum */
                checksum = <1>;
            };

            /* This creates a 768-byte partition */
            retention1: retention@100 {
                compatible = "zephyr,retention";
                status = "okay";

                /* Start position must be after the end of the previous partition. The total size of this area is 768 bytes which includes the prefix and checksum, this means that the usable data storage area is 768 - 6 = 762 bytes */
                reg = <0x100 0x300>;
            }
        }
    }
}
```

(continues on next page)
/* This is the prefix which must appear
   at the front of the data */
prefix = [00 11 55 88 fa bc];

/* If omitted, there will be no
   checksum */

/* Reduce SRAM0 usage by 1KB to account for non-init area */
&sram0 {
  reg = <0x20000000 DT_SIZE_K(255)>;
};

The retention areas can then be accessed using the data retention API (once enabled with CONFIG_RETENTION, which requires that CONFIG_RETAINED_MEM be enabled) by getting the device by using:

```
#include <zephyr/device.h>
#include <zephyr/retention/retention.h>

const struct device *retention1 = DEVICE_DT_GET(DT_NODELABEL(retention1));
const struct device *retention2 = DEVICE_DT_GET(DT_NODELABEL(retention2));
```

When the write function is called, the magic header and checksum (if enabled) will be set on the area, and it will be marked as valid from that point onwards.

### 4.25.2 Boot mode

An addition to the retention subsystem is a boot mode interface, this can be used to dynamically change the state of an application or run a different application with a minimal set of functions when a device is rebooted (an example is to have a buttonless way of entering mcuboot's serial recovery feature from the main application).

To use the boot mode feature, a data retention entry must exist in the device tree, which is dedicated for use as the boot mode selection (the user area data size only needs to be a single byte), and this area be assigned to the chosen node of zephyr,boot-mode. See the following example:

```
/ {
  sram@2003FFFF {
    compatible = "zephyr,memory-region", "mmio-sram";
    reg = <0x2003FFFF 0x1>;
    zephyr,memory-region = "RetainedMem";
    status = "okay";

    retainedmem {
      compatible = "zephyr,retained-ram";
      status = "okay";
      #address-cells = <1>;
      #size-cells = <1>;

      retention0: retention@0 {
```
compatible = "zephyr,retention";
status = "okay";
reg = <0x0 0x1>;
};
};

chosen {
    zephyr,boot-mode = &retention0;
};
}

/* Reduce SRAM0 usage by 1 byte to account for non-init area */
sram0 {
    reg = <0x20000000 0x3FFFF>
};

The boot mode interface can be enabled with CONFIG_RETENTION_BOOT_MODE and then accessed by using the boot mode functions. If using mcuboot with serial recovery, it can be built with CONFIG_MCUBOOT_SERIAL and CONFIG_BOOT_SERIAL_BOOT_MODE enabled which will allow rebooting directly into the serial recovery mode by using:

```c
#include <zephyr/retention/bootmode.h>
#include <zephyr/sys/reboot.h>

bootmode_set(BOOT_MODE_TYPE_BOOTLOADER);
sys_reboot(0);
```

### 4.25.3 API Reference

#### Retention system API

```c
group retention_api
    Retention API.

    Typedefs

typedef ssize_t (*retention_size_api)(const struct device *dev)

typedef int (*retention_is_valid_api)(const struct device *dev)

typedef int (*retention_read_api)(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)

typedef int (*retention_write_api)(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)

typedef int (*retention_clear_api)(const struct device *dev)
```

4.25. Retention System
Functions

ssize_t retention_size(const struct device *dev)

Returns the size of the retention area.

Parameters
• dev – Retention device to use.

Return values
Positive – value indicating size in bytes on success, else negative errno code.

int retention_is_valid(const struct device *dev)

Checks if the underlying data in the retention area is valid or not.

Parameters
• dev – Retention device to use.

Return values
• 1 – If successful and data is valid.
• 0 – If data is not valid.
• -ENOTSUP – If there is no header/checksum configured for the retention area.
• -errno – Error code code.

int retention_read(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)

Reads data from the retention area.

Parameters
• dev – Retention device to use.
• offset – Offset to read data from.
• buffer – Buffer to store read data in.
• size – Size of data to read.

Return values
• 0 – If successful.
• -errno – Error code code.

int retention_write(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)

Writes data to the retention area (underlying data does not need to be cleared prior to writing), once function returns with a success code, the data will be classed as valid if queried using retention_is_valid().

Parameters
• dev – Retention device to use.
• offset – Offset to write data to.
• buffer – Data to write.
• size – Size of data to be written.

Return values
0 – on success else negative errno code.

int retention_clear(const struct device *dev)

Clears all data in the retention area (sets it to 0)

Parameters
• dev – Retention device to use.
Return values
0 – on success else negative errno code.

struct retention_api
#include <retention.h>

Boot mode interface

group boot_mode_interface
  Boot mode interface.

Enums

enum BOOT_MODE_TYPES

Values:

enumerator BOOT_MODE_TYPE_NORMAL = 0x00
Default (normal) boot, to user application.

enumerator BOOT_MODE_TYPE_BOOTLOADER
Bootloader boot mode (e.g. serial recovery for MCUboot)

Functions

int bootmode_check(uint8_t boot_mode)
Checks if the boot mode of the device is set to a specific value.

Parameters

• boot_mode – Expected boot mode to check.

Return values

• 1 – If successful and boot mode matches.
• 0 – If boot mode does not match.
• -errno – Error code code.

int bootmode_set(uint8_t boot_mode)
Sets boot mode of device.

Parameters

• boot_mode – Boot mode value to set.

Return values

• 0 – If successful.
• -errno – Error code code.

int bootmode_clear(void)
Clear boot mode value (sets to 0) - which corresponds to BOOT_MODE_TYPE_NORMAL.

Return values

4.25. Retention System
• 0 – If successful.
• -errno – Error code code.

4.26 Real Time I/O (RTIO)

- Problem
- Inspiration, introducing io_uring
- Submission Queue
- Completion Queue
- Executor
- IO Device
- Cancellation
- Memory pools
- When to Use
- Examples
  - Chained Blocking Requests
  - Non blocking device to device
  - Nested iodevs for Devices on Buses (Sensors), Theoretical
- API Reference
  - MPSC Lock-free Queue API
  - SPSC Lock-free Queue API

RTIO provides a framework for doing asynchronous operation chains with event driven I/O. This section covers the RTIO API, queues, executor, iodev, and common usage patterns with peripheral devices.
RTIO takes a lot of inspiration from Linux's io_uring in its operations and API as that API matches up well with hardware transfer queues and descriptions such as DMA transfer lists.

### 4.26.1 Problem

An application wishing to do complex DMA or interrupt driven operations today in Zephyr requires direct knowledge of the hardware and how it works. There is no understanding in the DMA API of other Zephyr devices and how they relate.

This means doing complex audio, video, or sensor streaming requires direct hardware knowledge or leaky abstractions over DMA controllers. Neither is ideal.

To enable asynchronous operations, especially with DMA, a description of what to do rather than direct operations through C and callbacks is needed. Enabling DMA features such as channels with priority, and sequences of transfers requires more than a simple list of descriptions.

Using DMA and/or interrupt driven I/O shouldn’t dictate whether or not the call is blocking or not.

### 4.26.2 Inspiration, introducing io_uring

It’s better not to reinvent the wheel (or ring in this case) and io_uring as an API from the Linux kernel provides a winning model. In io_uring there are two lock-free ring buffers acting as queues shared between the kernel and a userland application. One queue for submission entries which may be chained and flushed to create concurrent sequential requests. A second queue for completion queue events. Only a single syscall is actually required to execute many operations, the io_uring_submit call. This call may block the caller when a number of operations to wait on is given.

This model maps well to DMA and interrupt driven transfers. A request to do a sequence of operations in an asynchronous way directly relates to the way hardware typically works with interrupt driven state machines potentially involving multiple peripheral IPs like bus and DMA controllers.

### 4.26.3 Submission Queue

The submission queue (sq), is the description of the operations to perform in concurrent chains.

For example imagine a typical SPI transfer where you wish to write a register address to then read from. So the sequence of operations might be . . .

1. Chip Select
2. Clock Enable
3. Write register address into SPI transmit register
4. Read from the SPI receive register into a buffer
5. Disable clock
6. Disable Chip Select

If anything in this chain of operations fails give up. Some of those operations can be embodied in a device abstraction that understands a read or write implicitly means setup the clock and chip select. The transactional nature of the request also needs to be embodied in some manner. Of the operations above perhaps the read could be done using DMA as its large enough make sense. That requires an understanding of how to setup the device's particular DMA to do so.

The above sequence of operations is embodied in RTIO as chain of submission queue entries (sqe). Chaining is done by setting a bitflag in an sqe to signify the next sqe must wait on the current one.

Because the chip select and clocking is common to a particular SPI controller and device on the bus it is embodied in what RTIO calls an iodev.
Multiple operations against the same iodev are done in the order provided as soon as possible. If two operation chains have varying points using the same device its possible one chain will have to wait for another to complete.

4.26.4 Completion Queue

In order to know when a sqe has completed there is a completion queue (cq) with completion queue events (cqe). A sqe once completed results in a cqe being pushed into the cq. The ordering of cqe may not be the same order of sqe. A chain of sqe will however ensure ordering and failure cascading. Other potential schemes are possible but a completion queue is a well trod idea with io_uring and other similar operating system APIs.

4.26.5 Executor

The RTIO executor is a low overhead concurrent I/O task scheduler. It ensures certain request flags provide the expected behavior. It takes a list of submissions working through them in order. Various flags allow for changing the behavior of how submissions are worked through. Flags to form in order chains of submissions, transactional sets of submissions, or create multi-shot (continuously producing) requests are all possible!

4.26.6 IO Device

Turning submission queue entries (sqe) into completion queue events (cqe) is the job of objects implementing the iodev (IO device) API. This API accepts requests in the form of the iodev submit API call. It is the io device job to work through its internal queue of submissions and convert them into completions. In effect every io device can be viewed as an independent, event driven actor like object, that accepts a never ending queue of I/O like requests. How the iodev does this work is up to the author of the iodev; perhaps the entire queue of operations can be converted to a set of DMA transfer descriptors, meaning the hardware does almost all of the real work.

4.26.7 Cancellation

Canceling an already queued operation is possible but not guaranteed. If the SQE has not yet started, it’s likely that a call to `rtio_sqe_cancel()` will remove the SQE and never run it. If, however, the SQE already started running, the cancel request will be ignored.

4.26.8 Memory pools

In some cases requests to read may not know how much data will be produced. Alternatively, a reader might be handling data from multiple io devices where the frequency of the data is unpredictable. In these cases it may be wasteful to bind memory to in flight read requests. Instead with memory pools the memory to read into is left to the iodev to allocate from a memory pool associated with the RTIO context that the read was associated with. To create such an RTIO context the `RTIO_DEFINE_WITH_MEMPOOL` can be used. It allows creating an RTIO context with a dedicated pool of “memory blocks” which can be consumed by the iodev. Below is a snippet setting up the RTIO context with a memory pool. The memory pool has 128 blocks, each block has the size of 16 bytes, and the data is 4 byte aligned.

```c
#include <zephyr/rtio/rtio.h>
#define SQ_SIZE 4
#define CQ_SIZE 4
#define MEM_BLK_COUNT 128
```
(continues on next page)
When a read is needed, the caller simply needs to replace the call `rtio_sqe_prep_read()` (which takes a pointer to a buffer and a length) with a call to `rtio_sqe_prep_read_with_pool()`. The iodev requires only a small change which works with both pre-allocated data buffers as well as the mempool. When the read is ready, instead of getting the buffers directly from the `rtio_iodev_sqe`, the iodev should get the buffer and count by calling `rtio_sqe_rx_buf()` like so:

```c
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_sqe_rx_buf(iodev_sqe, MIN_BUF_LEN, DESIRED_BUF_LEN, &buf, &buf_len);
if (rc != 0) {
    LOG_ERR("Failed to get buffer of at least %u bytes", MIN_BUF_LEN);
    return;
}
```

Finally, the consumer will be able to access the allocated buffer via `c:func:rtio_cqe_get_mempool_buffer`.

```c
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_cqe_get_mempool_buffer(&rtio_context, &cqe, &buf, &buf_len);
if (rc != 0) {
    LOG_ERR("Failed to get mempool buffer");
    return rc;
}

/* Release the cqe events (note that the buffer is not released yet */
rtio_cqe_release_all(&rtio_context);

/* Do something with the memory */

/* Release the mempool buffer */
rtio_release_buffer(&rtio_context, buf);
```

### 4.26.9 When to Use

RTIO is useful in cases where concurrent or batch like I/O flows are useful.

From the driver/hardware perspective the API enables batching of I/O requests, potentially in an optimal way. Many requests to the same SPI peripheral for example might be translated to hardware command queues or DMA transfer descriptors entirely. Meaning the hardware can potentially do more than ever.

There is a small cost to each RTIO context and iodev. This cost could be weighed against using a thread for each concurrent I/O operation or custom queues and threads per peripheral. RTIO is much lower cost than that.

### 4.26.10 Examples

Examples speak loudly about the intended uses and goals of an API. So several key examples are presented below. Some are entirely plausible today without a big leap. Others (the sensor example) would
require additional work in other APIs outside of RTIO as a sub system and are theoretical.

**Chained Blocking Requests**

A common scenario is needing to write the register address to then read from. This can be accomplished by chaining a write into a read operation.

The transaction on i2c is implicit for each operation chain.

```c
RTIO_I2C_IODEV(i2c_dev, I2C_DT_SPEC_INST(n));
RTIO_DEFINE(ez_io, 4, 4);
static uint16_t reg_addr;
static uint8_t buf[32];

int do_some_io(void)
{
    struct rtio_sqe *write_sqe = rtio_spsc_acquire(ez_io.sq);
    struct rtio_sqe *read_sqe = rtio_spsc_acquire(ez_io.sq);

    rtio_sqe_prep_write(write_sqe, i2c_dev, RTIO_PRIO_LOW, &reg_addr, 2);
    write_sqe->flags = RTIO_SQE_CHAINED; /* the next item in the queue will wait on this one */
    rtio_sqe_prep_read(read_sqe, i2c_dev, RTIO_PRIO_LOW, buf, 32);
    rtio_submit(rtio_inplace_executor, &ez_io, 2);

    struct rtio_cqe *read_cqe = rtio_spsc_consume(ez_io.cq);
    struct rtio_cqe *write_cqe = rtio_spsc_consume(ez_io.cq);

    if(read_cqe->result < 0) {
        LOG_ERR("read failed!");
    }

    if(write_cqe->result < 0) {
        LOG_ERR("write failed!");
    }

    rtio_spsc_release(ez_io.cq);
    rtio_spsc_release(ez_io.cq);
}
```

**Non blocking device to device**

Imagine wishing to read from one device on an I2C bus and then write the same buffer to a device on a SPI bus without blocking the thread or setting up callbacks or other IPC notification mechanisms.

Perhaps an I2C temperature sensor and a SPI lwrawan module. The following is a simplified version of that potential operation chain.

```c
RTIO_I2C_IODEV(i2c_dev, I2C_DT_SPEC_INST(n));
RTIO_SPI_IODEV(spi_dev, SPI_DT_SPEC_INST(m));
RTIO_DEFINE(ez_io, 4, 4);
static uint8_t buf[32];

int do_some_io(void)
{
    /* code */
}
```
{  
    uint32_t read, write;
    struct rtio_sqe *read_sqe = rtio_spsc_acquire(ez_io.sq);
    rtio_sqe_prep_read(read_sqe, i2c_dev, RTIO_PRIO_LOW, buf, 32);
    read_sqe->flags = RTIO_SQE_CHAINED;  /* the next item in the queue will wait
    on this one */
    /* Safe to do as the chained operation ensures that if one fails all
    subsequent ops fail */
    struct rtio_sqe *write_sqe = rtio_spsc_acquire(ez_io.sq);
    rtio_sqe_prep_write(write_sqe, spi_dev, RTIO_PRIO_LOW, buf, 32);
    /* call will return immediately without blocking if possible */
    rtio_submit(rtio_inplace_executor, &ez_io, 0);

    /* These calls might return NULL if the operations have not yet completed! */
    for (int i = 0; i < 2; i++) {
        struct rtio_cqe *cqe = rtio_spsc_consume(ez_io.cq);
        while(cqe == NULL) {
            cqe = rtio_spsc_consume(ez_io.cq);
            k_yield();
        }
        if(cqe->userdata == &read && cqe->result < 0) {
            LOG_ERR("read from i2c failed!");
        }
        if(cqe->userdata == &write && cqe->result < 0) {
            LOG_ERR("write to spi failed!");
        }
        /* Must release the completion queue event after consume */
        rtio_spsc_release(ez_io.cq);
    }
}

Nested iodevs for Devices on Buses (Sensors), Theoretical

Consider a device like a sensor or audio codec sitting on a bus.

It's useful to consider that the sensor driver can use RTIO to do I/O on the SPI bus, while also being an
RTIO device itself. The sensor iodev can set aside a small portion of the buffer in front or in back to
store some metadata describing the format of the data. This metadata could then be used in creating a
sensor readings iterator which lazily lets you map over each reading, doing calculations such as FIR/IIR
filtering, or perhaps translating the readings into other numerical formats with useful measurement units
such as SI. RTIO is a common movement API and allows for such uses while not deciding the mechanism.

This same sort of setup could be done for other data streams such as audio or video.

/* Note that the sensor device itself can use RTIO to get data over I2C/SPI
 * potentially with DMA, but we don't need to worry about that here
 * All we need to know is the device tree node_id and that it can be an iodev
 */
RTIO_SENSOR_IODEV(sensor_dev, DEVICE_DT_GET(DT_NODE(super6axis)));

RTIO_DEFINE(ez_io, 4, 4);

/* The sensor driver decides the minimum buffer size for us, we decide how
(continues on next page)
many bufs. This could be a typical multiple of a fifo packet the sensor produces, ICM42688 for example produces a FIFO packet of 20 bytes in 20bit mode at 32KHz so perhaps we’d like to get 4 buffers of 4ms of data each in this setup to process on. and its already been defined here for us.

*/
#include <sensors/icm42688_p.h>
static uint8_t bufs[4][ICM42688_RTIO_BUF_SIZE];

int do_some_sensors(void) {
    /* Obtain a dmac executor from the DMA device */
    struct device *dma = DEVICE_DT_GET(DT_NODE(dma0));
    const struct rtio_executor *rtio_dma_exec =
        dma_rtio_executor(dma);
    
    /* Mostly we want to feed the sensor driver enough buffers to fill while we wait and process! Small enough to process quickly with low latency, big enough to not spend all the time setting transfers up. */
    /* It's assumed here that the sensor has been configured already * and each FIFO watermark interrupt that occurs it attempts * to pull from the queue, fill the buffer with a small metadata * offset using its own rtio request to the SPI bus using DMA. */
    for(int i = 0; i < 4; i++) {
        struct rtio_sqe *read_sqe = rtio_spsc_acquire(ez_io.sq);
        rtio_sqe_prep_read(read_sqe, sensor_dev, RTIO_PRIO_HIGH, bufs[i],
        
            ICM42688_RTIO_BUF_SIZE);
    }

}

next:
/* Release completion queue event */
rtio_spac_release(ez_io.cq);
/* resubmit a read request with the newly freed buffer to the sensor */
struct rtio_sqe *read_sqe = rtio_spac_acquire(ez_io.sq);
rtio_sqe_prep_read(read_sqe, sensor_dev, RTIO_PRIO_HIGH, buf,
ICM20649_RTIO_BUF_SIZE);
}

4.26.11 API Reference

group rtio
    RTIO.

Defines

RTIO_IODEV_I2C_STOP
    Equivalent to the I2C_MSG_STOP flag.

RTIO_IODEV_I2C_RESTART
    Equivalent to the I2C_MSG_RESTART flag.

RTIO_IODEV_I2C_10_BITS
    Equivalent to the I2C_MSG_ADDR_10_BITS.

RTIO_OP_NOP
    An operation that does nothing and will complete immediately.

RTIO_OP_RX
    An operation that receives (reads)

RTIO_OP_TX
    An operation that transmits (writes)
RTIO_OP_TINY_TX
An operation that transmits tiny writes by copying the data to write.

RTIO_OP_CALLBACK
An operation that calls a given function (callback)

RTIO_OP_TXRX
An operation that transceives (reads and writes simultaneously)

RTIO_IODEV_DEFINE(name, iodev_api, iodev_data)
Statically define and initialize an RTIO IODev.

Parameters
- name – Name of the iodev
- iodev_api – Pointer to struct rtio_iodev_api
- iodev_data – Data pointer

RTIO_BMEM
Allocate to bss if available.
If CONFIG_USERSPACE is selected, allocate to the rtio_partition bss. Maps to:
K_APP_BMEM(rtio_partition) static
If CONFIG_USERSPACE is disabled, allocate as plain static: static

RTIO_DMEM
Allocate as initialized memory if available.
If CONFIG_USERSPACE is selected, allocate to the rtio_partition init. Maps to:
K_APP_DMEM(rtio_partition) static
If CONFIG_USERSPACE is disabled, allocate as plain static: static

RTIO_DEFINE(name, sq_sz, cq_sz)
Statically define and initialize an RTIO context.

Parameters
- name – Name of the RTIO
- sq_sz – Size of the submission queue entry pool
- cq_sz – Size of the completion queue entry pool

RTIO_DEFINE_WITH_MEMPOOL(name, sq_sz, cq_sz, num_blks, blk_size, balign)
Statically define and initialize an RTIO context.

Parameters
- name – Name of the RTIO
- sq_sz – Size of the submission queue, must be power of 2
- cq_sz – Size of the completion queue, must be power of 2
- num_blks – Number of blocks in the memory pool
- blk_size – The number of bytes in each block
- balign – The block alignment
Typedefs

typedef void (\*rtio_callback_t)(struct rtio \*r, const struct rtio_sqe \*sqe, void \*arg0)

Callback signature for RTIO_OP_CALLBACK.

**Param r**
RTIO context being used with the callback

**Param sqe**
Submission for the callback op

**Param arg0**
Argument option as part of the sqe

Functions

static inline void rtio_sqe_prep_nop(struct rtio_sqe \*sqe, const struct rtio_iodev \*iodev, void \*userdata)

Prepare a nop (no op) submission.

static inline void rtio_sqe_prep_read(struct rtio_sqe \*sqe, const struct rtio_iodev \*iodev, int8_t prio, uint8_t \*buf, uint32_t len, void \*userdata)

Prepare a read op submission.

static inline void rtio_sqe_prep_read_with_pool(struct rtio_sqe \*sqe, const struct rtio_iodev \*iodev, int8_t prio, void \*userdata)

Prepare a read op submission with context's mempool.

**See also:**
rtio_sqe_prep_read()

static inline void rtio_sqe_prep_read_multishot(struct rtio_sqe \*sqe, const struct rtio_iodev \*iodev, int8_t prio, void \*userdata)

Prepare a write op submission.

static inline void rtio_sqe_prep_tiny_write(struct rtio_sqe \*sqe, const struct rtio_iodev \*iodev, int8_t prio, const uint8_t \*tiny_write_data, uint8_t tiny_write_len, void \*userdata)

Prepare a tiny write op submission.

Unlike the normal write operation where the source buffer must outlive the call the tiny write data in this case is copied to the sqe. It must be tiny to fit within the specified size of a rtio_sqe.

This is useful in many scenarios with RTL logic where a write of the register to subsequently read must be done.

static inline void rtio_sqe_prep_callback(struct rtio_sqe \*sqe, rtio_callback_t callback, void \*arg0, void \*userdata)

Prepare a callback op submission.

A somewhat special operation in that it may only be done in kernel mode.

Used where general purpose logic is required in a queue of io operations to do transforms or logic.
static inline void rtio_sqe_prep_transceive(struct rtio_sqe *sqe, const struct rtio_iodev *iodev, int8_t prio, uint8_t *tx_buf, uint8_t *rx_buf, uint32_t buf_len, void *userdata)

Prepare a transceive op submission.

static inline struct rtio_iodev_sqe *rtio_sqe_pool_alloc(struct rtio_sqe_pool *pool)
static inline void rtio_sqe_pool_free(struct rtio_sqe_pool *pool, struct rtio_iodev_sqe *iodev_sqe)
static inline struct rtio_cqe *rtio_cqe_pool_alloc(struct rtio_cqe_pool *pool)
static inline void rtio_cqe_pool_free(struct rtio_cqe_pool *pool, struct rtio_cqe *cqe)
static inline int rtio_block_pool_alloc(struct rtio_block_pool *pool, size_t min_sz, size_t max_sz, uint8_t **buf, uint32_t *buf_len)
static inline void rtio_block_pool_free(struct rtio_block_pool *pool, void *buf, uint32_t buf_len)
static inline uint32_t rtio_sqe_acquirable(struct rtio *r)
Count of acquirable submission queue events.

Parameters
- r – RTIO context

Returns
Count of acquirable submission queue events

static inline struct rtio_iodev_sqe *rtio_txn_next(const struct rtio_iodev_sqe *iodev_sqe)
Get the next sqe in the transaction.

Parameters
- iodev_sqe – Submission queue entry

Return values
- NULL – if current sqe is last in transaction
- struct – rtio_sqe * if available

static inline struct rtio_iodev_sqe *rtio_chain_next(const struct rtio_iodev_sqe *iodev_sqe)
Get the next sqe in the chain.

Parameters
- iodev_sqe – Submission queue entry

Return values
- NULL – if current sqe is last in chain
- struct – rtio_sqe * if available

static inline struct rtio_iodev_sqe *rtio_iodev_sqe_next(const struct rtio_iodev_sqe *iodev_sqe)
Get the next sqe in the chain or transaction.

Parameters
- iodev_sqe – Submission queue entry

Return values
- NULL – if current sqe is last in chain
- struct – rtio_iodev_sqe * if available
static inline struct rtio_sqe *rtio_sqe_acquire(struct rtio *r)
Acquire a single submission queue event if available.

Parameters
• r – RTIO context

Return values
• sqe – A valid submission queue event acquired from the submission queue
• NULL – No submission queue event available

static inline void rtio_sqe_drop_all(struct rtio *r)
Drop all previously acquired sqe.

Parameters
• r – RTIO context

static inline struct rtio_cqe *rtio_cqe_acquire(struct rtio *r)
Acquire a complete queue event if available.

static inline void rtio_cqe_produce(struct rtio *r, struct rtio_cqe *cqe)
Produce a complete queue event if available.

static inline struct rtio_cqe *rtio_cqe_consume(struct rtio *r)
Consume a single completion queue event if available.
If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters
• r – RTIO context

Return values
• cqe – A valid completion queue event consumed from the completion queue
• NULL – No completion queue event available

static inline struct rtio_cqe *rtio_cqe_consume_block(struct rtio *r)
Wait for and consume a single completion queue event.
If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters
• r – RTIO context

Return values
• cqe – A valid completion queue event consumed from the completion queue

static inline void rtio_cqe_release(struct rtio *r, struct rtio_cqe *cqe)
Release consumed completion queue event.

Parameters
• r – RTIO context
• cqe – Completion queue entry

static inline uint32_t rtio_cqe_compute_flags(struct rtio_iodev_sqe *iodev_sqe)
Compute the CQE flags from the rtio_iodev_sqe entry.

Parameters
• iodev_sqe – The SQE entry in question.
Returns

The value that should be set for the CQE’s flags field.

int rtio_cqe_get_mempool_buffer(const struct rtio *r, struct rtio_cqe *cqe, uint8_t **buff, uint32_t *buff_len)

Retrieve the mempool buffer that was allocated for the CQE.

If the RTIO context contains a memory pool, and the SQE was created by calling rtio_sqe_read_with_pool(), this function can be used to retrieve the memory associated with the read. Once processing is done, it should be released by calling rtio_release_buffer().

Parameters

• r – [in] RTIO context
• cqe – [in] The CQE handling the event.
• buff – [out] Pointer to the mempool buffer
• buff_len – [out] Length of the allocated buffer

Returns

0 on success

Returns

-EINVAL if the buffer wasn’t allocated for this cqe

Returns

-ENOTSUP if memory blocks are disabled

void rtio_executor_submit(struct rtio *r)

void rtio_executor_ok(struct rtio_iodev_sqe *iodev_sqe, int result)

void rtio_executor_err(struct rtio_iodev_sqe *iodev_sqe, int result)

static inline void rtio_iodev_sqe_ok(struct rtio_iodev_sqe *iodev_sqe, int result)

Inform the executor of a submission completion with success.

This may start the next asynchronous request if one is available.

Parameters

• iodev_sqe – IODev Submission that has succeeded
• result – Result of the request

static inline void rtio_iodev_sqe_err(struct rtio_iodev_sqe *iodev_sqe, int result)

Inform the executor of a submissions completion with error.

This SHALL fail the remaining submissions in the chain.

Parameters

• iodev_sqe – Submission that has failed
• result – Result of the request

static inline void rtio_iodev_cancel_all(struct rtio_iodev *iodev)

Cancel all requests that are pending for the iodev.

Parameters

• iodev – IODev to cancel all requests for

static inline void rtio_cqe_submit(struct rtio *r, int result, void *userdata, uint32_t flags)

Submit a completion queue event with a given result and userdata.

Called by the executor to produce a completion queue event, no inherent locking is performed and this is not safe to do from multiple callers.
Parameters
• r – RTIO context
• result – Integer result code (could be -errno)
• userdata – Userdata to pass along to completion
• flags – Flags to use for the CQE see RTIO_CQE_FLAG_

static inline int rtio_sqe_rx_buf(const struct rtio_iodev_sqe *iodev_sqe, uint32_t min_buf_len,
                                 uint32_t max_buf_len, uint8_t **buf, uint32_t *buf_len)
Get the buffer associate with the RX submission.

Parameters
• iodev_sqe – [in] The submission to probe
• min_buf_len – [in] The minimum number of bytes needed for the operation
• max_buf_len – [in] The maximum number of bytes needed for the operation
• buf – [out] Where to store the pointer to the buffer
• buf_len – [out] Where to store the size of the buffer

Returns
  0 if buf and buf_len were successfully filled

Returns
-ENOMEM Not enough memory for min_buf_len

void rtio_release_buffer(struct rtio *r, void *buff, uint32_t buff_len)
Release memory that was allocated by the RTIO’s memory pool.

If the RTIO context was created by a call to RTIO_DEFINE_WITH_MEMPOOL(), then the cqe
data might contain a buffer that’s owned by the RTIO context. In those cases (if the read
request was configured via rtio_sqe_read_with_pool()) the buffer must be returned back to
the pool.

Call this function when processing is complete. This function will validate that the memory
actually belongs to the RTIO context and will ignore invalid arguments.

Parameters
• r – RTIO context
• buff – Pointer to the buffer to be released.
• buff_len – Number of bytes to free (will be rounded up to nearest memory
  block).

static inline void rtio_access_grant(struct rtio *r, struct k_thread *t)
Grant access to an RTIO context to a user thread.

int rtio_sqe_cancel(struct rtio_sqe *sqe)
Attempt to cancel an SQE.

If possible (not currently executing), cancel an SQE and generate a failure with -ECANCELED
result.

Parameters
• sqe – [in] The SQE to cancel

Returns
  0 if the SQE was flagged for cancellation

Returns
  <0 on error
int rtio_sqe_copy_in_get_handles(struct rtio *r, const struct rtio_sqe *sqes, struct rtio_sqe **handle, size_t sqe_count)

Copy an array of SQEs into the queue and get resulting handles back.

Copies one or more SQEs into the RTIO context and optionally returns their generated SQE handles. Handles can be used to cancel events via the \texttt{rtio_sqe\_cancel()} call.

\textbf{Parameters}

- \texttt{r} – [in] RTIO context
- \texttt{sqes} – [in] Pointer to an array of SQEs
- \texttt{handle} – [out] Optional pointer to \texttt{rtio\_sqe} pointer to store the handle of the first generated SQE. Use NULL to ignore.
- \texttt{sqe\_count} – [in] Count of sqes in array

\textbf{Return values}

- 0 – success
- -ENOMEM – not enough room in the queue

\textbf{static inline int rtio_sqe_copy_in(struct rtio *r, const struct rtio_sqe *sqes, size_t sqe\_count)}

Copy an array of SQEs into the queue.

Useful if a batch of submissions is stored in ROM or RTIO is used from user mode where a copy must be made.

Partial copying is not done as chained SQEs need to be submitted as a whole set.

\textbf{Parameters}

- \texttt{r} – RTIO context
- \texttt{sqes} – Pointer to an array of SQEs
- \texttt{sqe\_count} – Count of sqes in array

\textbf{Return values}

- 0 – success
- -ENOMEM – not enough room in the queue

\textbf{int rtio_cqe_copy_out(struct rtio *r, struct rtio_cqe *cqes, size_t cqe\_count, k\_timeout\_t timeout)}

Copy an array of CQEs from the queue.

Copies from the RTIO context and its queue completion queue events, waiting for the given time period to gather the number of completions requested.

\textbf{Parameters}

- \texttt{r} – RTIO context
- \texttt{cqes} – Pointer to an array of SQEs
- \texttt{cqe\_count} – Count of sqes in array
- \texttt{timeout} – Timeout to wait for each completion event. Total wait time is potentially timeout*cqe\_count at maximum.

\textbf{Return values}

- \texttt{copy\_count} – Count of copied CQEs (0 to cqe\_count)
int rtio_submit(struct rtio *r, uint32_t wait_count)
Submit I/O requests to the underlying executor.

Submits the queue of submission queue events to the executor. The executor will do the work of managing tasks representing each submission chain, freeing submission queue events when done, and producing completion queue events as submissions are completed.

**Parameters**

- `r` - RTIO context
- `wait_count` - Number of submissions to wait for completion of.

**Return values**

0 – On success

**Variables**

```c
struct k_mem_partition rtio_partition
The memory partition associated with all RTIO context information.
```

```c
struct rtio_sqe
#include <rtio.h> A submission queue event.
```

**Public Members**

```c
uint8_t op
Op code.
```

```c
uint8_t prio
Op priority.
```

```c
uint16_t flags
Op Flags.
```

```c
uint16_t iodev_flags
Op iodev flags.
```

```c
const struct rtio_iodev *iodev
Device to operation on.
```

```c
void *userdata
User provided data which is returned upon operation completion.
Could be a pointer or integer.
If unique identification of completions is desired this should be unique as well.
```

```c
uint32_t buf_len
Length of buffer.
```

```c
uint8_t *buf
Buffer to use.
```
### Public Members

- **uint8_t tiny_buf_len**
  - Length of tiny buffer.

- **uint8_t tiny_buf[7]**
  - Tiny buffer.

- **void *arg0**
  - Last argument given to callback.

```c
struct rtio_cqe
#include <rtio.h> A completion queue event.
```

#### Public Members

- **int32_t result**
  - Result from operation.

- **void *userdata**
  - Associated userdata with operation.

- **uint32_t flags**
  - Flags associated with the operation.

```c
struct rtio_sqe_pool
#include <rtio.h>
```

```c
struct rtio_cqe_pool
#include <rtio.h>
```

```c
struct rtio_block_pool
#include <rtio.h>
```

```c
struct rtio
#include <rtio.h> An RTIO context containing what can be viewed as a pair of queues.
```

A queue for submissions (available and in queue to be produced) as well as a queue of completions (available and ready to be consumed).

The rtio executor along with any objects implementing the `rtio_iodev` interface are the consumers of submissions and producers of completions.

No work is started until `rtio_submit()` is called.

```c
struct rtio_iodev_sqe
#include <rtio.h> Compute the mempool block index for a given pointer.
```

IO device submission queue entry

May be cast safely to and from a `rtio_sqe` as they occupy the same memory provided by the pool.
Param \( r \)
\[ \text{in} \] RTIO context

Param \( ptr \)
\[ \text{in} \] Memory pointer in the mempool

Return
Index of the mempool block associated with the pointer. Or UINT16_MAX if invalid.

```c
struct rtio_iodev_api
#include <rtio.h> API that an RTIO IO device should implement.
```

Public Members

```c
void (*\text{submit})(\text{struct } rtio_iodev_sqe *iodev_sqe)
Submit to the iodev an entry to work on.
This call should be short in duration and most likely either enqueue or kick off an entry with the hardware.
Param iodev_sqe
Submission queue entry
```

```c
struct rtio_iodev
#include <rtio.h> An IO device with a function table for submitting requests.
```

MPSC Lock-free Queue API

```c
\textbf{group \texttt{rtio_mpsc}}
RTIO Multiple Producer Single Consumer (MPSC) Queue API.
```

Defines

```c
mpsc_ptr_get(ptr)
mpsc_ptr_set(ptr, val)
mpsc_ptr_set_get(ptr, val)
RTIO_MPCSC_INIT(symbol)
Static initializer for a mpsc queue.
Since the queue is
```

Parameters

- symbol – name of the queue

Typedefs

```c
typedef atomic_ptr_t mpsc_ptr_t
```
Functions

static inline void rtio_mpsc_init(struct rtio_mpsc *q)
Initialize queue.

Parameters
• q – Queue to initialize or reset

ALWAYS_INLINE static void rtio_mpsc_push(struct rtio_mpsc *q, struct rtio_mpsc_node *n)
Push a node.

Parameters
• q – Queue to push the node to
• n – Node to push into the queue

static inline struct rtio_mpsc_node *rtio_mpsc_pop(struct rtio_mpsc *q)
Pop a node off of the list.

Return values
• NULL – When no node is available
• node – When node is available

struct rtio_mpsc_node
#include <rtio_mpsc.h> Queue member.

struct rtio_mpsc
#include <rtio_mpsc.h> MPSC Queue.

SPSC Lock-free Queue API

group rtio_spsc
RTIO Single Producer Single Consumer (SPSC) Queue API.

Defines

RTIO_SPSC_INITIALIZER(sz, buf)
Statically initialize an rtio_spsc.

Parameters
• sz – Size of the spsc, must be power of 2 (ex: 2, 4, 8)
• buf – Buffer pointer

RTIO_SPSC_DECLARE(name, type)
Declare an anonymous struct type for an rtio_spsc.

Parameters
• name – Name of the spsc symbol to be provided
• type – Type stored in the spsc
RTIO_SPSC_DEFINE(name, type, sz)
Define an rtio_spsc with a fixed size.

**Parameters**
- **name** – Name of the spsc symbol to be provided
- **type** – Type stored in the spsc
- **sz** – Size of the spsc, must be power of 2 (ex: 2, 4, 8)

rtio_spsc_size(spsc)
Size of the SPSC queue.

**Parameters**
- **spsc** – SPSC reference

rtio_spsc_reset(spsc)
Initialize/reset a spsc such that its empty.
Note that this is not safe to do while being used in a producer/consumer situation with multiple calling contexts (isrs/threads).

**Parameters**
- **spsc** – SPSC to initialize/reset

rtio_spsc_acquire(spsc)
Acquire an element to produce from the SPSC.

**Parameters**
- **spsc** – SPSC to acquire an element from for producing

**Returns**
A pointer to the acquired element or null if the spsc is full

rtio_spsc_produce(spsc)
Produce one previously acquired element to the SPSC.
This makes one element available to the consumer immediately

**Parameters**
- **spsc** – SPSC to produce the previously acquired element or do nothing

rtio_spsc_produce_all(spsc)
Produce all previously acquired elements to the SPSC.
This makes all previous acquired elements available to the consumer immediately

**Parameters**
- **spsc** – SPSC to produce all previously acquired elements or do nothing

rtio_spsc_drop_all(spsc)
Drop all previously acquired elements.
This makes all previous acquired elements available to be acquired again

**Parameters**
- **spsc** – SPSC to drop all previously acquired elements or do nothing

rtio_spsc_consume(spsc)
Consume an element from the spsc.

**Parameters**
- **spsc** – Spsc to consume from
Returns
  Pointer to element or null if no consumable elements left

\texttt{rtio\_spsc\_release(spsc)}
  Release a consumed element.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to release consumed element or do nothing
  \end{itemize}

\texttt{rtio\_spsc\_release\_all(spsc)}
  Release all consumed elements.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to release consumed elements or do nothing
  \end{itemize}

\texttt{rtio\_spsc\_acquirable(spsc)}
  Count of acquirable in spsc.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to get item count for
  \end{itemize}

\texttt{rtio\_spsc\_consumable(spsc)}
  Count of consumables in spsc.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to get item count for
  \end{itemize}

\texttt{rtio\_spsc\_peek(spsc)}
  Peek at the first available item in queue.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – Spsc to peek into
  \end{itemize}

Returns
  Pointer to element or null if no consumable elements left

\texttt{rtio\_spsc\_next(spsc, item)}
  Peek at the next item in the queue from a given one.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to peek at
  \item \texttt{item} – Pointer to an item in the queue
  \end{itemize}

Returns
  Pointer to element or null if none left

\texttt{rtio\_spsc\_prev(spsc, item)}
  Get the previous item in the queue from a given one.

Parameters
  \begin{itemize}
  \item \texttt{spsc} – SPSC to peek at
  \item \texttt{item} – Pointer to an item in the queue
  \end{itemize}

Returns
  Pointer to element or null if none left

\texttt{struct rtio\_spsc}
  Common SPSC attributes.
4.27 Zephyr message bus (zbus)

The Zephyr message bus - Zbus is a lightweight and flexible message bus enabling a simple way for threads to talk to one another.

- Concepts
  - Virtual Distributed Event Dispatcher
  - Limitations
- Usage
  - Publishing to a channel
  - Reading from a channel
  - Forcing channel notification
  - Declaring channels and observers
  - Iterating over channels and observers
  - Advanced channel control
- Samples
- Suggested Uses
- Configuration Options
- API Reference

4.27.1 Concepts

Threads can broadcast messages to all interested observers using zbus. Many-to-many communication is possible. The bus implements message-passing and publish/subscribe communication paradigms that enable threads to communicate synchronously or asynchronously through shared memory. The communication through zbus is channel-based, where threads publish and read to and from using messages. Additionally, threads can observe channels and receive notifications from the bus when the channels are modified. The figure below shows an example of a typical application using zbus in which the application logic (hardware independent) talks to other threads via message bus. Note that the threads are decoupled from each other because they only use zbus’ channels and do not need to know each other to talk.

The bus comprises:

- Set of channels that consists of a unique identifier, its control metadata information, and the message itself;
- Virtual distributed event dispatcher (VDED), the bus logic responsible for sending notifications to the observers. The VDED logic runs inside the publishing action in the same thread context, giving the bus an idea of a distributed execution. When a thread publishes to a channel, it also propagates the notifications to the observers;
- Threads (subscribers) and callbacks (listeners) publishing, reading, and receiving notifications from the bus.
Fig. 12: A typical zbus application architecture.

Fig. 13: Zbus anatomy.
The bus makes the publish, read, and subscribe actions available over channels. Publishing and reading are available in all RTOS thread contexts. However, it cannot run inside Interrupt Service Routines (ISR) because it uses mutexes to control channels access, and mutexes cannot work appropriately inside ISRs. The publish and read operations are simple and fast; the procedure is a mutex locking followed by a memory copy to and from a shared memory region and then a mutex unlocking. Another essential aspect of zbus is the observers, which can be:

- Static; defined in compile time. It is not possible to remove it at runtime, but it is possible to suppress it by calling the `zbus_obs_set_enable()`;
- Dynamic; it can be added and removed to and from a channel at runtime.

For illustration purposes, suppose a usual sensor-based solution in the figure below. When the timer is triggered, it pushes an action to a work queue that publishes to the Start trigger channel. As the sensor thread subscribed to the Start trigger channel, it fetches the sensor data. Notice the VDED executes the blink callback because it also listens to the Start trigger channel. When the sensor data is ready, the sensor thread publishes it to the Sensor data channel. The core thread, as a Sensor data channel subscriber, processes the sensor data and stores it in an internal sample buffer. It repeats until the sample buffer is full; when it happens, the core thread aggregates the sample buffer information, prepares a package, and publishes that to the Payload channel. The Lora thread receives that because it is a Payload channel subscriber and sends the payload to the cloud. When it completes the transmission, the Lora thread publishes to the Transmission done channel. The VDED executes the blink callback again since it listens to the Transmission done channel.

This way of implementing the solution makes the application more flexible, enabling us to change things independently. For example, we want to change the trigger from a timer to a button press. We can do that, and the change does not affect other parts of the system. Likewise, we would like to change the communication interface from LoRa to Bluetooth; we only need to change the LoRa thread. No other change is required in order to make that work. Thus, the developer would do that for every block of the image. Based on that, there is a sign zbus promotes decoupling in the system architecture.

Another important aspect of using zbus is the reuse of system modules. If a code portion with well-defined behaviors (we call that module) only uses zbus channels and not hardware interfaces, it can easily be reused in other solutions. The new solution must implement the interfaces (set of channels) the module needs to work. That indicates zbus could improve the module reuse.

The last important note is the zbus solution reach. We can count on many ways of using zbus to enable the developer to be as free as possible to create what they need. For example, messages can be dynamic or static allocated; notifications can be synchronous or asynchronous; the developer can control the channel in so many different ways claiming the channel, developers can add their metadata information to a channel by using the user-data field, the discretionary use of a validator enables the systems to be accurate over message format, and so on. Those characteristics increase the solutions that can be done with zbus and make it a good fit as an open-source community tool.
Virtual Distributed Event Dispatcher

The VDED execution always happens in the publishing's (thread) context. So it cannot occur inside an Interrupt Service Routine (ISR). Therefore, the IRSs must only access channels indirectly. The basic description of the execution is as follows:

- The channel mutex is acquired;
- The channel receives the new message via direct copy (by a raw `memcpy()`);
- The event dispatcher logic executes the listeners and pushes the channel’s reference to the subscribers' notification message queue in the same sequence they appear on the channel observers’ list. The listeners can perform non-copy quick access to the constant message reference directly (via the `zbus_chan_const_msg()` function) since the channel is still locked;
- At last, the publishing function unlocks the channel.

To illustrate the VDED execution, consider the example illustrated below. We have four threads in ascending priority T1, T2, T3, and T4 (the highest priority); two listeners, L1 and L2; and channel A. Supposing L1, L2, T2, T3, and T4 observer channel A.

![Zbus VDED execution example scenario.](image)

The following code implements channel A. Note the `struct a_msg` is illustrative only.

```c
ZBUS_CHAN_DEFINE(a_chan,
    struct a_msg,
    /* Name */
    /* Message type */
    NULL, /* Validator */
    NULL, /* User Data */
    ZBUS_OBSERVERS(L1, L2, T2, T3, T4), /* observers */
    ZBUS_MSG_INIT(0) /* Initial value {0} */
    );
```

In the figure below, the letters indicate some action related to the VDED execution. The X-axis represents the time, and the Y-axis represents the priority of threads. Channel A’s message, represented by a voice balloon, is only one memory portion (shared memory). It appears several times only as an illustration of the message at that point in time.

The figure above illustrates the actions performed during the VDED execution when T1 publishes to channel A. Thus, the figure below describes the actions (represented by a letter) of the VDED execution.
Table 15: VDED execution steps in detail.

<table>
<thead>
<tr>
<th>Actions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>T1 starts and at some point, publishes to channel A.</td>
</tr>
<tr>
<td>b</td>
<td>The publishing (VDED) process starts. The VDED locks the channel A’s mutex.</td>
</tr>
<tr>
<td>c</td>
<td>The VDED copies the T1 message to the channel A message.</td>
</tr>
<tr>
<td>d, e</td>
<td>The VDED executes L1 and L2 in the respective sequence. Inside the listeners, usually, there is a call to the <code>zbus_chan_const_msg()</code> function, which provides a direct constant reference to channel A’s message. It is quick, and no copy is needed here.</td>
</tr>
<tr>
<td>f, g, h</td>
<td>The VDED pushes the notification message to queues of T2, T3, and T4 sequentially. Notice the threads get ready to execute right after receiving the notification. However, they go to a pending state because they cannot access the channel since it is still locked. At that moment, the T1 thread gets its priority elevated (priority inheritance due to the mutex) to the highest pending thread (caused by channel A unavailability). In that case, T4’s priority. It ensures the T1 will finish the VDED execution as quickly as possible without preemption from threads with priority below the engaged ones.</td>
</tr>
<tr>
<td>i</td>
<td>VDED finishes the publishing by unlocking channel A.</td>
</tr>
<tr>
<td>j, k</td>
<td>The T4 leaves the pending state since channel A is not locked. It gets in the CPU again and starts executing. As it did receive a notification from channel A, it performs a channel read (as simple as lock, memory copy, unlock), continues its execution, and goes out the CPU.</td>
</tr>
<tr>
<td>l, m, n</td>
<td>Now, T3 can access the channel. It repeats the same steps from T4 (j and k). T2 does the same. That is the end of the VDED execution!</td>
</tr>
</tbody>
</table>

**Limitations**

Based on the fact that developers can use zbus to solve many different problems, some challenges arise. Zbus will not solve every problem, so it is necessary to analyze the situation to be sure zbus is applicable. For instance, based on the zbus benchmark, it would not be well suited to a high-speed stream of bytes between threads. The Pipe kernel object solves this kind of need.
Delivery guarantees  Zbus always delivers the messages to the listeners. However, there are no message delivery guarantees for subscribers because zbus only sends the notification, but the message reading depends on the subscriber's implementation. This is because channels have a mutex protected singleton objects for which message transfer is used. In other words, it can be seen as a single size queue where publishers always overwrite if queue is full. It is possible to increase the delivery rate by following design tips:

- Keep the listeners quick-as-possible (deal with them as ISRs). If some processing is needed, consider submitting a work to a work-queue;
- Try to give producers a high priority to avoid losses;
- Leave spare CPU for observers to consume data produced;
- Consider using message queues or pipes for intensive byte transfers.

Message delivery sequence The listeners (synchronous observers) will follow the channel definition sequence as the notification and message consumption sequence. However, the subscribers, as they have an asynchronous nature, will all receive the notification as the channel definition sequence but only will consume the data when they execute again. Hence, the delivery respects the order, but the priority assigned to the subscribers will define the reaction sequence. The delivery sequence is first the static observers and then the runtime ones.

4.27.2 Usage

Zbus operation depends on channels and observers. Therefore, it is necessary to determine its message and observers list during the channel definition. A message is a regular C struct; the observer can be a subscriber (asynchronous) or a listener (synchronous).

The following code defines and initializes a regular channel and its dependencies. This channel exchanges accelerometer data, for example.

```c
struct acc_msg {
    int x;
    int y;
    int z;
};

ZBUS_CHAN_DEFINE(acc_chan,
    /* Name */
    struct acc_msg,
    /* Message type */
    NULL,
    /* Validator */
    NULL,
    /* User Data */
    ZBUS_OBSERVERS(my_listener, my_subscriber),
    /* observers */
    ZBUS_MSG_INIT(.x = 0, .y = 0, .z = 0)
    /* Initial value */
);

void listener_callback_example(const struct zbus_channel *chan)
{
    const struct acc_msg *acc;
    if (&acc_chan == chan) {
        acc = zbus_chan_const_msg(chan); // Direct message access
        LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->
        z);
    }
}

ZBUS_LISTENER_DEFINE(my_listener, listener_callback_example);
```

(continues on next page)
ZBUS_LISTENER_DEFINE(my_listener2, listener_callback_example);
ZBUS_CHAN_ADD_OBS(acc_chan, my_listener2, 3);
ZBUS_SUBSCRIBER_DEFINE(my_subscriber, 4);

void subscriber_task(void)
{
    const struct zbus_channel *chan;

    while (!zbus_sub_wait(&my_subscriber, &chan, K_FOREVER)) {
        struct acc_msg acc = {0};
        if (&acc_chan == chan) {
            // Indirect message access
            zbus_chan_read(&acc_chan, &acc, K_NO_WAIT);
            LOG_DBG("From subscriber -> Acc x=%d, y=%d, z=%d", acc.x, acc.
            ...y, acc.z);
        }
    }
}

K_THREAD_DEFINE(subscriber_task_id, 512, subscriber_task, NULL, NULL, NULL, 3, 0, 0);

It is possible to add static observers to a channel using the `ZBUS_CHAN_ADD_OBS`. We call that a post-definition static observer. The command enables us to indicate an initialization priority that affects the observers’ initialization order. The priority param only affects the post-definition static observers. There is no possibility to overwrite the execution sequence of the static observers.

**Note:** It is unnecessary to claim/lock a channel before accessing the message inside the listener since the event dispatcher calls listeners with the notifying channel already locked. Subscribers, however, must claim/lock that or use regular read operations to access the message after being notified.

Channels can have a validator function that enables a channel to accept only valid messages. Publish attempts invalidated by hard channels will return immediately with an error code. This allows original creators of a channel to exert some authority over other developers/publishers who may want to piggy-back on their channels. The following code defines and initializes a hard channel and its dependencies.

Only valid messages can be published to a hard channel. It is possible because a validator function was passed to the channel's definition. In this example, only messages with `move` equal to 0, -1, and 1 are valid. Publish function will discard all other values to `move`.

```
struct control_msg {
    int move;
};

bool control_validator(const void* msg, size_t msg_size) {
    const struct control_msg* cm = msg;
    bool is_valid = (cm->move == -1) || (cm->move == 0) || (cm->move == 1);
    return is_valid;
}

static int message_count = 0;

ZBUS_CHAN_DEFINE(control_chan, /* Name */
    struct control_msg, /* Message type */
    int move;
    bool control_validator(const void* msg, size_t msg_size) {
        const struct control_msg* cm = msg;
        bool is_valid = (cm->move == -1) || (cm->move == 0) || (cm->move == 1);
        return is_valid;
    }
    static int message_count = 0;

    ZBUS_CHAN_DEFINE(control_chan, /* Name */
        struct control_msg, /* Message type */
    )
)
control_validator,    /* Validator */
&message_count,     /* User data */
ZBUS_OBSERVERS_EMPTY,  /* observers */
ZBUS_MSG_INIT(.move = 0) /* Initial value */
);

The following sections describe in detail how to use zbus features.

**Publishing to a channel**

Messages are published to a channel in zbus by calling `zbus_chan_pub()`. For example, the following code builds on the examples above and publishes to channel `acc_chan`. The code is trying to publish the message `acc1` to channel `acc_chan`, and it will wait up to one second for the message to be published. Otherwise, the operation fails. As can be inferred from the code sample, it's OK to use stack allocated messages since VDED copies the data internally.

```c
struct acc_msg acc1 = {.x = 1, .y = 1, .z = 1};
zbus_chan_pub(&acc_chan, &acc1, K_SECONDS(1));
```

**Warning:** Do not use this function inside an ISR.

**Reading from a channel**

Messages are read from a channel in zbus by calling `zbus_chan_read()`. So, for example, the following code tries to read the channel `acc_chan`, which will wait up to 500 milliseconds to read the message. Otherwise, the operation fails.

```c
struct acc_msg acc = {0};
zbus_chan_read(&acc_chan, &acc, K_MSEC(500));
```

**Warning:** Do not use this function inside an ISR.

**Warning:** Choose the timeout of `zbus_chan_read()` after receiving a notification from `zbus_sub_wait()` carefully because the channel will always be unavailable during the VDED execution. Using `K_NO_WAIT` for reading is highly likely to return a timeout error if there are more than one subscriber. For example, consider the VDED illustration again and notice how T3 and T4’s read attempts would definitely fail with `K_NO_WAIT`. For more details, check the `Virtual Distributed Event Dispatcher` section.

**Forcing channel notification**

It is possible to force zbus to notify a channel's observers by calling `zbus_chan_notify()`. For example, the following code builds on the examples above and forces a notification for the channel `acc_chan`. Note this can send events with no message, which does not require any data exchange. See the code example under `Claim and finish a channel` where this may become useful.

```c
zbus_chan_notify(&acc_chan, K_NO_WAIT);
```
Declaring channels and observers

For accessing channels or observers from files other than its defining files, it is necessary to declare them by calling `ZBUS_CHAN_DECLARE` and `ZBUS_OBS_DECLARE`. In other words, zbus channel definitions and declarations with the same channel names in different files would point to the same (global) channel. Thus, developers should be careful about existing channels, and naming new channels or linking will fail. It is possible to declare more than one channel or observer on the same call. The following code builds on the examples above and displays the defined channels and observers.

```
ZBUS_OBS_DECLARE(my_listener, my_subscriber);
ZBUS_CHAN_DECLARE(acc_chan, version_chan);
```

Iterating over channels and observers

Zbus subsystem also implements `Iterable Sections` for channels and observers, for which there are supporting APIs like `zbus_iterate_over_channels()`, `zbus_iterate_over_channels_with_user_data()`, `zbus_iterate_over_observers()` and `zbus_iterate_over_observers_with_user_data()`. This feature enables developers to call a procedure over all declared channels, where the procedure parameter is a `zbus_channel`. The execution sequence is in the alphabetical name order of the channels (see `Iterable Sections` documentation for details). Zbus also implements this feature for `zbus_observer`.

```
static bool print_channel_data_iterator(const struct zbus_channel *chan, void *user_data)
{
    int *count = user_data;

    LOG_INF("%d - Channel %s:", *count, zbus_chan_name(chan));
    LOG_INF(" Message size: %d", zbus_chan_msg_size(chan));
    LOG_INF(" Observers:");
    ++(*count);

    struct zbus_channel_observation *observation;

    for (int16_t i = *chan->observers_start_idx, limit = *chan->observers_end_idx; i < limit;
         ++i) {
        STRUCT_SECTION_GET(zbus_channel_observation, i, &observation);
        LOG_INF(" - %s", observation->obs->name);
    }

    struct zbus_observer_node *obs_nd, *tmp;

    SYS_SLIST_FOR_EACH_CONTAINER_SAFE(chan->observers, obs_nd, tmp, node) {
        LOG_INF(" - %s", obs_nd->obs->name);
    }

    return true;
}
```

```
static bool print_observer_data_iterator(const struct zbus_observer *obs, void *user_data)
{
    int *count = user_data;

    LOG_INF("%d - Observer %s:", *count, zbus_observer_name(obs));
    LOG_INF(" Message size: %d", zbus_observer_msg_size(obs));
    LOG_INF(" Observers:");
    ++(*count);

    struct zbus_observer_node *obs_nd, *tmp;

    SYS_SLIST_FOR_EACH_CONTAINER_SAFE(obs->observers, obs_nd, tmp, node) {
        LOG_INF(" - %s", obs_nd->obs->name);
    }

    return true;
}
```
The code will log the following output:

D: Channel list:
D: 0 - Channel acc-chan:
D:   Message size: 12
D:     Observers:
D:       - my_listener
D:       - my_subscriber
D: 1 - Channel version-chan:
D:   Message size: 4
D:     Observers:
D:     Observers list:
D: 0 - Listener my_listener
D: 1 - Subscriber my_subscriber

Advanced channel control

Zbus was designed to be as flexible and extensible as possible. Thus, there are some features designed to provide some control and extensibility to the bus.

Listeners message access  For performance purposes, listeners can access the receiving channel message directly since they already have the mutex lock for it. To access the channel's message, the listener should use the `zbus_chan_const_msg()` because the channel passed as an argument to the listener function is a constant pointer to the channel. The const pointer return type tells developers not to modify the message.
void listener_callback_example(const struct zbus_channel *chan)
{
    const struct acc_msg *acc;
    if (&acc_chan == chan) {
        acc = zbus_chan_const_msg(chan); // Use this
        // instead of zbus_chan_read(chan, &acc, K_MSEC(200))
        // or zbus_chan_msg(chan)
        LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->
˓
˓
˓→z);
    }
}

User Data  It is possible to pass custom data into the channel's user_data for various purposes, such as writing channel metadata. That can be achieved by passing a pointer to the channel definition macro's user_data field, which will then be accessible by others. Note that user_data is individual for each channel. Also, note that user_data access is not thread-safe. For thread-safe access to user_data, see the next section.

Claim and finish a channel  To take more control over channels, two functions were added zbus_chan_claim() and zbus_chan_finish(). With these functions, it is possible to access the channel's metadata safely. When a channel is claimed, no actions are available to that channel. After finishing the channel, all the actions are available again.

Warning:  Never change the fields of the channel struct directly. It may cause zbus behavior inconsistencies and scheduling issues.

Warning:  Do not use these functions inside an ISR.

The following code builds on the examples above and claims the acc_chan to set the user_data to the channel. Suppose we would like to count how many times the channels exchange messages. We defined the user_data to have the 32 bits integer. This code could be added to the listener code described above.

```c
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
    int *message_counting = (int *) zbus_chan_user_data(&acc_chan);
    *message_counting += 1;
    zbus_chan_finish(&acc_chan);
}
```

The following code has the exact behavior of the code in Publishing to a channel.

```c
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
    struct acc_msg *acc1 = (struct acc_msg *) zbus_chan_msg(&acc_chan);
    acc1.x = 1;
    acc1.y = 1;
    acc1.z = 1;
    zbus_chan_finish(&acc_chan);
    zbus_chan_notify(&acc_chan, K_SECONDS(1));
}
```

The following code has the exact behavior of the code in Reading from a channel.
Runtime observer registration  It is possible to add observers to channels in runtime. This feature uses the heap to allocate the nodes dynamically. The heap size limits the number of dynamic observers Zbus can create. Therefore, set the `CONFIG_ZBUS_RUNTIME_OBSERVERS` to enable the feature. It is possible to adjust the heap size by changing the configuration `CONFIG_HEAP_MEM_POOL_SIZE`. The following example illustrates the runtime registration usage.

```
ZBUS_LISTENER_DEFINE(my_listener, callback);
// ...
void thread_entry(void) {
// ...
/* Adding the observer to channel chan1 */
zbus_chan_add_obs(&chan1, &my_listener);
/* Removing the observer from channel chan1 */
zbus_chan_rm_obs(&chan1, &my_listener);
```

### 4.27.3 Samples

For a complete overview of zbus usage, take a look at the samples. There are the following samples available:

- `zbus-hello-world-sample` illustrates the code used above in action;
- `zbus-work-queue-sample` shows how to define and use different kinds of observers. Note there is an example of using a work queue instead of executing the listener as an execution option;
- `zbus-dyn-channel-sample` demonstrates how to use dynamically allocated exchanging data in zbus;
- `zbus-uart-bridge-sample` shows an example of sending the operation of the channel to a host via serial;
- `zbus-remote-mock-sample` illustrates how to implement an external mock (on the host) to send and receive messages to and from the bus.
- `zbus-runtime-obs-registration-sample` illustrates a way of using the runtime observer registration feature;
- `zbus-benchmark-sample` implements a benchmark with different combinations of inputs.

### 4.27.4 Suggested Uses

Use zbus to transfer data (messages) between threads in one-to-one, one-to-many, and many-to-many synchronously or asynchronously. Choosing the proper observer type is crucial. Use subscribers for scenarios that can tolerate message losses and duplications; when they cannot, use listeners. In addition to the listener, another asynchronous message processing mechanism (like message queues) may be necessary to retain the pending message until it gets processed.

**Note:** Zbus can be used to transfer streams from the producer to the consumer. However, this can increase zbus' communication latency. So maybe consider a Pipe a good alternative for this communication topology.
4.27.5 Configuration Options

For enabling zbus, it is necessary to enable the CONFIG_ZBUS option.

Related configuration options:

- **CONFIG_ZBUS_CHANNEL_NAME** enables the name of channels to be available inside the channels metadata. The log uses this information to show the channels’ names;
- **CONFIG_ZBUS_OBSERVER_NAME** enables the name of observers to be available inside the channels metadata;
- **CONFIG_ZBUS_RUNTIME_OBSERVERS** enables the runtime observer registration.
- **CONFIG_ZBUS_CHANNELS_SYS_INIT_PRIORITY** determine the SYS_INIT priority used by Zbus to organize the channels observations by channel.

4.27.6 API Reference

**group zbus_apis**

Zbus API.

**Defines**

**ZBUS_CHAN_ADD_OBS_WITH_MASK(_chan, _obs, _masked, _prio)**

Add a static channel observation.

This macro initializes a channel observation by receiving the channel and the observer.

**Parameters**

- _chan – Channel instance.
- _obs – Observer instance.
- _masked – Observation state.
- _prio – Observer notification sequence priority.

**ZBUS_CHAN_ADD_OBS(_chan, _obs, _prio)**

Add a static channel observation.

This macro initializes a channel observation by receiving the channel and the observer.

**Parameters**

- _chan – Channel instance.
- _obs – Observer instance.
- _prio – Observer notification sequence priority.

**ZBUS_OBS_DECLARE(...)**

This macro list the observers to be used in a file.

Internally, it declares the observers with the extern statement. Note it is only necessary when the observers are declared outside the file.

**ZBUS_CHAN_DECLARE(...)**

This macro list the channels to be used in a file.

Internally, it declares the channels with the extern statement. Note it is only necessary when the channels are declared outside the file.
ZBUS_OBSERVERS_EMPTY

This macro indicates the channel has no observers.

ZBUS_OBSERVERS(...)

This macro indicates the channel has listed observers.

Note the sequence of observer notification will follow the same as listed.

ZBUS_CHAN_DEFINE(_name, _type, _validator, _user_data, _observers, _init_val)

Zbus channel definition.

This macro defines a channel.

See also:

struct zbus_channel

Parameters

• _name – The channel's name.
• _type – The Message type. It must be a struct or union.
• _validator – The validator function.
• _user_data – A pointer to the user data.
• _observers – The observers list. The sequence indicates the priority of the observer. The first the highest priority.
• _init_val – The message initialization.

ZBUS_MSG_INIT(_val, ...)

Initialize a message.

This macro initializes a message by passing the values to initialize the message struct or union.

Parameters

• _val – [in] Variadic with the initial values. ZBUS_INIT(0) means {0}, as ZBUS_INIT(a=10, b=30) means {.a=10, .b=30}.

ZBUS_SUBSCRIBER_DEFINE_WITH_ENABLE(_name, _queue_size, _enable)

Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct zbus_observer defining the subscriber.

Parameters

• _name – [in] The subscriber's name.
• _enable – [in] The subscriber initial enable state.

ZBUS_SUBSCRIBER_DEFINE(_name, _queue_size)

Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct zbus_observer defining the subscriber. The subscribers are defined in the enabled state with this macro.

Parameters

• _name – [in] The subscriber's name.

ZBUS_LISTENER_DEFINE_WITH_ENABLE(_name, _cb, _enable)
Define and initialize a listener.
This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously, and initialize the struct `zbus_observer` defining the listener.

**Parameters**

• _name – [in] The listener's name.
• _enable – [in] The listener initial enable state.

ZBUS_LISTENER_DEFINE(_name, _cb)
Define and initialize a listener.
This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously and initialize the struct `zbus_observer` defining the listener. The listeners are defined in the enabled state with this macro.

**Parameters**

• _name – [in] The listener's name.

**Enums**

eenum zbus_observer_type
Type used to represent an observer type.
A observer can be a listener or a subscriber.

* Values: *

enumerator ZBUS_OBSERVER_LISTENER_TYPE
enumerator ZBUS_OBSERVER_SUBSCRIBER_TYPE

**Functions**

int zbus_chan_pub(const struct zbus_channel *chan, const void *msg, k_timeout_t timeout)
Publish to a channel.
This routine publishes a message to a channel.

**Parameters**

• chan – The channel's reference.
• msg – Reference to the message where the publish function copies the channel's message data from.
• timeout – Waiting period to publish the channel, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**

• 0 – Channel published.
- **ENOMEM** – The message is invalid based on the validator function or some of the observers could not receive the notification.
- **EBUSY** – The channel is busy.
- **EAGAIN** – Waiting period timed out.
- **EFAULT** – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
int zbus_chan_read(const struct zbus_channel *chan, void *msg, k_timeout_t timeout)
```

Read a channel.

**Parameters**
- `msg` – [out] Reference to the message where the read function copies the channel's message data to.
- `timeout` – [in] Waiting period to read the channel, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**
- 0 – Channel read.
- **EBUSY** – The channel is busy.
- **EAGAIN** – Waiting period timed out.
- **EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
int zbus_chan_claim(const struct zbus_channel *chan, k_timeout_t timeout)
```

Claim a channel.

This routine claims a channel. During the claiming period the channel is blocked for publishing, reading, notifying or claiming again. Finishing is the only available action.

**Warning:** After calling this routine, the channel cannot be used by other thread until the zbus_chan_finish routine is performed.

**Warning:** This routine should only be called once before a zbus_chan_finish.

**Parameters**
- `timeout` – [in] Waiting period to claim the channel, or one of the special values K_NO_WAIT and K_FOREVER.

**Return values**
- 0 – Channel claimed.
- **EBUSY** – The channel is busy.
- **EAGAIN** – Waiting period timed out.
• -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
int zbus_chan_finish(const struct zbus_channel *chan)
```

Finish a channel claim.

This routine finishes a channel claim. After calling this routine with success, the channel will be able to be used by other thread.

**Warning:** This routine must only be used after a zbus_chan_claim.

### Parameters
- chan – The channel’s reference.

### Return values
- 0 – Channel finished.
- -EPERM – The channel was claimed by other thread.
- -EINVAL – The channel’s mutex is not locked.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
int zbus_chan_notify(const struct zbus_channel *chan, k_timeout_t timeout)
```

Force a channel notification.

This routine forces the event dispatcher to notify the channel’s observers even if the message has no changes. Note this function could be useful after claiming/finishing actions.

### Parameters
- chan – The channel’s reference.
- timeout – Waiting period to notify the channel, or one of the special values K_NO_WAIT and K_FOREVER.

### Return values
- 0 – Channel notified.
- -EPERM – The current thread does not own the channel.
- -EBUSY – The channel’s mutex returned without waiting.
- -EAGAIN – Timeout to acquiring the channel’s mutex.
- -EFAULT – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

```c
static inline const char *zbus_chan_name(const struct zbus_channel *chan)
```

Get the channel’s name.

This routine returns the channel’s name reference.

### Parameters
- chan – The channel’s reference.

### Returns
- Channel’s name reference.
static inline void *zbus_chan_msg(const struct zbus_channel *chan)
Get the reference for a channel message directly.
This routine returns the reference of a channel message.

Warning: This function must only be used directly for acquired (locked by mutex) channels. This can be done inside a listener for the receiving channel or after claim a channel.

Parameters
• chan – The channel's reference.

Returns
Channel's message reference.

static inline const void *zbus_chan_const_msg(const struct zbus_channel *chan)
Get a constant reference for a channel message directly.
This routine returns a constant reference of a channel message. This should be used inside listeners to access the message directly. In this way zbus prevents the listener of changing the notifying channel's message during the notification process.

Warning: This function must only be used directly for acquired (locked by mutex) channels. This can be done inside a listener for the receiving channel or after claim a channel.

Parameters
• chan – The channel's constant reference.

Returns
A constant channel's message reference.

static inline uint16_t zbus_chan_msg_size(const struct zbus_channel *chan)
Get the channel's message size.
This routine returns the channel's message size.

Parameters
• chan – The channel's reference.

Returns
Channel's message size.

static inline void *zbus_chan_user_data(const struct zbus_channel *chan)
Get the channel's user data.
This routine returns the channel's user data.

Parameters
• chan – The channel's reference.

Returns
Channel's user data.

int zbus_chan_add_obs(const struct zbus_channel *chan, const struct zbus_observer *obs, k_timeout_t timeout)
Add an observer to a channel.
This routine adds an observer to the channel.

Parameters
• chan – The channel's reference.
• obs – The observer's reference to be added.
• timeout – Waiting period to add an observer, or one of the special values K_NO_WAIT and K_FOREVER.

Return values
• 0 – Observer added to the channel.
• -EALREADY – The observer is already present in the channel's runtime observers list.
• -ENOMEM – Returned without waiting.
• -EAGAIN – Waiting period timed out.
• -EINVAL – Some parameter is invalid.

int zbus_chan_rm_obs(const struct zbus_channel *chan, const struct zbus_observer *obs, k_timeout_t timeout)

Remove an observer from a channel.
This routine removes an observer to the channel.

Parameters
• chan – The channel's reference.
• obs – The observer's reference to be removed.
• timeout – Waiting period to remove an observer, or one of the special values K_NO_WAIT and K_FOREVER.

Return values
• 0 – Observer removed to the channel.
• -EINVAL – Invalid data supplied.
• -EBUSY – Returned without waiting.
• -EAGAIN – Waiting period timed out.
• -ENOMEM – Returned without waiting.
• -ENODATA – no observer found in channel’s runtime observer list.

static inline int zbus_obs_set_enable(struct zbus_observer *obs, bool enabled)

Change the observer state.
This routine changes the observer state. A channel when disabled will not receive notifications from the event dispatcher.

Parameters
• enabled – [in] State to be. When false the observer stops to receive notifications.

Return values
• 0 – Observer set enable.
• -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.
static inline int zbus_obs_is_enabled(struct zbus_observer *obs, bool *enable)

Get the observer state.

This routine retrieves the observer state.

**Parameters**

**Returns**

Observer state.

int zbus_obs_set_chan_notification_mask(const struct zbus_observer *obs, const struct zbus_channel *chan, bool masked)

Mask notifications from a channel to an observer.

The observer can mask notifications from a specific observing channel by calling this function.

**Parameters**

- **obs** – The observer's reference to be added.
- **chan** – The channel's reference.
- **masked** – The mask state. When the mask is true, the observer will not receive notifications from the channel.

**Return values**

- 0 – Channel notifications masked to the observer.
- -ESRCH – No observation found for the related pair chan/obs.
- -EINVAL – Some parameter is invalid.

int zbus_obs_is_chan_notification_masked(const struct zbus_observer *obs, const struct zbus_channel *chan, bool *masked)

Get the notifications masking state from a channel to an observer.

**Parameters**

- **obs** – The observer's reference to be added.
- **chan** – The channel's reference.
- **masked** – [out] The mask state. When the mask is true, the observer will not receive notifications from the channel.

**Return values**

- 0 – Retrieved the masked state.
- -ESRCH – No observation found for the related pair chan/obs.
- -EINVAL – Some parameter is invalid.

static inline const char *zbus_obs_name(const struct zbus_observer *obs)

Get the observer's name.

This routine returns the observer's name reference.

**Parameters**

- **obs** – The observer's reference.

**Returns**

The observer's name reference.
int zbus_sub_wait(const struct zbus_observer *sub, const struct zbus_channel **chan, k_timeout_t timeout)

Wait for a channel notification.

This routine makes the subscriber to wait a notification. The notification comes as a channel reference.

Parameters

- timeout – [in] Waiting period for a notification arrival, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- 0 – Notification received.
- -ENOMSG – Returned without waiting.
- -EAGAIN – Waiting period timed out.
- -EINVAL – The observer is not a subscriber.
- -EFAULT – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

bool zbus_iterate_over_channels(bool (*iterator_func)(const struct zbus_channel *chan))

Iterate over channels.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

Parameters

- iterator_func – [in] The function that will be execute on each iteration.

Return values

- true – Iterator executed for all channels.
- false – Iterator could not be executed. Some iterate returned false.

bool zbus_iterate_over_channels_with_user_data(bool (*iterator_func)(const struct zbus_channel *chan, void *user_data),
void *user_data)

Iterate over channels with user data.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

Parameters

- iterator_func – [in] The function that will be execute on each iteration.
- user_data – [in] The user data that can be passed in the function.

Return values

- true – Iterator executed for all channels.
- false – Iterator could not be executed. Some iterate returned false.

bool zbus_iterate_over_observers(bool (*iterator_func)(const struct zbus_observer *obs))

Iterate over observers.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.
Parameters

- **iterator_func** – [in] The function that will be execute on each iteration.

Return values

- **true** – Iterator executed for all channels.
- **false** – Iterator could not be executed. Some iterate returned false.

```c
bool zbus_iterate_overObservers_with_user_data(bool (*iterator_func)(const struct zbus_observer *obs, void *user_data),
                               void *user_data)
```

Iterate over observers with user data.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.

Parameters

- **iterator_func** – [in] The function that will be execute on each iteration.
- **user_data** – [in] The user data that can be passed in the function.

Return values

- **true** – Iterator executed for all channels.
- **false** – Iterator could not be executed. Some iterate returned false.

```c
struct zbus_channel_data
#include <zbus.h> Type used to represent a channel mutable data.
```

Every channel has a `zbus_channel_data` structure associated.

Public Members

```c
int16_t observers_start_idx
Static channel observer list start index.
Considering the ITERABLE SECTIONS allocation order.
```

```c
int16_t observers_end_idx
Static channel observer list end index.
Considering the ITERABLE SECTIONS allocation order.
```

```c
struct k_mutex mutex
Access control mutex.
Points to the mutex used to avoid race conditions for accessing the channel.
```

```c
sys_slist_t observers
Channel observer list.
Represents the channel's observers list, it can be empty or have listeners and subscribers mixed in any sequence. It can be changed in runtime.
```

```c
struct zbus_channel
#include <zbus.h> Type used to represent a channel.
```

Every channel has a `zbus_channel` structure associated used to control the channel access and usage.
Public Members

const char *const name
Channel name.

void *const message
Message reference.
Represents the message's reference that points to the actual shared memory region.

const size_t message_size
Message size.
Represents the channel's message size.

void *const user_data
User data available to extend zbus features.
The channel must be claimed before using this field.

bool (*const validator)(const void *msg, size_t msg_size)
Message validator.
Stores the reference to the function to check the message validity before actually performing the publishing. No invalid messages can be published. Every message is valid when this field is empty.

struct zbus_channel_data *const data
Mutable channel data struct.

struct zbus_observer
#include <zbus.h> Type used to represent an observer.
Every observer has an representation structure containing the relevant information. An observer is a code portion interested in some channel. The observer can be notified synchronously or asynchronously and it is called listener and subscriber respectively. The observer can be enabled or disabled during runtime by change the enabled boolean field of the structure. The listeners have a callback function that is executed by the bus with the index of the changed channel as argument when the notification is sent. The subscribers have a message queue where the bus enqueues the index of the changed channel when a notification is sent.

See also:
zbus_obs_set_enable function to properly change the observer's enabled field.

Public Members

const char *const name
Observer name.

enum zbus_observer_type type
Type indication.
bool enabled
  Enabled flag.
  Indicates if observer is receiving notification.

struct k_msgq *const queue
  Observer message queue.
  It turns the observer into a subscriber.

void (*const callback)(const struct zbus_channel *chan)
  Observer callback function.
  It turns the observer into a listener.

4.28  Miscellaneous

4.28.1  Checksum APIs

CRC

group crc

 Enums

enum crc_type
  CRC algorithm enumeration.
  These values should be used with the CRC dispatch function.
  Values:

  enumerator CRC7_BE
    Use crc7_be.

  enumerator CRC8
    Use crc8.

  enumerator CRC8_CCITT
    Use crc8_ccitt.

  enumerator CRC16
    Use crc16.

  enumerator CRC16_ANSI
    Use crc16_ansi.

  enumerator CRC16_CCITT
    Use crc16_ccitt.
enumerator CRC16_ITU_T
   Use \texttt{crc16	extunderscore itu	extunderscore t}.

enumerator CRC32_C
   Use \texttt{crc32	extunderscore c}.

enumerator CRC32_IEEE
   Use \texttt{crc32	extunderscore ieee}.

Functions

\begin{verbatim}
uint16_t crc16(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)

\end{verbatim}

Generic function for computing a CRC-16 without input or output reflection.

Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is \(O(n\times8)\) where \(n\) is the length of the buffer provided. No reflection is performed.

\textbf{Note:} If you are planning to use a CRC based on poly 0x1012 the functions \texttt{crc16	extunderscore itu	extunderscore t()} is faster and thus recommended over this one.

\textbf{Parameters}

\begin{itemize}
   \item \texttt{poly} – The polynomial to use omitting the leading \(x^{16}\) coefficient
   \item \texttt{seed} – Initial value for the CRC computation
   \item \texttt{src} – Input bytes for the computation
   \item \texttt{len} – Length of the input in bytes
\end{itemize}

\textbf{Returns}
The computed CRC16 value (without any XOR applied to it)

\begin{verbatim}
uint16_t crc16_reflect(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)

\end{verbatim}

Generic function for computing a CRC-16 with input and output reflection.

Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is \(O(n\times8)\) where \(n\) is the length of the buffer provided. Both input and output are reflected.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

\begin{itemize}
   \item CRC-16/ANSI, CRC-16/MODBUS, CRC-16/USB, CRC-16/IBM \hfill \url{https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-modbus}
     poly: 0x8005 (0xA001)
     initial seed: 0xffff, xor output: 0x0000
\end{itemize}

\textbf{Note:} If you are planning to use a CRC based on poly 0x1012 the function \texttt{crc16	extunderscore ccitt()} is faster and thus recommended over this one.

\textbf{Parameters}
• poly – The polynomial to use omitting the leading x^16 coefficient. Important: please reflect the poly. For example, use 0xA001 instead of 0x8005 for CRC-16-MODBUS.
• seed – Initial value for the CRC computation
• src – Input bytes for the computation
• len – Length of the input in bytes

Returns
The computed CRC16 value (without any XOR applied to it)

```c
uint8_t crc8(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool reversed)
```

Generic function for computing CRC 8.

Compute CRC 8 by passing in the address of the input, the input length and polynomial used in addition to the initial value.

Parameters
• src – Input bytes for the computation
• len – Length of the input in bytes
• polynomial – The polynomial to use omitting the leading x^8 coefficient
• initial_value – Initial value for the CRC computation
• reversed – Should we use reflected/reversed values or not

Returns
The computed CRC8 value

```c
uint16_t crc16_ccitt(uint16_t seed, const uint8_t *src, size_t len)
```

Compute the checksum of a buffer with polynomial 0x1021, reflecting input and output.

This function is able to calculate any CRC that uses 0x1021 as it polynomial and requires reflecting both the input and the output. It is a fast variant that runs in O(n) time, where n is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

- CRC-16/CCITT, CRC-16/CCITT-TRUE, CRC-16/KERMIT https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-kermit initial seed: 0x0000, xor output: 0x0000

Note: To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

Parameters
• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes
Returns
The computed CRC16 value (without any XOR applied to it)

uint16_t crc16_itu_t(uint16_t seed, const uint8_t *src, size_t len)

Compute the checksum of a buffer with polynomial 0x1021, no reflection of input or output.
This function is able to calculate any CRC that uses 0x1021 as it polynomial and requires no
reflection on both the input and the output. It is a fast variant that runs in O(n) time, where
n is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the
value provided for the initial seed and the value the final calculated CRC is XORed with:

crc-catalogue/16.htm#crc.cat.crc-16-xmodem initial seed: 0x0000, xor output: 0x0000
sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-ibm-3740 initial seed: 0xffff,
xor output: 0x0000
initial seed: 0x0000, xor output: 0xffff

Note: To calculate the CRC across non-contiguous blocks use the return value from block
N-1 as the seed for block N.

Parameters
- seed – Value to seed the CRC with
- src – Input bytes for the computation
- len – Length of the input in bytes

Returns
The computed CRC16 value (without any XOR applied to it)

static inline uint16_t crc16_ansi(const uint8_t *src, size_t len)

Compute the ANSI (or Modbus) variant of CRC-16.
The ANSI variant of CRC-16 uses 0x8005 (0xA001 reflected) as its polynomial with the initial
* value set to 0xffff.

Parameters
- src – Input bytes for the computation
- len – Length of the input in bytes

Returns
The computed CRC16 value

uint32_t crc32_ieee(const uint8_t *data, size_t len)

Generate IEEE conform CRC32 checksum.

Parameters
- data – Pointer to data on which the CRC should be calculated.
- len – Data length.
Returns
CRC32 value.

uint32_t crc32_ieee_update(uint32_t crc, const uint8_t *data, size_t len)
Update an IEEE conforming CRC32 checksum.

Parameters
• crc – CRC32 checksum that needs to be updated.
• data – Pointer to data on which the CRC should be calculated.
• len – Data length.

Returns
CRC32 value.

uint32_t crc32_c(uint32_t crc, const uint8_t *data, size_t len, bool first_pkt, bool last_pkt)
Calculate CRC32C (Castagnoli) checksum.

Parameters
• crc – CRC32C checksum that needs to be updated.
• data – Pointer to data on which the CRC should be calculated.
• len – Data length.
• first_pkt – Whether this is the first packet in the stream.
• last_pkt – Whether this is the last packet in the stream.

Returns
CRC32 value.

uint8_t crc8_ccitt(uint8_t initial_value, const void *buf, size_t len)
Compute CCITT variant of CRC 8.
Normal CCITT variant of CRC 8 is using 0x07.

Parameters
• initial_value – Initial value for the CRC computation
• buf – Input bytes for the computation
• len – Length of the input in bytes

Returns
The computed CRC8 value

uint8_t crc7_be(uint8_t seed, const uint8_t *src, size_t len)
Compute the CRC-7 checksum of a buffer.
See JESD84-A441. Used by the MMC protocol. Uses 0x09 as the polynomial with no reflection. The CRC is left justified, so bit 7 of the result is bit 6 of the CRC.

Parameters
• seed – Value to seed the CRC with
• src – Input bytes for the computation
• len – Length of the input in bytes

Returns
The computed CRC7 value
static inline uint32_t crc_by_type(enum crc_type type, const uint8_t *src, size_t len, uint32_t seed, uint32_t poly, bool reflect, bool first, bool last)

Compute a CRC checksum, in a generic way.

This is a dispatch function that calls the individual CRC routine determined by type.

For 7, 8, and 16-bit CRCs, the relevant seed and poly values should be passed in via the least-significant byte(s).

Similarly, for 7, 8, and 16-bit CRCs, the relevant result is stored in the least-significant byte(s) of the returned value.

**Parameters**

- `type` – CRC algorithm to use.
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes
- `seed` – Value to seed the CRC with
- `poly` – The polynomial to use omitting the leading coefficient
- `reflect` – Should we use reflected/reversed values or not
- `first` – Whether this is the first packet in the stream.
- `last` – Whether this is the last packet in the stream.

**Returns**

`uint32_t` the computed CRC value

### 4.28.2 Structured Data APIs

**JSON**

**group json**

**Defines**

`JSON_OBJ_DESCR_PRIM(struct_, field_name_, type_)`

Helper macro to declare a descriptor for supported primitive values.

Here's an example of use:

```c
struct foo {
    int32_t some_int;
};

struct json_obj_descr foo[] = {
    JSON_OBJ_DESCR_PRIM(struct foo, some_int, JSON_TOK_NUMBER),
};
```

**Parameters**

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct
type_ – Token type for JSON value corresponding to a primitive type. Must be one of: JSON_TOK_STRING for strings, JSON_TOK_NUMBER for numbers, JSON_TOK_TRUE (or JSON_TOK_FALSE) for booleans.

JSON_OBJ_DESCR_OBJECT(struct_, field_name_, sub_descr_)
Helper macro to declare a descriptor for an object value.

Here's an example of use:

```c
struct nested {
    int32_t foo;
    struct {
        int32_t baz;
    } bar;
};

struct json_obj_descr nested_bar[] = {
    { ... declare bar.baz descriptor ... },
};

struct json_obj_descr nested[] = {
    { ... declare foo descriptor ... },
    JSON_OBJ_DESCR_OBJECT(struct nested, bar, nested_bar),
};
```

**Parameters**
- struct_ – Struct packing the values
- field_name_ – Field name in the struct
- sub_descr_ – Array of json_obj_descr describing the subobject

JSON_OBJ_DESCR_ARRAY(struct_, field_name_, max_len_, len_field_, elem_type_)
Helper macro to declare a descriptor for an array of primitives.

Here's an example of use:

```c
struct example {
    int32_t foo[10];
    size_t foo_len;
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_ARRAY(struct example, foo, 10, foo_len, JSON_TOK_NUMBER)
};
```

**Parameters**
- struct_ – Struct packing the values
- field_name_ – Field name in the struct
- max_len_ – Maximum number of elements in array
- len_field_ – Field name in the struct for the number of elements in the array
- elem_type_ – Element type, must be a primitive type
Helper macro to declare a descriptor for an array of objects.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY(struct people_heights, heights, 10,
                            heights_len, person_height_descr,
                            ARRAY_SIZE(person_height_descr)),
};
```

**Parameters**

- `struct_` – Struct packing the values
- `field_name_` – Field name in the struct containing the array
- `max_len_` – Maximum number of elements in the array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_descr_` – Element descriptor, pointer to a descriptor array
- `elem_descr_len_` – Number of elements in `elem_descr_`

Helper macro to declare a descriptor for an array of array.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct person_heights_array {
    struct person_height heights;
}

struct people_heights {
    struct person_heights_array heights[10];
}
```
size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr person_height_array_descr[] = {
    JSON_OBJ_DESCR_OBJECT(struct person_heights_array,
                            heights, person_height_descr),
};

struct json_obj_descr array_array[] = {
    JSON_OBJ_DESCR_ARRAY_ARRAY(struct people_heights, heights, 10,
                               heights_len, person_height_array descr,
                               ARRAY_SIZE(person_height array descr)),
};

Parameters

- struct_ – Struct packing the values
- field_name_ – Field name in the struct containing the array
- max_len_ – Maximum number of elements in the array
- len_field_ – Field name in the struct for the number of elements in the array
- elem_descr_ – Element descriptor, pointer to a descriptor array
- elem_descr_len_ – Number of elements in elem_descr_

JSON_OBJ_DESCR_ARRAY_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_,
                                   len_field_, elem descr_, elem descr len_)

Variant of JSON_OBJ_DESCR_ARRAY_ARRAY that can be used when the structure and JSON
field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_ARRAY_ARRAY

Parameters

- struct_ – Struct packing the values
- json_field_name_ – String, field name in JSON strings
- struct_field_name_ – Field name in the struct containing the array
- max_len_ – Maximum number of elements in the array
- len_field_ – Field name in the struct for the number of elements in the array
- elem descr_ – Element descriptor, pointer to a descriptor array
- elem descr len_ – Number of elements in elem descr_
JSON_OBJ_DESCR_PRIM_NAMED(struct_, json_field_name_, struct_field_name_, type_)

Variant of JSON_OBJ_DESCR_PRIM that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_PRIM

Parameters

- struct_ – Struct packing the values.
- json_field_name_ – String, field name in JSON strings
- struct_field_name_ – Field name in the struct
- type_ – Token type for JSON value corresponding to a primitive type.

JSON_OBJ_DESCR_OBJECT_NAMED(struct_, json_field_name_, struct_field_name_, sub_descr_)

Variant of JSON_OBJ_DESCR_OBJECT that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_OBJECT

Parameters

- struct_ – Struct packing the values
- json_field_name_ – String, field name in JSON strings
- struct_field_name_ – Field name in the struct
- sub_descr_ – Array of json_obj_descr describing the subobject

JSON_OBJ_DESCR_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_type_)

Variant of JSON_OBJ_DESCR_ARRAY that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also:

JSON_OBJ_DESCR_ARRAY

Parameters

- struct_ – Struct packing the values
- json_field_name_ – String, field name in JSON strings
- struct_field_name_ – Field name in the struct
- max_len_ – Maximum number of elements in array
- len_field_ – Field name in the struct for the number of elements in the array
- elem_type_ – Element type, must be a primitive type
Variant of JSON_OBJ_DESCR_OBJ_ARRAY that can be used when the structure and JSON field names differ.
This is useful when the JSON field is not a valid C identifier.

Here's an example of use:

```c
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
    JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct people_heights, "people-heights", heights,
                                    10, heights_len,
                                    person_height_descr,
                                    ARRAY_SIZE(person_height_descr)),
};
```

**Parameters**

- `struct_` – Struct packing the values
- `json_field_name_` – String, field name of the array in JSON strings
- `struct_field_name_` – Field name in the struct containing the array
- `max_len_` – Maximum number of elements in the array
- `len_field_` – Field name in the struct for the number of elements in the array
- `elem_descr_` – Element descriptor, pointer to a descriptor array
- `elem_descr_len_` – Number of elements in `elem_descr_`

**Typedefs**

typedef int (*json_append_bytes_t)(const char *bytes, size_t len, void *data)

Function pointer type to append bytes to a buffer while encoding JSON data.

**Param bytes**
Contents to write to the output

**Param len**
Number of bytes to append to output
**Param data**
User-provided pointer

**Return**
This callback function should return a negative number on error (which will be propagated to the return value of `json_obj_encode()`), or 0 on success.

**Enums**

```c
enum json_tokens
{
  enumerator JSON_TOK_NONE = '_',
  enumerator JSON_TOK_OBJECT_START = '{',
  enumerator JSON_TOK_OBJECT_END = '}',
  enumerator JSON_TOK_LIST_START = '[',
  enumerator JSON_TOK_ARRAY_START = '[',
  enumerator JSON_TOK_LIST_END = ']',
  enumerator JSON_TOK_ARRAY_END = ']',
  enumerator JSON_TOK_STRING = '"',
  enumerator JSON_TOK_COLON = ':',
  enumerator JSON_TOK_COMMA = ',',
  enumerator JSON_TOK_NUMBER = '0',
  enumerator JSON_TOK_FLOAT = '1',
  enumerator JSON_TOK_OPAQUE = '2',
  enumerator JSON_TOK_OBJ_ARRAY = '3',
  enumerator JSON_TOK_TRUE = 't',
  enumerator JSON_TOK_FALSE = 'f',
  enumerator JSON_TOK_NULL = 'n',
  enumerator JSON_TOK_ERROR = '!'   
};
```

4.28. Miscellaneous
Functions

```c
int64_t json_obj_parse(char *json, size_t len, const struct json_obj_descr *descr, size_t descr_len, void *val)
```

Parses the JSON-encoded object pointed to by `json`, with size `len`, according to the descriptor pointed to by `descr`.

Values are stored in a struct pointed to by `val`. Set up the descriptor like this:

```c
struct s { int32_t foo; char *bar; } struct json_obj_descr descr[] = {
  JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER),
  JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING),
};
```

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no `strtod()` in the minimal libc).

Parameters

- `json` – Pointer to JSON-encoded value to be parsed
- `len` – Length of JSON-encoded value
- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array. Must be less than 63 due to implementation detail reasons (if more fields are necessary, use two descriptors)
- `val` – Pointer to the struct to hold the decoded values

Returns

< 0 if error, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

```c
int json_arr_parse(char *json, size_t len, const struct json_obj_descr *descr, void *val)
```

Parses the JSON-encoded array pointed to by `json`, with size `len`, according to the descriptor pointed to by `descr`.

Values are stored in a struct pointed to by `val`. Set up the descriptor like this:

```c
struct s { int32_t foo; char *bar; } struct json_obj_descr descr[] = {
  JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER),
  JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING),
}; struct a { struct s baz[10]; size_t count; } struct json_obj_descr array[] = {
  JSON_OBJ_DESCR_OBJ_ARRAY(struct a, baz, 10, count, descr, ARRAY_SIZE(descr)),
};
```

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no `strtod()` in the minimal libc).

Parameters

- `json` – Pointer to JSON-encoded array to be parsed
- `len` – Length of JSON-encoded array
- `descr` – Pointer to the descriptor array
- `val` – Pointer to the struct to hold the decoded values
**Returns**

0 if array has been successfully parsed. A negative value indicates an error (as defined on errno.h).

```c
int json_arr_separate_object_parse_init(struct json_obj *json, char *payload, size_t len)
```

Initialize single-object array parsing.

JSON-encoded array data is going to be parsed one object at a time. Data is provided by `payload` with the size of `len` bytes.

Function validate that Json Array start is detected and initialize `json` object for Json object parsing separately.

**Parameters**

- `json` – Provide storage for parser states. To be used when parsing the array.
- `payload` – Pointer to JSON-encoded array to be parsed
- `len` – Length of JSON-encoded array

**Returns**

0 if array start is detected and initialization is successful or negative error code in case of failure.

```c
int json_arr_separate_parse_object(struct json_obj *json, const struct json_obj_descr *descr, size_t descr_len, void *val)
```

Parse a single object from array.

Parses the JSON-encoded object pointed to by `json` object array, with size `len`, according to the descriptor pointed to by `descr`.

**Parameters**

- `json` – Pointer to JSON-object message state
- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array. Must be less than 31.
- `val` – Pointer to the struct to hold the decoded values

**Returns**

< 0 if error, 0 for end of message, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

```c
ssize_t json_escape(char *str, size_t *len, size_t buf_size)
```

Escapes the string so it can be used to encode JSON objects.

**Parameters**

- `str` – The string to escape; the escape string is stored the buffer pointed to by this parameter
- `len` – Points to a `size_t` containing the size before and after the escaping process
- `buf_size` – The size of buffer `str` points to

**Returns**

0 if string has been escaped properly, or -ENOMEM if there was not enough space to escape the buffer

```c
size_t json_calc_escaped_len(const char *str, size_t len)
```

Calculates the JSON-escaped string length.

**Parameters**

- `str` – The string to analyze
- `len` – String size
>Returns
The length str would have if it were escaped

ssize_t json_calc_encoded_len(const struct json_obj_descr *descr, size_t descr_len, const void *val)

Calculates the string length to fully encode an object.

Parameters
• descr – Pointer to the descriptor array
• descr_len – Number of elements in the descriptor array
• val – Struct holding the values

>Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

ssize_t json_calc_encoded_arr_len(const struct json_obj_descr *descr, const void *val)

Calculates the string length to fully encode an array.

Parameters
• descr – Pointer to the descriptor array
• val – Struct holding the values

>Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

int json_obj_encode_buf(const struct json_obj_descr *descr, size_t descr_len, const void *val, char *buffer, size_t buf_size)

Encodes an object in a contiguous memory location.

Parameters
• descr – Pointer to the descriptor array
• descr_len – Number of elements in the descriptor array
• val – Struct holding the values
• buffer – Buffer to store the JSON data
• buf_size – Size of buffer, in bytes, with space for the terminating NUL character

>Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).

int json_arr_encode_buf(const struct json_obj_descr *descr, const void *val, char *buffer, size_t buf_size)

Encodes an array in a contiguous memory location.

Parameters
• descr – Pointer to the descriptor array
• val – Struct holding the values
• buffer – Buffer to store the JSON data
• buf_size – Size of buffer, in bytes, with space for the terminating NUL character

>Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).
int json_obj_encode(const struct json_obj_descr *descr, size_t descr_len, const void *val,
                        json_append_bytes_t append_bytes, void *data)

Encodes an object using an arbitrary writer function.

Parameters
- descr – Pointer to the descriptor array
- descr_len – Number of elements in the descriptor array
- val – Struct holding the values
- append_bytes – Function to append bytes to the output
- data – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

int json_arr_encode(const struct json_obj_descr *descr, const void *val,
                        json_append_bytes_t append_bytes, void *data)

Encodes an array using an arbitrary writer function.

Parameters
- descr – Pointer to the descriptor array
- val – Struct holding the values
- append_bytes – Function to append bytes to the output
- data – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

```
struct json_token
    #include <json.h>

struct json_lexer
    #include <json.h>

struct json_obj
    #include <json.h>

struct json_obj_token
    #include <json.h>

struct json_obj_descr
    #include <json.h>
```

JWT

JSON Web Tokens (JWT) are an open, industry standard [RFC 7519](https://tools.ietf.org/html/rfc7519) method for representing claims securely between two parties. Although JWT is fairly flexible, this API is limited to creating the simplistic tokens needed to authenticate with the Google Core IoT infrastructure.

```
group jwt
    JSON Web Token (JWT)
```

4.28. Miscellaneous
Functions

```c
int jwt_init_builder(struct jwt_builder *builder, char *buffer, size_t buffer_size)
```
Initialize the JWT builder.
Initialize the given JWT builder for the creation of a fresh token. The buffer size should at least be as long as JWT_BUILDER_MAX_SIZE returns.

**Parameters**
- `builder` – The builder to initialize.
- `buffer` – The buffer to write the token to.
- `buffer_size` – The size of this buffer. The token will be NULL terminated, which needs to be allowed for in this size.

**Return values**
- `0` – Success
- `-ENOMEM` – Buffer is insufficient to initialize

```c
int jwt_add_payload(struct jwt_builder *builder, int32_t exp, int32_t iat, const char *aud)
```
add JWT primary payload.

```c
int jwt_sign(struct jwt_builder *builder, const char *der_key , size_t der_key_len)
```
Sign the JWT token.

```c
static inline size_t jwt_payload_len(struct jwt_builder *builder)
```

```c
struct jwt_builder
```
#include <jwt.h> JWT data tracking.

JSON Web Tokens contain several sections, each encoded in base-64. This structure tracks the token as it is being built, including limits on the amount of available space. It should be initialized with `jwt_init()`.

### Public Members

```c
char *base
```
The base of the buffer we are writing to.

```c
char *buf
```
The place in this buffer where we are currently writing.

```c
size_t len
```
The length remaining to write.

```c
bool overflowed
```
Flag that is set if we try to write past the end of the buffer.
If set, the token is not valid.
Chapter 5

Build and Configuration Systems

5.1 Build System (CMake)

CMake is used to build your application together with the Zephyr kernel. A CMake build is done in two stages. The first stage is called configuration. During configuration, the CMakeLists.txt build scripts are executed. After configuration is finished, CMake has an internal model of the Zephyr build, and can generate build scripts that are native to the host platform.

CMake supports generating scripts for several build systems, but only Ninja and Make are tested and supported by Zephyr. After configuration, you begin the build stage by executing the generated build scripts. These build scripts can recompile the application without involving CMake following most code changes. However, after certain changes, the configuration step must be executed again before building. The build scripts can detect some of these situations and reconfigure automatically, but there are cases when this must be done manually.

Zephyr uses CMake’s concept of a ‘target’ to organize the build. A target can be an executable, a library, or a generated file. For application developers, the library target is the most important to understand. All source code that goes into a Zephyr build does so by being included in a library target, even application code.

Library targets have source code, that is added through CMakeLists.txt build scripts like this:

```cmake
target_sources(app PRIVATE src/main.c)
```

In the above CMakeLists.txt, an existing library target named app is configured to include the source file src/main.c. The PRIVATE keyword indicates that we are modifying the internals of how the library is being built. Using the keyword PUBLIC would modify how other libraries that link with app are built. In this case, using PUBLIC would cause libraries that link with app to also include the source file src/main.c, behavior that we surely do not want. The PUBLIC keyword could however be useful when modifying the include paths of a target library.

5.1.1 Build and Configuration Phases

The Zephyr build process can be divided into two main phases: a configuration phase (driven by CMake) and a build phase (driven by Make or Ninja).

Configuration Phase

The configuration phase begins when the user invokes CMake to generate a build system, specifying a source application directory and a board target.
CMake begins by processing the `CMakeLists.txt` file in the application directory, which refers to the `CMakeLists.txt` file in the Zephyr top-level directory, which in turn refers to `CMakeLists.txt` files throughout the build tree (directly and indirectly). Its primary output is a set of Makefiles or Ninja files to drive the build process, but the CMake scripts also do some processing of their own, which is explained here.

Note that paths beginning with `build/` below refer to the build directory you create when running CMake.

**Devicetree**

- `*.dts` (devicetree source) and `*.dtsi` (devicetree source include) files are collected from the target’s architecture, SoC, board, and application directories.
- `*.dtsi` files are included by `*.dts` files via the C preprocessor (often abbreviated `cpp`, which should not be confused with C++). The C preprocessor is also used to merge in any devicetree `*.overlay` files, and to expand macros in `*.dts`, `*.dtsi`, and `*.overlay` files. The preprocessor output is placed in `build/zephyr/zephyr.dts.pre`.

The preprocessed devicetree sources are parsed by `gen_defines.py` to generate a `build/zephyr/include/generated/devicetree_generated.h` header with preprocessor macros.

Source code should access preprocessor macros generated from devicetree by including the `devicetree.h` header, which includes `devicetree_generated.h`.

`gen_defines.py` also writes the final devicetree to `build/zephyr/zephyr.dts` in the build directory. This file’s contents may be useful for debugging.

If the devicetree compiler `dtc` is installed, it is run on `build/zephyr/zephyr.dts` to catch any extra warnings and errors generated by this tool. The output from `dtc` is unused otherwise, and this step is skipped if `dtc` is not installed.

The above is just a brief overview. For more information on devicetree, see `Devicetree Guide`.

**Kconfig**

Kconfig files define available configuration options for for the target architecture, SoC, board, and application, as well as dependencies between options.

Kconfig configurations are stored in `configuration files`. The initial configuration is generated by merging configuration fragments from the board and application (e.g. `prj.conf`).

The output from Kconfig is an `autoconf.h` header with preprocessor assignments, and a `.config` file that acts both as a saved configuration and as configuration output (used by CMake). The definitions in `autoconf.h` are automatically exposed at compile time, so there is no need to include this header.

Information from devicetree is available to Kconfig, through the functions defined in `kconfigfunctions.py`.

See the Kconfig section of the manual for more information.

**Build Phase**

The build phase begins when the user invokes `make` or `ninja`. Its ultimate output is a complete Zephyr application in a format suitable for loading/flashng on the desired target board (`zephyr.elf`, `zephyr.hex`, etc.) The build phase can be broken down, conceptually, into four stages: the pre-build, first-pass binary, final binary, and post-processing.

**Pre-build**  Pre-build occurs before any source files are compiled, because during this phase header files used by the source files are generated.

**Offset generation**

Access to high-level data structures and members is sometimes required when the definitions of
those structures is not immediately accessible (e.g., assembly language). The generation of offsets.h (by gen_offset_header.py) facilitates this.

**System call boilerplate**

The gen_syscall.py and parse_syscalls.py scripts work together to bind potential system call functions with their implementations.

**Intermediate binaries**

Compilation proper begins with the first intermediate binary. Source files (C and assembly) are collected from various subsystems (which ones is decided during the configuration phase), and compiled into archives (with reference to header files in the tree, as well as those generated during the configuration phase and the pre-build stage(s)).

The exact number of intermediate binaries is decided during the configuration phase.

If memory protection is enabled, then:
Partition grouping

The gen_app_partitions.py script scans all the generated archives and outputs linker scripts to ensure that application partitions are properly grouped and aligned for the target’s memory protection hardware.

Then cpp is used to combine linker script fragments from the target’s architecture/SoC, the kernel tree, optionally the partition output if memory protection is enabled, and any other fragments selected during the configuration process, into a linker.cmd file. The compiled archives are then linked with ld as specified in the linker.cmd.

Unfixed size binary

The unfixed size intermediate binary is produced when User Mode is enabled or Devicetree is in use. It produces a binary where sizes are not fixed and thus it may be used by post-process steps that will impact the size of the final binary.

Fixed size binary

The fixed size intermediate binary is produced when User Mode is enabled or when generated IRQ tables are used, CONFIG_GEN_ISR_TABLES. It produces a binary where sizes are fixed and thus the size must not change between the intermediate binary and the final binary.

Intermediate binaries post-processing

The binaries from the previous stage are incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

To complete the build procedure the following scripts are executed on the intermediate binaries to produce the missing pieces needed for the final binary.

When User Mode is enabled:

Partition alignment

The gen_app_partitions.py script scans the unfixed size binary and generates an app shared memory aligned linker script snippet where the partitions are sorted in descending order.

When Devicetree is used:
Device dependencies

The `gen_device_deps.py` script scans the unfixed size binary to determine relationships between devices that were recorded from devicetree data, and replaces the encoded relationships with values that are optimized to locate the devices actually present in the application.

When **CONFIG_GEN_ISR_TABLES** is enabled:

The `gen_isr_tables.py` script scans the fixed size binary and creates an `isr_tables.c` source file with a hardware vector table and/or software IRQ table.

When **User Mode** is enabled:

**Kernel object hashing**

The `gen_kobject_list.py` scans the ELF DWARF debug data to find the address of the all kernel objects. This list is passed to `gperf`, which generates a perfect hash function and table of those addresses, then that output is optimized by `process_gperf.py`, using known properties of our special case.

When no intermediate binary post-processing is required then the first intermediate binary will be directly used as the final binary.

**Final binary**  The binary from the previous stage is incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

The link from the previous stage is repeated, this time with the missing pieces populated.

**Post processing**  Finally, if necessary, the completed kernel is converted from ELF to the format expected by the loader and/or flash tool required by the target. This is accomplished in a straightforward manner with `objdump`.
5.1.2 Supporting Scripts and Tools

The following is a detailed description of the scripts used during the build process.

scripts/build/gen_syscalls.py

Script to generate system call invocation macros

This script parses the system call metadata JSON file emitted by parse_syscalls.py to create several files:

- A file containing weak aliases of any potentially unimplemented system calls, as well as the system call dispatch table, which maps system call type IDs to their handler functions.
- A header file defining the system call type IDs, as well as function prototypes for all system call handler functions.
- A directory containing header files. Each header corresponds to a header that was identified as containing system call declarations. These generated headers contain the inline invocation functions for each system call in that header.

scripts/build/gen_device_deps.py

Translate generic handles into ones optimized for the application.

Immutable device data includes information about dependencies, e.g. that a particular sensor is controlled through a specific I2C bus and that it signals event on a pin on a specific GPIO controller. This information is encoded in the first-pass binary using identifiers derived from the devicetree. This script extracts those identifiers and replaces them with ones optimized for use with the devices actually present.
For example the sensor might have a first-pass handle defined by its devicetree ordinal 52, with the I2C
driver having ordinal 24 and the GPIO controller ordinal 14. The runtime ordinal is the index of the
corresponding device in the static devicetree array, which might be 6, 5, and 3, respectively.
The output is a C source file that provides alternative definitions for the array contents referenced from
the immutable device objects. In the final link these definitions supersede the ones in the driver-specific
object file.

scripts/build/gen_kobject_list.py

Script to generate gperf tables of kernel object metadata

User mode threads making system calls reference kernel objects by memory address, as the kernel/driver
APIs in Zephyr are the same for both user and supervisor contexts. It is necessary for the kernel to be
able to validate accesses to kernel objects to make the following assertions:

• That the memory address points to a kernel object
• The kernel object is of the expected type for the API being invoked
• The kernel object is of the expected initialization state
• The calling thread has sufficient permissions on the object

For more details see the Kernel Objects section in the documentation.

The zephyr build generates an intermediate ELF binary, zephyr_prebuilt.elf, which this script scans look-
ing for kernel objects by examining the DWARF debug information to look for instances of data structures
that are considered kernel objects. For device drivers, the API struct pointer populated at build time is
also examined to disambiguate between various device driver instances since they are all ‘struct device’.

This script can generate five different output files:

• A gperf script to generate the hash table mapping kernel object memory addresses to kernel object
  metadata, used to track permissions, object type, initialization state, and any object-specific data.
• A header file containing generated macros for validating driver instances inside the system call
  handlers for the driver subsystem APIs.
• A code fragment included by kernel.h with one enum constant for each kernel object type and each
  driver instance.
• The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping the kernel
  object types and driver instances to their human-readable representation in the otype_to_str() function.
• The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping ker-
  nel object types to their sizes. This is used for allocating instances of them at runtime (CON-
  FIG_DYNAMIC_OBJECTS) in the obj_size_get() function.

scripts/build/gen_offset_header.py

This script scans a specified object file and generates a header file that defined macros for the offsets
of various found structure members (particularly symbols ending with _OFFSET or _SIZEOF), primarily
intended for use in assembly code.

scripts/build/parse_syscalls.py

Script to scan Zephyr include directories and emit system call and subsystem metadata

System calls require a great deal of boilerplate code in order to implement completely. This script is the
first step in the build system's process of auto-generating this code by doing a text scan of directories
containing C or header files, and building up a database of system calls and their function call prototypes. This information is emitted to a generated JSON file for further processing.

This script also scans for struct definitions such as __subsystem and __net_socket, emitting a JSON dictionary mapping tags to all the struct declarations found that were tagged with them.

If the output JSON file already exists, its contents are checked against what information this script would have outputted; if the result is that the file would be unchanged, it is not modified to prevent unnecessary incremental builds.

**arch/x86/gen_idt.py**

Generate Interrupt Descriptor Table for x86 CPUs.

This script generates the interrupt descriptor table (IDT) for x86. Please consult the IA Architecture SW Developer Manual, volume 3, for more details on this data structure.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the IDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols. From the kernel binary we read a special section “intList” which contains the desired interrupt routing configuration for the kernel, populated by instances of the IRQ_CONNECT() macro.

This script outputs three binary tables:

1. The interrupt descriptor table itself.
2. A bitfield indicating which vectors in the IDT are free for installation of dynamic interrupts at runtime.
3. An array which maps configured IRQ lines to their associated vector entries in the IDT, used to program the APIC at runtime.

**arch/x86/gen_gdt.py**

Generate a Global Descriptor Table (GDT) for x86 CPUs.

For additional detail on GDT and x86 memory management, please consult the IA Architecture SW Developer Manual, vol. 3.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the GDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols.

The input kernel ELF binary is used to obtain the following information:

- Memory addresses of the Main and Double Fault TSS structures so GDT descriptors can be created for them
- Memory addresses of where the GDT lives in memory, so that this address can be populated in the GDT pseudo descriptor
- whether userspace or HW stack protection are enabled in Kconfig

The output is a GDT whose contents depend on the kernel configuration. With no memory protection features enabled, we generate flat 32-bit code and data segments. If hardware-based stack overflow protection or userspace is enabled, we additionally create descriptors for the main and double-fault IA tasks, needed for userspace privilege elevation and double-fault handling. If userspace is enabled, we also create flat code/data segments for ring 3 execution.
scripts/build/gen_relocate_app.py

This script will relocate .text, .rodata, .data and .bss sections from required files and places it in the required memory region. This memory region and file are given to this python script in the form of a string.

Example of such a string would be:

```
SRAM2:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c,
SRAM1:COPY:/home/xyz/zephyr/samples/hello_world/src/main2.c, 
FLASH2:NOCOPY:/home/xyz/zephyr/samples/hello_world/src/main3.c
```

One can also specify the program header for a given memory region:

```
SRAM2:\:phdr0:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c
```

To invoke this script:

```
python3 gen_relocate_app.py -i input_string -o generated_linker -c generated_code
```

Configuration that needs to be sent to the python script.

- If the memory is like SRAM1/SRAM2/CCD/AON then place full object in the sections
- If the memory type is appended with _DATA / _TEXT/ _RODATA/ _BSS only the selected memory is placed in the required memory region. Others are ignored.
- COPY/NOCOPY defines whether the script should generate the relocation code in code_relocation.c or not

Multiple regions can be appended together like SRAM2_DATA_BSS this will place data and bss inside SRAM2.

scripts/build/process_gperf.py

gperf C file post-processor

We use gperf to build up a perfect hashtable of pointer values. The way gperf does this is to create a table ‘wordlist’ indexed by a string representation of a pointer address, and then doing memcmp() on a string passed in for comparison

We are exclusively working with 4-byte pointer values. This script adjusts the generated code so that we work with pointers directly and not strings. This saves a considerable amount of space.

scripts/build/gen_app_partitions.py

Script to generate a linker script organizing application memory partitions

Applications may declare build-time memory domain partitions with K_APPMEM_PARTITION_DEFINE, and assign globals to them using K_APP_DMEM or K_APP_BMEM macros. For each of these partitions, we need to route all their data into appropriately-sized memory areas which meet the size/alignment constraints of the memory protection hardware.

This linker script is created very early in the build process, before the build attempts to link the kernel binary, as the linker script this tool generates is a necessary pre-condition for kernel linking. We extract the set of memory partitions to generate by looking for variables which have been assigned to input sections that follow a defined naming convention. We also allow entire libraries to be pulled in to assign their globals to a particular memory partition via command line directives.

This script takes as inputs:

- The base directory to look for compiled objects
- key/value pairs mapping static library files to what partitions their globals should end up in.
The output is a linker script fragment containing the definition of the app shared memory section, which is further divided, for each partition found, into data and BSS for each partition.

*scripts/build/check_init_priorities.py*

Checks the initialization priorities

This script parses the object files in the specified build directory, creates a list of known devices and their effective initialization priorities and compares that with the device dependencies inferred from the devicetree hierarchy.

This can be used to detect devices that are initialized in the incorrect order, but also devices that are initialized at the same priority but depends on each other, which can potentially break if the linking order is changed.

### 5.2 Devicetree

A devicetree is a hierarchical data structure primarily used to describe hardware. Zephyr uses devicetree in two main ways:

- to describe hardware to the Device Driver Model
- to provide that hardware's initial configuration

This page links to a high level guide on devicetree as well as reference material.

#### 5.2.1 Devicetree Guide

The pages in this section are a high-level guide to using devicetree for Zephyr development.

**Introduction to devicetree**

**Tip:** This is a conceptual overview of devicetree and how Zephyr uses it. For step-by-step guides and examples, see Devicetree HOWTOs.

The following pages introduce general devicetree concepts and how they apply to Zephyr.

**Scope and purpose** A devicetree is primarily a hierarchical data structure that describes hardware. The Devicetree specification defines its source and binary representations.

Zephyr uses devicetree to describe:

- the hardware available on its boards
- that hardware's initial configuration

As such, devicetree is both a hardware description language and a configuration language for Zephyr. See Devicetree versus Kconfig for some comparisons between devicetree and Zephyr's other main configuration language, Kconfig.

There are two types of devicetree input files: devicetree sources and devicetree bindings. The sources contain the devicetree itself. The bindings describe its contents, including data types. The build system uses devicetree sources and bindings to produce a generated C header. The generated header's contents are abstracted by the devicetree.h API, which you can use to get information from your devicetree.

Here is a simplified view of the process:
All Zephyr and application source code files can include and use `devicetree.h`. This includes device drivers, applications, tests, the kernel, etc.

The API itself is based on C macros. The macro names all start with `DT_`. In general, if you see a macro that starts with `DT_` in a Zephyr source file, it's probably a `devicetree.h` macro. The generated C header contains macros that start with `DT_` as well; you might see those in compiler error messages. You always can tell a generated- from a non-generated macro: generated macros have some lowercased letters, while the `devicetree.h` macro names have all capital letters.

**Syntax and structure**  As the name indicates, a devicetree is a tree. The human-readable text format for this tree is called DTS (for devicetree source), and is defined in the Devicetree specification.

This page’s purpose is to introduce devicetree in a more gradual way than the specification. However, you may still need to refer to the specification to understand some detailed cases.

**Example**  Here is an example DTS file:

```dts
/dts-v1/;
/
{
    a-node {
        subnode_nodelabel: a-sub-node {
            foo = <3>;
        }
    }
};
```
The `/dts-v1/` line means the file’s contents are in version 1 of the DTS syntax, which has replaced a now-obsolete “version 0”.

**Nodes**  Like any tree data structure, a devicetree has a hierarchy of nodes. The above tree has three nodes:

1. A root node: `/`
2. A node named `a-node`, which is a child of the root node
3. A node named `a-sub-node`, which is a child of `a-node`

Nodes can be assigned **node labels**, which are unique shorthands that refer to the labeled node. Above, `a-sub-node` has the node label `subnode_node1abel`. A node can have zero, one, or multiple node labels. You can use node labels to refer to the node elsewhere in the devicetree.

Devicetree nodes have **paths** identifying their locations in the tree. Like Unix file system paths, devicetree paths are strings separated by slashes (`/`), and the root node’s path is a single slash: `/`. Otherwise, each node’s path is formed by concatenating the node’s ancestors’ names with the node’s own name, separated by slashes. For example, the full path to `a-sub-node` is `/a-node/a-sub-node`.

**Properties**  Devicetree nodes can also have **properties**. Properties are name/value pairs. Property values can be any sequence of bytes. In some cases, the values are an array of what are called **cells**. A cell is just a 32-bit unsigned integer.

Node `a-sub-node` has a property named `foo`, whose value is a cell with value 3. The size and type of `foo`’s value are implied by the enclosing angle brackets (`<` and `>`) in the DTS.

See **Writing property values** below for more example property values.

**Devicetrees reflect hardware**  In practice, devicetree nodes usually correspond to some hardware, and the node hierarchy reflects the hardware’s physical layout. For example, let’s consider a board with three I2C peripherals connected to an I2C bus controller on an SoC, like this:

Nodes corresponding to the I2C bus controller and each I2C peripheral would be present in the devicetree. Reflecting the hardware layout, the I2C peripheral nodes would be children of the bus controller node. Similar conventions exist for representing other types of hardware.

The DTS would look something like this:
Properties in practice   In practice, properties usually describe or configure the hardware the node represents. For example, an I2C peripheral’s node has a property whose value is the peripheral’s address on the bus.

Here’s a tree representing the same example, but with real-world node names and properties you might see when working with I2C devices.

Fig. 2: I2C devicetree example with real-world names and properties. Node names are at the top of each node with a gray background. Properties are shown as “name=value” lines.

This is the corresponding DTS:
i2c@40003000 {
    compatible = "nordic,nrf-twim";
    reg = <0x40003000 0x1000>;
    apds9960@39 {
        compatible = "avago,apds9960";
        reg = <0x39>;
    }; ti_hdc@43 {
        compatible = "ti,hdc", "ti,hdc1010";
        reg = <0x43>;
    }; mma8652fc@1d {
        compatible = "nxp,fxos8700", "nxp,mma8652fc";
        reg = <0x1d>;
    }
};

Unit addresses  In addition to showing more real-world names and properties, the above example introduces a new devicetree concept: unit addresses. Unit addresses are the parts of node names after an “at” sign (@), like 40003000 in i2c@40003000, or 39 in apds9960@39. Unit addresses are optional: the soc node does not have one.

In devicetree, unit addresses give a node’s address in the address space of its parent node. Here are some example unit addresses for different types of hardware.

Memory-mapped peripherals
The peripheral’s register map base address. For example, the node named i2c@40003000 represents an I2C controller whose register map base address is 0x40003000.

I2C peripherals
The peripheral’s address on the I2C bus. For example, the child node apds9960@39 of the I2C controller in the previous section has I2C address 0x39.

SPI peripherals
An index representing the peripheral’s chip select line number. (If there is no chip select line, 0 is used.)

Memory
The physical start address. For example, a node named memory@2000000 represents RAM starting at physical address 0x2000000.

Memory-mapped flash
Like RAM, the physical start address. For example, a node named flash@8000000 represents a flash device whose physical start address is 0x8000000.

Fixed flash partitions
This applies when the devicetree is used to store a flash partition table. The unit address is the partition’s start offset within the flash memory. For example, take this flash device and its partitions:

flash@8000000 {
    /* ... */
    partitions {
        partition@0 {
            /* ... */
        };
        partition@20000 {
            /* ... */
        };
        /* ... */
    }
}
The node named partition@0 has offset 0 from the start of its flash device, so its base address is 0x8000000. Similarly, the base address of the node named partition@20000 is 0x8020000.

**Important properties** The devicetree specification defines several standard properties. Some of the most important ones are:

**compatible**

The name of the hardware device the node represents.

The recommended format is "vendor,device", like "avago,apds9960", or a sequence of these, like "ti,hdc", "ti,hdc1010". The vendor part is an abbreviated name of the vendor. The file `dts/bindings/vendor-prefixes.txt` contains a list of commonly accepted vendor names. The device part is usually taken from the datasheet.

It is also sometimes a value like gpio-keys, mmio-sram, or fixed-clock when the hardware's behavior is generic.

The build system uses the compatible property to find the right bindings for the node. Device drivers use devicetree.h to find nodes with relevant compatibles, in order to determine the available hardware to manage.

The compatible property can have multiple values. Additional values are useful when the device is a specific instance of a more general family, to allow the system to match from most- to least-specific device drivers.

Within Zephyr's bindings syntax, this property has type string-array.

**reg**

Information used to address the device. The value is specific to the device (i.e. is different depending on the compatible property).

The reg property is a sequence of (address, length) pairs. Each pair is called a “register block”. Values are conventionally written in hex.

Here are some common patterns:

- Devices accessed via memory-mapped I/O registers (like i2c@40003000): address is usually the base address of the I/O register space, and length is the number of bytes occupied by the registers.
- I2C devices (like apds9960@39 and its siblings): address is a slave address on the I2C bus. There is no length value.
- SPI devices: address is a chip select line number; there is no length.

You may notice some similarities between the reg property and common unit addresses described above. This is not a coincidence. The reg property can be seen as a more detailed view of the addressable resources within a device than its unit address.

**status**

A string which describes whether the node is enabled.

The devicetree specification allows this property to have values "okay", "disabled", "reserved", "fail", and "fail-sss". Only the values "okay" and "disabled" are currently relevant to Zephyr; use of other values currently results in undefined behavior.

A node is considered enabled if its status property is either "okay" or not defined (i.e. does not exist in the devicetree source). Nodes with status "disabled" are explicitly disabled. (For backwards compatibility, the value "ok" is treated the same as "okay", but this usage is deprecated.) Device-tree nodes which correspond to physical devices must be enabled for the corresponding `struct device` in the Zephyr driver model to be allocated and initialized.
interrupts

Information about interrupts generated by the device, encoded as an array of one or more interrupt specifiers. Each interrupt specifier has some number of cells. See section 2.4, Interrupts and Interrupt Mapping, in the Devicetree Specification release v0.3 for more details.

Zephyr’s devicetree bindings language lets you give a name to each cell in an interrupt specifier.

Note: Earlier versions of Zephyr made frequent use of the label property, which is distinct from the standard node label. Use of the label property in new devicetree bindings, as well as use of the DT_LABEL macro in new code, are actively discouraged. Label properties continue to persist for historical reasons in some existing bindings and overlays, but should not be used in new bindings or device implementations.

Writing property values

This section describes how to write property values in DTS format. The property types in the table below are described in detail in Devicetree bindings.

Some specifics are skipped in the interest of keeping things simple; if you’re curious about details, see the devicetree specification.

<table>
<thead>
<tr>
<th>Property type</th>
<th>How to write</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Double quoted</td>
<td>a-string = &quot;hello, world!&quot;;</td>
</tr>
<tr>
<td>int</td>
<td>between angle brackets (&lt; and &gt;)</td>
<td>an-int = &lt;1&gt;;</td>
</tr>
<tr>
<td>boolean</td>
<td>for true, with no value (for false, use / delete-property/)</td>
<td>my-true-boolean;</td>
</tr>
<tr>
<td>array</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>foo = &lt;0xdeadbeef 1234 0&gt;;</td>
</tr>
<tr>
<td>uint8-array</td>
<td>in hexadecimal without leading 0x, between square brackets ([] and []).</td>
<td>a-byte-array = [00 01 ab];</td>
</tr>
<tr>
<td>string-array</td>
<td>separated by commas</td>
<td>a-string-array = &quot;string one&quot;, &quot;string two&quot;, &quot;string three&quot;;</td>
</tr>
<tr>
<td>phandle</td>
<td>between angle brackets (&lt; and &gt;)</td>
<td>a-phandle = &lt;&amp;mynode&gt;;</td>
</tr>
<tr>
<td>phandles</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>some-phandles = &lt;&amp;mynode0 &amp;mynode1 &amp;mynode2&gt;;</td>
</tr>
<tr>
<td>phandle-array</td>
<td>between angle brackets (&lt; and &gt;), separated by spaces</td>
<td>a-phandle-array = &lt;&amp;mynode0 1 2&gt;, &lt;&amp;mynode1 3 4&gt;;</td>
</tr>
</tbody>
</table>

Additional notes on the above:

- The values in the phandle, phandles, and phandle-array types are are described further in Phandles.

- Boolean properties are true if present. They should not have a value. A boolean property is only false if it is completely missing in the DTS.

- The foo property value above has three cells with values 0xdeadbeef, 1234, and 0, in that order. Note that hexadecimal and decimal numbers are allowed and can be intermixed. Since Zephyr transforms DTS to C sources, it is not necessary to specify the endianness of an individual cell here.

- 64-bit integers are written as two 32-bit cells in big-endian order. The value 0xaaaa0000b1111 would be written <0xaaaa0000 0xb1111>.

- The a-byte-array property value is the three bytes 0x00, 0x01, and 0xab, in that order.

- Parentheses, arithmetic operators, and bitwise operators are allowed. The bar property contains a single cell with value 64:

  \[
  \text{bar} = \langle (2 \times (1 << 5)) \rangle;
  \]

  Note that the entire expression must be parenthesized.
• Property values refer to other nodes in the devicetree by their phandles. You can write a phandle using &foo, where foo is a node label. Here is an example devicetree fragment:

```c
foo: device@0 { }
device@1 {
    sibling = <&foo 1 2>;
};
```

The sibling property of node device@1 contains three cells, in this order:

1. The device@0 node's phandle, which is written here as &foo since the device@0 node has a node label foo
2. The value 1
3. The value 2

In the devicetree, a phandle value is a cell – which again is just a 32-bit unsigned int. However, the Zephyr devicetree API generally exposes these values as node identifiers. Node identifiers are covered in more detail in Devicetree access from C/C++.

• Array and similar type property values can be split into several <> blocks, like this:

```c
foo = <1 2>, <3 4>; // Okay for 'type: array'
foo = <&label1 &label2>, <&label3 &label4>; // Okay for 'type: phandles'
foo = <&label1 1 2>, <&label2 3 4>; // Okay for 'type: phandle-array'
```

This is recommended for readability when possible if the value can be logically grouped into blocks of sub-values.

**Aliases and chosen nodes** There are two additional ways beyond node labels to refer to a particular node without specifying its entire path: by alias, or by chosen node.

Here is an example devicetree which uses both:

```c
/../../../dts-v1/;
/
{
    chosen {
        zephyr,console = &uart0;
    };

    aliases {
        my-uart = &uart0;
    };

    soc {
        uart0: serial@12340000 {
            ...
        };
    };
}
```

The /aliases and /chosen nodes do not refer to an actual hardware device. Their purpose is to specify other nodes in the devicetree.

Above, my-uart is an alias for the node with path /soc/serial@12340000. Using its node label uart0, the same node is set as the value of the chosen zephyr,console node.

Zephyr sample applications sometimes use aliases to allow overriding the particular hardware device used by the application in a generic way. For example, blinky-sample uses this to abstract the LED to blink via the led0 alias.
The /chosen node's properties are used to configure system- or subsystem-wide values. See Chosen nodes for more information.

**Input and output files** This section describes the input and output files shown in the figure in Scope and purpose in more detail.

Fig. 3: Devicetree input (green) and output (yellow) files

**Input files** There are four types of devicetree input files:

- sources (.dts)
- includes (.dti)
- overlays (.overlay)
- bindings (.yaml)

The devicetree files inside the zephyr directory look like this:

```
boards/<ARCH>//<BOARD>.dts
dts/common/skeleton.dtsi
dts/<ARCH>/.../<SOC>.dti

dts/bindings/.../binding.yaml
```

Generally speaking, every supported board has a BOARD.dts file describing its hardware. For example, the reel_board has boards/arm/reel_board/reel_board.dts.
BOARD.dts includes one or more .dtsi files. These .dtsi files describe the CPU or system-on-chip Zephyr runs on, perhaps by including other .dtsi files. They can also describe other common hardware features shared by multiple boards. In addition to these includes, BOARD.dts also describes the board’s specific hardware.

The dts/common directory contains skeleton.dtsi, a minimal include file for defining a complete devicetree. Architecture-specific subdirectories (dts/<ARCH>) contain .dtsi files for CPUs or SoCs which extend skeleton.dtsi.

The C preprocessor is run on all devicetree files to expand macro references, and includes are generally done with #include <filename> directives, even though DTS has a /include/ "<filename>" syntax.

BOARD.dts can be extended or modified using overlays. Overlays are also DTS files; the .overlay extension is just a convention which makes their purpose clear. Overlays adapt the base devicetree for different purposes:

- Zephyr applications can use overlays to enable a peripheral that is disabled by default, select a sensor on the board for an application specific purpose, etc. Along with Configuration System (Kconfig), this makes it possible to reconfigure the kernel and device drivers without modifying source code.

- Overlays are also used when defining Shields.

The build system automatically picks up .overlay files stored in certain locations. It is also possible to explicitly list the overlays to include, via the DTC_OVERLAY_FILE CMake variable. See Set devicetree overlays for details.

The build system combines BOARD.dts and any .overlay files by concatenating them, with the overlays put last. This relies on DTS syntax which allows merging overlapping definitions of nodes in the devicetree. See Example: FRDM-K64F and Hexiwear K64 for an example of how this works (in the context of .dtsi files, but the principle is the same for overlays). Putting the contents of the .overlay files last allows them to override BOARD.dts.

Devicetree bindings (which are YAML files) are essentially glue. They describe the contents of devicetree sources, includes, and overlays in a way that allows the build system to generate C macros usable by device drivers and applications. The dts/bindings directory contains bindings.

Scripts and tools The following libraries and scripts, located in scripts/dts/, create output files from input files. Their sources have extensive documentation.

dtlib.py
A low-level DTS parsing library.

dtlib.py
A library layered on top of dtlib that uses bindings to interpret properties and give a higher-level view of the devicetree. Uses dtlib to do the DTS parsing.

gen_defines.py
A script that uses edtlib to generate C preprocessor macros from the devicetree and bindings.

In addition to these, the standard dtc (devicetree compiler) tool is run on the final devicetree if it is installed on your system. This is just to catch errors or warnings. The output is unused. Boards may need to pass dtc additional flags, e.g. for warning suppression. Board directories can contain a file named pre_dt_board.cmake which configures these extra flags, like this:

```
list(APPEND EXTRA_DTC_FLAGS "-Wno-simple_bus_reg")
```

Output files These are created in your application’s build directory.

Warning: Don’t include the header files directly. Devicetree access from C/C++ explains what to do instead.
Design goals

Zephyr's use of devicetree has evolved significantly over time, and further changes are expected. The following are the general design goals, along with specific examples about how they impact Zephyr's source code, and areas where more work remains to be done.

Single source for hardware information  Zephyr's built-in device drivers and sample applications shall obtain configurable hardware descriptions from devicetree.

Examples

- New device drivers shall use devicetree APIs to determine which devices to create.
- In-tree sample applications shall use aliases to determine which of multiple possible generic devices of a given type will be used in the current build. For example, the blinky-sample uses this to determine the LED to blink.
- Boot-time pin muxing and pin control for new SoCs shall be accomplished via a devicetree-based pinctrl driver

Example remaining work

- Zephyr's Test Runner (Twister) currently use board.yaml files to determine the hardware supported by a board. This should be obtained from devicetree instead.
- Legacy device drivers currently use Kconfig to determine which instances of a particular compatible are enabled. This can and should be done with devicetree overlays instead.
- Board-level documentation still contains tables of hardware support which are generated and maintained by hand. This can and should be obtained from the board level devicetree instead.
- Runtime determination of struct device relationships should be done using information obtained from devicetree, e.g. for device power management.

Source compatibility with other operating systems  Zephyr's devicetree tooling is based on a generic layer which is interoperable with other devicetree users, such as the Linux kernel.

Zephyr's binding language semantics can support Zephyr-specific attributes, but shall not express Zephyr-specific relationships.

Examples

- Zephyr's devicetree source parser, dtlib.py, is source-compatible with other tools like dtc in both directions: dtlib.py can parse dtc output, and dtc can parse dtlib.py output.
• Zephyr's “extended dtlib” library, `edtlib.py`, shall not include Zephyr-specific features. Its purpose is to provide a higher-level view of the devicetree for common elements like interrupts and buses. Only the high-level `gen_defines.py` script, which is built on top of `edtlib.py`, contains Zephyr-specific knowledge and features.

Example remaining work

• Zephyr has a custom Devicetree bindings language syntax. While Linux's dtschema does not yet meet Zephyr's needs, we should try to follow what it is capable of representing in Zephyr's own bindings.

• Due to inflexibility in the bindings language, Zephyr cannot support the full set of bindings supported by Linux.

• Devicetree source sharing between Zephyr and Linux is not done.

Devicetree bindings

A devicetree on its own is only half the story for describing hardware, as it is a relatively unstructured format. **Devicetree bindings** provide the other half.

A devicetree binding declares requirements on the contents of nodes, and provides semantic information about the contents of valid nodes. Zephyr devicetree bindings are YAML files in a custom format (Zephyr does not use the dt-schema tools used by the Linux kernel).

These pages introduce bindings, describe what they do, note where they are found, and explain their data format.

Note: See the **Bindings index** for reference information on bindings built in to Zephyr.

**Introduction to Devicetree Bindings**

Note: For a detailed syntax reference, see **Devicetree bindings syntax**.

Devicetree nodes are matched to bindings using their **compatible properties**.

During the **Configuration Phase**, the build system tries to match each node in the devicetree to a binding file. When this succeeds, the build system uses the information in the binding file both when validating the node's contents and when generating macros for the node.

A simple example Here is an example devicetree node:

```c
/* Node in a DTS file */
bar-device {
   compatible = "foo-company,bar-device";
   num-foos = <3>;
};
```

Here is a minimal binding file which matches the node:

```
# A YAML binding matching the node
compatible: "foo-company,bar-device"
properties:
   num-foos:
   (continues on next page)```
The build system matches the bar-device node to its YAML binding because the node's compatible property matches the binding's compatible: line.

What the build system does with bindings  The build system uses bindings both to validate devicetree nodes and to convert the devicetree's contents into the generated devicetree_generated.h header file.

For example, the build system would use the above binding to check that the required num-foos property is present in the bar-device node, and that its value, <3>, has the correct type.

The build system will then generate a macro for the bar-device node's num-foos property, which will expand to the integer literal 3. This macro lets you get the value of the property in C code using the API which is discussed later in this guide in Devicetree access from C/C++.

For another example, the following node would cause a build error, because it has no num-foos property, and this property is marked required in the binding:

```yaml
bad-node {
    compatible = "foo-company,bar-device";
};
```

Other ways nodes are matched to bindings  If a node has more than one string in its compatible property, the build system looks for compatible bindings in the listed order and uses the first match.

Take this node as an example:

```yaml
baz-device {
    compatible = "foo-company,baz-device", "generic-baz-device";
};
```

The baz-device node would get matched to a binding with a compatible: "generic-baz-device" line if the build system can't find a binding with a compatible: "foo-company,baz-device" line.

Nodes without compatible properties can be matched to bindings associated with their parent nodes. These are called "child bindings". If a node describes hardware on a bus, like I2C or SPI, then the bus type is also taken into account when matching nodes to bindings. (See On-bus for details).

See The /zephyr/user node for information about a special node that doesn't require any binding.

Where bindings are located  Binding file names usually match their compatible: lines. For example, the above example binding would be named foo-company,bar-device.yaml by convention.

The build system looks for bindings in dts/bindings subdirectories of the following places:

- the zephyr repository
- your application source directory
- your board directory
- any shield directories
- any directories manually included in the DTS_ROOT CMake variable
- any module that defines a dts_root in its Build settings

The build system will consider any YAML file in any of these, including in any subdirectories, when matching nodes to bindings. A file is considered YAML if its name ends with .yaml or .yml.
**Warning:** The binding files must be located somewhere inside the `dts/bindings` subdirectory of the above places.

For example, if `my-app` is your application directory, then you must place application-specific bindings inside `my-app/dts/bindings`. So `my-app/dts/bindings/serial/my-company,my-serial-port.yaml` would be found, but `my-app/my-company,my-serial-port.yaml` would be ignored.

**Devicetree bindings syntax** This page documents the syntax of Zephyr's bindings format. Zephyr bindings files are YAML files. A *simple example* was given in the introduction page.

---

**Top level keys**  The top level of a bindings file maps keys to values. The top-level keys look like this:

```yaml
# A high level description of the device the binding applies to:
description: |
    This is the Vendomatic company's foo-device.

    Descriptions which span multiple lines (like this) are OK, 
    and are encouraged for complex bindings.

    See https://yaml-multiline.info/ for formatting help.

# You can include definitions from other bindings using this syntax:
include: other.yaml
```

(continues on next page)
These keys are explained in the following sections.

**Description**  A free-form description of node hardware goes here. You can put links to datasheets or example nodes or properties as well.

**Compatible**  This key is used to match nodes to this binding as described in *Introduction to Devicetree Bindings*. It should look like this in a binding file:

```plaintext
# Note the comma-separated vendor prefix and device name
compatible: "manufacturer,device"
```

This devicetree node would match the above binding:

```plaintext
device {
    compatible = "manufacturer,device";
};
```

Assuming no binding has `compatible: "manufacturer,device-v2"`, it would also match this node:

```plaintext
device-2 {
    compatible = "manufacturer,device-v2", "manufacturer,device";
};
```

Each node’s `compatible` property is tried in order. The first matching binding is used. The `on-bus:` key can be used to refine the search.

If more than one binding for a `compatible` is found, an error is raised.

The `manufacturer` prefix identifies the device vendor. See `dts/bindings/vendor-prefixes.txt` for a list of accepted vendor prefixes. The `device` part is usually from the datasheet.
Some bindings apply to a generic class of devices which do not have a specific vendor. In these cases, there is no vendor prefix. One example is the gpio-leds compatible which is commonly used to describe board LEDs connected to GPIOs.

### Properties

The properties key describes properties that nodes which match the binding contain. For example, a binding for a UART peripheral might look something like this:

```yaml
compatible: "manufacturer,serial"

properties:
  reg:
    type: array
    description: UART peripheral MMIO register space
    required: true
  current-speed:
    type: int
    description: current baud rate
    required: true
```

In this example, a node with compatible "manufacturer,serial" must contain a node named current-speed. The property's value must be a single integer. Similarly, the node must contain a reg property.

The build system uses bindings to generate C macros for devicetree properties that appear in DTS files. You can read more about how to get property values in source code from these macros in Devicetree access from C/C++. Generally speaking, the build system only generates macros for properties listed in the properties key for the matching binding. Properties not mentioned in the binding are generally ignored by the build system.

The one exception is that the build system will always generate macros for standard properties, like reg, whose meaning is defined by the devicetree specification. This happens regardless of whether the node has a matching binding or not.

#### Property entry syntax

Property entries in properties are written in this syntax:

```yaml
<property name>:
  required: <true | false>
  type: <string | int | boolean | array | uint8-array | string-array |
  phandle | phandles | phandle-array | path | compound>
  deprecated: <true | false>
  default: <default>
  description: <description of the property>
  enum:
    - <item1>
    - <item2>
    ...
    - <itemN>
  const: <string | int | array | uint8-array | string-array>
  specifier-space: <space-name>
```

#### Example property definitions

Here are some more examples.

```yaml
# Describes a property like 'current-speed = <115200>;'. We pretend that
# it's obligatory for the example node and set 'required: true'.

properties:
  current-speed:
```

(continues on next page)
type: int
required: true
description: Initial baud rate for bar-device

# Describes an optional property like 'keys = "foo", "bar";'
keys:
  type: string-array
description: Keys for bar-device

# Describes an optional property like 'maximum-speed = "full-speed";'
# the enum specifies known values that the string property may take
maximum-speed:
  type: string
description: Configures USB controllers to work up to a specific speed.
enum:
  - "low-speed"
  - "full-speed"
  - "high-speed"
  - "super-speed"

# Describes an optional property like 'resolution = <16>;' 
# the enum specifies known values that the int property may take
resolution:
  type: int
enum:
  - 8
  - 16
  - 24
  - 32

# Describes a required property '#address-cells = <1>; the const 
# specifies that the value for the property is expected to be the value 1
"#address-cells":
  type: int
  required: true
  const: 1

int-with-default:
  type: int
default: 123
description: Value for int register, default is power-up configuration.

array-with-default:
  type: array
default: [1, 2, 3] # Same as 'array-with-default = <1 2 3>,'

string-with-default:
  type: string
default: "foo"

string-array-with-default:
  type: string-array
default: ["foo", "bar"] # Same as 'string-array-with-default = "foo", "bar"'

uint8-array-with-default:
  type: uint8-array
default: [0x12, 0x34] # Same as 'uint8-array-with-default = [12 34]'

**required**  Adding `required: true` to a property definition will fail the build if a node matches the binding, but does not contain the property.

The default setting is `required: false`; that is, properties are optional by default. Using `required: false` is therefore redundant and strongly discouraged.

**type**  The type of a property constrains its values. The following types are available. See *Writing property values* for more details about writing values of each type in a DTS file. See *Phandles* for more information about the `phandle*` type properties.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example in DTS</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>exactly one string</td>
<td>status = &quot;disabled&quot;;</td>
</tr>
<tr>
<td><code>int</code></td>
<td>exactly one 32-bit value (cell)</td>
<td>current-speed = &lt;115200&gt;;</td>

</tr>
<tr>
<td><code>compound</code></td>
<td>a catch-all for more complex types (no macros will be generated)</td>
<td>foo = &lt;&amp;label&gt;, [01 02];</td>
</tr>
</tbody>
</table>

**deprecated**  A property with `deprecated: true` indicates to both the user and the tooling that the property is meant to be phased out.

The tooling will report a warning if the devicetree includes the property that is flagged as deprecated. (This warning is upgraded to an error in the *Test Runner (Twister)* for upstream pull requests.)

The default setting is `deprecated: false`. Using `deprecated: false` is therefore redundant and strongly discouraged.

**default**  The optional `default:` setting gives a value that will be used if the property is missing from the devicetree node.

For example, with this binding fragment:

```dts
properties:
  foo:
    type: int
    default: 3
```
If property \texttt{foo} is missing in a matching node, then the output will be as if \texttt{foo = <3>}; had appeared in the DTS (except YAML data types are used for the default value).

Note that combining \texttt{default:} with \texttt{required: true} will raise an error.

For rules related to \texttt{default} in upstream Zephyr bindings, see \textit{Rules for default values}.

See \textit{Example property definitions} for examples. Putting \texttt{default:} on any property type besides those used in Example property definitions will raise an error.

\textbf{enum} \quad The \texttt{enum:} line is followed by a list of values the property may contain. If a property value in DTS is not in the \texttt{enum:} list in the binding, an error is raised. See \textit{Example property definitions} for examples.

\textbf{const} \quad This specifies a constant value the property must take. It is mainly useful for constraining the values of common properties for a particular piece of hardware.

\begin{quote}
\textbf{Warning:} It is an abuse of this feature to use it to name properties in unconventional ways. For example, this feature is not meant for cases like naming a property \texttt{my-pin}, then assigning it to the “gpio” specifier space using this feature. Properties which refer to GPIOs should use conventional names, i.e. end in -gpios or -gpio.
\end{quote}

\textbf{specifier-space} \quad This property, if present, manually sets the specifier space associated with a property with type \texttt{phandle-array}.

Normally, the specifier space is encoded implicitly in the property name. A property named \texttt{foos} with type \texttt{phandle-array} implicitly has specifier space \texttt{foo}. As a special case, *-gpios properties have specifier space “gpio”, so that \texttt{foo-gpios} will have specifier space “gpio” rather than “foo-gpio”.

You can use \textbf{specifier-space} to manually provide a space if using this convention would result in an awkward or unconventional name.

For example:

\begin{verbatim}
compatible: ...
properties:
  bar:
    type: phandle-array
    specifier-space: my-custom-space
\end{verbatim}

Above, the \texttt{bar} property’s specifier space is set to “my-custom-space”.

You could then use the property in a devicetree like this:

\begin{verbatim}
controller1: custom-controller@1000 {
    #my-custom-space-cells = <2>;
};
controller2: custom-controller@2000 {
    #my-custom-space-cells = <1>;
};
my-node {
    bar = <&controller1 10 20>, <&controller2 30>;
};
\end{verbatim}
Generally speaking, you should reserve this feature for cases where the implicit specifier space naming convention doesn’t work. One appropriate example is an `mboxes` property with specifier space “mbox”, not “mboxe”. You can write this property as follows:

```plaintext
properties:
  mboxes:
    type: phandle-array
    specifier-space: mbox
```

**Child-binding**  
Child-binding can be used when a node has children that all share the same properties. Each child gets the contents of child-binding as its binding, though an explicit `compatible = ...` on the child node takes precedence, if a binding is found for it.

Consider a binding for a PWM LED node like this one, where the child nodes are required to have a `pwms` property:

```plaintext
pwmleds {
  compatible = "pwm-leds";

  red_pwm_led {
    pwms = <&pwm3 4 15625000>;
  }

  green_pwm_led {
    pwms = <&pwm3 0 15625000>;
  }

  /* ... */
}
```

The binding would look like this:

```plaintext
compatible: "pwm-leds"

child-binding:
  description: LED that uses PWM

properties:
  pwms:
    type: phandle-array
    required: true
```

Child-binding also works recursively. For example, this binding:

```plaintext
compatible: foo

child-binding:
  child-binding:
    child-binding:
      properties:
        my-property:
          type: int
          required: true
```

will apply to the grandchild node in this DTS:

```plaintext
parent {
  compatible = "foo";
  child {
    grandchild {
      my-property = <123>;
    }
  }
}
```

(continues on next page)
Bus  If the node is a bus controller, use `bus:` in the binding to say what type of bus. For example, a binding for a SPI peripheral on an SoC would look like this:

```plaintext
compatible: "manufacturer,spi-peripheral"
bu: spi
# ...
```

The presence of this key in the binding informs the build system that the children of any node matching this binding appear on this type of bus.

This in turn influences the way `on-bus:` is used to match bindings for the child nodes.

For a single bus supporting multiple protocols, e.g. I3C and I2C, the `bus:` in the binding can have a list as value:

```plaintext
compatible: "manufacturer,i3c-controller"
bu: [i3c, i2c]
# ...
```

On-bus  If the node appears as a device on a bus, use `on-bus:` in the binding to say what type of bus.

For example, a binding for an external SPI memory chip should include this line:

```plaintext
on-bus: spi
```

And a binding for an I2C based temperature sensor should include this line:

```plaintext
on-bus: i2c
```

When looking for a binding for a node, the build system checks if the binding for the parent node contains `bus: <bus type>`. If it does, then only bindings with a matching `on-bus: <bus type>` and bindings without an explicit `on-bus` are considered. Bindings with an explicit `on-bus: <bus type>` are searched for first, before bindings without an explicit `on-bus`. The search repeats for each item in the node's `compatible` property, in order.

This feature allows the same device to have different bindings depending on what bus it appears on. For example, consider a sensor device with `compatible manufacturer,sensor` which can be used via either I2C or SPI.

The sensor node may therefore appear in the devicetree as a child node of either an SPI or an I2C controller, like this:

```plaintext
spi-bus%0 { /* ... some compatible with 'bus: spi', etc. ... */
  sensor%0 {
    compatible = "manufacturer,sensor";
    reg = <0>;
    /* ... */
  }
};
i2c-bus%0 {
}
```
You can write two separate binding files which match these individual sensor nodes, even though they have the same compatible:

```yaml
# manufacturer,sensor-spi.yaml, which matches sensor@0 on the SPI bus:
compatible: "manufacturer,sensor"
on-bus: spi

# manufacturer,sensor-i2c.yaml, which matches sensor@79 on the I2C bus:
compatible: "manufacturer,sensor"
properties:
  uses-clock-stretching:
    type: boolean
on-bus: i2c
```

Only sensor@79 can have a use-clock-stretching property. The bus-sensitive logic ignores manufacturer,sensor-i2c.yaml when searching for a binding for sensor@0.

Specifier cell names (*-cells) This section documents how to name the cells in a specifier within a binding. These concepts are discussed in detail later in this guide in phandle-array properties.

Consider a binding for a node whose phandle may appear in a phandle-array property, like the PWM controllers pwm1 and pwm2 in this example:

```yaml
pwm1: pwm@deadbeef {
  compatible = "foo,pwm";
  #pwm-cells = <2>;
};

pwm2: pwm@deadbeef {
  compatible = "foo,pwm";
  #pwm-cells = <1>;
};

my-node {
  pwms = <&pwm1 1 2000>, <&pwm2 3000>;
};
```

The bindings for compatible "foo,pwm" and "bar,pwm" must give a name to the cells that appear in a PWM specifier using pwm-cells:, like this:

```yaml
# foo,pwm.yaml
compatible: "foo,pwm"
...
pwm-cells:
  - channel
  - period

# bar,pwm.yaml
```
A *-names (e.g. pwm-names) property can appear on the node as well, giving a name to each entry.
This allows the cells in the specifiers to be accessed by name, e.g. using APIs like `DT_PWMS_CHANNEL_BY_NAME`.
If the specifier is empty (e.g. `#clock-cells = <0>`), then *-cells can either be omitted (recommended) or set to an empty array. Note that an empty array is specified as e.g. `clock-cells: []` in YAML.

Include  Bindings can include other files, which can be used to share common property definitions between bindings. Use the `include:` key for this. Its value is either a string or a list.
In the simplest case, you can include another file by giving its name as a string, like this:

```yaml
include: foo.yaml
```
If any file named `foo.yaml` is found (see Where bindings are located for the search process), it will be included into this binding.
Included files are merged into bindings with a simple recursive dictionary merge. The build system will check that the resulting merged binding is well-formed. It is allowed to include at any level, including child-binding, like this:

```yaml
# foo.yaml will be merged with content at this level
include: foo.yaml

child-binding:
  # bar.yaml will be merged with content at this level
  include: bar.yaml
```
It is an error if a key appears with a different value in a binding and in a file it includes, with one exception: a binding can have `required: true` for a property definition for which the included file has `required: false`. The `required: true` takes precedence, allowing bindings to strengthen requirements from included files.
Note that weakening requirements by having `required: false` where the included file has `required: true` is an error. This is meant to keep the organization clean.
The file `base.yaml` contains definitions for many common properties. When writing a new binding, it is a good idea to check if `base.yaml` already defines some of the needed properties, and include it if it does.
Note that you can make a property defined in `base.yaml` obligatory like this, taking `reg` as an example:

```yaml
reg:
  required: true
```
This relies on the dictionary merge to fill in the other keys for `reg`, like `type`.
To include multiple files, you can use a list of strings:

```yaml
include:
  - foo.yaml
  - bar.yaml
```
This includes the files `foo.yaml` and `bar.yaml`. (You can write this list in a single line of YAML as `include: [foo.yaml, bar.yaml].`)
When including multiple files, any overlapping required keys on properties in the included files are ORed together. This makes sure that a required: true is always respected.

In some cases, you may want to include some property definitions from a file, but not all of them. In this case, include: should be a list, and you can filter out just the definitions you want by putting a mapping in the list, like this:

```yaml
include:
  - name: foo.yaml
    property-allowlist:
      - i-want-this-one
      - and-this-one
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Each map element must have a name key which is the filename to include, and may have property-allowlist and property-blocklist keys that filter which properties are included.

You cannot have a single map element with both property-allowlist and property-blocklist keys. A map element with neither property-allowlist nor property-blocklist is valid; no additional filtering is done.

You can freely intermix strings and mappings in a single include: list:

```yaml
include:
  - foo.yaml
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Finally, you can filter from a child binding like this:

```yaml
include:
  - name: bar.yaml
    child-binding:
      property-allowlist:
        - child-prop-to-allow
```

Nexus nodes and maps  All phandle-array type properties support mapping through *-map properties, e.g. gpio-map, as defined by the Devicetree specification.

This is used, for example, to define connector nodes for common breakout headers, such as the arduino_header nodes that are conventionally defined in the devicetrees for boards with Arduino compatible expansion headers.

Rules for upstream bindings  This section includes general rules for writing bindings that you want to submit to the upstream Zephyr Project. (You don’t need to follow these rules for bindings you don’t intend to contribute to the Zephyr Project, but it’s a good idea.)

Decisions made by the Zephyr devicetree maintainer override the contents of this section. If that happens, though, please let them know so they can update this page, or you can send a patch yourself.

Contents
- Always check for existing bindings
Always check for existing bindings  Zephyr aims for devicetree Source compatibility with other operating systems. Therefore, if there is an existing binding for your device in an authoritative location, you should try to replicate its properties when writing a Zephyr binding, and you must justify any Zephyr-specific divergences.

In particular, this rule applies if:

- There is an existing binding in the mainline Linux kernel. See Documentation/devicetree/bindings in Linus's tree for existing bindings and the Linux devicetree documentation for more information.
- Your hardware vendor provides an official binding outside of the Linux kernel.

General rules

File names  Bindings which match a compatible must have file names based on the compatible.

- For example, a binding for compatible vnd,foo must be named vnd,foo.yaml.
- If the binding is bus-specific, you can append the bus to the file name; for example, if the binding YAML has on-bus: bar, you may name the file vnd,foo-bar.yaml.

Recommendations are requirements  All recommendations in default are requirements when submitting the binding.

In particular, if you use the default: feature, you must justify the value in the property's description.

Descriptions  There are only two acceptable ways to write property description: strings.

If your description is short, it's fine to use this style:

```
description: my short string
```

If your description is long or spans multiple lines, you must use this style:

```
| description: |
| My very long string goes here.
| Look at all these lines!
```

This | style prevents YAML parsers from removing the newlines in multi-line descriptions. This in turn makes these long strings display properly in the Bindings index.
Naming conventions  Do not use uppercase letters (A through Z) or underscores (_) in property names. Use lowercase letters (a through z) instead of uppercase. Use dashes (-) instead of underscores. (The one exception to this rule is if you are replicating a well-established binding from somewhere like Linux.)

Rules for vendor prefixes  The following general rules apply to vendor prefixes in compatible properties.

- If your device is manufactured by a specific vendor, then its compatible should have a vendor prefix.
  
  If your binding describes hardware with a well known vendor from the list in dts/bindings/vendor-prefixes.txt, you must use that vendor prefix.
  
  - If your device is not manufactured by a specific hardware vendor, do not invent a vendor prefix. Vendor prefixes are not mandatory parts of compatible properties, and compatibles should not include them unless they refer to an actual vendor. There are some exceptions to this rule, but the practice is strongly discouraged.
  
  - Do not submit additions to Zephyr’s dts/bindings/vendor-prefixes.txt file unless you also include users of the new prefix. This means at least a binding and a devicetree using the vendor prefix, and should ideally include a device driver handling that compatible.
  
  For custom bindings, you can add a custom dts/bindings/vendor-prefixes.txt file to any directory in your DTS_ROOT. The devicetree tooling will respect these prefixes, and will not generate warnings or errors if you use them in your own bindings or devicetrees.
  
  - We sometimes synchronize Zephyr’s vendor-prefixes.txt file with the Linux kernel’s equivalent file; this process is exempt from the previous rule.
  
  - If your binding is describing an abstract class of hardware with Zephyr specific drivers handling the nodes, it’s usually best to use zephyr as the vendor prefix. See Zephyr-specific binding (zephyr) for examples.

Rules for default values  In any case where default: is used in a devicetree binding, the description: for that property must explain why the value was selected and any conditions that would make it necessary to provide a different value. Additionally, if changing one property would require changing another to create a consistent configuration, then those properties should be made required.

There is no need to document the default value itself; this is already present in the Bindings index output. There is a risk in using default: when the value in the binding may be incorrect for a particular board or hardware configuration. For example, defaulting the capacity of the connected power cell in a charging IC binding is likely to be incorrect. For such properties it’s better to make the property required: true, forcing the user to make an explicit choice.

Driver developers should use their best judgment as to whether a value can be safely defaulted. Candidates for default values include:

- delays that would be different only under unusual conditions (such as intervening hardware)
- configuration for devices that have a standard initial configuration (such as a USB audio headset)
- defaults which match the vendor-specified power-on reset value (as long as they are independent from other properties)

Examples of how to write descriptions according to these rules:

```
properties:
  cs-interval:
    type: int
    default: 0
    description: |
    Minimum interval between chip select deassertion and assertion.
    The default corresponds to the reset value of the register field.
```
Some examples of what **not** to do, and why:

```
properties:
  # Description doesn't mention anything about the default
  foo:
    type: int
    default: 1
    description: number of foos

  # Description mentions the default value instead of why it was chosen
  bar:
    type: int
    default: 2
    description: bar size; default is 2

  # Explanation of the default value is in a comment instead of the description. This won't be shown in the bindings index.
  baz:
    type: int
    default: 2
    description: baz time in milliseconds
```

**The `zephyr`, prefix**  You must add this prefix to property names in the following cases:

- Zephyr-specific extensions to bindings we share with upstream Linux. One example is the `zephyr,vref-mv` ADC channel property which is common to ADC controllers defined in `dts/bindings/adc/adc-controller.yaml`. This channel binding is partially shared with an analogous Linux binding, and Zephyr-specific extensions are marked as such with the prefix.

- Configuration values that are specific to a Zephyr device driver. One example is the `zephyr,lazy-load` property in the `ti,bq274xx` binding. Though devicetree in general is a hardware description and configuration language, it is Zephyr's only mechanism for configuring driver behavior for an individual `struct device`. Therefore, as a compromise, we do allow some software configuration in Zephyr's devicetree bindings, as long as they use this prefix to show that they are Zephyr specific.

You may use the `zephyr`, prefix when naming a devicetree compatible that is specific to Zephyr. One example is `zephyr,ipc-openamp-static-vrings`. In this case, it's permitted but not required to add the `zephyr`, prefix to properties defined in the binding.

**Devicetree access from C/C++**

This guide describes Zephyr's `<zephyr/devicetree.h>` API for reading the devicetree from C source files. It assumes you're familiar with the concepts in *Introduction to devicetree* and *Devicetree bindings*. See *Devicetree Reference* for reference material.

5.2. Devicetree
A note for Linux developers  Linux developers familiar with devicetree should be warned that the API described here differs significantly from how devicetree is used on Linux.

Instead of generating a C header with all the devicetree data which is then abstracted behind a macro API, the Linux kernel would instead read the devicetree data structure in its binary form. The binary representation is parsed at runtime, for example to load and initialize device drivers.

Zephyr does not work this way because the size of the devicetree binary and associated handling code would be too large to fit comfortably on the relatively constrained devices Zephyr supports.

Node identifiers  To get information about a particular devicetree node, you need a node identifier for it. This is a just a C macro that refers to the node.

These are the main ways to get a node identifier:

By path
  Use `DT_PATH()` along with the node's full path in the devicetree, starting from the root node. This is mostly useful if you happen to know the exact node you're looking for.

By node label
  Use `DT_NODELABEL()` to get a node identifier from a node label. Node labels are often provided by SoC .dtsi files to give nodes names that match the SoC datasheet, like i2c1, spi2, etc.

By alias
  Use `DT_ALIAS()` to get a node identifier for a property of the special /aliases node. This is sometimes done by applications (like blinky, which uses the led0 alias) that need to refer to some device of a particular type (“the board’s user LED”) but don't care which one is used.

By instance number
  This is done primarily by device drivers, as instance numbers are a way to refer to individual nodes based on a matching compatible. Get these with `DT_INST()`, but be careful doing so. See below.

By chosen node
  Use `DT_CHOSEN()` to get a node identifier for /chosen node properties.

By parent/child
  Use `DT_PARENT()` and `DT_CHILD()` to get a node identifier for a parent or child node, starting from a node identifier you already have.

Two node identifiers which refer to the same node are identical and can be used interchangeably.

Here's a DTS fragment for some imaginary hardware we'll return to throughout this file for examples:

```
/dts-v1/;
/
{
    aliases {
        sensor-controller = &i2c1;
    };
    soc {
        i2c1: i2c@40002000 {
            compatible = "vnd,soc-i2c";
            label = "I2C_1";
            reg = <0x40002000 0x1000>;
            status = "okay";
            clock-frequency = < 100000 >;
        };
    }; clock-frequency = < 100000 >;
}
```

Here are a few ways to get node identifiers for the i2c@40002000 node:
• DT_PATH(soc, i2c_40002000)
• DT_NODELABEL(i2c1)
• DT_ALIAS(sensor_controller)
• DT_INST(x, vnd_soc_i2c) for some unknown number x. See the DT_INST() documentation for details.

**Important:** Non-alphanumeric characters like dash (-) and the at sign (@) in devicetree names are converted to underscores (_). The names in a DTS are also converted to lowercase.

**Node identifiers are not values**  There is no way to store one in a variable. You cannot write:

```c
/* These will give you compiler errors: */
void *i2c_0 = DT_INST(0, vnd_soc_i2c);
unsigned int i2c_1 = DT_INST(1, vnd_soc_i2c);
long my_i2c = DT_NODELABEL(i2c1);
```

If you want something short to save typing, use C macros:

```c
/* Use something like this instead: */
#define MY_I2C DT_NODELABEL(i2c1)
#define INST(i) DT_INST(i, vnd_soc_i2c)
#define I2C_0 INST(0)
#define I2C_1 INST(1)
```

**Property access**  The right API to use to read property values depends on the node and property.

- **Checking properties and values**
- **Simple properties**
- **reg properties**
- **interrupts properties**
- **phandle properties**

**Checking properties and values**  You can use DT_NODE_HAS_PROP() to check if a node has a property. For the example devicetree above:

```c
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), clock_frequency)  /* expands to 1 */
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), not_a_property)    /* expands to 0 */
```

**Simple properties**  Use DT_PROP(node_id, property) to read basic integer, boolean, string, numeric array, and string array properties.

For example, to read the clock-frequency property’s value in the above example:

```c
DT_PROP(DT_PATH(soc, i2c_40002000), clock_frequency)  /* This is 100000, */
DT_PROP(DT_NODELABEL(i2c1), clock_frequency)            /* and so is this, */
DT_PROP(DT_ALIAS(sensor_controller), clock_frequency)  /* and this. */
```
Important: The DTS property clock-frequency is spelled clock_frequency in C. That is, properties also need special characters converted to underscores. Their names are also forced to lowercase.

Properties with string and boolean types work the exact same way. The DT_PROP() macro expands to a string literal in the case of strings, and the number 0 or 1 in the case of booleans. For example:

```c
#define I2C1 DT_NODELABEL(i2c1)
DT_PROP(I2C1, status) // expands to the string literal "okay" */
```

Note: Don’t use DT_NODE_HAS_PROP() for boolean properties. Use DT_PROP() instead as shown above. It will expand to either 0 or 1 depending on if the property is present or absent.

Properties with type array, uint8-array, and string-array work similarly, except DT_PROP() expands to an array initializer in these cases. Here is an example devicetree fragment:

```c
tree foo: foo@1234 {
    a = <1000 2000 3000>; /* array */
    b = [aa bb cc dd]; /* uint8-array */
    c = "bar", "baz"; /* string-array */
}
```

Its properties can be accessed like this:

```c
#define FOO DT_NODELABEL(foo)
int a[] = DT_PROP(FOO, a); /* {1000, 2000, 3000} */
unsigned char b[] = DT_PROP(FOO, b); /* {0xaa, 0xbb, 0xcc, 0xdd} */
char* c[] = DT_PROP(FOO, c); /* {"foo", "bar"} */
```

You can use DT_PROP_LEN() to get logical array lengths in number of elements.

```c
size_t a_len = DT_PROP_LEN(FOO, a); /* 3 */
size_t b_len = DT_PROP_LEN(FOO, b); /* 4 */
size_t c_len = DT_PROP_LEN(FOO, c); /* 2 */
```

DT_PROP_LEN() cannot be used with the special reg or interrupts properties. These have alternative macros which are described next.

reg properties See Important properties for an introduction to reg.

Given a node identifier node_id, DT_NUM_REGS(node_id) is the total number of register blocks in the node's reg property.

You cannot read register block addresses and lengths with DT_PROP(node, reg). Instead, if a node only has one register block, use DT_REG_ADDR() or DT_REG_SIZE():

- DT_REG_ADDR(node_id): the given node's register block address
- DT_REG_SIZE(node_id): its size

Use DT_REG_ADDR_BY_IDX() or DT_REG_SIZE_BY_IDX() instead if the node has multiple register blocks:

- DT_REG_ADDR_BY_IDX(node_id, idx): address of register block at index idx
- DT_REG_SIZE_BY_IDX(node_id, idx): size of block at index idx

The idx argument to these must be an integer literal or a macro that expands to one without requiring any arithmetic. In particular, idx cannot be a variable. This won't work:
interrupts properties  See Important properties for a brief introduction to interrupts.

Given a node identifier node_id, DT_NUM_IRQS(node_id) is the total number of interrupt specifiers in the node's interrupts property.

The most general purpose API macro for accessing these is DT_IRQ_BY_IDX():

\[\text{DT_IRQ_BY_IDX}(\text{node_id}, \text{idx}, \text{val})\]

Here, idx is the logical index into the interrupts array, i.e. it is the index of an individual interrupt specifier in the property. The val argument is the name of a cell within the interrupt specifier. To use this macro, check the bindings file for the node you are interested in to find the val names.

Most Zephyr devicetree bindings have a cell named irq, which is the interrupt number. You can use DT_IRQN() as a convenient way to get a processed view of this value.

Warning:  Here, "processed" reflects Zephyr's devicetree Scripts and tools, which change the irq number in zephyr.dts to handle hardware constraints on some SoCs and in accordance with Zephyr's multilevel interrupt numbering.

This is currently not very well documented, and you'll need to read the scripts' source code and existing drivers for more details if you are writing a device driver.

phandle properties  Note:  See Phandles for a detailed guide to phandles.

Property values can refer to other nodes using the &another-node phandle syntax introduced in Writing property values. Properties which contain phandles have type phandle, phandles, or phandle-array in their bindings. We'll call these "phandle properties" for short.

You can convert a phandle to a node identifier using DT_PHANDLE(), DT_PHANDLE_BY_IDX(), or DT_PHANDLE_BY_NAME(), depending on the type of property you are working with.

One common use case for phandle properties is referring to other hardware in the tree. In this case, you usually want to convert the devicetree-level phandle to a Zephyr driver-level struct device. See Get a struct device from a devicetree node for ways to do that.

Another common use case is accessing specifier values in a phandle array. The general purpose APIs for this are DT_PHA_BY_IDX() and DT_PHA(). There are also hardware-specific short-hands like DT_GPIO_CTLR_BY_IDX(), DT_GPIO_CTLR(), DT_GPIO_PIN_BY_IDX(), DT_GPIO_PIN(), DT_GPIO_FLAGS_BY_IDX(), and DT_GPIO_FLAGS().

See DT_PHA_HAS_CELL_AT_IDX() and DT_PROP_HAS_IDX() for ways to check if a specifier value is present in a phandle property.

Other APIs  Here are pointers to some other available APIs.

- DT_CHOSEN(), DT_HAS_CHOSEN(): for properties of the special /chosen node
- DT_HAS_COMPAT_STATUS_OKAY(), DT_NODE_HAS_COMPAT(): global- and node-specific tests related to the compatible property
- DT_BUS(): get a node's bus controller, if there is one
- **DT_ENUM_IDX()**: for properties whose values are among a fixed list of choices

- **Fixed flash partitions**: APIs for managing fixed flash partitions. Also see *Flash map*, which wraps this in a more user-friendly API.

**Device driver conveniences**  
Special purpose macros are available for writing device drivers, which usually rely on *instance identifiers*.

To use these, you must define `DT_DRV_COMPAT` to the compat value your driver implements support for. This compat value is what you would pass to `DT_INST()`.

If you do that, you can access the properties of individual instances of your compatible with less typing, like this:

```c
#include <zephyr/devicetree.h>

#define DT_DRV_COMPAT my_driver_compat

/* This is same thing as DT_INST(0, my_driver_compat): */
DT_DRV_INST(0)

/*
   * This is the same thing as
   * DT_PROP(DT_INST(0, my_driver_compat), clock_frequency)
   */
DT_INST_PROP(0, clock_frequency)
```

See *Instance-based APIs* for a generic API reference.

**Hardware specific APIs**  
Convenience macros built on top of the above APIs are also defined to help readability for hardware specific code. See *Hardware specific APIs* for details.

**Generated macros**  
While the `zephyr/devicetree.h` API is not generated, it does rely on a generated C header which is put into every application build directory: `devicetree_generated.h`. This file contains macros with devicetree data.

These macros have tricky naming conventions which the *Devicetree API* API abstracts away. They should be considered an implementation detail, but it's useful to understand them since they will frequently be seen in compiler error messages.

This section contains an Augmented Backus-Naur Form grammar for these generated macros, with examples and more details in comments. See RFC 7405 (which extends RFC 5234) for a syntax specification.

node-macro = / %s"DT_N" path-id %s"_FULL_NAME"
; The dependency ordinals of a node's requirements (direct dependencies).
node-macro = / %s"DT_N" path-id %s"_REQUIRES_ORDS"
; The dependency ordinals of a node supports (reverse direct dependencies).
node-macro = / %s"DT_N" path-id %s"_SUPPORTS_ORDS"

; pinctrl-macro: a macro related to the pinctrl properties in a node
;
; These are a bit of a special case because they kind of form an array,
; but the array indexes correspond to pinctrl-DIGIT properties in a node.
;
; So they're related to a node, but not just one property within the node.
;
; The following examples assume something like this:
;
; foo {
;     pinctrl-0 = <&bar>;
;     pinctrl-1 = <&baz>;
;     pinctrl-names = "default", "sleep";
; }

; Total number of pinctrl-DIGIT properties in the node. May be zero.
;
#define DT_N_<node path>_PINCTRL_NUM 2
pinctrl-macro = / %s"DT_N" path-id %s"_PINCTRL_NUM"
; A given pinctrl-DIGIT property exists.
;
#define DT_N_<node path>_PINCTRL_IDX_0_EXISTS 1
#define DT_N_<node path>_PINCTRL_IDX_1_EXISTS 1
pinctrl-macro = / %s"DT_N" path-id %s"_PINCTRL_IDX_" DIGIT %s"_EXISTS"
; A given pinctrl property name exists.
#define DT_N_<node path>_PINCTRL_NAME_default.Exists 1
#define DT_N_<node path>_PINCTRL_NAME_sleep.Exists 1
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_EXISTS"
The corresponding index number of a named pinctrl property.

#define DT_N_<node path>_PINCTRL_NAME_default_IDX 0
#define DT_N_<node path>_PINCTRL_NAME_sleep_IDX 1
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_IDX"
The node identifier for the phandle in a named pinctrl property.

#define DT_N_<node path>_PINCTRL_NAME_default_IDX_0_PH <node id for 'bar'>
There's no need for a separate macro for access by index: that's
covered by property-macro. We only need this because the map from
names to properties is implicit in the structure of the DT.
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_IDX_" DIGIT %s"_PH"

------------------------
gpiohogs-macro: a macro related to GPIO hog nodes

The following examples assume something like this:

gpio1: gpio0... {
  compatible = "vnd,gpio";
  #gpio-cells = <2>;

  node-1 {
    gpio-hog;
    gpios = <0x0 0x10>, <0x1 0x20>;
    output-high;
  };

  node-2 {
    gpio-hog;
    gpios = <0x2 0x30>;
    output-low;
  };
}

Bindings fragment for the vnd,gpio compatible:

gpio-cells:
  - pin
  - flags

The node contains GPIO hogs.

#define DT_N_<node-1 path>_GPIO_HOGS.Exists 1
#define DT_N_<node-2 path>_GPIO_HOGS.Exists 1
gpioshogs-macro = %s"DT_N" path-id %s"_GPIO_HOGS.Exists"
Number of hogged GPIOs in a node.

#define DT_N_<node-1 path>_GPIO_HOGS.Num 2
#define DT_N_<node-2 path>_GPIO_HOGS.Num 1
gpioshogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS.Num"
A given logical GPIO hog array index exists.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_EXISTS 1
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_EXISTS 1
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_EXISTS 1
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_EXISTS"

The node identifier for the phandle of a logical index in the GPIO hogs array.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_PH <node id for 'gpio1'>
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_PH <node id for 'gpio1'>
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_PH <node id for 'gpio1'>
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_PH"

The pin cell of a logical index in the GPIO hogs array exists.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_VAL_pin_EXISTS 1
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_pin_EXISTS 1
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_pin_EXISTS 1
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_VAL_pin_EXISTS"

The value of the pin cell of a logical index in the GPIO hogs array.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_VAL_pin 0
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_pin 1
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_pin 2
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_VAL_pin"

The flags cell of a logical index in the GPIO hogs array exists.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_VAL_flags_EXISTS 1
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_flags_EXISTS 1
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_flags_EXISTS 1
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_VAL_flags_EXISTS"

The value of the flags cell of a logical index in the GPIO hogs array.

#define DT_N_<node-1 path>_GPIO_HOGS_IDX_0_VAL_flags 0x10
#define DT_N_<node-1 path>_GPIO_HOGS_IDX_1_VAL_flags 0x20
#define DT_N_<node-2 path>_GPIO_HOGS_IDX_0_VAL_flags 0x30
gpiohogs-macro =/ %s"DT_N" path-id %s"_GPIO_HOGS_IDX_" DIGIT %s"_VAL_flags"

property-macro: a macro related to a node property

These combine a node identifier with a "lowercase-and-underscores form"
property name. The value expands to something related to the property's
value.

The optional prop-suf suffix is when there's some specialized
subvalue that deserves its own macro, like the macros for an array
property's individual elements

The "plain vanilla" macro for a property's value, with no prop-suf,
looks like this:

DT_N_<node path>_P_<property name>

Components:
property-macro = %s"DT_N" path-id %s"_P_" prop-id [prop-suf]

; path-id: a node's path-based macro identifier
; This in "lowercase-and-underscores" form. I.e. it is
; the node's devicetree path converted to a C token by changing:
; - each slash (/) to _S_
; - all letters to lowercase
; - non-alphanumerics characters to underscores
; For example, the leaf node "bar-BAZ" in this devicetree:
; /
;   foo0123 {
;       bar-BAZ {}
;   }
; has path-id "S_foo_0123_S_bar_baz".
path-id = 1*( %s"_S_" dt-name )

; prop-id: a property identifier
; A property name converted to a C token by changing:
; - all letters to lowercase
; - non-alphanumeric characters to underscores
; Example node:
; chosen {
;       zephyr,console = &uart1;
;       WHY,AM_I_SHOUTING = "unclear";
; }
; The 'zephyr,console' property has prop-id 'zephyr_console'.
; 'WHY,AM_I_SHOUTING' has prop-id 'why_am_i_shouting'.
prop-id = dt-name

; prop-suf: a property-specific macro suffix
; Extra macros are generated for properties:
; - that are special to the specification ("reg", "interrupts", etc.)
; - with array types (uint8-array, phandle-array, etc.)
; - with "enum:" in their bindings
; - that have zephyr device API specific macros for phandle-arrays
; - related to phandle specifier names ("foo-names")

(continues on next page)
Here are some examples:

- `_EXISTS`: property, index or name existence flag
- `_SIZE`: logical property length
- `_IDX_<i>`: values of individual array elements
- `_IDX_<DIGIT>_VAL_<dt-name>`: values of individual specifier cells within a phandle array
- `_ADDR_<i>`: for reg properties, the i-th register block address
- `_LEN_<i>`: for reg properties, the i-th register block length

The different cases are not exhaustively documented here to avoid this file going stale. Please see devicetree.h if you need to know the details.

`prop-suf = 1*(`"_" gen-name `["_" dt-name] `)

; other-macro: grab bag for everything that isn't a node-macro.

See examples below.

`other-macro = %s"DT_N_" alternate-id`
; Total count of enabled instances of a compatible.
`other-macro =/ %s"DT_N_INST_" dt-name %s"_NUM_OKAY"
; These are used internally by DT_FOREACH_NODE and DT_FOREACH_STATUS_OKAY_NODE respectively.
`other-macro =/ %s"DT_FOREACH_HELPER"
`other-macro =/ %s"DT_FOREACH_OKAY_HELPER"
; These are used internally by DT_FOREACH_STATUS_OKAY, which iterates over each enabled node of a compatible.
`other-macro =/ %s"DT_FOREACH_OKAY_" dt-name`
`other-macro =/ %s"DT_FOREACH_OKAY_VARGS_" dt-name`
; E.g.: #define DT_CHOSEN_zephyr_flash
`other-macro =/ %s"DT_CHOSEN_" dt-name`
; Declares that a compatible has at least one node on a bus.
; Example:
;
#define DT_COMPAT_vnd_dev_BUS_spi 1
`other-macro =/ %s"DT_COMPAT_" dt-name %s"_BUS_" dt-name`
; Declares that a compatible has at least one status "okay" node.
; Example:
;
#define DT_COMPAT_HAS_OKAY_vnd_dev 1
`other-macro =/ %s"DT_COMPAT_HAS_OKAY_" dt-name`
; Currently used to allow mapping a lowercase-and-underscores "label" property to a fixed-partitions node. See the flash map API docs for an example.
`other-macro =/ %s"DT_COMPAT_" dt-name %s"_LABEL_" dt-name`

; alternate-id: another way to specify a node besides a path-id
; Example devicetree:
(continued from previous page)

; / {
;     aliases {
;         dev = &dev_1;
;     };
;     soc {
;         dev_1: device@123 {
;             compatible = "vnd,device";
;         };
;     };
; };

Node device@123 has these alternate-id values:

- ALIAS_dev
- NODELABEL_dev_1
- INST_0_vnd_device

The full alternate-id macros are:

#define DT_N_INST_0_vnd_device DT_N_S_soc_S_device_123
#define DT_N_ALIAS_dev DT_N_S_soc_S_device_123
#define DT_N_NODELABEL_dev_1 DT_N_S_soc_S_device_123

These mainly exist to allow pasting an alternate-id macro onto a "_P_<prop-id>" to access node properties given a node’s alias, etc.

Notice that “inst”-type IDs have a leading instance identifier, which is generated by the devicetree scripts. The other types of alternate-id begin immediately with names taken from the devicetree.

alternate-id = ( %s"ALIAS" / %s"NODELABEL" ) dt-name
alternate-id =/ %s"INST_" 1*DIGIT "_" dt-name

miscellaneous helper definitions

A dt-name is one or more:
- lowercase ASCII letters (a-z)
- numbers (0-9)
- underscores ("_")

They are the result of converting names or combinations of names from devicetree to a valid component of a C identifier by lowercasing letters (in practice, this is a no-op) and converting non-alphanumeric characters to underscores.

You’ll see these referred to as "lowercase-and-underscores" forms of various devicetree identifiers throughout the documentation.

dt-name = 1*( lower / DIGIT / "_" )

gen-name is used as a stand-in for a component of a generated macro name which does not come from devicetree (dt-name covers that case).

- uppercase ASCII letters (a-z)
- numbers (0-9)
- underscores ("_")

(continues on next page)
Phandles

The devicetree concept of a phandle is very similar to pointers in C. You can use phandles to refer to nodes in devicetree similarly to the way you can use pointers to refer to structures in C.

Getting phandles  The usual way to get a phandle for a devicetree node is from one of its node labels. For example, with this devicetree:

/ {
  lbl_a: node-1 {};
  lbl_b: lbl_c: node-2 {};
};

You can write the phandle for:
Notice how the `&node1` devicetree syntax is similar to the “address of” C syntax.

**Using phandles**

**Note:** “Type” in this section refers to one of the type names documented in *Properties* in the devicetree bindings documentation.

Here are the main ways you will use phandles.

**One node: phandle type**

You can use phandles to refer to a node from another node, where the other node is related to the first node in some way.

One common example is when a node represents some hardware that generates an interrupt, and another node represents the interrupt controller that receives the asserted interrupt. In this case, you could write:

```plaintext
define node_b: node-b {
    interrupt-controller;
};
define node-a {
    interrupt-parent = <&node_b>;
};
```

This uses the standard `interrupt-parent` property defined in the devicetree specification to capture the relationship between the two nodes.

These properties have type `phandle`.

**Zero or more nodes: phandles type**

You can use phandles to make an array of references to other nodes.

One common example occurs in pin control. Pin control properties like `pinctrl-0`, `pinctrl-1` etc. may contain multiple phandles, each of which “points” to a node containing information related to pin configuration for that hardware peripheral. Here’s an example of six phandles in a single property:

```plaintext
define pinctrl-0 = <&quadspi_clk_pe10 &quadspi_ncs_pe11
    &quadspi_bk1_io0_pe12 &quadspi_bk1_io1_pe13
    &quadspi_bk1_io2_pe14 &quadspi_bk1_io3_pe15>;
```

These properties have type `phandles`.

**Zero or more nodes with metadata: phandle-array type**

You can use phandles to refer to and configure one or more resources that are “owned” by some other node.

This is the most complex case. There are examples and more details in the next section.

These properties have type `phandle-array`.

**phandle-array properties**

These properties are commonly used to specify a resource that is owned by another node along with additional metadata about the resource.
High level description  Usually, properties with this type are written like `phandle-array-prop` in this example:

```
node {
    phandle-array-prop = <&foo 1 2>, <&bar 3>, <&baz 4 5>;
};
```

That is, the property's value is written as a comma-separated sequence of “groups”, where each “group” is written inside of angle brackets (`< ... >`). Each “group” starts with a phandle (`&foo`, `&bar`, `&baz`).

The values that follow the phandle in each “group” are called `specifiers`. There are three specifiers in the above example:

1. 1 2
2. 3
3. 4 5

The phandle in each “group” is used to “point” to the hardware that controls the resource you are interested in. The specifier describes the resource itself, along with any additional necessary metadata.

The rest of this section describes a common example. Subsequent sections document more rules about how to use phandle-array properties in practice.

Example phandle-arrays: GPIOs  Perhaps the most common use case for phandle-array properties is specifying one or more GPIOs on your SoC that another chip on your board connects to. For that reason, we'll focus on that use case here. However, there are many other use cases that are handled in devicetree with phandle-array properties.

For example, consider an external chip with an interrupt pin that is connected to a GPIO on your SoC. You will typically need to provide that GPIO's information (GPIO controller and pin number) to the device driver for that chip. You usually also need to provide other metadata about the GPIO, like whether it is active low or high, what kind of internal pull resistor within the SoC should be enabled in order to communicate with the device, etc., to the driver.

In the devicetree, there will be a node that represents the GPIO controller that controls a group of pins. This reflects the way GPIO IP blocks are usually developed in hardware. Therefore, there is no single node in the devicetree that represents a GPIO pin, and you can't use a single phandle to represent it.

Instead, you would use a phandle-array property, like this:

```
my-external-ic {
    irq-gpios = <&gpioX pin flags>
};
```

In this example, `irq-gpios` is a phandle-array property with just one “group” in its value. `&gpioX` is the phandle for the GPIO controller node that controls the pin. `pin` is the pin number (0, 1, 2, ...). `flags` is a bit mask describing pin metadata (for example `(GPIO_ACTIVE_LOW | GPIO_PULL_UP)`); see include/zephyr/dt-bindings/gpio/gpio.h for more details.

The device driver handling the `my-external-ic` node can then use the `irq-gpios` property's value to set up interrupt handling for the chip as it is used on your board. This lets you configure the device driver in devicetree, without changing the driver's source code.

Such properties can contain multiple values as well:

```
my-other-external-ic {
    handshake-gpios = <&gpioX pinX flagsX>, <&gpioY pinY flagsY>
};
```

The above example specifies two pins:

- `pinX` on the GPIO controller with phandle `&gpioX`, flags `flagsX`
You may be wondering how the “pin and flags” convention is established and enforced. To answer this question, we’ll need to introduce a concept called specifier spaces before moving on to some information about devicetree bindings.

**Specifier spaces** Specifier spaces are a way to allow nodes to describe how you should use them in phandle-array properties.

We’ll start with an abstract, high level description of how specifier spaces work in DTS files, before moving on to a concrete example and providing references to further reading for how this all works in practice using DTS files and bindings files.

**High level description** As described above, a phandle-array property is a sequence of “groups” of phandles followed by some number of cells:

```
node {
    phandle-array-prop = <&foo 1 2>, <&bar 3>;
};
```

The cells that follow each phandle are called a specifier. In this example, there are two specifiers:

1.  1 2: two cells
2.  3: one cell

Every phandle-array property has an associated specifier space. This sounds complex, but it’s really just a way to assign a meaning to the cells that follow each phandle in a hardware specific way. Every specifier space has a unique name. There are a few “standard” names for commonly used hardware, but you can create your own as well.

Devicetree nodes encode the number of cells that must appear in a specifier, by name, using the #SPACE_NAME-cells property. For example, let’s assume that phandle-array-prop’s specifier space is named baz. Then we would need the foo and bar nodes to have the following #baz-cells properties:

```
foo: node@1000 {
    #baz-cells = <2>;
};
bar: node@2000 {
    #baz-cells = <1>;
};
```

Without the #baz-cells property, the devicetree tooling would not be able to validate the number of cells in each specifier in phandle-array-prop.

This flexibility allows you to write down an array of hardware resources in a single devicetree property, even though the amount of metadata you need to describe each resource might be different for different nodes.

A single node can also have different numbers of cells in different specifier spaces. For example, we might have:

```
foo: node@1000 {
    #baz-cells = <2>;
    #bob-cells = <1>;
};
```

With that, if phandle-array-prop-2 has specifier space bob, we could write:
This flexibility allows you to have a node that manages multiple different kinds of resources at the same time. The node describes the amount of metadata needed to describe each kind of resource (how many cells are needed in each case) using different `#SPACE_NAME-cells` properties.

**Example specifier space: gpio** From the above example, you’re already familiar with how one specifier space works: in the “gpio” space, specifiers almost always have two cells:

1. a pin number
2. a bit mask of flags related to the pin

Therefore, almost all GPIO controller nodes you will see in practice will look like this:

```plaintext
gpioX: gpio-controller@deadbeef {
   gpio-controller;
   #gpio-cells = <2>;
};
```

**Associating properties with specifier spaces** Above, we have described that:

- each phandle-array property has an associated specifier space
- specifier spaces are identified by name
- devicetree nodes use `#SPECIFIER_NAME-cells` properties to configure the number of cells which must appear in a specifier

In this section, we explain how phandle-array properties get their specifier spaces.

**High level description** In general, a phandle-array property named foos implicitly has specifier space foo. For example:

```plaintext
properties:
   dmas:
      type: phandle-array
   pwms:
      type: phandle-array
```

The `dmas` property’s specifier space is “dma”. The `pwms` property’s specifier space is `pwms`.

**Special case: GPIO** `-gpios` properties are special-cased so that e.g. `foo-gpios` resolves to `#gpio-cells` rather than `#foo-gpio-cells`.

**Manually specifying a space** You can manually specify the specifier space for any phandle-array property. See `specifier-space`.

**Naming the cells in a specifier** You should name the cells in each specifier space your hardware supports when writing bindings. For details on how to do this, see `Specifier cell names (*-cells)`.

This allows C code to query information about and retrieve the values of cells in a specifier by name using devicetree APIs like these:
This feature and these macros are used internally by numerous hardware-specific APIs. Here are a few examples:

- `DT_GPIO_PIN_BY_IDX`
- `DT_PWMS_CHANNEL_BY_IDX`
- `DT_DMAS_CELL_BY_NAME`
- `DT_IO_CHANNELS_INPUT_BY_IDX`
- `DT_CLOCKS_CELL_BY_NAME`

See also

- **Writing property values**: how to write phandles in devicetree properties
- **Properties**: how to write bindings for properties with phandle types (phandle, phandles, phandle-array)
- **specifier-space**: how to manually specify a phandle-array property's specifier space

**The /zephyr, user node**

Zephyr's devicetree scripts handle the /zephyr, user node as a special case: you can put essentially arbitrary properties inside it and retrieve their values without having to write a binding. It is meant as a convenient container when only a few simple properties are needed.

**Note:** This node is meant for sample code and user applications. It should not be used in the upstream Zephyr source code for device drivers, subsystems, etc.

**Simple values**

You can store numeric or array values in /zephyr, user if you want them to be configurable at build time via devicetree.

For example, with this devicetree overlay:

```c
/ {
    zephyr, user {
        boolean;
        bytes = [81 82 83];
        number = <23>;
        numbers = <1>, <2>, <3>;
        string = "text";
        strings = "a", "b", "c";
    }
};
```

You can get the above property values in C/C++ code like this:

```c
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

DT_PROP(ZEPHYR_USER_NODE, boolean) // 1
DT_PROP(ZEPHYR_USER_NODE, bytes) // {0x81, 0x82, 0x83}
DT_PROP(ZEPHYR_USER_NODE, number) // 23
DT_PROP(ZEPHYR_USER_NODE, numbers) // {1, 2, 3}
```

(continues on next page)
DT_PROP(ZEPHYR_USER_NODE, string) // "text"
DT_PROP(ZEPHYR_USER_NODE, strings) // {"a", "b", "c"}

Devices

You can store phandles in /zephyr,user if you want to be able to reconfigure which devices your application uses in simple cases using devicetree overlays.

For example, with this devicetree overlay:

```
/ {
    zephyr,user {
        handle = <&gpio0>;
        handles = <&gpio0>, <&gpio1>;
    };
}
```

You can convert the phandles in the handle and handles properties to device pointers like this:

```
/*
 * Same thing as:
 * ...
 * my_dev = DEVICE_DT_GET(DT_NODELABEL(gpio0));
 */
const struct device *my_device =
    DEVICE_DT_GET(DT_PROP(ZEPHYR_USER_NODE, handle));

#define PHANDLE_TO_DEVICE(node_id, prop, idx) \
    DEVICE_DT_GET(DT_PHANDLE_BY_IDX(node_id, prop, idx)),
```

```
/*
 * Same thing as:
 * ...
 * my_devices[] = {
 *     DEVICE_DT_GET(DT_NODELABEL(gpio0)),
 *     DEVICE_DT_GET(DT_NODELABEL(gpio1)),
 * };
 */
const struct device *my_devices[] = {
    DT_FOREACH_PROP_ELEM(ZEPHYR_USER_NODE, handles, PHANDLE_TO_DEVICE)
};
```

GPIOs

The /zephyr,user node is a convenient place to store application-specific GPIOs that you want to be able to reconfigure with a devicetree overlay.

For example, with this devicetree overlay:

```
#include <zephyr/dt-bindings/gpio/gpio.h>
/
    zephyr,user {
        signal-gpios = <&gpio0 1 GPIO_ACTIVE_HIGH>;
    };
```

You can convert the pin defined in signal-gpios to a struct gpio_dt_spec in your source code, then use it like this:
```c
#include <zephyr/drivers/gpio.h>
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

const struct gpio_dt_spec signal =
  GPIO_DT_SPEC_GET(ZEPHYR_USER_NODE, signal_gpios);

/* Configure the pin */
gpio_pin_configure_dt(&signal, GPIO_OUTPUT_INACTIVE);

/* Set the pin to its active level */
gpio_pin_set_dt(&signal, 1);
```

(See `gpio_dt_spec`, `GPIO_DT_SPEC_GET`, and `gpio_pin_configure_dt()` for details on these APIs.)

**Devicetree HOWTOs**

This page has step-by-step advice for getting things done with devicetree.

**Tip:** See *Troubleshooting devicetree* for troubleshooting advice.

---

**Get your devicetree and generated header**  
A board's devicetree (*BOARD.dts*) pulls in common node definitions via `#include` preprocessor directives. This at least includes the SoC's .dtsi. One way to figure out the devicetree's contents is by opening these files, e.g. by looking in `dts/<ARCH>/<vendor>/<soc>.dtsi`, but this can be time consuming.

If you just want to see the “final” devicetree for your board, build an application and open the zephyr.dts file in the build directory.

**Tip:** You can build hello_world to see the “base” devicetree for your board without any additional changes from *overlay files*.

For example, using the qemu_cortex_m3 board to build hello_world:

```
# --cmake-only here just forces CMake to run, skipping the # build process to save time.
w west build -b qemu_cortex_m3 samples/hello_world --cmake-only
```

You can change qemu_cortex_m3 to match your board.

CMake prints the input and output file locations like this:

```
-- Found BOARD.dts: .../zephyr/boards/arm/qemu_cortex_m3/qemu_cortex_m3.dts
-- Generated zephyr.dts: .../zephyr/build/zephyr/zephyr.dts
-- Generated devicetree_generated.h: .../zephyr/build/zephyr/include/generated/
       devicetree_generated.h
```

The zephyr.dts file is the final devicetree in DTS format.

The devicetree_generated.h file is the corresponding generated header.

See *Input and output files* for details about these files.
Get a struct device from a devicetree node  When writing Zephyr applications, you’ll often want to get a driver-level struct device corresponding to a devicetree node.

For example, with this devicetree fragment, you might want the struct device for serial@40002000:

```
/ {
    soc {
        serial0: serial@40002000 {
            status = "okay";
            current-speed = <115200>;
            /* ... */
        }
    }
    aliases {
        my-serial = &serial0;
    }
    chosen {
        zephyr,console = &serial0;
    }
}
```

Start by making a node identifier for the device you are interested in. There are different ways to do this; pick whichever one works best for your requirements. Here are some examples:

```
/* Option 1: by node label */
#define MY_SERIAL DT_NODELABEL(serial0)

/* Option 2: by alias */
#define MY_SERIAL DT_ALIAS(my_serial)

/* Option 3: by chosen node */
#define MY_SERIAL DT_CHOSEN(zephyr,console)

/* Option 4: by path */
#define MY_SERIAL DT_PATH(soc, serial_40002000)
```

Once you have a node identifier there are two ways to proceed. One way to get a device is to use DEVICE_DT_GET():

```
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
if (!device_is_ready(uart_dev)) {
    /* Not ready, do not use */
    return -ENODEV;
}
```

There are variants of DEVICE_DT_GET() such as DEVICE_DT_GET_OR_NULL(), DEVICE_DT_GET_ONE() or DEVICE_DT_GET_ANY(). This idiom fetches the device pointer at build-time, which means there is no runtime penalty. This method is useful if you want to store the device pointer as configuration data. But because the device may not be initialized, or may have failed to initialize, you must verify that the device is ready to be used before passing it to any API functions. (This check is done for you by device_get_binding().)

In some situations the device cannot be known at build-time, e.g., if it depends on user input like in a shell application. In this case you can get the struct device by combining device_get_binding() with the device name:
const char *dev_name = /* TODO: insert device name from user */;
const struct device *uart_dev = device_get_binding(dev_name);

You can then use `uart_dev` with Universal Asynchronous Receiver-Transmitter (UART) API functions like `uart_configure()`. Similar code will work for other device types; just make sure you use the correct API for the device.

If you're having trouble, see Troubleshooting devicetree. The first thing to check is that the node has status = "okay", like this:

```c
#define MY_SERIAL DT_NODELABEL(my_serial)
#if DT_NODE_HAS_STATUS(MY_SERIAL, okay)
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
#else
#error "Node is disabled"
#endif
```

If you see the `#error` output, make sure to enable the node in your devicetree. In some situations your code will compile but it will fail to link with a message similar to:

```c
...undefined reference to `__device_dts_ord_N'
collect2: error: ld returned 1 exit status
```

This likely means there's a Kconfig issue preventing the device driver from being built, resulting in a reference that does not exist. If your code compiles successfully, the last thing to check is if the device is ready, like this:

```c
if (!device_is_ready(uart_dev)) {
    printk("Device not ready\n");
}
```

If you find that the device is not ready, it likely means that the device's initialization function failed. Enabling logging or debugging driver code may help in such situations. Note that you can also use `device_get_binding()` to obtain a reference at runtime. If it returns `NULL` it can either mean that device's driver failed to initialize or that it does not exist.

Find a devicetree binding  Devicetree bindings are YAML files which declare what you can do with the nodes they describe, so it's critical to be able to find them for the nodes you are using.

If you don't have them already, Get your devicetree and generated header. To find a node's binding, open the generated header file, which starts with a list of nodes in a block comment:

```c
/*
 * Nodes in dependency order (ordinal and path):
 * 0 / 1 /aliases 2 /chosen 3 /flash@0 4 /memory@20000000 (etc.) ...
 */
```

Make note of the path to the node you want to find, like `/flash@0`. Search for the node's output in the file, which starts with something like this if the node has a matching binding:
Set devicetree overlays  Devicetree overlays are explained in Introduction to devicetree. The CMake variable DTC_OVERLAY_FILE contains a space- or semicolon-separated list of overlay files to use. If DTC_OVERLAY_FILE specifies multiple files, they are included in that order by the C preprocessor. A file in a Zephyr module can be referred to by escaping the Zephyr module dir variable like \${ZEPHYR_<module>_MODULE_DIR}/<path-to>/dts.overlay when setting the DTC_OVERLAY_FILE variable.

You can set DTC_OVERLAY_FILE to contain exactly the files you want to use. Here is an example using west build.

If you don't set DTC_OVERLAY_FILE, the build system will follow these steps, looking for files in your application configuration directory to use as devicetree overlays:

1. If the file boards/<BOARD>.overlay exists, it will be used.
2. If the current board has multiple revisions and boards/<BOARD>_<revision>.overlay exists, it will be used. This file will be used in addition to boards/<BOARD>.overlay if both exist.
3. If one or more files have been found in the previous steps, the build system stops looking and just uses those files.
4. Otherwise, if <BOARD>.overlay exists, it will be used, and the build system will stop looking for more files.
5. Otherwise, if app.overlay exists, it will be used.

Extra devicetree overlays may be provided using EXTRA_DTC_OVERLAY_FILE which will still allow the build system to automatically use devicetree overlays described in the above steps.

The build system appends overlays specified in EXTRA_DTC_OVERLAY_FILE to the overlays in DTC_OVERLAY_FILE when processing devicetree overlays. This means that changes made via EXTRA_DTC_OVERLAY_FILE have higher precedence than those made via DTC_OVERLAY_FILE.

All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the DTC_OVERLAY_FILE or EXTRA_DTC_OVERLAY_FILE argument.

See Application Configuration Directory on how the application configuration directory is defined.

Using Shields will also add devicetree overlay files.

The DTC_OVERLAY_FILE value is stored in the CMake cache and used in successive builds.

The build system prints all the devicetree overlays it finds in the configuration phase, like this:

```
-- Found devicetree overlay: .../some/file.overlay
```

Use devicetree overlays  See Set devicetree overlays for how to add an overlay to the build.

Overlays can override node property values in multiple ways. For example, if your BOARD.dts contains this node:
These are equivalent ways to override the `current-speed` value in an overlay:

```plaintext
/* Option 1 */
&serial0 {
    current-speed = <9600>;
};

/* Option 2 */
&{/soc/serial@40002000} {
    current-speed = <9600>;
};
```

We'll use the `&serial0` style for the rest of these examples.

You can add aliases to your devicetree using overlays: an alias is just a property of the `/aliases` node. For example:

```plaintext
/ {
    aliases {
        my-serial = &serial0;
    }
};
```

Chosen nodes work the same way. For example:

```plaintext
/ {
    chosen {
        zephyr,console = &serial0;
    }
};
```

To delete a property (in addition to deleting properties in general, this is how to set a boolean property to false if it's true in BOARD.dts):

```plaintext
&serial0 {
    /delete-property/ some-unwanted-property;
};
```

You can add subnodes using overlays. For example, to configure a SPI or I2C child device on an existing bus node, do something like this:

```plaintext
/* SPI device example */
&spi1 {
    my_spi_device: temp-sensor@0 {
        compatible = "...";
        label = "TEMP_SENSOR_0";
        /* reg is the chip select number, if needed; */
        * If present, it must match the node's unit address. */
        reg = <0>;
```
/* Configure other SPI device properties as needed. * Find your device’s DT binding for details. */
spi-max-frequency = <4000000>;
};

/* I2C device example */
i2c2 {
    my_i2c_device: touchscreen@76 {
        compatible = "...";
        label = "TOUCHSCREEN";
        /* reg is the I2C device address. * It must match the node’s unit address. */
        reg = <76>;

        /* Configure other I2C device properties as needed. * Find your device’s DT binding for details. */
    }
};

Other bus devices can be configured similarly:

• create the device as a subnode of the parent bus
• set its properties according to its binding

Assuming you have a suitable device driver associated with the my_spi_device and my_i2c_device compatibles, you should now be able to enable the driver via Kconfig and get the struct device for your newly added bus node, then use it with that driver API.

Write device drivers using devicetree APIs  “Devicetree-aware” device drivers should create a struct device for each status = “okay” devicetree node with a particular compatible (or related set of compatibles) supported by the driver.

Writing a devicetree-aware driver begins by defining a devicetree binding for the devices supported by the driver. Use existing bindings from similar drivers as a starting point. A skeletal binding to get started needs nothing more than this:

description: <Human-readable description of your binding>
compatible: "foo-company,bar-device"
include: base.yaml

See Find a devicetree binding for more advice on locating existing bindings.

After writing your binding, your driver C file can then use the devicetree API to find status = "okay" nodes with the desired compatible, and instantiate a struct device for each one. There are two options for instantiating each struct device: using instance numbers, and using node labels.

In either case:

• Each struct device’s name should be set to its devicetree node’s label property. This allows the driver’s users to Get a struct device from a devicetree node in the usual way.

• Each device’s initial configuration should use values from devicetree properties whenever practical. This allows users to configure the driver using devicetree overlays.

Examples for how to do this follow. They assume you’ve already implemented the device-specific configuration and data structures and API functions, like this:
/* include <zephyr/drivers/some_api.h> */

/* Define data (RAM) and configuration (ROM) structures: */
struct my_dev_data {
    /* per-device values to store in RAM */
};

struct my_dev_cfg {
    uint32_t freq; /* Just an example: initial clock frequency in Hz */
    /* other configuration to store in ROM */
};

/* Implement driver API functions (drivers/some_api.h callbacks): */
static int my_driver_api_func1(const struct device *dev, uint32_t *foo) {
    /* ... */
}

static int my_driver_api_func2(const struct device *dev, uint64_t bar) {
    /* ... */
}

static struct some_api my_api_funcs = {
    .func1 = my_driver_api_func1,
    .func2 = my_driver_api_func2,
};

Option 1: create devices using instance numbers  Use this option, which uses Instance-based APIs, if possible. However, they only work when devicetree nodes for your driver’s compatible are all equivalent, and you do not need to be able to distinguish between them.

To use instance-based APIs, begin by defining DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible that the device driver supports. For example, if your driver’s compatible is "vnd, my-device" in devicetree, you would define DT_DRV_COMPAT to vnd_my_device in your driver C file:

/* * Put this near the top of the file. After the includes is a good place. * (Note that you can therefore run "git grep DT_DRV_COMPAT drivers" in * the zephyr Git repository to look for example drivers using this style). * */
#define DT_DRV_COMPAT vnd_my_device

Important:  As shown, the DT_DRV_COMPAT macro should have neither quotes nor special characters. Remove quotes and convert special characters to underscores when creating DT_DRV_COMPAT from the compatible property.

Finally, define an instantiation macro, which creates each struct device using instance numbers. Do this after defining my_api_funcs.

/* * This instantiation macro is named "CREATE_MY_DEVICE". * Its "inst" argument is an arbitrary instance number. * * Put this near the end of the file, e.g. after defining "my_api_funcs". * */
#define CREATE_MY_DEVICE(inst) 
static struct my_dev_data my_data_##inst = {
    /* initialize RAM values as needed, e.g.: */
    .freq = DT_INST_PROP(inst, clock_frequency),
};

static const struct my_dev_cfg my_cfg_##inst = {
    /* initialize ROM values as needed. */
};
Notice the use of APIs like \texttt{DT_INST_PROP()} and \texttt{DEVICE_DT_INST_DEFINE()} to access devicetree node data. These APIs retrieve data from the devicetree for instance number \texttt{inst} of the node with compatible determined by \texttt{DT_DRV_COMPAT}.

Finally, pass the instantiation macro to \texttt{DT_INST_FOREACH_STATUS_OKAY()}:

\begin{verbatim}
/* Call the device creation macro for each instance: */
DT_INST_FOREACH_STATUS_OKAY(CREATE_MY_DEVICE)
\end{verbatim}

\texttt{DT_INST_FOREACH_STATUS_OKAY} expands to code which calls \texttt{CREATE_MY_DEVICE} once for each enabled node with the compatible determined by \texttt{DT_DRV_COMPAT}. It does not append a semicolon to the end of the expansion of \texttt{CREATE_MY_DEVICE}, so the macro's expansion must end in a semicolon or function definition to support multiple devices.

**Option 2: create devices using node labels** Some device drivers cannot use instance numbers. One example is an SoC peripheral driver which relies on vendor HAL APIs specialized for individual IP blocks to implement Zephyr driver callbacks. Cases like this should use \texttt{DT_NODELABEL()} to refer to individual nodes in the devicetree representing the supported peripherals on the SoC. The devicetree.h \texttt{Generic APIs} can then be used to access node data.

For this to work, your SoC's \texttt{dtsi} file must define node labels like \texttt{mydevice0}, \texttt{mydevice1}, etc. appropriately for the IP blocks your driver supports. The resulting devicetree usually looks something like this:

\begin{verbatim}
/ {
  soc {
    mydevice0: dev00 {
      compatible = "vnd,my-device";
    }; 
    mydevice1: dev01 {
      compatible = "vnd,my-device";
    }; 
  }
};
\end{verbatim}

The driver can use the \texttt{mydevice0} and \texttt{mydevice1} node labels in the devicetree to operate on specific device nodes:

\begin{verbatim}
/*
 * This is a convenience macro for creating a node identifier for
 * the relevant devices. An example use is MYDEV(0) to refer to
 * the node with label "mydevice0".
 */
#define MYDEV(idz) DT_NODELABEL(mydevice ## idz)

/*
 * Define your instantiation macro; "idz" is a number like 0 for mydevice0
 * or 1 for mydevice1. It uses MYDEV() to create the node label from the
 * (continues on next page)
\end{verbatim}
Notice the use of APIs like `DT_PROP()` and `DEVICE_DT_DEFINE()` to access devicetree node data.

Finally, manually detect each enabled devicetree node and use `CREATE_MY_DEVICE` to instantiate each `struct device`:

```c
# if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice0), okay)
CREATE_MY_DEVICE(0)
# endif

# if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice1), okay)
CREATE_MY_DEVICE(1)
# endif
```

Since this style does not use `DT_INST_FOREACH_STATUS_OKAY()`, the driver author is responsible for calling `CREATE_MY_DEVICE()` for every possible node, e.g. using knowledge about the peripherals available on supported SoCs.

**Device drivers that depend on other devices** At times, one `struct device` depends on another `struct device` and requires a pointer to it. For example, a sensor device might need a pointer to its SPI bus controller device. Some advice:

- Write your devicetree binding in a way that permits use of [*Hardware specific APIs*](../devicetree.h) from devicetree.h if possible.
- In particular, for bus devices, your driver’s binding should include a file like `dts/bindings/spi/spi-device.yaml` which provides common definitions for devices addressable via a specific bus. This enables use of APIs like `DT_BUS()` to obtain a node identifier for the bus node. You can then [Get a struct device from a devicetree node](#) for the bus in the usual way.

Search existing bindings and device drivers for examples.

**Applications that depend on board-specific devices** One way to allow application code to run unmodified on multiple boards is by supporting a devicetree alias to specify the hardware specific portions, as is done in the blinky-sample. The application can then be configured in `BOARD.dts` files or via [device-tree overlays](#).

**Troubleshooting devicetree**

Here are some tips for fixing misbehaving devicetree related code.

See [*Devicetree HOWTOs*](#) for other “HOWTO” style information.

---

5.2. Devicetree
Try again with a pristine build directory

**Important:** Try this first, before doing anything else.

See *Pristine Builds* for examples, or just delete the build directory completely and retry.

This is general advice which is especially applicable to debugging devicetree issues, because the outputs are created during the CMake configuration phase, and are not always regenerated when one of their inputs changes.

Make sure `<devicetree.h>` is included

Unlike Kconfig symbols, the `devicetree.h` header must be included explicitly.

Many Zephyr header files rely on information from devicetree, so including some other API may transitively include `devicetree.h`, but that's not guaranteed.

**undefined reference to __device_dts_ord_<N>**

This usually happens on a line like this:

```c
const struct device *dev = DEVICE_DT_GET(NODE_ID);
```

where `NODE_ID` is a valid node identifier, but no device driver has allocated a `struct device` for this devicetree node. You thus get a linker error, because you're asking for a pointer to a device that isn't defined.

To fix it, you need to make sure that:

1. The node is enabled: the node must have `status = "okay";`.

   (Recall that a missing `status` property means the same thing as `status = "okay";`; see *Important properties* for more information about `status`).

2. A device driver responsible for allocating the `struct device` is enabled. That is, the Kconfig option which makes the build system compile the driver sources into your application needs to be set to `y`.

   (See *Setting Kconfig configuration values* for more information on setting Kconfig options.)

Below, `<build>` means your build directory.

**Making sure the node is enabled:**

To find the devicetree node you need to check, use the number `<N>` from the linker error. Look for this number in the list of nodes at the top of `<build>/zephyr/include/generated/devicetree_generated.h`. For example, if `<N>` is 15, and your `devicetree_generated.h` file looks like this, the node you are interested in is `/soc/i2c@deadbeef`:

```c
/*
 * Generated by gen_defines.py
 *
 * DTS input file:
 *  <build>/zephyr/zephyr.dts.pre
 *
 * Directories with bindings:
 *  $ZEPHYR_BASE/dts/bindings
 *
 * Node dependency ordering (ordinal and path):
 *  0  /
 *  1  /aliases
 *  [...]
 *  15  /soc/i2c@deadbeef
 *  [...]
 */
```
Now look for this node in `<build>/zephyr/zephyr.dts`, which is the final devicetree for your application build. (See *Get your devicetree and generated header* for information and examples.)

If the node has `status = "disabled"` in `zephyr.dts`, then you need to enable it by setting `status = "okay"`, probably by using a devicetree overlay. For example, if `zephyr.dts` looks like this:

```plaintext
i2c0: i2c@deadbeef {
    status = "disabled";
};
```

Then you should put this into your devicetree overlay and *Try again with a pristine build directory*:

```plaintext
i2c0 {
    status = "okay";
};
```

Make sure that you see `status = "okay"` in `zephyr.dts` after you rebuild.

### Making sure the device driver is enabled:

The first step is to figure out which device driver is responsible for handling your devicetree node and allocating devices for it. To do this, you need to start with the `compatible` property in your devicetree node, and find the driver that allocates `struct device` instances for that compatible.

If you're not familiar with how devices are allocated from devicetree nodes based on compatible properties, the ZDS 2021 talk *A deep dive into the Zephyr 2.5 device model* may be a useful place to start, along with the *Device Driver Model* pages. See *Important properties* and the Devicetree specification for more information about `compatible`.

There is currently no documentation for what device drivers exist and which devicetree compatibles they are associated with. You will have to figure this out by reading the source code:

- Look in `drivers` for the appropriate subdirectory that corresponds to the API your device implements
- Look inside that directory for relevant files until you figure out what the driver is, or realize there is no such driver.

Often, but not always, you can find the driver by looking for a file that sets the `DT_DRV_COMPAT` macro to match your node's `compatible` property, except lowercased and with special characters converted to underscores. For example, if your node's compatible is `vnd_foo-device`, look for a file with this line:

```plaintext
#define DT_DRV_COMPAT vnd_foo_device
```

**Important**: This does not always work since not all drivers use `DT_DRV_COMPAT`.

If you find a driver, you next need to make sure the Kconfig option that compiles it is enabled. (If you don’t find a driver, and you are sure the compatible property is correct, then you need to write a driver. Writing drivers is outside the scope of this documentation page.)

Continuing the above example, if your devicetree node looks like this now:

```plaintext
i2c0: i2c@deadbeef {
    compatible = "nordic,nrf-twim";
    status = "okay";
};
```

Then you would look inside of `drivers/i2c` for the driver file that handles the compatible `nordic, nrf-twim`. In this case, that is `drivers/i2c/i2c_nrfx_twim.c`. Notice how even in cases where `DT_DRV_COMPAT` is not set, you can use information like driver file names as clues.

Once you know the driver you want to enable, you need to make sure its Kconfig option is set to `y`. You can figure out which Kconfig option is needed by looking for a line similar to this one in the CMakeLists.
txt file in the drivers subdirectory. Continuing the above example, drivers/i2c/CMakeLists.txt has a line that looks like this:

```
zephyr_library_sources_ifdef(CONFIG_NRFX_TWIM i2c_nrfx_twim.c)
```

This means that CONFIG_NRFX_TWIM must be set to y in <build>/zephyr/.config file.

If your driver's Kconfig is not set to y, you need to figure out what you need to do to make that happen. Often, this will happen automatically as soon as you enable the devicetree node. Otherwise, it is sometimes as simple as adding a line like this to your application's prj.conf file and then making sure to Try again with a pristine build directory:

```
CONFIG_FOO=y
```

where CONFIG_FOO is the option that CMakeLists.txt uses to decide whether or not to compile the driver.

However, there may be other problems in your way, such as unmet Kconfig dependencies that you also have to enable before you can enable your driver.

Consult the Kconfig file that defines CONFIG_FOO (for your value of FOO) for more information.

**Make sure you're using the right names**  Remember that:

- In C/C++, devicetree names must be lowercased and special characters must be converted to underscores. Zephyr's generated devicetree header has DTS names converted in this way into the C tokens used by the preprocessor-based `<devicetree.h>` API.

- In overlays, use devicetree node and property names the same way they would appear in any DTS file. Zephyr overlays are just DTS fragments.

For example, if you're trying to get the clock-frequency property of a node with path /soc/i2c@12340000 in a C/C++ file:

```c
/*
 * foo.c: lowercase-and-underscores names
 */

/* Don't do this: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c@12340000), clock-frequency)
/*
 * @ should be _  - should be _ */

/* Do this instead: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c_12340000), clock_frequency)
/* */
```

And if you're trying to set that property in a devicetree overlay:

```c
/*
 * foo.overlay: DTS names with special characters, etc.
 */

/* Don't do this; you'll get devicetree errors. */
k{/soc/i2c_12340000/} {
    clock_frequency = <115200>;
};

/* Do this instead. Overlays are just DTS fragments. */
k{/soc/i2c@12340000/} {
```

(continues on next page)
Look at the preprocessor output

To save preprocessor output files, enable the
CONFIG_COMPILER_SAVE_TEMPS option. For example, to build hello_world with west with this
option set, use:

```
west build -b BOARD samples/hello_world -- -DCONFIG_COMPILER_SAVE_TEMPS=y
```

This will create a preprocessor output file named `foo.c.i` in the build directory for each source file `foo.c`.

You can then search for the file in the build directory to see what your devicetree macros expanded to.

For example, on macOS and Linux, using `find` to find `main.c.i`:

```
$ find build -name main.c.i
build/CMakeFiles/app.dir/src/main.c.i
```

It's usually easiest to run a style formatter on the results before opening them. For example, to use
clang-format to reformat the file in place:

```
clang-format -i build/CMakeFiles/app.dir/src/main.c.i
```

You can then open the file in your favorite editor to view the final C results after preprocessing.

Do not track macro expansion

Compiler messages for devicetree errors can sometimes be very long. This typically happens when the compiler prints a message for every step of a complex macro expansion that has several intermediate expansion steps.

To prevent the compiler from doing this, you can disable the CONFIG_COMPILER_TRACK_MACRO_EXPANSION option. This typically reduces the output to one mes-
sage per error.

For example, to build hello_world with west and this option disabled, use:

```
w west build -b BOARD samples/hello_world -- -DCONFIG_COMPILER_TRACK_MACRO_EXPANSION=n
```

Validate properties

If you're getting a compile error reading a node property, check your node identi-
fier and property. For example, if you get a build error on a line that looks like this:

```
int baud_rate = DT_PROP(DT_NODELABEL(my_serial), current_speed);
```

Try checking the node by adding this to the file and recompiling:

```
#include "dt/db.h"

#if !DT_NODE_EXISTS(DT_NODELABEL(my_serial))
#error "whoops"
#endif
```

If you see the "whoops" error message when you rebuild, the node identifier isn't referring to a valid
node. Get your devicetree and generated header and debug from there.

Some hints for what to check next if you don't see the "whoops" error message:

- did you Make sure you're using the right names?
- does the property exist?
- does the node have a matching binding?
• does the binding define the property?

Check for missing bindings  See Devicetree bindings for information about bindings, and Bindings index for information on bindings built into Zephyr.

If the build fails to Find a devicetree binding for a node, then either the node's compatible property is not defined, or its value has no matching binding. If the property is set, check for typos in its name. In a devicetree source file, compatible should look like "vnd,some-device" – Make sure you're using the right names.

If your binding file is not under zephyr/dts, you may need to set DTS_ROOT; see Where bindings are located.

Errors with DT_INST_() APIs  If you're using an API like DT_INST_PROP(), you must define DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible you are interested in. See Option 1: create devices using instance numbers.

Devicetree versus Kconfig

Along with devicetree, Zephyr also uses the Kconfig language to configure the source code. Whether to use devicetree or Kconfig for a particular purpose can sometimes be confusing. This section should help you decide which one to use.

In short:

• Use devicetree to describe hardware and its boot-time configuration. Examples include peripherals on a board, boot-time clock frequencies, interrupt lines, etc.

• Use Kconfig to configure software support to build into the final image. Examples include whether to add networking support, which drivers are needed by the application, etc.

In other words, devicetree mainly deals with hardware, and Kconfig with software.

For example, consider a board containing a SoC with 2 UART, or serial port, instances.

• The fact that the board has this UART hardware is described with two UART nodes in the devicetree. These provide the UART type (via the compatible property) and certain settings such as the address range of the hardware peripheral registers in memory (via the reg property).

• Additionally, the UART boot-time configuration is also described with devicetree. This could include configuration such as the RX IRQ line's priority and the UART baud rate. These may be modifiable at runtime, but their boot-time configuration is described in devicetree.

• Whether or not to include software support for UART in the build is controlled via Kconfig. Applications which do not need to use the UARTs can remove the driver source code from the build using Kconfig, even though the board's devicetree still includes UART nodes.

As another example, consider a device with a 2.4GHz, multi-protocol radio supporting both the Bluetooth Low Energy and 802.15.4 wireless technologies.

• Devicetree should be used to describe the presence of the radio hardware, what driver or drivers it's compatible with, etc.

• Boot-time configuration for the radio, such as TX power in dBm, should also be specified using devicetree.

• Kconfig should determine which software features should be built for the radio, such as selecting a BLE or 802.15.4 protocol stack.

As another example, Kconfig options that formerly enabled a particular instance of a driver (that is itself enabled by Kconfig) have been removed. The devices are selected individually using devicetree's status keyword on the corresponding hardware instance.

There are exceptions to these rules:
• Because Kconfig is unable to flexibly control some instance-specific driver configuration parameters, such as the size of an internal buffer, these options may be defined in devicetree. However, to make clear that they are specific to Zephyr drivers and not hardware description or configuration these properties should be prefixed with `zephyr`, e.g. `zephyr,random-mac-address` in the common Ethernet devicetree properties.

• Devicetree's chosen keyword, which allows the user to select a specific instance of a hardware device to be used for a particular purpose. An example of this is selecting a particular UART for use as the system's console.

5.2.2 Devicetree Reference

These pages contain reference material for Zephyr's devicetree APIs and built-in bindings. For the platform-independent details, see the Devicetree specification.

Devicetree API

This is a reference page for the `<zephyr/devicetree.h>` API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these – the ones beginning with `DT_INST_` – require a special macro named `DT_DRV_COMPAT` to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within device drivers, though they can be used outside of drivers with appropriate care.

Contents

• **Generic APIs**
  – Node identifiers and helpers
  – Property access
  – `ranges` property
  – `reg` property
  – `interrupts` property
  – For-each macros
  – Existence checks
  – Inter-node dependencies
  – Bus helpers

• **Instance-based APIs**

• **Hardware specific APIs**
  – `CAN`
  – `Clocks`
  – `DMA`
  – `Fixed flash partitions`
  – `GPIO`
  – `IO channels`
  – `MBOX`
  – `Memory attributes`
Generic APIs The APIs in this section can be used anywhere and do not require DT_DRV_COMPAT to be defined.

Node identifiers and helpers A node identifier is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the Property access API.

The root node / has node identifier DT_ROOT. You can create node identifiers for other devicetree nodes using DT_PATH(), DT_NODELABEL(), DT_ALIAS(), and DT_INST().

There are also DT_PARENT() and DT_CHILD() macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

group devicetree-generic-id

Defines

DT_INVALID_NODE
Name for an invalid node identifier.

This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

DT_ROOT
Node identifier for the root node in the devicetree.

DT_PATH(...) Get a node identifier for a devicetree path.

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```c
/ {
    soc {
        serial1: serial@40001000 {
            status = "okay";
            current-speed = <115200>;
            ...}
```
You can use `DT_PATH(soc, serial_40001000)` to get a node identifier for the serial@40001000 node. Node labels like `serial1` cannot be used as `DT_PATH()` arguments; use `DT_NODELABEL()` for those instead.

Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The current-speed property is also in lowercase-and-underscores form when used with this API.)

When determining arguments to `DT_PATH()`:

- the first argument corresponds to a child node of the root (`soc` above)
- a second argument corresponds to a child of the first argument (`serial_40001000` above, from the node name `serial@40001000` after lowercasing and changing `@` to `_`)
- and so on for deeper nodes in the desired node's path

**Note:** This macro returns a node identifier from path components. To get a path string from a node identifier, use `DT_NODE_PATH()` instead.

**Parameters**

- `...` – lowercase-and-underscores node names along the node's path, with each name given as a separate argument

**Returns**

node identifier for the node with that path

`DT_NODELABEL(label)`  
Get a node identifier for a node label.

Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

```
serial1: serial@40001000 {
    label = "UART_0";
    status = "okay";
    current-speed = <115200>;
    ...
};
```

The only node label in this example is `serial1`. The string UART_0 is not a node label; it's the value of a property named label.

You can use `DT_NODELABEL(serial1)` to get a node identifier for the serial@40001000 node. Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
```

Another example devicetree fragment:

```
5.2. Devicetree
Example usage to get the cache-level property:

```
DT_PROP(DT_NODELABEL(l2_0), cache_level) // 2
```

Notice how L2_0 in the devicetree is lowercased to l2_0 in the `DT_NODELABEL()` argument.

**Parameters**

- `label` – lowercase-and-underscores node label name

**Returns**

node identifier for the node with that label

`DT_ALIAS(alias)`

Get a node identifier from `/aliases`.

This macro’s argument is a property of the `/aliases` node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:

```
/ {
    aliases {
        my-serial = &serial1;
    };
    soc {
        serial1: serial@40001000 {
            status = "okay";
            current-speed = <115200>;
            ...;
        };
    };
};
```

You can use `DT_ALIAS(my_serial)` to get a node identifier for the serial@40001000 node. Notice how `my-serial` in the devicetree becomes `my_serial` in the `DT_ALIAS()` argument.

Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_ALIAS(my_serial), current_speed) // 115200
```

**Parameters**

- `alias` – lowercase-and-underscores alias name.

**Returns**

node identifier for the node with that alias

`DT_INST(inst, compat)`

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these
nodes by passing `DT_INST()` an instance number, `inst`, along with the lowercase-and-underscores version of the compatible, `compat`.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, **including disabled nodes**
- enabled nodes (status property is `okay` or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the `/aliases` node (use `DT_NODELABEL()` or `DT_ALIAS()` for those)
- there is **no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory

Example devicetree fragment:

```plaintext
serial1: serial@40001000 {
    compatible = "vnd,soc-serial";
    status = "disabled";
    current-speed = <9600>;
    ...
};

serial2: serial@40002000 {
    compatible = "vnd,soc-serial";
    status = "okay";
    current-speed = <57600>;
    ...
};

serial3: serial@40003000 {
    compatible = "vnd,soc-serial";
    current-speed = <115200>;
    ...
};
```

Assuming no other nodes in the devicetree have compatible "vnd,soc-serial", that compatible has nodes with instance numbers 0, 1, and 2.

The nodes `serial@40002000` and `serial@40003000` are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since `serial@40001000` is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
```

(continues on next page)
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)

// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)

// 9600, because there is only one disabled node, and
// disabled nodes are "at the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)

Notice how "vnd_soc_serial" in the devicetree becomes vnd_soc_serial (without quotes) in the DT_INST() arguments. (As usual, current-speed in the devicetree becomes current_speed as well.)

Nodes whose compatible property has multiple values are assigned independent instance numbers for each compatible.

**Parameters**
- inst – instance number for compatible compat
- compat – lowercase-and-underscores compatible, without quotes

**Returns**
node identifier for the node with that instance number and compatible

DT_PARENT(node_id)
Get a node identifier for a parent node.

Example devicetree fragment:

```plaintext
parent: parent-node {
    child: child-node {
        ...
    };
};
```

The following are equivalent ways to get the same node identifier:

DT_NODELABEL(parent)
DT_PARENT(DT_NODELABEL(child))

**Parameters**
- node_id – node identifier

**Returns**
a node identifier for the node's parent

DT_GPARENT(node_id)
Get a node identifier for a grandparent node.

Example devicetree fragment:

```plaintext
gparent: grandparent-node {
    parent: parent-node {
        child: child-node { ... }
    };
};
```
The following are equivalent ways to get the same node identifier:

\[
\begin{align*}
\text{DT_GPARENT(DT_NODELABEL(child))} \\
\text{DT_PARENT(DT_PARENT(DT_NODELABEL(child)))}
\end{align*}
\]

**Parameters**

- node_id – node identifier

**Returns**

a node identifier for the node’s parent’s parent

**DT_CHILD(node_id, child)**

Get a node identifier for a child node.

Example devicetree fragment:

```plaintext
/ {
  soc-label: soc {
    serial1: serial@40001000 {
      status = "okay";
      current-speed = <115200>;
      ...
    };
  };
}
```

Example usage with `DT_PROP()` to get the status of the serial@40001000 node:

```plaintext
#define SOC_NODE DT_NODELABEL(soc_label)
DT_PROP(DT_CHILD(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like `serial1` cannot be used as the child argument to this macro. Use `DT_NODELABEL()` for that instead.

You can also use `DT_FOREACH_CHILD()` to iterate over node identifiers for all of a node’s children.

**Parameters**

- node_id – node identifier
- child – lowercase-and-underscores child node name

**Returns**

node identifier for the node with the name referred to by ‘child’

**DT_COMPAT_GET_ANY_STATUS_OKAY(compat)**

Get a node identifier for a status okay node with a compatible.

Use this if you want to get an arbitrary enabled node with a given compatible, and you do not care which one you get. If any enabled nodes with the given compatible exist, a node identifier for one of them is returned. Otherwise, `DT_INVALID_NODE` is returned.

Example devicetree fragment:

```plaintext
node-a {
  compatible = "vnd,device";
  status = "okay";
};
node-b {
  compatible = "vnd,device";
}
```
status = "okay";
};

node-c {
    compatible = "vnd.device";
    status = "disabled";
};

Example usage:

DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)

This expands to a node identifier for either node-a or node-b. It will not expand to a node identifier for node-c, because that node does not have status okay.

Parameters
- compat – lowercase-and-underscores compatible, without quotes

Returns
node identifier for a node with that compatible, or DT_INVALID_NODE

DT_NODE_PATH(node_id)
Get a devicetree node's full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from path components instead, use DT_PATH().

Example devicetree fragment:

/ {
    soc {
        node: my-node@12345678 { ... };
    }
};

Example usage:

DT_NODE_PATH(DT_NODELABEL(node)) // "/soc/my-node@12345678"
DT_NODE_PATH(DT_PATH(soc)) // "/soc"
DT_NODE_PATH(DT_ROOT) // "/"

Parameters
- node_id – node identifier

Returns
the node's full path in the devicetree

DT_NODE_FULL_NAME(node_id)
Get a devicetree node's name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:

/ {
    soc {
        node: my-node@12345678 { ... };
    }
};
Example usage:

```
DT_NODE_FULL_NAME(DT_NODELABEL(node)) // "my-node@12345678"
```

**Parameters**

- `node_id` – node identifier

**Returns**

the node’s name with unit-address as a string in the devicetree

```
DT_NODE_CHILD_IDX(node_id)
```

Get a devicetree node's index into its parent's list of children.

Indexes are zero-based.

It is an error to use this macro with the root node.

Example devicetree fragment:

```
parent {
  c1: child-1 {};
  c2: child-2 {};
}
```

Example usage:

```
DT_NODE_CHILD_IDX(DT_NODELABEL(c1)) // 0
DT_NODE_CHILD_IDX(DT_NODELABEL(c2)) // 1
```

**Parameters**

- `node_id` – node identifier

**Returns**

the node’s index in its parent node’s list of children

```
DT_SAME_NODE(node_id1, node_id2)
```

Do node_id1 and node_id2 refer to the same node?

Both node_id1 and node_id2 must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with `DT_NODE_EXISTS()`).

The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

**Parameters**

- `node_id1` – first node identifier
- `node_id2` – second node identifier

**Returns**

an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

**Property access**

The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the `ranges property`, `reg property` and `interrupts property`.

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.

```
group devicetree-generic-prop
```
Defines

**DT_PROP(node_id, prop)**

Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- string: a string literal
- boolean: 0 if the property is false, or 1 if it is true
- int: the property's value as an integer literal
- array, uint8-array, string-array: an initializer expression in braces, whose elements are integer or string literals (like `{0, 1, 2}, {"hello", "world"}`, etc.)
- phandle: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: `compatible` has type string-array, `status` has type string, and `interrupt-controller` has type boolean. For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see **DT_PATH()**, **DT_ALIAS()**, **DT_NODELABEL()**, and **DT_INST()** above.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name

**Returns**

a representation of the property's value

**DT_PROP_LEN(node_id, prop)**

Get a property's logical length.

Here, “length” is a number of elements, which may differ from the property’s size in bytes.

The return value depends on the property’s type:

- for types array, string-array, and uint8-array, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles
- for type phandle-array, this expands to the number of phandle and specifier blocks in the property
- for type phandle, this expands to 1 (so that a phandle can be treated as a degenerate case of phandles with length 1)
- for type string, this expands to 1 (so that a string can be treated as a degenerate case of string-array with length 1)

These properties are handled as special cases:

- reg property: use **DT_NUM_REGS(node_id)** instead
- interrupts property: use **DT_NUM_IRQS(node_id)** instead

It is an error to use this macro with the ranges, dma-ranges, reg or interrupts properties. For other properties, behavior is undefined.
Parameters

- node_id – node identifier
- prop – a lowercase-and-underscores property with a logical length

Returns

the property's length

`DT_PROP_LEN_OR(node_id, prop, default_value)`

Like `DT_PROP_LEN()`, but with a fallback to `default_value`.

If the property is defined (as determined by `DT_NODE_HAS_PROP()`), this expands to `DT_PROP_LEN(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- node_id – node identifier
- prop – a lowercase-and-underscores property with a logical length
- default_value – a fallback value to expand to

Returns

the property's length or the given default value

`DT_PROP_HAS_IDX(node_id, prop, idx)`

Is index `idx` valid for an array type property?

If this returns 1, then `DT_PROP_BY_IDX(node_id, prop, idx)` or `DT_PHA_BY_IDX(node_id, prop, idx, ...)` are valid at index `idx`. If it returns 0, it is an error to use those macros with that index.

These properties are handled as special cases:

- `reg` property: use `DT_REG_HAS_IDX(node_id, idx)` instead
- `interrupts` property: use `DT_IRQ_HAS_IDX(node_id, idx)` instead

It is an error to use this macro with the `reg` or `interrupts` properties.

Parameters

- node_id – node identifier
- prop – a lowercase-and-underscores property with a logical length
- idx – index to check

Returns

An expression which evaluates to 1 if `idx` is a valid index into the given property, and 0 otherwise.

`DT_PROP_HAS_NAME(node_id, prop, name)`

Is name `name` available in a `foo-names` property?

This property is handled as special case:

- `interrupts` property: use `DT_IRQ_HAS_NAME(node_id, idx)` instead

It is an error to use this macro with the `interrupts` property.

Example devicetree fragment:
nx: node-x {
    foos = <&bar xx yy>, <&baz xx zz>;
    foo-names = "event", "error";
    status = "okay";
};

Example usage:

DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, event) // 1
DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, failure) // 0

Parameters
- node_id – node identifier
- prop – a lowercase-and-underscores prop-names type property
- name – a lowercase-and-underscores name to check

Returns
An expression which evaluates to 1 if “name” is an available name into the given property, and 0 otherwise.

DT_PROP_BY_IDX(node_id, prop, idx)
Get the value at index idx in an array type property.
It might help to read the argument order as being similar to node->property[index].
The return value depends on the property's type:

- for types array, string-array, uint8-array, and phandles, this expands to the idx-th array element as an integer, string literal, integer, and node identifier respectively
- for type phandle, idx must be 0 and the expansion is a node identifier (this treats phandle like a phandles of length 1)
- for type string, idx must be 0 and the expansion is the the entire string (this treats string like string-array of length 1)

These properties are handled as special cases:

- reg: use DT_REG_ADDR_BY_IDX() or DT_REG_SIZE_BY_IDX() instead
- interrupts: use DT_IRQ_BY_IDX()
- ranges: use DT_NUM_RANGES()
- dma-ranges: it is an error to use this property with DT_PROP_BY_IDX()

For properties of other types, behavior is undefined.

Parameters
- node_id – node identifier
- prop – lowercase-and-underscores property name
- idx – the index to get

Returns
a representation of the idx-th element of the property
DT_PROP_OR(node_id, prop, default_value)

Like `DT_PROP()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PROP(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**

the property's value or `default_value`

DT_LABEL(node_id)

Equivalent to `DT_PROP(node_id, label)`

*Deprecated:*

Use `DT_PROP(node_id, label)`

This is a convenience for the Zephyr device API, which uses label properties as `device_get_binding()` arguments.

**Parameters**

- `node_id` – node identifier

**Returns**

node's label property value

DT_ENUM_IDX(node_id, prop)

Get a property value's index into its enumeration values.

The return values start at zero.

Example devicetree fragment:

```plaintext
usb1: usb@12340000 {
    maximum-speed = "full-speed";
};
usb2: usb@12341000 {
    maximum-speed = "super-speed";
};
```

Example bindings fragment:

```plaintext
properties:
    maximum-speed:
        type: string
        enum:
            - "low-speed"
            - "full-speed"
            - "high-speed"
            - "super-speed"
```

Example usage:

```plaintext
DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed) // 1
DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed) // 3
```
Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns

zero-based index of the property's value in its enum: list

\[
\text{DT_ENUM_IDX}_\text{OR}(\text{node}_\text{id}, \text{prop}, \text{default}_\text{idx}_\text{value})
\]

Like \text{DT_ENUM_IDX()}, but with a fallback to a default enum index.

If the value exists, this expands to its zero based index value thanks to \text{DT_ENUM_IDX}(\text{node}_\text{id}, \text{prop}).

Otherwise, this expands to provided default index enum value.

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_idx_value – a fallback index value to expand to

Returns

zero-based index of the property's value in its enum if present, default_idx_value otherwise

\[
\text{DT_ENUM_HAS_VALUE}(\text{node}_\text{id}, \text{prop}, \text{value})
\]

Does a node enumeration property have a given value?

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name
- value – lowercase-and-underscores enumeration value

Returns

1 if the node property has the value \text{value}, 0 otherwise.

\[
\text{DT_STRING_TOKEN}(\text{node}_\text{id}, \text{prop})
\]

Get a string property's value as a token.

This removes "the quotes" from a string property's value, converting any non-alphanumeric characters to underscores. This can be useful, for example, when programmatically using the value to form a C variable or code.

\text{DT_STRING_TOKEN()} can only be used for properties with string type.

It is an error to use \text{DT_STRING_TOKEN()} in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "FOO";
}
n3: node-3 {
    prop = "123 foo";
};
```

Example bindings fragment:
properties:
  prop:
    type: string

Example usage:

```plaintext
DT_STRING_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_STRING_TOKEN(DT_NODELABEL(n2), prop) // FOO
DT_STRING_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It’s the user’s responsibility not to use such values as the name of a C identifier.
- The uppercased "FOO" in the DTS remains FOO as a token. It is not converted to foo.
- The whitespace in the DTS "123 foo" string is converted to 123_foo as a token.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name

**Returns**

the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

```plaintext
DT_STRING_TOKEN_OR(node_id, prop, default_value)
```

Like `DT_STRING_TOKEN()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_STRING_TOKEN(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_value – a fallback value to expand to

**Returns**

the property's value as a token, or `default_value`

```plaintext
DT_STRING_UPPER_TOKEN(node_id, prop)
```

Like `DT_STRING_TOKEN()`, but uppercased.

This removes “the quotes” from a string property's value, converting any non-alphanumeric characters to underscores, and capitalizing the result. This can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_UPPER_TOKEN()` can only be used for properties with string type.

It is an error to use `DT_STRING_UPPER_TOKEN()` in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
  prop = "foo";
};
```

(continues on next page)
Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n1), prop) // FOO
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n2), prop) // 123_FOO
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes FOO as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123_FOO as a token, i.e. it is uppercased and whitespace becomes an underscore.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns**

the value of `prop` as an uppercased token, i.e. without any quotes and with special characters converted to underscores

**DT_STRING_UPPER_TOKEN_OR(node_id, prop, default_value)**

Like `DT_STRING_UPPER_TOKEN()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_STRING_UPPER_TOKEN(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**

the property's value as an uppercased token, or `default_value`

**DT_STRING_UNQUOTED(node_id, prop)**

Get a string property's value as an unquoted sequence of tokens.

This removes “the quotes” from string-valued properties. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

`DT_STRING_UNQUOTED()` can only be used for properties with string type.

It is an error to use `DT_STRING_UNQUOTED()` in other circumstances.
Example devicetree fragment:

```
node-1 {
    prop = "12.7";
};
node-2 {
    prop = "0.5";
}
node-3 {
    prop = "A B C";
};
```

Example bindings fragment:

```
properties:
    prop:
        type: string
```

Example usage:

```c
DT_STRING_UNQUOTED(DT_NODELABEL(n1), prop)  // 12.7
DT_STRING_UNQUOTED(DT_NODELABEL(n2), prop)  // 0.5
DT_STRING_UNQUOTED(DT_NODELABEL(n3), prop)  // A B C
```

### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

### Returns

The property's value as a sequence of tokens, with no quotes

```
DT_STRING_UNQUOTED_OR(node_id, prop, default_value)
```

Like `DT_STRING_UNQUOTED()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_STRING_UNQUOTED(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

### Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

### Returns

The property's value as a sequence of tokens, with no quotes, or `default_value`

```
DT_STRING_TOKEN_BY_IDX(node_id, prop, idx)
```

Get an element out of a string-array property as a token.

This removes “the quotes” from an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_TOKEN_BY_IDX()` can only be used for properties with string-array type.

It is an error to use `DT_STRING_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:
Example bindings fragment:

```
properties:
  prop:
    type: string-array
```

Example usage:

```
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0) // f1
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1) // F2
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0) // 123_foo
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1) // 456_FOO
```

For more information, see `DT_STRING_TOKEN`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**

the element in `prop` at index `idx` as a token

Like `DT_STRING_TOKEN_BY_IDX()`, but uppercased.

This removes “the quotes” and capitalizes an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_UPPER_TOKEN_BY_IDX()` can only be used for properties with string-array type.

It is an error to use `DT_STRING_UPPER_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```
Example bindings fragment:

```
```
For more information, see `DT_STRING_UPPER_TOKEN`.

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as an uppercased token

```
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0)  // F1
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1)  // F2
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0)  // 123_FOO
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1)  // 456_FOO
```

**DT_STRING_UPPER_TOKEN**

Get a string array item value as an uppercased token.

```
DT_STRING_UPPER_TOKEN_BINARY_BY_IDX(node_id, prop, idx)
```

This removes “the quotes” from string-valued item. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

**DT_STRING_UPPER_TOKEN** can only be used for properties with string-array type.

It is an error to use `DT_STRING_UPPER_TOKEN` in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
  prop = "12.7", "34.1";
};
n2: node-2 {
  prop = "A B", "C D";
}
```

Example bindings fragment:

```
properties:
  prop:
    type: string-array
```

Example usage:

```
DT_STRING_UPPER_TOKEN_BINARY_BY_IDX(DT_NODELABEL(n1), prop, 0)  // 12.7
DT_STRING_UPPER_TOKEN_BINARY_BY_IDX(DT_NODELABEL(n1), prop, 1)  // 34.1
DT_STRING_UPPER_TOKEN_BINARY_BY_IDX(DT_NODELABEL(n2), prop, 0)  // A B
DT_STRING_UPPER_TOKEN_BINARY_BY_IDX(DT_NODELABEL(n2), prop, 1)  // C D
```

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the property's value as a sequence of tokens, with no quotes

---

5.2. Devicetree
DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)

Get a property value from a phandle in a property.

This is a shorthand for:

```
DT_PROP(DT_PHANDLE_BY_IDX(node_id, phs, idx), prop)
```

That is, prop is a property of the phandle's node, not a property of node_id.

Example devicetree fragment:

```
node1: node-1 {
    foo = <&node2 &node3>;
};
node2: node-2 {
    bar = <42>;
};
node3: node-3 {
    baz = <43>;
};
```

Example usage:

```
#define N1 DT_NODELABEL(node1)
DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar)  // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz)  // 43
```

**Parameters**

- node_id – node identifier
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- idx – logical index into phs, which must be zero if phs has type phandle
- prop – lowercase-and-underscores property of the phandle's node

**Returns**

the property's value

DT_PROP_BY_PHANDLE_IDX_OR(node_id, phs, idx, prop, default_value)

Like `DT_PROP_BY_PHANDLE_IDX()`, but with a fallback to default_value.

If the value exists, this expands to `DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)`. The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

**Parameters**

- node_id – node identifier
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- idx – logical index into phs, which must be zero if phs has type phandle
- prop – lowercase-and-underscores property of the phandle's node
- default_value – a fallback value to expand to
Returns
the property's value

\texttt{DT\_PROP\_BY\_PHANDLE(node\_id, ph, prop)}

Get a property value from a phandle's node.

This is equivalent to \texttt{DT\_PROP\_BY\_PHANDLE\_IDX(node\_id, ph, 0, prop)}.

Parameters

- \texttt{node\_id} – node identifier
- \texttt{ph} – lowercase-and-underscores property of \texttt{node\_id} with type \texttt{phandle}
- \texttt{prop} – lowercase-and-underscores property of the phandle's node

Returns
the property's value

\texttt{DT\_PHA\_BY\_IDX(node\_id, pha, idx, cell)}

Get a phandle-array specifier cell value at an index.

It might help to read the argument order as being similar to \texttt{node->phandle\_array[index].cell}. That is, the cell value is in the \texttt{pha} property of \texttt{node\_id}, inside the specifier at index \texttt{idx}.

Example devicetree fragment:

```plaintext
gpio0: gpio@abcd1234 {
    #gpio-cells = <2>;
};
gpio1: gpio@1234abcd {
    #gpio-cells = <2>;
};
led: led_0 {
    gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```

**Bindings fragment for the gpio0 and gpio1 nodes:**

\texttt{gpio\_cells:}
- \texttt{pin}
- \texttt{flags}

Above, \texttt{gpios} has two elements:

- index 0 has specifier \texttt{<17 0x1>}, so its \texttt{pin} cell is 17, and its \texttt{flags} cell is 0x1
- index 1 has specifier \texttt{<5 0x3>}, so \texttt{pin} is 5 and \texttt{flags} is 0x3

Example usage:

```
#define LED DT\_NODELABEL(led)

DT\_PHA\_BY\_IDX(LED, gpios, 0, pin) // 17
DT\_PHA\_BY\_IDX(LED, gpios, 1, flags) // 0x3
```

Parameters

- \texttt{node\_id} – node identifier
- \texttt{pha} – lowercase-and-underscores property with type \texttt{phandle\_array}
• idx – logical index into pha
• cell – lowercase-and-underscores cell name within the specifier at pha index

Returns
the cell's value

DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)
Like DT_PHA_BY_IDX(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA_BY_IDX(node_id, pha, idx, cell). The
default_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• idx – logical index into pha
• cell – lowercase-and-underscores cell name within the specifier at pha index
• default_value – a fallback value to expand to

Returns
the cell's value or default_value

DT_PHA(node_id, pha, cell)
Equivalent to DT_PHA_BY_IDX(node_id, pha, 0, cell)

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• cell – lowercase-and-underscores cell name

Returns
the cell's value

DT_PHA_OR(node_id, pha, cell, default_value)
Like DT_PHA(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA(node_id, pha, cell). The default_value parameter
is not expanded in this case.
Otherwise, this expands to default_value.

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• cell – lowercase-and-underscores cell name
• default_value – a fallback value to expand to

Returns
the cell's value or default_value
DT_PHA_BY_NAME(node_id, pha, name, cell)
Get a value within a phandle-array specifier by name.
This is like DT_PHA_BY_IDX(), except it treats pha as a structure where each array element
has a name.
It might help to read the argument order as being similar to node->phandle_struct.name.
cell. That is, the cell value is in the pha property of node_id, treated as a data structure
where each array element has a name.
Example devicetree fragment:

```
node { 
  io-channels = <&adc1 10>, <&adc2 20>; 
  io-channel-names = "SENSOR", "BANDGAP"; 
};
```

Bindings fragment for the “adc1” and “adc2” nodes:

```
io-channel-cells:
  - input
```

Example usage:

```
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input) // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input) // 20
```

Parameters

- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – lowercase-and-underscores cell name in the named specifier

Returns
the cell’s value

DT_PHA_BY_NAME_OR(node_id, pha, name, cell, default_value)
Like DT_PHA_BY_NAME(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA_BY_NAME(node_id, pha, name, cell). The
default_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

Parameters

- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – lowercase-and-underscores cell name in the named specifier
- default_value – a fallback value to expand to

Returns
the cell’s value or default_value

5.2. Devicetree
DT_PHANDLE_BY_NAME(node_id, pha, name)
Get a phandle's node identifier from a phandle array by name.

It might help to read the argument order as being similar to node->phandle_struct.name.
phandle. That is, the phandle array is treated as a structure with named elements. The return
value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

```c
adc1: adc@abcd1234 {
    foobar = "ADC_1";
};
adc2: adc@1234abcd {
    foobar = "ADC_2";
};
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```

Above, “io-channels” has two elements:

- the element named “SENSOR” has phandle &adc1
- the element named “BANDGAP” has phandle &adc2

Example usage:

```c
#define NODE DT_NODELABEL(n)

DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, sensor), foobar) // "ADC_1"
DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, bandgap), foobar) // "ADC_2"
```

Notice how devicetree properties and names are lowercased, and non-alphanumeric characters
are converted to underscores.

**Parameters**
- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of an element in pha

**Returns**
- a node identifier for the node with that phandle

DT_PHANDLE_BY_IDX(node_id, prop, idx)
Get a node identifier for a phandle in a property.

When a node's value at a logical index contains a phandle, this macro returns a node identifier
for the node with that phandle.

Therefore, if prop has type phandle, idx must be zero. (A phandle type is treated as a
phandles with a fixed length of 1).

Example devicetree fragment:

```c
n1: node-1 {
    foo = <&n2 &n3>;
};
```
Above, foo has type phandles and has two elements:

- index 0 has phandle &n2, which is node-2's phandle
- index 1 has phandle &n3, which is node-3's phandle

Example usage:

```c
#define N1 DT_NODELABEL(n1)

DT_PHANDLE_BY_IDX(N1, foo, 0) // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1) // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name in node_id with type phandle, phandles or phandle-array
- idx – index into prop

**Returns**
- node identifier for the node with the phandle at that index

```c
DT_PHANDLE(node_id, prop)
```

Get a node identifier for a phandle property's value.

This is equivalent to `DT_PHANDLE_BY_IDX(node_id, prop, 0)`. Its primary benefit is readability when prop has type phandle.

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property of node_id with type phandle

**Returns**
- a node identifier for the node pointed to by “ph”

*ranges property*  Use these APIs instead of *Property access* to access the *ranges* property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings. However, they take on special semantics when the node's binding indicates it is a PCIe bus node, as defined in the PCI Bus Binding to: IEEE Std 1275-1994 Standard for Boot (Initialization Configuration) Firmware

*group devicetree-ranges-prop*

**Defines**
DT_NUM_RANGES(node_id)
Get the number of range blocks in the ranges property.
Use this instead of DT_PROP_LEN(node_id, ranges).
Example devicetree fragment:

```c
pcie0: pcie0 {
    compatible = "intel,pcie";
    reg = <0 1>;
    #address-cells = <3>;
    #size-cells = <2>;

    ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
             <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
             <0x3000000 0x80 0 0x80 0 0x80 0>;
};
other: other01 {
    reg = <1 1>;

    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```c
DT_NUM_RANGES(DT_NODELABEL(pcie0)) // 3
DT_NUM_RANGES(DT_NODELABEL(other)) // 2
```

Parameters

- node_id – node identifier

DT_RANGES_HAS_IDX(node_id, idx)
Is idx a valid range block index?
If this returns 1, then DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx),
D T_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)
or DT_RANGES_LENGTH_BY_IDX(node_id, idx) are valid. For
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx) the return value of
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx) will indicate validity.
If it returns 0, it is an error to use those macros with index idx, including
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx).
Example devicetree fragment:

```c
pcie0: pcie0 {
    compatible = "intel,pcie";
    reg = <0 1>;
    #address-cells = <3>;
    #size-cells = <2>;

    ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
             <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
             <0x3000000 0x80 0 0x80 0 0x80 0>;
};
other: other01 {
    reg = <1 1>;
}```
ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
       <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};

Example usage:
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 3) // 0

Parameters
- node_id – node identifier
- idx – index to check

Returns
1 if idx is a valid register block index, 0 otherwise.

DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)
Does a ranges property have child bus flags at index?
If this returns 1, then DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx) is valid. If it returns 0, it is an error to use this macro with index idx. This macro only returns 1 for PCIe buses (i.e. nodes whose bindings specify they are “pcie” bus nodes.)

Example devicetree fragment:

parent {
  #address-cells = <2>;

  pcie0: pcie00 {
    compatible = "intel,pcie";
    reg = <0 0 1>;
    #address-cells = <3>;
    #size-cells = <2>;

    ranges = <0x1000000 0 0 0x3eff0000 0x10000>,
      <0x2000000 0x10000000 0x00000000 0x2eff0000>,
      <0x3000000 0x80 0x80 0x80 0x80 0>;
  }

  other: other@1 {
    reg = <0 1 1>;

    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
      <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
  }
};

Example usage:
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 1) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 3) // 0

Parameters

• node_id – node identifier
• idx – logical index into the ranges array

Returns

1 if idx is a valid child bus flags index, 0 otherwise.

DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)
Get the ranges property child bus flags at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is extracted from the Child Bus Address as Child Bus Flags field.

Example devicetree fragments:

```
parent {
    #address-cells = <2>;

    pcie0: pcie00 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
        <0x2000000 0x10000000 0 0x10000000 0 0x2eff0000>,
        <0x3000000 0x80 0 0x80 0x80 0x80 0>;
    }
};
```

Example usage:

```
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x1000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x3000000
```

Parameters

• node_id – node identifier
• idx – logical index into the ranges array

Returns

range child bus flags field at idx

DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)
Get the ranges property child bus address at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is removed from the Child Bus Address.
Example devicetree fragments:

```
parent {
  #address-cells = <2>;

  pcie0: pcie00 {
    compatible = "intel,pcie";
    reg = <0 0 1>;
    #address-cells = <3>;
    #size-cells = <2>;
    ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
             <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
             <0x3000000 0x80 0 0x80 0 0x80 0>;
  }

  other: other@1 {
    reg = <0 1 1>;
    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
  }
};
```

Example usage:

```
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

### Parameters

- node_id – node identifier
- idx – logical index into the ranges array

### Returns

range child bus address field at idx

```
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)
```

Get the ranges property parent bus address at index.

Similarly to `DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX()`, this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
  #address-cells = <2>;

  pcie0: pcie00 {
    compatible = "intel,pcie";
    reg = <0 0 1>;
    #address-cells = <3>;
    #size-cells = <2>;
    ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
             <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>;
  }

  other: other@1 {
    reg = <0 1 1>;
    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
  }
};
```
Example usage:

```
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

Parameters

- `node_id` – node identifier
- `idx` – logical index into the ranges array

Returns

range parent bus address field at idx

```
DT_RANGES_LENGTH_BY_IDX(node_id, idx)
```

Get the ranges property length at index.

Similarly to `DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX()`, this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
    #address-cells = <2>;

    pcie0: pcie00 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0x10000>,
                <0x2000000 0x10000000 0x1000000 0x2eff0000>,
                <0x3000000 0x80 0 0x80 0 0x80 0>;
    };

    other: other@1 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    };
};
```

Example usage:
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2eff0000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 1) // 0x2eff0000

Parameters
• node_id – node identifier
• idx – logical index into the ranges array

Returns
range length field at idx

DT_FOREACH_RANGE(node_id, fn)
Invokes fn for each entry of node_id ranges property.
The macro fn must take two parameters, node_id which will be the node identifier of the
node with the ranges property and idx the index of the ranges block.

Example devicetree fragment:

n: node@0 {
  reg = <0 0 1>;
  ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
         <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};

Example usage:

#define RANGE_LENGTH(node_id, idx) DT_RANGES_LENGTH_BY_IDX(node_id, idx),

const uint64_t *ranges_length[] = {
  DT_FOREACH_RANGE(DT_NODELABEL(n), RANGE_LENGTH)
};

This expands to:

const char *ranges_length[] = {
  0x10000, 0x2eff0000,
};

Parameters
• node_id – node identifier
• fn – macro to invoke

reg property Use these APIs instead of Property access to access the reg property. Because this prop-
erty’s semantics are defined by the devicetree specification, these macros can be used even for nodes
without matching bindings.

group devicetree-reg-prop

Defines

5.2. Devicetree
DT_NUM_REGS(node_id)
Get the number of register blocks in the reg property.
Use this instead of DT_PROP_LEN(node_id, reg).

Parameters
• node_id – node identifier

Returns
Number of register blocks in the node's “reg” property.

DT_REG_HAS_IDX(node_id, idx)
Is idx a valid register block index?
If this returns 1, then DT_REG_ADDR_BY_IDX(node_id, idx) or DT_REG_SIZE_BY_IDX(node_id, idx) are valid. If it returns 0, it is an error to use those macros with index idx.

Parameters
• node_id – node identifier
• idx – index to check

Returns
1 if idx is a valid register block index, 0 otherwise.

DT_REG_ADDR_BY_IDX(node_id, idx)
Get the base address of the register block at index idx.

Parameters
• node_id – node identifier
• idx – index of the register whose address to return

Returns
address of the idx-th register block

DT_REG_SIZE_BY_IDX(node_id, idx)
Get the size of the register block at index idx.
This is the size of an individual register block, not the total number of register blocks in the property; use DT_NUM_REGS() for that.

Parameters
• node_id – node identifier
• idx – index of the register whose size to return

Returns
size of the idx-th register block

DT_REG_ADDR(node_id)
Get a node’s (only) register block address.
Equivalent to DT_REG_ADDR_BY_IDX(node_id, 0).

Parameters
• node_id – node identifier

Returns
node’s register block address

DT_REG_ADDR_U64(node_id)
64-bit version of DT_REG_ADDR()
This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to DT_REG_ADDR() in linker/ASM context.
Parameters

- node_id – node identifier

Returns

node’s register block address

\texttt{DT\_REG\_SIZE(node\_id)}

Get a node’s (only) register block size.

Equivalent to \texttt{DT\_REG\_SIZE\_BY\_IDX(node\_id, 0)}.

Parameters

- node_id – node identifier

Returns

node’s only register block’s size

\texttt{DT\_REG\_ADDR\_BY\_NAME(node\_id, name)}

Get a register block’s base address by name.

Parameters

- node_id – node identifier
- name – lowercase-and-underscores register specifier name

Returns

address of the register block specified by name

\texttt{DT\_REG\_ADDR\_BY\_NAME\_U64(node\_id, name)}

64-bit version of \texttt{DT\_REG\_ADDR\_BY\_NAME()}

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to \texttt{DT\_REG\_ADDR\_BY\_NAME()} in linker/ASM context.

Parameters

- node_id – node identifier
- name – lowercase-and-underscores register specifier name

Returns

address of the register block specified by name

\texttt{DT\_REG\_SIZE\_BY\_NAME(node\_id, name)}

Get a register block’s size by name.

Parameters

- node_id – node identifier
- name – lowercase-and-underscores register specifier name

Returns

size of the register block specified by name

\textbf{interrupts property}  Use these APIs instead of Property access to access the interrupts property.

Because this property’s semantics are defined by the devicetree specification, some of these macros can be used even for nodes without matching bindings. This does not apply to macros which take cell names as arguments.

\textit{group} devicetree-interrupts-prop

\section{5.2. Devicetree}
**Defines**

**DT_NUM_IRQS(node_id)**

Get the number of interrupt sources for the node.

Use this instead of \( DT_PROP_LEN(node_id, interrupts) \).

**Parameters**

- `node_id` – node identifier

**Returns**

Number of interrupt specifiers in the node’s “interrupts” property.

**DT_IRQ_HAS_IDX(node_id, idx)**

Is `idx` a valid interrupt index?

If this returns 1, then \( DT_IRQ_BY_IDX(node_id, idx) \) is valid. If it returns 0, it is an error to use that macro with this index.

**Parameters**

- `node_id` – node identifier
- `idx` – index to check

**Returns**

1 if the idx is valid for the interrupt property 0 otherwise.

**DT_IRQ_HAS_CELL_AT_IDX(node_id, idx, cell)**

Does an interrupts property have a named cell specifier at an index? If this returns 1, then \( DT_IRQ_BY_IDX(node_id, idx, cell) \) is valid.

If it returns 0, it is an error to use that macro.

**Parameters**

- `node_id` – node identifier
- `idx` – index to check
- `cell` – named cell value whose existence to check

**Returns**

1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

**DT_IRQ_HAS_CELL(node_id, cell)**

Equivalent to \( DT_IRQ_HAS_CELL_AT_IDX(node_id, 0, cell) \)

**Parameters**

- `node_id` – node identifier
- `cell` – named cell value whose existence to check

**Returns**

1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

**DT_IRQ_HAS_NAME(node_id, name)**

Does an interrupts property have a named specifier value at an index? If this returns 1, then \( DT_IRQ_BY_NAME(node_id, name, cell) \) is valid.

If it returns 0, it is an error to use that macro.

**Parameters**

- `node_id` – node identifier
- `name` – lowercase-and-underscores interrupt specifier name
**Returns**  
1 if "name" is a valid named specifier 0 otherwise.

```c
DT_IRQ_BY_IDX(node_id, idx, cell)
```

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to “node->interrupts[index].cell”.

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```c
dt: serial@abcd1234 {
    interrupts = < 33 0 >, < 34 1 >;
}
```

Assuming the node’s interrupt domain has “#interrupt-cells = <2>;” and the individual cells in each interrupt specifier are named “irq” and “priority” by the node’s binding, here are some examples:

```c
#define SERIAL DT_NODELABEL(my_serial)
```

<table>
<thead>
<tr>
<th>Example usage</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 0, irq)</code></td>
<td>33</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 0, priority)</code></td>
<td>0</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 1, irq)</code></td>
<td>34</td>
</tr>
<tr>
<td><code>DT_IRQ_BY_IDX(SERIAL, 1, priority)</code></td>
<td>1</td>
</tr>
</tbody>
</table>

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the interrupt specifier array
- `cell` – cell name specifier

**Returns**

the named value at the specifier given by the index

```c
DT_IRQ_BY_NAME(node_id, name, cell)
```

Get a value within an interrupt specifier by name.

It might help to read the argument order as being similar to `node->interrupts[name].cell`.

This can be used to get information about an individual interrupt when a device generates more than one, if the bindings give each interrupt specifier a name.

**Parameters**

- `node_id` – node identifier
- `name` – lowercase-and-underscores interrupt specifier name
- `cell` – cell name specifier

**Returns**

the named value at the specifier given by the index

```c
DT_IRQ(node_id, cell)
```

Get an interrupt specifier’s value Equivalent to `DT_IRQ_BY_IDX(node_id, 0, cell)`.

**Parameters**

- `node_id` – node identifier
cell – cell name specifier

**Returns**
the named value at that index

`DT_IRQN(node_id)`
Get a node's (only) irq number.
Equivalent to `DT_IRQ(node_id, irq)`. This is provided as a convenience for the common case where a node generates exactly one interrupt, and the IRQ number is in a cell named `irq`.

**Parameters**
- `node_id` – node identifier

**Returns**
the interrupt number for the node's only interrupt

**For-each macros**
There is currently only one “generic” for-each macro, `DT_FOREACH_CHILD()`, which allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like `DT_INST_FOREACH_STATUS_OKAY()`, but these require `DT_DRV_COMPAT` to be defined before use.

**group devicetree-generic-foreach**

**Defines**

`DT_FOREACH_NODE(fn)`
Invokes `fn` for every node in the tree.
The macro must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

**Parameters**
- `fn` – macro to invoke

`DT_FOREACH_NODE_VARGS(fn, ...)`
Invokes `fn` for every node in the tree with multiple arguments.
The macro takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.
The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

**Parameters**
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_STATUS_OKAY_NODE(fn)`
Invokes `fn` for every status okay node in the tree.
The macro must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

**Parameters**
- `fn` – macro to invoke
DT_FOREACH_STATUS_OKAY_NODE_VARGS(fn, ...)  
Invokes fn for every status okay node in the tree with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.

The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

**Parameters**

- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD(node_id, fn)  
Invokes fn for each child of node_id.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.

The children will be iterated over in the same order as they appear in the final devicetree.

Example devicetree fragment:

```c
n: node {
    child-1 {
        foobar = "foo";
    };
    child-2 {
        foobar = "bar";
    };
};
```

Example usage:

```c
#define FOOBAR_AND_COMMA(node_id) DT_PROP(node_id, foobar),
const char *child_foobars[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), FOOBAR_AND_COMMA)
};
```

This expands to:

```c
const char *child_foobars[] = {
    "foo", "bar",
};
```

**Parameters**

- node_id – node identifier
- fn – macro to invoke

DT_FOREACH_CHILD_SEP(node_id, fn, sep)  
Invokes fn for each child of node_id with a separator.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.

Example devicetree fragment:
n: node {
  child-1 {
    ...
  }
  child-2 {
    ...
  }
};

Example usage:

const char *child_names[] = {
  DT_FOREACH_CHILD_SEP(DT_NODELABEL(n), DT_NODE_FULL_NAME, (,))
};

This expands to:

const char *child_names[] = {
  "child-1", "child-2"
};

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is
  required to enable providing a comma as separator.

DT_FOREACH_CHILD_VARGS(node_id, fn, ...)

Invokes fn for each child of node_id with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child
node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

DT_FOREACH_CHILD

Parameters

- node_id – node identifier
- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD_SEP_VARGS(node_id, fn, sep, ...)

Invokes fn for each child of node_id with separator and multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child
node. The remaining are passed-in by the caller.

See also:

DT_FOREACH_CHILD_VARGS

Parameters
• node_id – node identifier
• fn – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD_STATUS_OKAY(node_id, fn)
Call fn on the child nodes with status okay
The macro fn should take one argument, which is the node identifier for the child node.
As usual, both a missing status and an ok status are treated as okay.
The children will be iterated over in the same order as they appear in the final devicetree.

Parameters
• node_id – node identifier
• fn – macro to invoke

DT_FOREACH_CHILD_STATUS_OKAY_SEP(node_id, fn, sep)
Call fn on the child nodes with status okay with separator.
The macro fn should take one argument, which is the node identifier for the child node.
As usual, both a missing status and an ok status are treated as okay.

See also:
DT_FOREACH_CHILD_STATUS_OKAY

Parameters
• node_id – node identifier
• fn – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_FOREACH_CHILD_STATUS_OKAY_VARGS(node_id, fn, ...)
Call fn on the child nodes with status okay with multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
As usual, both a missing status and an ok status are treated as okay.
The children will be iterated over in the same order as they appear in the final devicetree.

See also:
DT_FOREACH_CHILD_STATUS_OKAY

Parameters
• node_id – node identifier
• fn – macro to invoke
• ... – variable number of arguments to pass to fn
DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(node_id, fn, sep, ...)
Call fn on the child nodes with status okay with separator and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child	node. The remaining are passed-in by the caller.
As usual, both a missing status and an ok status are treated as okay.

See also:
DT_FOREACH_CHILD_SEP_STATUS_OKAY

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is
  required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM(node_id, prop, fn)
Invokes fn for each element in the value of property prop.
The macro fn must take three parameters: fn(node_id, prop, idx). node_id and prop are the
same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the
array. The idx values are integer literals starting from 0.
The prop argument must refer to a property that can be passed to DT_PROP_LEN().
Example devicetree fragment:

```c
define TIMES_TWO(node_id, prop, idx) \n  (2 * DT_PROP_BY_IDX(node_id, prop, idx)),
int array[] = {
  DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```

This expands to:

```c
int array[] = {
  (2 * 1), (2 * 2), (2 * 3),
};
```
In general, this macro expands to:

```c
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)
```
where n is the number of elements in prop, as it would be returned by DT_PROP_LEN(node_id,
prop).

See also:
DT_PROP_LEN
Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name
- fn – macro to invoke

\texttt{DT_FOREACH_PROP_ELEM_SEP(node_id, prop, fn, sep)}

Invokes \texttt{fn} for each element in the value of property \texttt{prop} with separator.

Example devicetree fragment:

```
struct gpio_dt_spec specs[] = {
    DT_FOREACH_PROP_ELEM_SEP(DT_NODELABEL(n), my_gpios,
        GPIO_DT_SPEC_GET_BY_IDX, (,),
    )
};
```

Example usage:

```
struct gpio_dt_spec specs[] = {
    struct gpio_dt_spec specs[] = {
        GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 0),
        GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 1)
    }
};
```

The \texttt{prop} parameter has the same restrictions as the same parameter given to \texttt{DT_FOREACH_PROP_ELEM}.

See also:

\texttt{DT_FOREACH_PROP_ELEM}

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

\texttt{DT_FOREACH_PROP_ELEM_VARGS(node_id, prop, fn, ...)}

Invokes \texttt{fn} for each element in the value of property \texttt{prop} with multiple arguments.

The macro \texttt{fn} must take multiple parameters: \texttt{fn(node_id, prop, idx, ...)}. \texttt{node_id} and \texttt{prop} are the same as what is passed to \texttt{DT_FOREACH_PROP_ELEM}, and \texttt{idx} is the current index into the array. The \texttt{idx} values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

The \texttt{prop} parameter has the same restrictions as the same parameter given to \texttt{DT_FOREACH_PROP_ELEM}. 5.2. Devicetree
See also:

**DT_FOREACH_PROP_ELEM**

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

**DT_FOREACH_PROP_ELEM_SEP_VARGS**

Invokes `fn` for each element in the value of property `prop` with multiple arguments and a separator.

The `prop` parameter has the same restrictions as the same parameter given to **DT_FOREACH_PROP_ELEM**.

See also:

**DT_FOREACH_PROP_ELEM_VARGS**

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- `...` – variable number of arguments to pass to `fn`

**DT_FOREACH_STATUS_OKAY**

Invokes `fn` for each status okay node of a compatible.

This macro expands to:

```
fn(node_id_1) fn(node_id_2) ... fn(node_id_n)
```

where each `node_id_<i>` is a node identifier for some node with compatible `compat` and status okay. Whitespace is added between expansions as shown above.

Example devicetree fragment:

```c
/ {
  a {
    compatible = "foo";
    status = "okay";
  };
  b {
    compatible = "foo";
    status = "disabled";
  };
  c {
    compatible = "foo";
  };
};
```
Example usage:

\[
\text{DT_FOREACH_STATUS_OKAY(\texttt{foo}, \texttt{DT\_NODE\_PATH})}
\]

This expands to one of the following:

\begin{verbatim}
"/a" "/c"
"/c" "/a"
\end{verbatim}

“One of the following” is because no guarantees are made about the order that node identifiers are passed to \texttt{fn} in the expansion.

(The \texttt{/c} string literal is present because a missing status property is always treated as if the status were set to \texttt{okay}.)

Note also that \texttt{fn} is responsible for adding commas, semicolons, or other terminators as needed.

**Parameters**

- \texttt{compat} – lowercase-and-underscores devicetree compatible
- \texttt{fn} – Macro to call for each enabled node. Must accept a node\_id as its only parameter.

\[
\text{DT_FOREACH_STATUS_OKAY\_VARGS(\texttt{compat, fn, ...})}
\]

Invokes \texttt{fn} for each status okay node of a compatible with multiple arguments.

This is like \texttt{DT_FOREACH_STATUS_OKAY()} except you can also pass additional arguments to \texttt{fn}.

Example devicetree fragment:

\begin{verbatim}
/ {
  a {
    compatible = "foo";
    val = <3>;
  };
  b {
    compatible = "foo";
    val = <4>;
  };
}
\end{verbatim}

Example usage:

\[
\texttt{# define MY\_FN(node\_id, operator) DT\_PROP(node\_id, val) operator}
\]
\[
\texttt{x = DT_FOREACH\_STATUS\_OKAY\_VARGS(\texttt{foo, MY\_FN, +}) 0;}
\]

This expands to one of the following:

\begin{verbatim}
x = 3 + 4 + 0;
x = 4 + 3 + 0;
\end{verbatim}

i.e. it sets \texttt{x} to 7. As with \texttt{DT_FOREACH\_STATUS\_OKAY()}, there are no guarantees about the order nodes appear in the expansion.

**Parameters**

- \texttt{compat} – lowercase-and-underscores devicetree compatible
- \texttt{fn} – Macro to call for each enabled node. Must accept a node\_id as its only parameter.
- \ldots – Additional arguments to pass to \texttt{fn}
Existence checks This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as `DT_IRQ_HAS_IDX` and all macros which require `DT_DRV_COMPAT`) are documented elsewhere on this page.

** Defines **

```
DT_NODE_EXISTS(node_id)
```

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree. It doesn't matter whether or not the node has a matching binding, or what the node's status value is. This is purely a check of whether the node exists at all.

** Parameters **

- `node_id` – a node identifier

** Returns **

1 if the node identifier refers to a node, 0 otherwise.

```
DT_NODE_HAS_STATUS(node_id, status)
```

Does a node identifier refer to a node with a status?

Example uses:

```
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), okay)
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), disabled)
```

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an `ok` status in the devicetree is treated as if it were `okay` instead)

** Parameters **

- `node_id` – a node identifier
- `status` – a status as one of the tokens `okay` or `disabled`, not a string

** Returns **

1 if the node has the given status, 0 otherwise.

```
DT_HAS_COMPAT_STATUS_OKAY(compat)
```

Does the devicetree have a status `okay` node with a compatible?

Test for whether the devicetree has any nodes with status `okay` and the given compatible. That is, this returns 1 if and only if there is at least one `node_id` for which both of these expressions return 1:

```
DT_NODE_HAS_STATUS(node_id, okay)
DT_NODE_HAS_COMPAT(node_id, compat)
```

As usual, both a missing status and an `ok` status are treated as `okay`.

** Parameters **

- `compat` – lowercase-and-underscores compatible, without quotes
Returns
1 if both of the above conditions are met, 0 otherwise

DT_NUM_INST_STATUS_OKAY(compat)
Get the number of instances of a given compatible with status okay

Parameters
- compat – lowercase-and-underscores compatible, without quotes

Returns
Number of instances with status okay

DT_NODE_HAS_COMPAT(node_id, compat)
Does a devicetree node match a compatible?

Example devicetree fragment:

```
n: node {
    compatible = "vnd,specific-device", "generic-device";
}
```

Example usages which evaluate to 1:

```
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), vnd_specific_device)
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), generic_device)
```

This macro only uses the value of the compatible property. Whether or not a particular compatible has a matching binding has no effect on its value, nor does the node's status.

Parameters
- node_id – node identifier
- compat – lowercase-and-underscores compatible, without quotes

Returns
1 if the node's compatible property contains compat, 0 otherwise.

DT_NODE_HAS_COMPAT_STATUS(node_id, compat, status)
Does a devicetree node have a compatible and status?

This is equivalent to:

```
(DT_NODE_HAS_COMPAT(node_id, compat) &&
 DT_NODE_HAS_STATUS(node_id, status))
```

Parameters
- node_id – node identifier
- compat – lowercase-and-underscores compatible, without quotes
- status – okay or disabled as a token, not a string

DT_NODE_HAS_PROP(node_id, prop)
Does a devicetree node have a property?

Tests whether a devicetree node has a property defined.

This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use DT_PROP(node_id, prop) instead.

Parameters
- node_id – node identifier
• prop – lowercase-and-underscores property name

**Returns**
1 if the node has the property, 0 otherwise.

```c
DT_PHA_HAS_CELL_AT_IDX(node_id, pha, idx, cell)
```

Does a phandle array have a named cell specifier at an index?

If this returns 1, then the phandle-array property `pha` has a cell named `cell` at index `idx`, and therefore `DT_PHA_BY_IDX(node_id,pha,idx,cell)` is valid. If it returns 0, it's an error to use `DT_PHA_BY_IDX()` with the same arguments.

**Parameters**
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `idx` – index to check within `pha`
- `cell` – lowercase-and-underscores cell name whose existence to check at index `idx`

**Returns**
1 if the named cell exists in the specifier at index `idx`, 0 otherwise.

```c
DT_PHA_HAS_CELL(node_id, pha, cell)
```

Equivalent to `DT_PHA_HAS_CELL_AT_IDX(node_id, pha, 0, cell)`

**Parameters**
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `cell` – lowercase-and-underscores cell name whose existence to check at index `idx`

**Returns**
1 if the named cell exists in the specifier at index 0, 0 otherwise.

**Inter-node dependencies**
The `devicetree.h` API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary “depends on” relation between devicetree nodes, which is defined as the transitive closure of the following “directly depends on” relation:

- every non-root node directly depends on its parent node
- a node directly depends on any nodes its properties refer to by phandle
- a node directly depends on its `interrupt-parent` if it has an `interrupts` property

A dependency ordering of a devicetree is a list of its nodes, where each node `n` appears earlier in the list than any nodes that depend on `n`. A node's dependency ordinal is then its zero-based index in that list. Thus, for two distinct devicetree nodes `n1` and `n2` with dependency ordinals `d1` and `d2`, we have:

- `d1 != d2`
- if `n1` depends on `n2`, then `d1 > d2`
- `d1 > d2` does not necessarily imply that `n1` depends on `n2`

The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see `DT_INST_DEP_ORD()` and subsequent documentation.
group devicetree-dep-ord

Defines

DT_DEP_ORD(node_id)
Get a node's dependency ordinal.

Parameters
• node_id – Node identifier

Returns
the node's dependency ordinal as an integer literal

DT_DEP_ORD_STR_SORTABLE(node_id)
Get a node's dependency ordinal in string sortable form.

Parameters
• node_id – Node identifier

Returns
the node's dependency ordinal as a zero-padded integer literal

DT_REQUIRES_DEP_ORDS(node_id)
Get a list of dependency ordinals of a node's direct dependencies.

There is a comma after each ordinal in the expansion, including the last one:

DT_REQUIRES_DEP_ORDS(my_node) // required_ord_1, ..., required_ord_n

The one case DT_REQUIRES_DEP_ORDS() expands to nothing is when given the root node identifier DT_ROOT as argument. The root has no direct dependencies; every other node at least depends on its parent.

Parameters
• node_id – Node identifier

Returns
a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

DT_SUPPORTS_DEP_ORDS(node_id)
Get a list of dependency ordinals of what depends directly on a node.

There is a comma after each ordinal in the expansion, including the last one:

DT_SUPPORTS_DEP_ORDS(my_node) // supported_ord_1, ..., supported_ord_n,

DT_SUPPORTS_DEP_ORDS() may expand to nothing. This happens when node_id refers to a leaf node that nothing else depends on.

Parameters
• node_id – Node identifier

Returns
a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

DT_INST_DEP_ORD(inst)
Get a DT_DRV_COMPAT instance's dependency ordinal.

Equivalent to DT_DEP_ORD(DT_DRV_INST(inst)).

5.2. Devicetree 1189
Parameters

- inst – instance number

Returns

The instance's dependency ordinal

\texttt{DT\_INST\_REQUIRES\_DEP\_ORDS(inst)}

Get a list of dependency ordinals of a DT\_DRV\_COMPAT instance's direct dependencies.

Equivalent to \texttt{DT\_REQUIRES\_DEP\_ORDS(DT\_DRV\_INST(inst))}.

Parameters

- inst – instance number

Returns

a list of dependency ordinals for the nodes the instance depends on directly

\texttt{DT\_INST\_SUPPORTS\_DEP\_ORDS(inst)}

Get a list of dependency ordinals of what depends directly on a DT\_DRV\_COMPAT instance.

Equivalent to \texttt{DT\_SUPPORTS\_DEP\_ORDS(DT\_DRV\_INST(inst))}.

Parameters

- inst – instance number

Returns

a list of node identifiers for the nodes that depend directly on the instance

**Bus helpers**  Zephyr's devicetree bindings language supports a `bus:` key which allows bindings to declare that nodes with a given compatible describe system buses. In this case, child nodes are considered to be on a bus of the given type, and the following APIs may be used.

**group devicetree-generic-bus**

**Defines**

\texttt{DT\_BUS(node\_id)}

Node's bus controller.

Get the node identifier of the node's bus controller. This can be used with \texttt{DT\_PROP()} to get properties of the bus controller.

It is an error to use this with nodes which do not have bus controllers.

Example devicetree fragment:

```plaintext
i2c@deadbeef {
    status = "okay";
    clock-frequency = < 100000 >;
    i2c_device: accelerometer@12 {
        ...
    }
};
```

Example usage:

\texttt{DT\_PROP(DT\_BUS(DT\_NODELABEL(i2c\_device)), clock\_frequency) \// 100000}
• node_id – node identifier

Returns
a node identifier for the node’s bus controller

DT_BUS_LABEL(node_id)
Node’s bus controller’s label property.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using
DEVICE_DT_GET(DT_BUS(node)).

Parameters
• node_id – node identifier

Returns
the label property of the node’s bus controller DT_BUS(node)

DT_ON_BUS(node_id, bus)
Is a node on a bus of a given type?

Example usage, assuming i2c0 is an I2C bus controller node, and therefore temp is on an I2C bus:

```
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```

Parameters
• node_id – node identifier
• bus – lowercase-and-underscores bus type as a C token (i.e. without quotes)

Returns
1 if the node is on a bus of the given type, 0 otherwise

Instance-based APIs These are recommended for use within device drivers. To use them, define
DT_DRV_COMPAT to the lowercase-and-underscores compatible the device driver implements support for.
Here is an example devicetree fragment:

```
serial@40001000 {
    compatible = "vnd,serial";
    status = "okay";
    current-speed = <115200>;
};
```

Example usage, assuming serial@40001000 is the only enabled node with compatible vnd,serial:
# define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0) // node identifier for serial@40001000
DT_INST_PROP(0, current_speed) // 115200

Warning: Be careful making assumptions about instance numbers. See DT_INST() for the API guarantees.

As shown above, the DT_INST_* APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the Generic APIs. The equivalent generic API can be found by removing INST_ from the macro name. For example, DT_INST_PROP(inst, prop) is equivalent to DT_PROP(DT_DRV_INST(inst), prop). Similarly, DT_INST_REG_ADDR(inst) is equivalent to DT_REG_ADDR(DT_DRV_INST(inst)), and so on. There are some exceptions: DT_ANY_INST_ON_BUS_STATUS_OKAY() and DT_INST_FOREACH_STATUS_OKAY() are special-purpose helpers without straightforward generic equivalents.

Since DT_DRV_INST() requires DT_DRV_COMPAT to be defined, it’s an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in Hardware specific APIs.

group devicetree-inst

Defines

DT_DRV_INST(inst)
Node identifier for an instance of a DT_DRV_COMPAT compatible.

Parameters
- inst – instance number

Returns
a node identifier for the node with DT_DRV_COMPAT compatible and instance number inst

DT_INST_PARENT(inst)
Get a DT_DRV_COMPAT parent's node identifier.

See also:
DT_PARENT

Parameters
- inst – instance number

Returns
a node identifier for the instance's parent

DT_INST_GPARENT(inst)
Get a DT_DRV_COMPAT grandparent's node identifier.

See also:
DT_GPARENT
Parameters
• inst – instance number

Returns
a node identifier for the instance’s grandparent

\texttt{DT_INST_CHILD}(inst, child)
Get a node identifier for a child node of \texttt{DT_DRV_INST}(inst)

See also:
\texttt{DT_CHILD}

Parameters
• inst – instance number
• child – lowercase-and-underscores child node name

Returns
node identifier for the node with the name referred to by ‘child’

\texttt{DT_INST_FOREACH_CHILD}(inst, fn)
Call \texttt{fn} on all child nodes of \texttt{DT_DRV_INST}(inst).
The macro \texttt{fn} should take one argument, which is the node identifier for the child node.
The children will be iterated over in the same order as they appear in the final devicetree.

See also:
\texttt{DT_FOREACH_CHILD}

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier

\texttt{DT_INST_FOREACH_CHILD_SEP}(inst, fn, sep)
Call \texttt{fn} on all child nodes of \texttt{DT_DRV_INST}(inst) with a separator.
The macro \texttt{fn} should take one argument, which is the node identifier for the child node.

See also:
\texttt{DT_FOREACH_CHILD_SEP}

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
DT_INSTALL_FOREACH_CHILD_VARGS(inst, fn, ...)
Call fn on all child nodes of DT_DRV_INST(inst).

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:
DT_FOREACH_CHILD

Parameters
- inst – instance number
- fn – macro to invoke on each child node identifier
- ... – variable number of arguments to pass to fn

DT_INSTALL_FOREACH_CHILD_SEP_VARGS(inst, fn, sep, ...)
Call fn on all child nodes of DT_DRV_INST(inst) with separator.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
DT_FOREACH_CHILD_SEP_VARGS

Parameters
- inst – instance number
- fn – macro to invoke on each child node identifier
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_INSTALL_FOREACH_CHILD_STATUS_OKAY(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay.

The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_STATUS_OKAY

Parameters
- inst – instance number
- fn – macro to invoke on each child node identifier

DT_INSTALL_FOREACH_CHILD_STATUS_OKAY_SEP(inst, fn, sep)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and with separator.

The macro fn should take one argument, which is the node identifier for the child node.
See also:

`DT_FOREACH_CHILD_STATUS_OKAY_SEP`

Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

`DT_INST_FOREACH_CHILD_STATUS_OKAY_VARGS(inst, fn, ...)`

Call `fn` on all child nodes of `DT_DRV_INST(inst)` with status okay and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:

`DT_FOREACH_CHILD_STATUS_OKAY_VARGS`

Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier
- `...` – variable number of arguments to pass to `fn`

`DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(inst, fn, sep, ...)`

Call `fn` on all child nodes of `DT_DRV_INST(inst)` with status okay and with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:

`DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS`

Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- `...` – variable number of arguments to pass to `fn`

`DT_INST_ENUM_IDX(inst, prop)`

Get a `DT_DRV_COMPAT` value's index into its enumeration values.

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

Returns

zero-based index of the property's value in its enum: list
**DT_INST_ENUM_IDX_OR**(inst, prop, default_idx_value)

Like **DT_INST_ENUM_IDX()**, but with a fallback to a default enum index.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- default_idx_value – a fallback index value to expand to

**Returns**
- zero-based index of the property's value in its enum if present, default_idx_value otherwise

**DT_INST_ENUM_HAS_VALUE**(inst, prop, value)

Does a **DT_DRV_COMPAT** enumeration property have a given value?

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- value – lowercase-and-underscores enumeration value

**Returns**
- 1 if the node property has the value value, 0 otherwise.

**DT_INST_PROP**(inst, prop)

Get a **DT_DRV_COMPAT** instance property.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
- a representation of the property's value

**DT_INST_PROP_LEN**(inst, prop)

Get a **DT_DRV_COMPAT** property length.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
- logical length of the property

**DT_INST_PROP_HAS_IDX**(inst, prop, idx)

Is index idx valid for an array type property on a **DT_DRV_COMPAT** instance?

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – index to check

**Returns**
- 1 if idx is a valid index into the given property, 0 otherwise.

**DT_INST_PROP_HAS_NAME**(inst, prop, name)

Is name name available in a foo-names property?

**Parameters**
• inst – instance number
• prop – a lowercase-and-underscores prop-names type property
• name – a lowercase-and-underscores name to check

Returns
An expression which evaluates to 1 if name is an available name into the given property, and 0 otherwise.

DT_INST_PROP_BY_IDX(inst, prop, idx)
Get a DT_DRV_COMPAT element value in an array property.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• idx – the index to get

Returns
a representation of the idx-th element of the property

DT_INST_PROP_OR(inst, prop, default_value)
Like DT_INST_PROP(), but with a fallback to default_value.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
DT_INST_PROP(inst, prop) or default_value

DT_INST_PROP_LEN_OR(inst, prop, default_value)
Like DT_INST_PROP_LEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• prop – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
DT_INST_PROP_LEN(inst, prop) or default_value

DT_INST_LABEL(inst)
Get a DT_DRV_COMPAT instance's label property.

Deprecated:
Use DT_INST_PROP(inst, label)

Parameters
• inst – instance number

Returns
instance's label property value
DT_INST_STRING_TOKEN(inst, prop)

Get a DT_DRV_COMPAT instance's string property's value as a token.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

DT_INST_STRING_UPPER_TOKEN(inst, prop)

Like `DT_INST_STRING_TOKEN()`, but uppercased.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores

DT_INST_STRING_UNQUOTED(inst, prop)

Get a DT_DRV_COMPAT instance's string property's value as an unquoted sequence of tokens.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name

**Returns**
the value of prop as a sequence of tokens, with no quotes

DT_INST_STRING_TOKEN_BY_IDX(inst, prop, idx)

Get an element out of string-array property as a token.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as a token

DT_INST_STRING_UPPER_TOKEN_BY_IDX(inst, prop, idx)

Like `DT_INST_STRING_TOKEN_BY_IDX()`, but uppercased.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as an uppercased token

DT_INST_STRING_UNQUOTED_BY_IDX(inst, prop, idx)

Get an element out of string-array property as an unquoted sequence of tokens.

**Parameters**
• inst – instance number
• prop – lowercase-and-underscores property name
• idx – the index to get

Returns
the value of prop at index idx as a sequence of tokens, with no quotes

DT_INST_PROP_BY_PHANDLE(inst, ph, prop)
Get a DT_DRV_COMPAT instance’s property value from a phandle’s node.

Parameters
• inst – instance number
• ph – lowercase-and-underscores property of inst with type phandle
• prop – lowercase-and-underscores property of the phandle’s node

Returns
the value of prop as described in the DT_PROP() documentation

DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)
Get a DT_DRV_COMPAT instance’s property value from a phandle in a property.

Parameters
• inst – instance number
• phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
• idx – logical index into “phs”, which must be zero if “phs” has type phandle
• prop – lowercase-and-underscores property of the phandle’s node

Returns
the value of prop as described in the DT_PROP() documentation

DT_INST_PHA_BY_IDX(inst, pha, idx, cell)
Get a DT_DRV_COMPAT instance’s phandle-array specifier value at an index.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• idx – logical index into the property pha
• cell – binding’s cell name within the specifier at index idx

Returns
the value of the cell inside the specifier at index idx

DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)
Like DT_INST_PHA_BY_IDX(), but with a fallback to default_value.

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• idx – logical index into the property pha
• cell – binding’s cell name within the specifier at index idx
• default_value – a fallback value to expand to

Returns
DT_INST_PHA_BY_IDX(inst, pha, idx, cell) or default_value
DT_INST_PHA(inst, pha, cell)
Get a DT_DRV_COMPAT instance’s phandle-array specifier value. Equivalent to

\[ DT_INST_PHA_BY_IDX(inst, pha, 0, cell) \]

Parameters
- `inst` – instance number
- `pha` – lowercase-and-underscores property with type phandle-array
- `cell` – binding’s cell name for the specifier at `pha` index 0

Returns
the cell value

DT_INST_PHA_OR(inst, pha, cell, default_value)
Like `DT_INST_PHA()`, but with a fallback to `default_value`.

Parameters
- `inst` – instance number
- `pha` – lowercase-and-underscores property with type phandle-array
- `cell` – binding’s cell name for the specifier at `pha` index 0
- `default_value` – a fallback value to expand to

Returns
`DT_INST_PHA(inst, pha, cell)` or `default_value`

DT_INST_PHA_BY_NAME(inst, pha, name, cell)
Get a DT_DRV_COMPAT instance’s value within a phandle-array specifier by name.

Parameters
- `inst` – instance number
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of a specifier in `pha`
- `cell` – binding’s cell name for the named specifier

Returns
the cell value

DT_INST_PHA_BY_NAME_OR(inst, pha, name, cell, default_value)
Like `DT_INST_PHA_BY_NAME()`, but with a fallback to `default_value`.

Parameters
- `inst` – instance number
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of a specifier in `pha`
- `cell` – binding’s cell name for the named specifier
- `default_value` – a fallback value to expand to

Returns
`DT_INST_PHA_BY_NAME(inst, pha, name)` or `default_value`

DT_INST_PHANDLE_BY_NAME(inst, pha, name)
Get a DT_DRV_COMPAT instance’s phandle node identifier from a phandle array by name.

Parameters
- `inst` – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of an element in pha

**Returns**
node identifier for the phandle at the element named “name”

DT_INST_PHANDLE_BY_IDX(inst, prop, idx)
Get a DT_DRV_COMPAT instance's node identifier for a phandle in a property.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name in inst with type phandle, phandles or phandle-array
- idx – index into prop

**Returns**
a node identifier for the phandle at index idx in prop

DT_INST_PHANDLE(inst, prop)
Get a DT_DRV_COMPAT instance's node identifier for a phandle property's value.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property of inst with type phandle

**Returns**
a node identifier for the node pointed to by “ph”

DT_INST_REG_HAS_IDX(inst, idx)
is idx a valid register block index on a DT_DRV_COMPAT instance?

**Parameters**
- inst – instance number
- idx – index to check

**Returns**
1 if idx is a valid register block index, 0 otherwise.

DT_INST_REG_ADDR_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance's idx-th register block's address.

**Parameters**
- inst – instance number
- idx – index of the register whose address to return

**Returns**
address of the instance's idx-th register block

DT_INST_REG_SIZE_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance's idx-th register block's size.

**Parameters**
- inst – instance number
- idx – index of the register whose size to return

**Returns**
size of the instance's idx-th register block
DT_INST_REG_ADDR_BY_NAME(inst, name)
Get a DT_DRV_COMPAT's register block address by name.

Parameters
• inst – instance number
• name – lowercase-and-underscores register specifier name

Returns
address of the register block with the given name

DT_INST_REG_ADDR_BY_NAME_U64(inst, name)
64-bit version of DT_INST_REG_ADDR_BY_NAME()
This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to DT_INST_REG_ADDR_BY_NAME() in linker/ASM context.

Parameters
• inst – instance number
• name – lowercase-and-underscores register specifier name

Returns
address of the register block with the given name

DT_INST_REG_SIZE_BY_NAME(inst, name)
Get a DT_DRV_COMPAT's register block size by name.

Parameters
• inst – instance number
• name – lowercase-and-underscores register specifier name

Returns
size of the register block with the given name

DT_INST_REG_ADDR(inst)
Get a DT_DRV_COMPAT's (only) register block address.

Parameters
• inst – instance number

Returns
instance's register block address

DT_INST_REG_ADDR_U64(inst)
64-bit version of DT_INST_REG_ADDR()
This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to DT_INST_REG_ADDR() in linker/ASM context.

Parameters
• inst – instance number

Returns
instance's register block address

DT_INST_REG_SIZE(inst)
Get a DT_DRV_COMPAT's (only) register block size.

Parameters
• inst – instance number

Returns
instance's register block size
DT_INST_IRQ_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT interrupt specifier value at an index.

Parameters
• inst – instance number
• idx – logical index into the interrupt specifier array
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_INST_IRQ_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT interrupt specifier value by name.

Parameters
• inst – instance number
• name – lowercase-and-underscores interrupt specifier name
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_INST_IRQ(inst, cell)
Get a DT_DRV_COMPAT interrupt specifier’s value.

Parameters
• inst – instance number
• cell – cell name specifier

Returns
the named value at that index

DT_INST_IRQN(inst)
Get a DT_DRV_COMPAT’s (only) irq number.

Parameters
• inst – instance number

Returns
the interrupt number for the node's only interrupt

DT_INST_BUS(inst)
Get a DT_DRV_COMPAT’s bus node identifier.

Parameters
• inst – instance number

Returns
node identifier for the instance's bus node

DT_INST_BUS_LABEL(inst)
Get a DT_DRV_COMPAT’s bus node’s label property.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using
DEVICE_DT_GET(DT_INST_BUS(inst)).

Parameters
• inst – instance number

Returns
the label property of the instance’s bus controller

DT_INST_ON_BUS(inst, bus)
Test if a DT_DRV_COMPAT’s bus type is a given type.

Parameters
• inst – instance number
• bus – a binding’s bus type as a C token, lowercased and without quotes

Returns
1 if the given instance is on a bus of the given type, 0 otherwise

DT_INST_STRING_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
if prop exists, its value as a token, i.e. without any quotes and with special characters converted to underscores. Otherwise default_value

DT_INST_STRING_UPPER_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_UPPER_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
the property’s value as an uppercased token, or default_value

DT_INST_STRING_UNQUOTED_OR(inst, name, default_value)
Like DT_INST_STRING_UNQUOTED(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
the property’s value as a sequence of tokens, with no quotes, or default_value

DT_ANY_INST_ON_BUS_STATUS_OKAY(bus)
Test if any DT_DRV_COMPAT node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:
Example usage, assuming \texttt{i2c0} is an I2C bus controller node, and therefore \texttt{temp} is on an I2C bus:

\begin{verbatim}
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
\end{verbatim}

\textbf{Parameters}

- \texttt{bus} – a binding's bus type as a C token, lowercased and without quotes

\textbf{Returns}

1 if any enabled node with that compatible is on that bus type, 0 otherwise

\begin{verbatim}
DT_ANY_INST_HAS_PROP_STATUS_OKAY(prop)
\end{verbatim}

Check if any DT_DRV_COMPAT node with status okay has a given property.

Example devicetree overlay:

\begin{verbatim}
i2c0 {
    sensor0: sensor@0 {
        compatible = "vnd,some-sensor";
        status = "okay";
        reg = <0>;
        foo = <1>;
        bar = <2>;
    };

    sensor1: sensor@1 {
        compatible = "vnd,some-sensor";
        status = "okay";
        reg = <1>;
        foo = <2>;
    };

    sensor2: sensor@2 {
        compatible = "vnd,some-sensor";
        status = "disabled";
        reg = <2>;
        baz = <1>;
    };
};
\end{verbatim}

Example usage:

\begin{verbatim}
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_HAS_PROP_STATUS_OKAY(foo) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(bar) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(baz) // 0
\end{verbatim}
Parameters

- prop – lowercase-and-underscores property name

DT_INST_FOREACH_STATUS_OKAY(fn)

Call fn on all nodes with compatible DT_DRV_COMPAT and status okay.

This macro calls fn(inst) on each inst number that refers to a node with status okay. Whitespace is added between invocations.

Example devicetree fragment:

```c
a {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_A";
};

b {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_B";
};

c {
    compatible = "vnd,device";
    status = "disabled";
    foobar = "DEV_C";
};
```

Example usage:

```c
#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_PROP(inst, foobar),
DT_INST_FOREACH_STATUS_OKAY(MY_FN)
```

This expands to:

```c
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```c
"DEV_A", "DEV_B",
```

or this:

```c
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that fn is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver's compatible DT_DRV_COMPAT.

Parameters

- fn – Macro to call for each enabled node. Must accept an instance number as its only parameter.
DT_INST_FOREACH_STATUS_OKAY_VARS(fn, ...)
Call fn on all nodes with compatible DT_DRV_COMPAT and status okay with multiple arguments.

See also:
DT_INST_FOREACH_STATUS_OKAY

Parameters
- fn – Macro to call for each enabled node. Must accept an instance number as its only parameter.
- ... – variable number of arguments to pass to fn

DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance.
Equivalent to DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn).

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke

DT_INST_FOREACH_PROP_ELEM_SEP(inst, prop, fn, sep)
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with a separator.
Equivalent to DT_FOREACH_PROP_ELEM_SEP(DT_DRV_INST(inst), prop, fn, sep).

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_PROP_ELEM_VARS(inst, prop, fn, ...)
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments.
Equivalent to DT_FOREACH_PROP_ELEM_VARS(DT_DRV_INST(inst), prop, fn, VA_ARGS)

See also:
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- ... – variable number of arguments to pass to fn
DT_INST_FOREACH_PROP_ELEM_SEP_VARGS(inst, prop, fn, sep, ...)
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments and a separator.

Equivalent to DT_FOREACH_PROP_ELEM_SEP_VARGS(DT_DRV_INST(inst), prop, fn, sep, VA_ARGS)

See also:
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_INST_NODE_HAS_PROP(inst, prop)
Does a DT_DRV_COMPAT instance have a property?

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
1 if the instance has the property, 0 otherwise.

DT_INST_PHA_HAS_CELL_AT_IDX(inst, pha, idx, cell)
Does a phandle array have a named cell specifier at an index for a DT_DRV_COMPAT instance?

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- idx – index to check
- cell – named cell value whose existence to check

Returns
1 if the named cell exists in the specifier at index idx, 0 otherwise.

DT_INST_PHA_HAS_CELL(inst, pha, cell)
Does a phandle array have a named cell specifier at index 0 for a DT_DRV_COMPAT instance?

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- cell – named cell value whose existence to check

Returns
1 if the named cell exists in the specifier at index 0, 0 otherwise.
**DT_INST_IRQ_HAS_IDX** (inst, idx)

is index valid for interrupt property on a DT_DRV_COMPAT instance?

**Parameters**

- inst – instance number
- idx – logical index into the interrupt specifier array

**Returns**

1 if the idx is valid for the interrupt property 0 otherwise.

**DT_INST_IRQ_HAS_CELL_AT_IDX** (inst, idx, cell)

Does a DT_DRV_COMPAT instance have an interrupt named cell specifier?

**Parameters**

- inst – instance number
- idx – index to check
- cell – named cell value whose existence to check

**Returns**

1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

**DT_INST_IRQ_HAS_CELL** (inst, cell)

Does a DT_DRV_COMPAT instance have an interrupt value?

**Parameters**

- inst – instance number
- cell – named cell value whose existence to check

**Returns**

1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

**DT_INST_IRQ_HAS_NAME** (inst, name)

Does a DT_DRV_COMPAT instance have an interrupt value?

**Parameters**

- inst – instance number
- name – lowercase-and-underscores interrupt specifier name

**Returns**

1 if name is a valid named specifier

**Hardware specific APIs**

The following APIs can also be used by including `<devicetree.h>`; no additional include is needed.

**CAN**

These conveniences may be used for nodes which describe CAN controllers/transceivers, and properties related to them.

**group devicetree-can**

**Defines**

1209
DT_CAN_TRANSCEIVER_MAX_BITRATE(node_id, max)

Get the maximum transceiver bitrate for a CAN controller.

The bitrate will be limited to the maximum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the maximum bitrate will be that of the CAN controller.

Example devicetree fragment:

```plaintext
transceiver0: can-phy0 {
    compatible = "vnd,can-transceiver";
    max-bitrate = <1000000>;
    #phy-cells = <0>;
};

can0: can@... {
    compatible = "vnd,can-controller";
    phys = <&transceiver0>;
};

can1: can@... {
    compatible = "vnd,can-controller";

    can-transceiver {
        max-bitrate = <2000000>;
    };
};
```

Example usage:

```plaintext
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can0), 5000000) // 1000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 5000000) // 2000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 1000000) // 1000000
```

**Parameters**
- node_id – node identifier
- max – maximum bitrate supported by the CAN controller

**Returns**
the maximum bitrate supported by the CAN controller/transceiver combination

DT_INST_CAN_TRANSCEIVER_MAX_BITRATE(inst, max)

Get the maximum transceiver bitrate for a DT_DRV_COMPAT CAN controller.

**See also:**

*DT_CAN_TRANSCEIVER_MAX_BITRATE()*

**Parameters**
- inst – DT_DRV_COMPAT instance number
- max – maximum bitrate supported by the CAN controller

**Returns**
the maximum bitrate supported by the CAN controller/transceiver combination
Clocks  These conveniences may be used for nodes which describe clock sources, and properties related to them.

group devicetree-clocks

Defines

DT_CLOCKS_HAS_IDX(node_id, idx)
Test if a node has a clocks phandle-array property at a given index.
This expands to 1 if the given index is valid clocks property phandle-array index. Otherwise, it expands to 0.
Example devicetree fragment:

```plaintext
n1: node-1 {
  clocks = <...>, <...>;
};
n2: node-2 {
  clocks = <...>;
};
```

Example usage:

```
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n2), 1) // 0
```

Parameters

- node_id – node identifier; may or may not have any clocks property
- idx – index of a clocks property phandle-array whose existence to check

Returns
1 if the index exists, 0 otherwise

DT_CLOCKS_HAS_NAME(node_id, name)
Test if a node has a clock-names array property holds a given name.
This expands to 1 if the name is available as clocks-name array property cell. Otherwise, it expands to 0.
Example devicetree fragment:

```plaintext
n1: node-1 {
  clocks = <...>, <...>;
  clock-names = "alpha", "beta";
};
n2: node-2 {
  clocks = <...>;
  clock-names = "alpha";
};
```

Example usage:
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), alpha) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), beta) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n2), beta) // 0

Parameters

- node_id – node identifier; may or may not have any clock-names property.
- name – lowercase-and-underscores clock-names cell value name to check

Returns

1 if the clock name exists, 0 otherwise

DT_NUM_CLOCKS(node_id)
Get the number of elements in a clocks property.

Example devicetree fragment:

```
n1: node-1 {
  clocks = <&foo>, <&bar>;
};
n2: node-2 {
  clocks = <&foo>;
};
```

Example usage:

```
DT_NUM_CLOCKS(DT_NODELABEL(n1)) // 2
DT_NUM_CLOCKS(DT_NODELABEL(n2)) // 1
```

Parameters

- node_id – node identifier with a clocks property

Returns

number of elements in the property

DT_CLOCKS_CTLR_BY_IDX(node_id, idx)
Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };
clk2: clock-controller@... { ... };
n: node {
  clocks = <&clk1 10 20>, <&clk2 30 40>;
};
```

Example usage:

```
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)
```

See also:

DT_PHANDLE_BY_IDX()
Parameters

- node_id – node identifier
- idx – logical index into “clocks”

Returns

the node identifier for the clock controller referenced at index “idx”

```
DT_CLOCKS_CTLR(node_id)
```
Equivalent to `DT_CLOCKS_CTLR_BY_IDX(node_id, 0)`

See also:

`DT_CLOCKS_CTLR_BY_IDX()`

Parameters

- node_id – node identifier

Returns

a node identifier for the clocks controller at index 0 in “clocks”

```
DT_CLOCKS_CTLR_BY_NAME(node_id, name)
```
Get the node identifier for the controller phandle from a clocks phandle-array property by name.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };
clk2: clock-controller@... { ... };
n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
    clock-names = "alpha", "beta";
}
```

Example usage:

```
DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)
```

See also:

`DT_PHANDLE_BY_NAME()`

Parameters

- node_id – node identifier
- name – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

Returns

the node identifier for the clock controller referenced by name

```
DT_CLOCKS_CELL_BY_IDX(node_id, idx, cell)
```
Get a clock specifier’s cell value at an index.

Example devicetree fragment:
```c
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};

Bindings fragment for the vnd,clock compatible:

clock-cells:
  - bus
  - bits

Example usage:

DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 0, bus) // 10
DT_CLOCKS_CELL_BYIDX(DT_NODELABEL(n), 1, bits) // 40

See also:

DT_PHA_BYIDX()

Parameters

• node_id – node identifier for a node with a clocks property
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

Returns

cell value at index “idx”

DT_CLOCKS_CELL_BY_NAME(node_id, name, cell)

Get a clock specifier’s cell value by name.

Example devicetree fragment:

clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
    clock-names = "alpha", "beta";
};

Bindings fragment for the vnd,clock compatible:

clock-cells:
  - bus
  - bits

Example usage:

DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus) // 10
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40
```
See also:

**DT_PHA_BY_NAME()**

**Parameters**
- node_id – node identifier for a node with a clocks property
- name – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
- cell – lowercase-and-underscores cell name

**Returns**
the cell value in the specifier at the named element

`DT_CLOCKS_CELL(node_id, cell)`
Equivalent to `DT_CLOCKS_CELL_BY_IDX(node_id, 0, cell)`

See also:

**DT_CLOCKS_CELL_BY_IDX()**

**Parameters**
- node_id – node identifier for a node with a clocks property
- cell – lowercase-and-underscores cell name

**Returns**
the cell value at index 0

`DT_INST_CLOCKS_HAS_IDX(inst, idx)`
Equivalent to `DT_CLOCKS_HAS_IDX(DT_DRV_INST(inst), idx)`

**Parameters**
- inst – DT_DRV_COMPAT instance number; may or may not have any clocks property
- idx – index of a clocks property phandle-array whose existence to check

**Returns**
1 if the index exists, 0 otherwise

`DT_INST_CLOCKS_HAS_NAME(inst, name)`
Equivalent to `DT_CLOCK_HAS_NAME(DT_DRV_INST(inst), name)`

**Parameters**
- inst – DT_DRV_COMPAT instance number; may or may not have any clock-names property.
- name – lowercase-and-underscores clock-names cell value name to check

**Returns**
1 if the clock name exists, 0 otherwise

`DT_INST_NUM_CLOCKS(inst)`
Equivalent to `DT_NUM_CLOCKS(DT_DRV_INST(inst))`

**Parameters**
- inst – instance number

**Returns**
number of elements in the clocks property
DT_INST_CLOCKS_CTRLR_BY_IDX(inst, idx)
Get the node identifier for the controller phandle from a “clocks” phandle-array property at
an index.

See also:

DT_CLOCKS_CTRLR_BY_IDX()

Parameters

• inst – instance number
• idx – logical index into “clocks”

Returns
the node identifier for the clock controller referenced at index “idx”

DT_INST_CLOCKS_CTRLR(inst)
Equivalent to DT_INST_CLOCKS_CTRLR_BY_IDX(inst, 0)

See also:

DT_CLOCKS_CTRLR()

Parameters

• inst – instance number

Returns
a node identifier for the clocks controller at index 0 in “clocks”

DT_INST_CLOCKS_CTRLR_BY_NAME(inst, name)
Get the node identifier for the controller phandle from a clocks phandle-array property by

See also:

DT_CLOCKS_CTRLR_BY_NAME()

Parameters

• inst – instance number
• name – lowercase-and-underscores name of a clocks element as defined by the
node's clock-names property

Returns
the node identifier for the clock controller referenced by the named element

DT_INST_CLOCKS_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value at an index.

See also:

DT_CLOCKS_CELL_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

>Returns
the cell value at index “idx”

DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value by name.

See also:
DT_CLOCKS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a clocks element as defined by the
  node's clock-names property
• cell – lowercase-and-underscores cell name

>Returns
the cell value in the specifier at the named element

DT_INST_CLOCKS_CELL(inst, cell)
Equivalent to DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)

Parameters
• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

>Returns
the value of the cell inside the specifier at index 0

DMA These conveniences may be used for nodes which describe direct memory access controllers or
channels, and properties related to them.

group devicetree-dmas

Defines

DT_DMAS_CTLR_BY_IDX(node_id, idx)
Get the node identifier for the DMA controller from a dmas property at an index.

Example devicetree fragment:

```plaintext
dma1: dma@... { ... };
dma2: dma@... { ... };
n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
    <&dma2 6 3 0x404 0x5>;
}
```

Example usage:
See also:

DT_DMAS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the DMA controller from a dmas property by name.

Example devicetree fragment:

```
    dma1: dma@... { ... };

    dma2: dma@... { ... };

    n: node {
        dmas = <&dma1 1 2 0x400 0x3>,
               <&dma2 6 3 0x404 0x5>;
        dma-names = "tx", "rx";
    };
```

Example usage:

```
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)
```

See also:

DT_PHANDLE_BY_NAME()

Parameters

• node_id – node identifier for a node with a dmas property
• name – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns

the node identifier for the DMA controller in the named element

DT_DMAS_CTLR(node_id)

Equivalent to DT_DMAS_CTLR_BY_IDX(node_id, 0)

See also:

DT_DMAS_CTLR_BY_IDX()
Returns
the node identifier for the DMA controller at index 0 in the node's "dmas" property

DT_INST_DMAS_CTLR_BY_IDX(inst, idx)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property at an index.

See also:
DT_DMAS_CTRLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

DT_INST_DMAS_CTLR_BY_NAME(inst, name)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property by name.

See also:
DT_DMAS_CTRLR_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
the node identifier for the DMA controller in the named element

DT_INST_DMAS_CTLR(inst)
Equivalent to DT_INST_DMAS_CTLR_BY_IDX(inst, 0)

See also:
DT_DMAS_CTRLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the node identifier for the DMA controller at index 0 in the instance's "dmas" property

DT_DMAS_CELL_BY_IDX(node_id, idx, cell)
Get a DMA specifier's cell value at an index.

Example devicetree fragment:
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
          <&dma2 6 0x404>;
};

Bindings fragment for the vnd,dma compatible:

dma-cells:
    - channel
    - config

Example usage:

DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 6
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, config) // 0x400
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, config) // 0x404

See also:

DT_PHA_BY_IDX()

Parameters

- node_id – node identifier for a node with a dmas property
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

DT_INST_DMAS_CELL_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT instance’s DMA specifier’s cell value at an index.

See also:

DT_DMAS_CELL_BY_IDX()

Parameters

- inst – DT_DRV_COMPAT instance number
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”
DT_DMAS_CELL_BY_NAME(node_id, name, cell)
Get a DMA specifier's cell value by name.

Example devicetree fragment:

```c
DMA1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

DMA2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&DMA1 1 0x400>,
           <&DMA2 6 0x404>;
    dma-names = "tx", "rx";
};
```

Bindings fragment for the vnd,dma compatible:

```c
dma-cells:
    - channel
    - config
```

Example usage:

```c
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

See also:

`DT_PHA_BY_NAME()`

Parameters

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_DMAS_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's DMA specifier's cell value by name.

See also:

`DT_DMAS_CELL_BY_NAME()`

Parameters

- `inst` – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the
  node's dma-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_DMAS_HAS_IDX(node_id, idx)
Is index “idx” valid for a dmas property?

Parameters
• node_id – node identifier for a node with a dmas property
• idx – logical index into dmas property

Returns
1 if the “dmas” property has index “idx”, 0 otherwise

DT_INST_DMAS_HAS_IDX(inst, idx)
Is index “idx” valid for a DT_DRV_COMPAT instance's dmas property?

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into dmas property

Returns
1 if the “dmas” property has a specifier at index “idx”, 0 otherwise

DT_DMAS_HAS_NAME(node_id, name)
Does a dmas property have a named element?

Parameters
• node_id – node identifier for a node with a dmas property
• name – lowercase-and-underscores name of a dmas element as defined by the
  node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

DT_INST_DMAS_HAS_NAME(inst, name)
Does a DT_DRV_COMPAT instance's dmas property have a named element?

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the
  node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

Fixed flash partitions These conveniences may be used for the special-purpose fixed-partitions
compatible used to encode information about flash memory partitions in the device tree. See See
fixed-partition for more details.

group devicetree-fixed-partition
Defines

**DT_NODE_BY_FIXED_PARTITION_LABEL(label)**
Get a node identifier for a fixed partition with a given label property.

Example devicetree fragment:

```plaintext
flash@... {
  partitions {
    compatible = "fixed-partitions";
    boot_partition: partition@0 {
      label = "mcuboot";
    };
    slot0_partition: partition@c000 {
      label = "image-0";
    };
    ...
  };
};
```

Example usage:

```plaintext
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_partition
```

**Parameters**

- `label` – lowercase-and-underscores label property value

**Returns**
a node identifier for the partition with that label property

**DT_HAS_FIXED_PARTITION_LABEL(label)**
Test if a fixed partition with a given label property exists.

**Parameters**

- `label` – lowercase-and-underscores label property value

**Returns**
1 if any “fixed-partitions” child node has the given label, 0 otherwise.

**DT_FIXED_PARTITION_EXISTS(node_id)**
Test if fixed-partition compatible node exists.

**Parameters**

- `node_id` – DTS node to test

**Returns**
1 if node exists and is fixed-partition compatible, 0 otherwise.

**DT_FIXED_PARTITION_ID(node_id)**
Get a numeric identifier for a fixed partition.

**Parameters**

- `node_id` – node identifier for a fixed-partitions child node

**Returns**
the partition's ID, a unique zero-based index number
DT_MEM_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash memory for a partition.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the internal memory that contains the fixed-partitions node,
or DT_INVALID_NODE if it doesn't exist.

DT_MTD_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash controller for a partition.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the memory technology device that contains the fixed-partitions node.

DT_FIXED_PARTITION_ADDR(node_id)
Get the absolute address of a fixed partition.

Example devicetree fragment:

```devicetree
&flash_controller {
  flash@1000000 {
    compatible = "soc-nv-flash";
    partitions {
      compatible = "fixed-partitions";
      storage_partition: partition@3a000 {
        label = "storage";
      }
    }
  }
};
```

Here, the “storage” partition is seen to belong to flash memory starting at address 0x1000000. The partition's unit address of 0x3a000 represents an offset inside that flash memory.

Example usage:

```c
DT_FIXED_PARTITION_ADDR(DT_NODELABEL(storage_partition)) // 0x103a000
```

This macro can only be used with partitions of internal memory addressable by the CPU. Otherwise, it may produce a compile-time error, such as: `__REG_IDX_0_VAL_ADDRESS` undeclared`.

Parameters
• node_id – node identifier for a fixed-partitions child node

Returns
the partition's offset plus the base address of the flash node containing it.

GPIO These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

group devicetree-gpio
Defines

\texttt{DT_GPIO_CTLR\_BY\_IDX(node\_id, gpio\_pha, idx)}
Get the node identifier for the controller phandle from a gpio phandle-array property at an
index.

Example devicetree fragment:

\begin{verbatim}
gpio1: gpio@... { 

gpio2: gpio@... { 

n: node {
  gpios = <&gpio1 10 GPIO\_ACTIVE\_LOW>,
  <&gpio2 30 GPIO\_ACTIVE\_HIGH>;
}
\end{verbatim}

Example usage:
\begin{verbatim}
DT\_GPIO\_CTLR\_BY\_IDX(DT\_NODELABEL(n), gpios, 1) // DT\_NODELABEL(gpio2)
\end{verbatim}

See also:
\texttt{DT\_PHANDLE\_BY\_IDX()}

Parameters
\begin{itemize}
  \item node\_id – node identifier
  \item gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-
array”
  \item idx – logical index into “gpio\_pha”
\end{itemize}

Returns
the node identifier for the gpio controller referenced at index “idx”

\texttt{DT\_GPIO\_CTLR(node\_id, gpio\_pha)}
Equivalent to \texttt{DT\_GPIO\_CTLR\_BY\_IDX(node\_id, gpio\_pha, 0)}

See also:
\texttt{DT\_GPIO\_CTLR\_BY\_IDX()}

Parameters
\begin{itemize}
  \item node\_id – node identifier
  \item gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-
array”
\end{itemize}

Returns
a node identifier for the gpio controller at index 0 in “gpio\_pha”

\texttt{DT\_GPIO\_LABEL\_BY\_IDX(node\_id, gpio\_pha, idx)}
Get a label property from a gpio phandle-array property at an index.

\textit{Deprecated:}
If used to obtain a device instance with device_get Binding, consider using
\texttt{DEVICE\_DT\_GET(DT\_GPIO\_CTLR\_BY\_IDX(node, gpio\_pha, idx))}.
It's an error if the GPIO controller node referenced by the phandle in node_id's “gpio_pha” property at index “idx” has no label property.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
   label = "GPIO_1";
};
gpio2: gpio@... {
   label = "GPIO_2";
};
n: node {
   gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
   <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```plaintext
DT_GPIO_LABEL_BY_IDX(DT_NODELABEL(n), gpios, 1) // "GPIO_2"
```

See also:

`DT_GPIO_LABEL()`

**Parameters**

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
- idx – logical index into “gpio_pha”

**Returns**

the label property of the node referenced at index “idx”

`DT_GPIO_LABEL(node_id, gpio_pha)`

Equivalent to `DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, 0)`

**Deprecated:**

If used to obtain a device instance with device_get_binding, consider using `DEVICE_DT_GET(DT_GPIO_CTLR(node, gpio_pha))`.

See also:

`DT_GPIO_LABEL_BY_IDX()`

**Parameters**

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**

the label property of the node referenced at index 0
DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)
Get a GPIO specifier's pin cell at an index.

This macro only works for GPIO specifiers with cells named “pin”. Refer to the node's binding
to check if necessary.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
        <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```plaintext
gpio-cells:
- pin
- flags
```

Example usage:

```plaintext
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30
```

See also:

* DT_GPIO_PIN()

Parameters

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
- idx – logical index into “gpio_pha”

Returns

the pin cell value at index “idx”

DT_GPIO_PIN(node_id, gpio_pha)
Equivalent to DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, 0)

See also:

* DT_GPIO_PIN_BY_IDX()

Parameters

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
**Returns**
the pin cell value at index 0

```c
DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, idx)
```

Get a GPIO specifier’s flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

Example devicetree fragment:

```c
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```markdown
- pin
- flags
```

Example usage:

```c
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 0) // GPIO_ACTIVE_LOW
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 1) // GPIO_ACTIVE_HIGH
```

See also:

* [DT_GPIO_FLAGS_BY_IDX()](#)

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio_pha”

**Returns**

the flags cell value at index “idx”, or zero if there is none

```c
DT_GPIO_FLAGS(node_id, gpio_pha)
```

Equivalent to `DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, 0)`

See also:

* [DT_GPIO_FLAGS_BY_IDX()](#)

**Parameters**

• node_id – node identifier

• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the flags cell value at index 0, or zero if there is none

DT_NUM_GPIO_HOGS(node_id)
Get the number of GPIO hogs in a node.
This expands to the number of hogged GPIOs, or zero if there are none.
Example devicetree fragment:

```
gpio1: gpio0... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;

    n1: node-1 {
        gpio-hog;
        gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
        output-high;
    };

    n2: node-2 {
        gpio-hog;
        gpios = <3 GPIO_ACTIVE_HIGH>;
        output-low;
    };
}
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
    - pin
    - flags
```

Example usage:

```
DT_NUM_GPIO_HOGS(DT_NODELABEL(n1)) // 2
DT_NUM_GPIO_HOGS(DT_NODELABEL(n2)) // 1
```

Parameters
• node_id – node identifier; may or may not be a GPIO hog node.

Returns
number of hogged GPIOs in the node

DT_GPIO_HOG_PIN_BY_IDX(node_id, idx)
Get a GPIO hog specifier’s pin cell at an index.
This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding
to check if necessary.
Example devicetree fragment:

```
gpio1: gpio0... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
```

(continues on next page)
n1: node-1 {
    gpio-hog;
    gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
    output-high;
};

n2: node-2 {
    gpio-hog;
    gpios = <3 GPIO_ACTIVE_HIGH>;
    output-low;
};

Bindings fragment for the vnd,gpio compatible:

gpio-cells:
- pin
- flags

Example usage:

DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 0) // 0
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 1) // 1
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n2), 0) // 3

Parameters

• node_id – node identifier
• idx – logical index into “gpios”

Returns

the pin cell value at index “idx”

DT_GPIO_HOG_FLAGS_BY_IDX(node_id, idx)

Get a GPIO hog specifier’s flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the
GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if
necessary.

Example devicetree fragment:
Bindings fragment for the vnd_gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 0) // GPIO_ACTIVE_HIGH
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 1) // GPIO_ACTIVE_LOW
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n2), 0) // GPIO_ACTIVE_HIGH
```

**Parameters**

- **node_id** – node identifier
- **idx** – logical index into “gpios”

**Returns**

the flags cell value at index “idx”, or zero if there is none

```
DT_INST_GPIO_LABEL_BY_IDX(inst, gpio_pha, idx)
```

Get a label property from a DT_DRV_COMPAT instance's GPIO property at an index.

*Deprecated:*

If used to obtain a device instance with device_get_binding, consider using `DEVICE_DT_GET(DT_INST_GPIO_CTLR_BY_IDX(node, gpio_pha, idx))`.

**Parameters**

- **inst** – DT_DRV_COMPAT instance number
- **gpio_pha** – lowercase-and-underscores GPIO property with type “phandle-array”
- **idx** – logical index into “gpio_pha”

**Returns**

the label property of the node referenced at index “idx”

```
DT_INST_GPIO_LABEL(inst, gpio_pha)
```

Equivalent to `DT_INST_GPIO_LABEL_BY_IDX(inst, gpio_pha, 0)`

*Deprecated:*

If used to obtain a device instance with device_get_binding, consider using `DEVICE_DT_GET(DT_INST_GPIO_CTLR(node, gpio_pha))`.

**Parameters**

- **inst** – DT_DRV_COMPAT instance number
- **gpio_pha** – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**

the label property of the node referenced at index 0
DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance's GPIO specifier's pin cell value at an index.

See also:

DT_GPIO_PIN_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the pin cell value at index “idx”

DT_INST_GPIO_PIN(inst, gpio_pha)
Equivalent to DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, 0)

See also:

DT_INST_GPIO_PIN_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance's GPIO specifier's flags cell at an index.

See also:

DT_GPIO_FLAGS_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the flags cell value at index “idx”, or zero if there is none

DT_INST_GPIO_FLAGS(inst, gpio_pha)
Equivalent to DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, 0)

See also:

DT_INST_GPIO_FLAGS_BY_IDX()
Parameters

- `inst` – DT_DRV_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the flags cell value at index 0, or zero if there is none

**IO channels**
These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

```plaintext
group devicetree-io-channels
```

**Defines**

`DT_IO_CHANNELS_CTLR_BY_IDX(node_id, idx)`
Get the node identifier for the node referenced by an io-channels property at an index.

Example devicetree fragment:
```
adc1: adc@... { ... };
adc2: adc@... { ... };
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:
```
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)
```

**See also:**
`DT_PROP_BY_PHANDLE_IDX()`

**Parameters**

- `node_id` – node identifier for a node with an io-channels property
- `idx` – logical index into io-channels property

**Returns**
the node identifier for the node referenced at index “idx”

`DT_IO_CHANNELS_CTLR_BY_NAME(node_id, name)`
Get the node identifier for the node referenced by an io-channels property by name.

Example devicetree fragment:
```
adc1: adc@... { ... };
adc2: adc@... { ... };
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
```
Example usage:

```
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), sensor) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), bandgap) // DT_NODELABEL(adc2)
```

See also:

`DT_PHANDLE_BY_NAME()`

**Parameters**

- `node_id` – node identifier for a node with an io-channels property
- `name` – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

**Returns**

the node identifier for the node referenced at the named element

```
DT_IO_CHANNELS_CTLR(node_id)
```

Equivalent to `DT_IO_CHANNELS_CTLR_BY_IDX(node_id, 0)`

See also:

`DT_IO_CHANNELS_CTLR_BY_IDX()`

**Parameters**

- `node_id` – node identifier for a node with an io-channels property

**Returns**

the node identifier for the node referenced at index 0 in the node's “io-channels” property

```
DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, idx)
```

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property at an index.

See also:

`DT_IO_CHANNELS_CTLR_BY_IDX()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into io-channels property

**Returns**

the node identifier for the node referenced at index “idx”

```
DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)
```

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property by name.

See also:

`DT_IO_CHANNELS_CTLR_BY_NAME()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

**Returns**
the node identifier for the node referenced at the named element

`DT_INST_IO_CHANNELS_CTLR(inst)`
Equivalent to `DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, 0)`

**See also:**
`DT_IO_CHANNELS_CTLR_BY_IDX()`

**Parameters**
• inst – DT_DRV_COMPAT instance number

**Returns**
the node identifier for the node referenced at index 0 in the node’s “io-channels” property

`DT_IOCHANNELS_INPUT_BY_IDX(node_id, idx)`
Get an io-channels specifier input cell at an index.
This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
adc1: adc@... {
   compatible = "vnd,adc";
   #io-channel-cells = <1>;
};
adc2: adc@... {
   compatible = "vnd,adc";
   #io-channel-cells = <1>;
};
n: node {
   io-channels = <&adc1 10>, <&adc2 20>;
};
```

Bindings fragment for the vnd,adc compatible:
io-channel-cells:
• input

Example usage:

```plaintext
DT_IOCHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 0) // 10
DT_IOCHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 1) // 20
```

**See also:**
`DT_PHA_BY_IDX()`

**Parameters**
• node_id – node identifier for a node with an io-channels property
• idx – logical index into io-channels property
Returns
the input cell in the specifier at index “idx”

DT_IO_CHANNELS_INPUT_BY_NAME(node_id, name)
Get an io-channels specifier input cell by name.
This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.
Example devicetree fragment:

adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};

Bindings fragment for the vnd,adc compatible:
io-channel-cells:
• input
Example usage:

DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), sensor) // 10
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), bandgap) // 20

See also:
DT_PHA_BY_NAME()
Returns
the input cell in the specifier at index 0

`DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, idx)`
Get an input cell from the “DT_DRV_INST(inst)” io-channels property at an index.

See also:
`DT_IO_CHANNELS_INPUT_BY_IDX()`

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into io-channels property

Returns
the input cell in the specifier at index “idx”

`DT_INST_IO_CHANNELS_INPUT_BY_NAME(inst, name)`
Get an input cell from the “DT_DRV_INST(inst)” io-channels property by name.

See also:
`DT_IO_CHANNELS_INPUT_BY_NAME()`

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of an io-channels element as defined by the instance’s io-channel-names property

Returns
the input cell in the specifier at the named element

`DT_INST_IO_CHANNELS_INPUT(inst)`
Equivalent to `DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, 0)`

Parameters
- `inst` – DT_DRV_COMPAT instance number

Returns
the input cell in the specifier at index 0

**MBOX** These conveniences may be used for nodes which describe MBOX controllers/users, and properties related to them.

`group devicetree-mbox`

**Defines**

`DT_MBOX_CTLR_BY_NAME(node_id, name)`
Get the node identifier for the MBOX controller from a mboxes property by name.

Example devicetree fragment:
mbox1: mbox-controller@... { ... ;

n: node {
    mbox = <&mbox1 8>,
    <&mbox1 9>;
    mbox-names = "tx", "rx";
};

Example usage:

DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(mbox1)
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(mbox1)

See also:

DT_PHANDLE_BY_NAME()

Parameters

• node_id – node identifier for a node with a mbox property
• name – lowercase-and-underscores name of a mbox property

Returns

the node identifier for the MBOX controller in the named element

DT_MBOX_CHANNEL_BY_NAME(node_id, name)

Get a MBOX channel value by name.

Example devicetree fragment:

mbox1: mbox@... {
    #mbox-cells = <1>;
};

n: node {
    mbox = <&mbox1 1>,
    <&mbox1 6>;
    mbox-names = "tx", "rx";
};

Bindings fragment for the mbox compatible:

mbox-cells:
    - channel

Example usage:

DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), tx) // 1
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), rx) // 6

See also:

DT_PHA_BY_NAME_OR()

Parameters

• node_id – node identifier for a node with a mbox property
• name – lowercase-and-underscores name of a mbox property
**Returns**

the channel value in the specifier at the named element or 0 if no channels are supported

**Memory attributes**  These conveniences may be used for nodes with a memory attribute property.

**group** devicetree-memory-attr

**Defines**

`DT_MEMORY_ATTR_FOREACH_NODE(fn)`

Invokes `fn` for every node in the tree with property `zephyr,memory-attr`

The macro `fn` must take one parameter, which will be a node identifier with the `zephyr,memory-attr` property. The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

**Parameters**

- `fn` – macro to invoke

`DT_MEMORY_ATTR_APPLY(fn)`

Invokes `fn` for MPU/MMU regions generation from the device tree nodes with `zephyr,memory-attr` property.

Helper macro to invoke a `fn` macro on all the memory regions declared using the `zephyr,memory-attr` property

The macro `fn` must take the form:

```
#define MPU_FN(name, base, size, attr) ...
```

The `name`, `base` and `size` parameters are retrieved from the DT node. When the `zephyr, memory-region` property is present in the node, the `name` parameter is retrieved from there, otherwise the full node name is used.

The `zephyr,memory-attr` enum property is passed as an extended token to the `fn` macro using the `attr` parameter in the form of a macro `REGION_{attr}_ATTR`.

The following enums are supported for the `zephyr,memory-attr` property (see `zephyr,memory-attr.yaml` for a complete list):

- RAM
- RAM_NOCACHE
- FLASH
- PPB
- IO
- EXTMEM

This means that usually the user code would provide some macros or defines with the same name of the extended property, that is:

- `REGION_RAM_ATTR`
- `REGION_RAM_NOCACHE_ATTR`
- `REGION_FLASH_ATTR`
- REGION_PPB_ATTR
- REGION_IO_ATTR
- REGION_EXTMEM_ATTR

Example devicetree fragment:

```
/ {
    soc {
        res0: memory@20000000 {
            reg = <0x20000000 0x4000>;
            zephyr,memory-region = "MY_NAME";
            zephyr,memory-attr = "RAM_NOCACHE";
        };
        res1: memory@30000000 {
            reg = <0x30000000 0x2000>;
            zephyr,memory-attr = "RAM";
        };
    }
};
```

Example usage:

```
#define REGION_RAM_NOCACHE_ATTR 0xAAAA
#define REGION_RAM_ATTR 0xBBBB
#define REGION_FLASH_ATTR 0xCCCC

#define MPU_FN(p_name, p_base, p_size, p_attr) |
    { .name = p_name, .base = p_base, .size = p_size, .attr = p_attr, }
};

static const struct arm_mpu_region mpu_regions[] = {
    DT_MEMORY_ATTR_APPLY(MPU_FN)
};
```

This expands to:

```
static const struct arm_mpu_region mpu_regions[] = {
    { "MY_NAME", 0x20000000, 0x4000, 0xAAAA },
    { "memory@30000000", 0x30000000, 0x2000, 0xBBBB },
};
```

Parameters

- `fn` - macro to invoke

**Pinctrl (pin control)** These are used to access pin control properties by name or index.

Devicetree nodes may have properties which specify pin control (sometimes known as pin mux) settings. These are expressed using `pinctrl<-index>` properties within the node, where the `<index>` values are contiguous integers starting from 0. These may also be named using the `pinctrl-names` property.

Here is an example:
node {
  ...
  pinctrl-0 = <&foo &bar ...>;
  pinctrl-1 = <&baz ...>;
  pinctrl-names = "default", "sleep";
};

Above, pinctrl-0 has name "default", and pinctrl-1 has name "sleep". The pinctrl-<index> property values contain phandles. The &foo, &bar, etc. phandles within the properties point to nodes whose contents vary by platform, and which describe a pin configuration for the node.

group devicetree-pinctrl

Defines

**DT_PINCTRL_BY_IDX(node_id, pc_idx, idx)**
Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```c
n: node {
  pinctrl-0 = <&foo &bar>;
  pinctrl-1 = <&baz &blub>;
}
```

Example usage:

```c
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

Parameters

- node_id – node with a pinctrl-‘pc_idx' property
- pc_idx – index of the pinctrl property itself
- idx – index into the value of the pinctrl property

Returns

node identifier for the phandle at index 'idx' in 'pinctrl-‘pc_idx'

**DT_PINCTRL_0(node_id, idx)**
Get a node identifier from a pinctrl-0 property.

This is equivalent to:

```c
DT_PINCTRL_BY_IDX(node_id, 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

Parameters

- node_id – node with a pinctrl-0 property
- idx – index into the pinctrl-0 property

Returns

node identifier for the phandle at index idx in the pinctrl-0 property of that node

5.2. Devicetree
DT_PINCTRL_BY_NAME(node_id, name, idx)
Get a node identifier for a phandle inside a pinctrl node by name.

Example devicetree fragment:

```
{ node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

`DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1)` // DT_NODELABEL(bar)
`DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0)` // DT_NODELABEL(baz)

**Parameters**

- `node_id` – node with a named pinctrl property
- `name` – lowercase-and-underscores pinctrl property name
- `idx` – index into the value of the named pinctrl property

**Returns**

node identifier for the phandle at that index in the pinctrl property

---

DT_PINCTRL_NAME_TO_IDX(node_id, name)
Convert a pinctrl name to its corresponding index.

Example devicetree fragment:

```
{ node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

`DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), default)` // 0
`DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), sleep)` // 1

**Parameters**

- `node_id` – node identifier with a named pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl whose index to get

**Returns**

integer literal for the index of the pinctrl property with that name

---

DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)
Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property's name, and “remove the quotes” from it.
**DT_PINCTRL_IDX_TO_NAME_TOKEN()** can only be used if the node has a pinctrl-'pc_idx' property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

Example devicetree fragment:

```c
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```c
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // f_o_o2
```

The same caveats and restrictions that apply to **DT_STRING_TOKEN()**’s return value also apply here.

**Parameters**

- **node_id** – node identifier
- **pc_idx** – index of a pinctrl property in that node

**Returns**

name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

**DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(node_id, pc_idx)**

Like **DT_PINCTRL_IDX_TO_NAME_TOKEN()**, but with an uppercased result.

This does the a similar conversion as **DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)**. The only difference is that alphabetical characters in the result are uppercased.

Example devicetree fragment:

```c
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```c
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_O_O2
```

The same caveats and restrictions that apply to **DT_STRING_UPPER_TOKEN()**’s return value also apply here.

**DT_NUM_PINCTRLS_BY_IDX(node_id, pc_idx)**

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```c
n1: node-1 {
    pinctrl-0 = &foo &bar;
};

n2: node-2 {
    pinctrl-0 = &baz;
};
```
Example usage:

```
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

**Parameters**
- `node_id` – node identifier with a pinctrl property
- `pc_idx` – index of the pinctrl property itself

**Returns**
number of phandles in the property with that index

```
DT_NUM_PINCTRLS_BY_NAME(node_id, name)
```

Like `DT_NUM_PINCTRLS_BY_IDX()`, but by name instead.

Example devicetree fragment:

```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz>
    pinctrl-names = "default", "sleep";
}
```

Example usage:

```
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep) // 1
```

**Parameters**
- `node_id` – node identifier with a pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl property

**Returns**
number of phandles in the property with that name

```
DT_NUM_PINCTRL_STATES(node_id)
```

Get the number of pinctrl properties in a node.

This expands to 0 if there are no pinctrl-i properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};
n2: node-2 {
};
```

Example usage:

```
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n2)) // 0
```

**Parameters**
• node_id – node identifier; may or may not have any pinctrl properties

**Returns**

number of pinctrl properties in the node

**DT_PINCTRL_HAS_IDX(node_id, pc_idx)**

Test if a node has a pinctrl property with an index.

This expands to 1 if the pinctrl-‘idx’ property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
  pinctrl-0 = <...>;
  pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```plaintext
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0
```

**Parameters**

• node_id – node identifier; may or may not have any pinctrl properties

• pc_idx – index of a pinctrl property whose existence to check

**Returns**

1 if the property exists, 0 otherwise

**DT_PINCTRL_HAS_NAME(node_id, name)**

Test if a node has a pinctrl property with a name.

This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
  pinctrl-0 = <...>;
  pinctrl-names = "default";
};

n2: node-2 {
};
```

Example usage:

```plaintext
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep) // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

**Parameters**

• node_id – node identifier; may or may not have any pinctrl properties

• name – lowercase-and-underscores pinctrl property name to check
Returns
1 if the property exists, 0 otherwise

DT_INST_PINCTRL_BY_IDX(inst, pc_idx, idx)
Get a node identifier for a phandle in a pinctrl property by index for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself
• idx – index into the value of the pinctrl property

Returns
node identifier for the phandle at index 'idx' in 'pinctrl-‘pc_idx”

DT_INST_PINCTRL_0(inst, idx)
Get a node identifier from a pinctrl-0 property for a DT_DRV_COMPAT instance.
This is equivalent to:
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
It is provided for convenience since pinctrl-0 is commonly used.

Parameters
• inst – instance number
• idx – index into the pinctrl-0 property

Returns
node identifier for the phandle at index idx in the pinctrl-0 property of that instance

DT_INST_PINCTRL_BY_NAME(inst, name, idx)
Get a node identifier for a phandle inside a pinctrl node for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_BY_NAME(DT_DRV_INST(inst), name, idx).

Parameters
• inst – instance number
• name – lowercase-and-underscores pinctrl property name
• idx – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

DT_INST_PINCTRL_NAME_TO_IDX(inst, name)
Convert a pinctrl name to its corresponding index for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_NAME_TO_IDX(DT_DRV_INST(inst), name).

Parameters
• inst – instance number
• name – lowercase-and-underscores name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name
DT_INST_PINCTRL_IDX_TO_NAME_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercased token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_DRV_INST(inst), pc_idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as a token

DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercase token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(DT_DRV_INST(inst), idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as an uppercase token

DT_INST_NUM_PINCTRLS_BY_IDX(inst, pc_idx)
Get the number of phandles in a pinctrl property for a DT_DRV_COMPAT instance.
This is equivalent to DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst), pc_idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
number of phandles in the property with that index

DT_INST_NUM_PINCTRLS_BY_NAME(inst, name)
Like DT_INST_NUM_PINCTRLS_BY_IDX(), but by name instead.
This is equivalent to DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst), name).

Parameters
• inst – instance number
• name – lowercase-and-underscores name of the pinctrl property

Returns
number of phandles in the property with that name

DT_INST_NUM_PINCTRL STATES(inst)
Get the number of pinctrl properties in a DT_DRV_COMPAT instance.
This is equivalent to DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst)).

Parameters
• inst – instance number

Returns
number of pinctrl properties in the instance
DT_INST_PINCTRL_HAS_IDX(inst, pc_idx)

Test if a DT_DRV_COMPAT instance has a pinctrl property with an index.
This is equivalent to `DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx)`.

**Parameters**

- inst – instance number
- pc_idx – index of a pinctrl property whose existence to check

**Returns**

1 if the property exists, 0 otherwise

DT_INST_PINCTRL_HAS_NAME(inst, name)

Test if a DT_DRV_COMPAT instance has a pinctrl property with a name.
This is equivalent to `DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name)`.

**Parameters**

- inst – instance number
- name – lowercase-and-underscores pinctrl property name to check

**Returns**

1 if the property exists, 0 otherwise

---

**PWM** These conveniences may be used for nodes which describe PWM controllers and properties related to them.

**group devicetree-pwms**

**Defines**

DT_PWMS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the PWM controller from a pwms property at an index.

Example devicetree fragment:

```plaintext
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };

n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
          <&pwm2 3 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```plaintext
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)
```

**See also:**

`DT_PROP_BY_PHANDLE_IDX()`

**Parameters**

- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property
Returns
the node identifier for the PWM controller referenced at index “idx”

DT_PWMS_CTRLR_BY_NAME(node_id, name)

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };
n: node { pwms = <&pwm1 1 PWM_POLARITY_NORMAL>, <&pwm2 3 PWM_POLARITY_INVERTED>; pwm-names = “alpha”, “beta”; };
```

Example usage:

```
DT_PWMS_CTRLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)
DT_PWMS_CTRLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(pwm2)
```

See also:

`DT_PHANDLE_BY_NAME()`

Parameters

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the node identifier for the PWM controller in the named element

DT_PWMS_CTRLR(node_id)

Equivalent to `DT_PWMS_CTRLR_BY_IDX(node_id, 0)`

See also:

`DT_PWMS_CTRLR_BY_IDX()`

Parameters

- node_id – node identifier for a node with a pwms property

Returns
the node identifier for the PWM controller at index 0 in the node's “pwms” property

DT_PWMS_CELL_BY_IDX(node_id, idx, cell)

Get PWM specifier's cell value at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    compatible = "vnd_pwm";
    #pwm-cells = <2>;
};
pwm2: pwm-controller@... {
    compatible = "vnd_pwm";
    #pwm-cells = <2>;
}
```

(continues on next page)
Bindings fragment for the “vnd,pwm” compatible:

```plaintext
pwm-cells:
- channel
- period
- flags
```

Example usage:

```plaintext
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period) // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period) // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags) // PWM_POLARITY_INVERTED
```

See also:

`DT_PHA_BY_IDX()`

**Parameters**

- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property
- cell – lowercase-and-underscores cell name

**Returns**

the cell value at index “idx”

```plaintext
DT_PWMS_CELL_BY_NAME(node_id, name, cell)
```

Get a PWM specifier’s cell value by name.

Example devicetree fragment:

```plaintext
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
           <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

Bindings fragment for the “vnd,pwm” compatible:
pwm-cells:
- channel
- period
- flags

Example usage:

```
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel) // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period) // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period) // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, flags) // PWM_POLARITY_INVERTED
```

See also:

`DT_PHA_BY_NAME()`

Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_PWMS_CELL(node_id, cell)

Equivalent to `DT_PWMS_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_PWMS_CELL_BY_IDX()`

Parameters

- `node_id` – node identifier for a node with a pwms property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value at index 0

DT_PWMS_CHANNEL_BY_IDX(node_id, idx)

Get a PWM specifier's channel cell value at an index.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_IDX(node_id, idx, channel)`.

See also:

`DT_PWMS_CELL_BY_IDX()`

Parameters

- `node_id` – node identifier for a node with a pwms property
• idx – logical index into pwms property

**Returns**

the channel cell value at index “idx”

**DT_PWMS_CHANNEL_BY_NAME(node_id, name)**

Get a PWM specifier's channel cell value by name.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_NAME(node_id, name, channel)*.

**See also:**

*DT_PWMS_CELL_BY_NAME()*

**Parameters**

• node_id – node identifier for a node with a pwms property

• name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

**Returns**

the channel cell value in the specifier at the named element

**DT_PWMS_CHANNEL(node_id)**

Equivalent to *DT_PWMS_CHANNEL_BY_IDX(node_id, 0)*

**See also:**

*DT_PWMS_CHANNEL_BY_IDX()*

**Parameters**

• node_id – node identifier for a node with a pwms property

**Returns**

the channel cell value at index 0

**DT_PWMS_PERIOD_BY_IDX(node_id, idx)**

Get PWM specifier's period cell value at an index.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_IDX(node_id, idx, period)*.

**See also:**

*DT_PWMS_CELL_BY_IDX()*

**Parameters**

• node_id – node identifier for a node with a pwms property

• idx – logical index into pwms property

**Returns**

the period cell value at index “idx”
DT_PWMS_PERIOD_BY_NAME(node_id, name)

Get a PWM specifier's period cell value by name.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_NAME(node_id, name, period)`.

See also:

`DT_PWMS_CELL_BY_NAME()`

Parameters

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns

the period cell value in the specifier at the named element

DT_PWMS_PERIOD(node_id)

Equivalent to `DT_PWMS_PERIOD_BY_IDX(node_id, 0)`

See also:

`DT_PWMS_PERIOD_BY_IDX()`

Parameters

- node_id – node identifier for a node with a pwms property

Returns

the period cell value at index 0

DT_PWMS_FLAGS_BY_IDX(node_id, idx)

Get a PWM specifier's flags cell value at an index.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if necessary.

This is equivalent to `DT_PWMS_CELL_BY_IDX(node_id, idx, flags)`.

See also:

`DT_PWMS_CELL_BY_IDX()`

Parameters

- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property

Returns

the flags cell value at index “idx”, or zero if there is none
DT_PWMS_FLAGS_BY_NAME(node_id, name)
Get a PWM specifier’s flags cell value by name.
This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the
PWM specifier, zero is returned. Refer to the node’s binding to check specifier cell names if
necessary.
This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, flags) if there is a flags cell,
but expands to zero if there is none.

See also:
DT_PWMS_CELL_BY_NAME()

Parameters
- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

DT_PWMS_FLAGS(node_id)
Equivalent to DT_PWMS_FLAGS_BY_IDX(node_id, 0)

See also:
DT_PWMS_FLAGS_BY_IDX()

Parameters
- node_id – node identifier for a node with a pwms property

Returns
the flags cell value at index 0, or zero if there is none

DT_INST_PWMS_CTLR_BY_IDX(inst, idx)
Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s pwms
property at an index.

See also:
DT_PWMS_CTLR_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property

Returns
the node identifier for the PWM controller referenced at index “idx”

DT_INST_PWMS_CTLR_BY_NAME(inst, name)
Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s pwms
property by name.
DT_PWMS_CTLR_BY_NAME()

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns

the node identifier for the PWM controller in the named element

DT_INST_PWMS_CTLR(inst)

Equivalent to DT_INST_PWMS_CTLR_BY_IDX(inst, 0)

See also:

DT_PWMS_CTLR_BY_IDX()

Parameters

- inst – DT_DRV_COMPAT instance number

Returns

the node identifier for the PWM controller at index 0 in the instance's “pwms” property

DT_INST_PWMS_CELL_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT instance's PWM specifier's cell value at an index.

Parameters

- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

DT_INST_PWMS_CELL_BY_NAME(inst, name, cell)

Get a DT_DRV_COMPAT instance's PWM specifier's cell value by name.

See also:

DT_PWMS_CELL_BY_NAME()

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property
- cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element
DT_INST_PWMS_CELL(inst, cell)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, 0, cell)

Parameters
- inst – DT_DRV_COMPAT instance number
- cell – lowercase-and-underscores cell name

Returns
the cell value at index 0

DT_INST_PWMS_CHANNEL_BY_IDX(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, channel)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property

Returns
the channel cell value at index “idx”

DT_INST_PWMS_CHANNEL_BY_NAME(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, channel)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns
the channel cell value in the specifier at the named element

DT_INST_PWMS_CHANNEL(inst)
Equivalent to DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_CHANNEL_BY_IDX()
DT_INST_PWMS_PERIOD_BY_IDX(inst, idx)
   Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property

Returns
the period cell value at index “idx”

DT_INST_PWMS_PERIOD_BY_NAME(inst, name)
   Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, period)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns
the period cell value in the specifier at the named element

DT_INST_PWMS_PERIOD(inst)
   Equivalent to DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_PERIOD_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number

Returns
the period cell value at index 0

DT_INST_PWMS_FLAGS_BY_IDX(inst, idx)
   Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, flags)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into pwms property
Returns

the flags cell value at index “idx”, or zero if there is none

DT_INST_PWMS_FLAGS_BY_NAME(inst, name)

Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, flags)

See also:

DT_INST_PWMS_CELL_BY_NAME()

Parameters

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns

the flags cell value in the specifier at the named element, or zero if there is none

DT_INST_PWMS_FLAGS(inst)

Equivalent to DT_INST_PWMS_FLAGS_BY_IDX(inst, 0)

See also:

DT_INST_PWMS_FLAGS_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number

Returns

the flags cell value at index 0, or zero if there is none

Reset Controller

These conveniences may be used for nodes which describe reset controllers and prop-
erties related to them.

group devicetree-reset-controller

Defines

DT_RESET_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the controller phandle from a “resets” phandle-array property at an
index.

Example devicetree fragment:

```plaintext
reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;

n: node {
    resets = &reset1 10, &reset2 20;
}
```

Example usage:
DT_RESET_CTLR_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(reset1)
DT_RESET_CTLR_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(reset2)

See also:

DT_PHANDLE_BY_IDX()

Parameters

- node_id – node identifier
- idx – logical index into “resets”

Returns

the node identifier for the reset controller referenced at index “idx”

DT_RESET_CTLR(node_id)

Equivalent to DT_RESET_CTLR_CTLR_BY_IDX(node_id, 0)

See also:

DT_RESET_CTLR_CTLR_BY_IDX()

Parameters

- node_id – node identifier

Returns

a node identifier for the reset controller at index 0 in “resets”

DT_RESET_CTLR_CTLR_BY_NAME(node_id, name)

Get the node identifier for the controller phandle from a resets phandle-array property by name.

Example devicetree fragment:

reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;

n: node {
resets = <&reset1 10>, <&reset2 20>;
reset-names = "alpha", "beta";
};

Example usage:

DT_RESET_CTLR_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(reset1)
DT_RESET_CTLR_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(reset2)

See also:

DT_PHANDLE_BY_NAME()

Parameters

- node_id – node identifier
- name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property

Returns

the node identifier for the reset controller referenced by name
DT_RESET_CELL_BY_IDX(node_id, idx, cell)
Get a reset specifer's cell value at an index.

Example devicetree fragment:

```c
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```c
reset-cells:
- id
```

Example usage:

```c
DT_RESET_CELL_BY_IDX(DT_NODELABEL(n), 0, id) // 10
```

See also:

`DT_PHA_BY_IDX()`

Parameters

- node_id – node identifier for a node with a resets property
- idx – logical index into resets property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

DT_RESET_CELL_BY_NAME(node_id, name, cell)
Get a reset specifer's cell value by name.

Example devicetree fragment:

```c
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
    reset-names = "alpha";
};
```

Bindings fragment for the vnd,reset compatible:

```c
reset-cells:
- id
```

Example usage:

```c
DT_RESET_CELL_BY_NAME(DT_NODELABEL(n), alpha, id) // 10
```
See also:

`DT_PHA_BY_NAME()`

Parameters

- `node_id` – node identifier for a node with a resets property
- `name` – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

```
DT_RESET_CELL(node_id, cell)
```

Equivalent to `DT_RESET_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_RESET_CELL_BY_IDX()`

Parameters

- `node_id` – node identifier for a node with a resets property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value at index 0

```
DT_INST_RESET_CTLR_BY_IDX(inst, idx)
```

Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.

See also:

`DT_RESET_CTLR_BY_IDX()`

Parameters

- `inst` – instance number
- `idx` – logical index into “resets”

Returns

the node identifier for the reset controller referenced at index “idx”

```
DT_INST_RESET_CTLR(inst)
```

Equivalent to `DT_INST_RESET_CTLR_BY_IDX(inst, 0)`

See also:

`DT_RESET_CTLR()`

Parameters

- `inst` – instance number

Returns

a node identifier for the reset controller at index 0 in “resets”
DT_INST_RESET_CTRLR_BY_NAME(inst, name)
Get the node identifier for the controller phandle from a resets phandle-array property by name.

See also:

DT_RESET_CTRLR_BY_NAME()

Parameters

• inst – instance number
• name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property

Returns
the node identifier for the reset controller referenced by the named element

DT_INST_RESET_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance's reset specifier's cell value at an index.

See also:

DT_RESET_CELL_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into resets property
• cell – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_INST_RESET_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's reset specifier's cell value by name.

See also:

DT_RESET_CELL_BY_NAME()

Parameters

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_RESET_CELL(inst, cell)
Equivalent to DT_INST_RESET_CELL_BY_IDX(inst, 0, cell)

Parameters

• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name
Returns
the value of the cell inside the specifier at index 0

DT_RESET_ID_BY_IDX(node_id, idx)
Get a Reset Controller specifier’s id cell at an index.
This macro only works for Reset Controller specifiers with cells named “id”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```dts
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```dts
reset-cells:
    - id
```

Example usage:

```dts
DT_RESET_ID_BY_IDX(DT_NODELABEL(n), 0) // 10
```

See also:
`DT_PHA_BY_IDX()`

Parameters
- node_id – node identifier
- idx – logical index into “resets”

Returns
the id cell value at index “idx”

DT_RESET_ID(node_id)
Equivalent to `DT_RESET_ID_BY_IDX(node_id, 0)`

See also:
`DT_RESET_ID_BY_IDX()`

Parameters
- node_id – node identifier

Returns
the id cell value at index 0

DT_INST_RESET_ID_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance’s Reset Controller specifier’s id cell value at an index.

See also:
`DT_RESET_ID_BY_IDX()`
Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into “resets”

Returns
the id cell value at index “idx”

**DT_INST_RESET_ID**(`inst`)
Equivalent to **DT_INST_RESET_ID_BY_IDX**(`inst`, 0)

See also:

**DT_INST_RESET_ID_BY_IDX()**

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns
the id cell value at index 0

SPI These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

**group devicetree-spi**

Defines

**DT_SPI_HAS_CS_GPIOS**(`spi`)

Does a SPI controller node have chip select GPIOs configured?

SPI bus controllers use the “cs-gpios” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {
    compatible = "vnd.spi";
};
```

Example usage:

```
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

- `spi` – a SPI bus controller node identifier

Returns
1 if “spi” has a cs-gpios property, 0 otherwise
DT_SPI_NUM_CS_GPIOS(spi)

Number of chip select GPIOs in a SPI controller's cs-gpios property.

Example devicetree fragment:

```c
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};

spi2: spi@... {
    compatible = "vnd.spi";
};
```

Example usage:

```c
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

- `spi` – a SPI bus controller node identifier

Returns

Logical length of spi's cs-gpios property, or 0 if "spi" doesn't have a cs-gpios property

DT_SPI_DEV_HAS_CS_GPIOS(spi_dev)

Does a SPI device have a chip select line configured? Example devicetree fragment:

```c
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    }

    b: spi-dev-b@1 {
        reg = <1>;
    }
};

spi2: spi@... {
    compatible = "vnd.spi";
    c: spi-dev-c@0 {
        reg = <0>;
    }
};
```

Example usage:

```c
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0
```
Parameters

• spi_dev – a SPI device node identifier

Returns

1 if spi_dev's bus node $DT_BUS(spi_dev)$ has a chip select pin at index $DT_REG_ADDR(spi_dev)$, 0 otherwise

$DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)$

Get a SPI device's chip select GPIO controller's node identifier.

Example devicetree fragment:

```markdown
gpio1: gpio@... { ... };
gpio2: gpio@... { ... };
spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
}
```

Example usage:

```c
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)
```

Parameters

• spi_dev – a SPI device node identifier

Returns

node identifier for spi_dev's chip select GPIO controller

$DT_SPI_DEV_CS_GPIOS_LABEL(spi_dev)$

Get a SPI device's chip select GPIO controller's label property.

Deprecated:

If used to obtain a device instance with device_get_binding, consider using $DEVICE_DT_GET(DT_SPI_DEV_CS_GPIOS_CTLR(node))$.

Example devicetree fragment:

```markdown
gpio1: gpio@... {
    label = "GPIO_1";
};
gpio2: gpio@... {
    label = "GPIO_2";
};
```

(continues on next page)
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
              <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

Example usage:

DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(a)) // "GPIO_1"
DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(b)) // "GPIO_2"

Parameters

• spi_dev – a SPI device node identifier

Returns

label property of spi_dev's chip select GPIO controller

DT_SPI_DEV_CS_GPIOS_PIN(spi_dev)

Get a SPI device's chip select GPIO pin number.

It's an error if the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no pin cell.

Example devicetree fragment:

spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
              <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

Example usage:

DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(b)) // 20

Parameters

• spi_dev – a SPI device node identifier

Returns

pin number of spi_dev's chip select GPIO
DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)
Get a SPI device's chip select GPIO flags.

Example devicetree fragment:

```plaintext
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;
    a: spi-dev-a@0 {
       reg = <0>;
    };
};
```

Example usage:

```plaintext
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_NODELABEL(a)) // GPIO_ACTIVE_LOW
```

If the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no flags cell, this expands to zero.

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

flags value of spi_dev's chip select GPIO specifier, or zero if there is none

DT_INST_SPI_DEV_HAS_CS_GPIOS(inst)
Equivalent to `DT_SPI_DEV_HAS_CS_GPIOS(DT_DRV_INST(inst))`.

**See also:**

`DT_SPI_DEV_HAS_CS_GPIOS()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number

**Returns**

1 if the instance's bus has a CS pin at index `DT_INST_REG_ADDR(inst)`, 0 otherwise

DT_INST_SPI_DEV_CS_GPIOS_CTLR(inst)
Get GPIO controller node identifier for a SPI device instance This is equivalent to `DT_SPI_DEV_CS_GPIOS_CTLR(DT_DRV_INST(inst))`.

**See also:**

`DT_SPI_DEV_CS_GPIOS_CTLR()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number

**Returns**

node identifier for instance’s chip select GPIO controller
DT_INST_SPI_DEV_CS_GPIOS_LABEL(inst)
Get GPIO controller name for a SPI device instance. This is equivalent to

\texttt{DT_SPI_DEV_CS_GPIOS_LABEL(DT_DRV_INST(inst))}.

\textit{Deprecated:}
If used to obtain a device instance with \texttt{device_get_binding}, consider using

\texttt{DEVICE_DT_GET(DT_INST_SPI_DEV_CS_GPIOS_CTLR(node))}.

\textit{See also:}

\texttt{DT_SPI_DEV_CS_GPIOS_LABEL()}

\textbf{Parameters}
\begin{itemize}
\item \texttt{inst} – DT_DRV_COMPAT instance number
\end{itemize}

\textbf{Returns}
label property of the instance's chip select GPIO controller

DT_INST_SPI_DEV_CS_GPIOS_PIN(inst)
Equivalent to \texttt{DT_SPI_DEV_CS_GPIOS_PIN(DT_DRV_INST(inst))}.

\textit{See also:}

\texttt{DT_SPI_DEV_CS_GPIOS_PIN()}

\textbf{Parameters}
\begin{itemize}
\item \texttt{inst} – DT_DRV_COMPAT instance number
\end{itemize}

\textbf{Returns}
pin number of the instance's chip select GPIO

DT_INST_SPI_DEV_CS_GPIOS_FLAGS(inst)

\texttt{DT_SPI_DEV_CS_GPIOS_FLAGS(DT_DRV_INST(inst))}.

\textit{See also:}

\texttt{DT_SPI_DEV_CS_GPIOS_FLAGS()}

\textbf{Parameters}
\begin{itemize}
\item \texttt{inst} – DT_DRV_COMPAT instance number
\end{itemize}

\textbf{Returns}
flags value of the instance's chip select GPIO specifier, or zero if there is none

\textbf{Chosen nodes}
The special \texttt{/chosen} node contains properties whose values describe system-wide settings. The \texttt{DT_CHOSEN()} macro can be used to get a node identifier for a chosen node.

\texttt{group devicetree-generic-chosen}
Defines

DT_CHOSEN(prop)
Get a node identifier for a /chosen node property.
This is only valid to call if DT_HAS_CHOSEN(prop) is 1.

Parameters
• prop – lowercase-and-underscores property name for the /chosen node

Returns
a node identifier for the chosen node property

DT_HAS_CHOSEN(prop)
Test if the devicetree has a /chosen node.

Parameters
• prop – lowercase-and-underscores devicetree property

Returns
1 if the chosen property exists and refers to a node, 0 otherwise

Zephyr-specific chosen nodes
The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node’s label property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.

<tr>
<td>zephyr, entropy</td>
<td>A device which can be used as a system-wide entropy source</td>
</tr>
<tr>
<td>zephyr, flash</td>
<td>A node whose reg is sometimes used to set the defaults for CONFIG_FLASH_BASE_ADDRESS and CONFIG_FLASH_SIZE</td>
</tr>
<tr>
<td>zephyr, flash-controller</td>
<td>The node corresponding to the flash controller device for the zephyr, flash node</td>
</tr>
<tr>
<td>zephyr, gdbstub-uart</td>
<td>Sets UART device used by the GDB stub subsystem</td>
</tr>
<tr>
<td>zephyr, ieee802154</td>
<td>Used by the networking subsystem to set the IEEE 802.15.4 device</td>
</tr>
<tr>
<td>zephyr, ipc</td>
<td>Used by the OpenAMP subsystem to specify the inter-process communication (IPC) device</td>
</tr>
<tr>
<td>zephyr, ipc_shm</td>
<td>A node whose reg is used by the OpenAMP subsystem to determine the base address and size of the shared memory (SHM) usable for interprocess-communication (IPC)</td>
</tr>
<tr>
<td>zephyr, itcm</td>
<td>Instruction Tightly Coupled Memory node on some Arm SoCs</td>
</tr>
<tr>
<td>zephyr, ocm</td>
<td>On-chip memory node on Xilinx Zynq-7000 and ZynqMP SoCs</td>
</tr>
</tbody>

Table 1 – continued from previous page

<table>
<thead>
<tr>
<th>Property</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>zephyr,osdp_uart</td>
<td>Sets UART device used by OSDP subsystem</td>
</tr>
<tr>
<td>zephyr,ot_uart</td>
<td>Used by the OpenThread to specify UART device for Spinel protocol</td>
</tr>
<tr>
<td>zephyr,pcie_controller</td>
<td>The node corresponding to the PCIe Controller</td>
</tr>
<tr>
<td>zephyr,ppp_uart</td>
<td>Sets UART device used by PPP</td>
</tr>
<tr>
<td>zephyr,settings-partition</td>
<td>Fixed partition node. If defined this selects the partition used by the NVS and FCB settings backends.</td>
</tr>
<tr>
<td>zephyr,shell_uart</td>
<td>Sets UART device used by serial shell backend</td>
</tr>
<tr>
<td>zephyr,sram</td>
<td>A node whose reg sets the base address and size of SRAM memory available to the Zephyr image, used during linking</td>
</tr>
<tr>
<td>zephyr,tracing_uart</td>
<td>Sets UART device used by tracing subsystem</td>
</tr>
<tr>
<td>zephyr,uart-mcumgr</td>
<td>UART used for Device Management</td>
</tr>
<tr>
<td>zephyr,uart-pipe</td>
<td>Sets UART device used by serial pipe driver</td>
</tr>
<tr>
<td>zephyr,usb-device</td>
<td>USB device node. If defined and has a vbus-gpios property, these will be used by the USB subsystem to enable/disable VBUS</td>
</tr>
</tbody>

### Bindings index

This page documents the available devicetree bindings. See Devicetree bindings for an introduction to the Zephyr bindings file format.

### Vendor index

This section contains an index of hardware vendors. Click on a vendor's name to go to the list of bindings for that vendor.

- **Generic or vendor-independent**

• Zhengzhou Winsen Electronics Technology Co., Ltd. (winsen)
• Unknown vendor

Bindings by vendor  This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the “compatible” property they apply to, like this:

Vendor name (vendor prefix)
• <compatible-A>
• <compatible-B> (on <bus-name> bus)
• <compatible-C>
• ...

1274 Chapter 5. Build and Configuration Systems
The text “(on <bus-name> bus)” appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

5.2. Devicetree
5.3 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called symbols) are defined in Kconfig files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.

The output from Kconfig is a header file autoconf.h with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing Kconfig files.

5.3.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: menuconfig and guiconfig. menuconfig is a curses-based interface that runs in the terminal, while guiconfig is a graphical configuration interface.

Note: The configuration can also be changed by editing zephyr/.config in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in zephyr/.config, the assignment will be ignored and overwritten when re-configuring.

To make a setting permanent, you should set it in a *.conf file, as described in Setting Kconfig configuration values.

Tip: Saving a minimal configuration file (with e.g. D in menuconfig) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their default value.

To run one of the configuration interfaces, do this:

1. Build your application as usual using either west or cmake:
   Using west:
   ```
   west build -b <board>
   ```
   Using CMake and ninja:
   ```
   mkdir build && cd build
   cmake -GNinja -DBOARD=<board> ..
   ninja
   ```

2. To run the terminal-based menuconfig interface, use either of these commands:
   ```
   west build -t menuconfig
   ```
   ```
   ninja menuconfig
   ```

   To run the graphical guiconfig, use either of these commands:
west build -t guiconfig

ninja guiconfig

**Note:** If you get an import error for `tkinter` when trying to run `guiconfig`, you are missing required packages. See *Install Linux Host Dependencies*. The package you need is usually called something like `python3-tk` or `python3-tkinter`.

`tkinter` is not included by default in many Python installations, despite being part of the standard library.

The two interfaces are shown below:

The `guiconfig` always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press `?` to view the same information.

**Note:** If you prefer to work in the `guiconfig` interface, then it's a good idea to check any changes to Kconfig files you make in single-menu mode, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

3. Change configuration values in the `menuconfig` interface as follows:

   - Navigate the menu with the arrow keys. Common *Vim* key bindings are supported as well.
   - Use `Space` and `Enter` to enter menus and toggle values. Menus appear with `-->` next to them. Press `ESC` to return to the parent menu.

   Boolean configuration options are shown with `[ ]` brackets, while numeric and string-valued configuration symbols are shown with `( )` brackets. Symbol values that can't be changed are shown as `--` or `*`.

   **Note:** You can also press `Y` or `N` to set a boolean configuration symbol to the corresponding value.
• Press ? to display information about the currently selected symbol, including its help text. Press ESC or Q to return from the information display to the menu.

In the guiconfig interface, either click on the image next to the symbol to change its value, or double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).

guiconfig also supports keyboard controls, which are similar to menuconfig.

4. Pressing Q in the menuconfig interface will bring up the save-and-quit dialog (if there are changes to save):

Press Y to save the kernel configuration options to the default filename (zephyr/.config). You will typically save to the default filename unless you are experimenting with different configurations. The guiconfig interface will also prompt for saving the configuration on exit if it has been modified.

**Note:** The configuration file used during the build is always zephyr/.config. If you have another saved configuration that you want to build with, copy it to zephyr/.config. Make sure to back up your original configuration file.

Also note that filenames starting with . are not listed by ls by default on Linux and macOS. Use the -a flag to see them.

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the / key (this also works in guiconfig). This brings up the following dialog, where you can search for symbols by name and jump to them. In guiconfig, you can also change symbol values directly within the dialog.
5.3. Configuration System (Kconfig)
If you jump to a symbol that isn't currently visible (e.g., due to having unsatisfied dependencies), then show-all mode will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press A in menuconfig or Ctrl-A in guiconfig.

**Note:** Show-all mode can't be turned off if there are no visible items in the current menu.

To figure out why a symbol you jumped to isn't visible, inspect its dependencies, either by pressing ? in menuconfig or in the information pane at the bottom in guiconfig. If you discover that the symbol depends on another symbol that isn't enabled, you can jump to that symbol in turn to see if it can be enabled.

**Note:** In menuconfig, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

For more information on menuconfig and guiconfig, see the Python docstrings at the top of menuconfig.py and guiconfig.py.

### 5.3.2 Setting Kconfig configuration values

The menuconfig and guiconfig interfaces can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

**Note:** Before making changes to Kconfig files, it's a good idea to also go through the Kconfig - Tips and Best Practices page.

#### Visible and invisible Kconfig symbols

When making Kconfig changes, it's important to understand the difference between visible and invisible symbols.

- A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence visible), and can be set in configuration files.

  Here's an example of a visible symbol:

  ```
  config FPU
  bool "Support floating point operations"
  depends on HAS_FPU
  ```

  The symbol is shown like this in menuconfig, where it can be toggled:

  [ ] Support floating point operations

- An invisible symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

  Here's an example of an invisible symbol:

  ```
  config CPU_HAS_FPU
  bool
  help
  This symbol is y if the CPU has a hardware floating point unit.
  ```
In this case, CPU_HAS_FPU is enabled through other symbols having select CPU_HAS_FPU.

### Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a *_.defconfig file for the board with application settings, usually from prj.conf. See The Initial Configuration below for more details.

Assignments in configuration files use this syntax:

```
CONFIG_<symbol name>=<value>
```

There should be no spaces around the equals sign.

**bool** symbols can be enabled or disabled by setting them to y or n, respectively. The FPU symbol from the example above could be enabled like this:

```
CONFIG_FPU=y
```

**Note:** A boolean symbol can also be set to n with a comment formatted like this:

```
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in zephyr/.config.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn't use this). Having n-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```
CONFIG_SOME_STRING="cool value"
CONFIG_SOME_INT=123
```

Comments use a #:

```
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the interactive configuration interfaces (you can jump directly to a symbol with /), or look up the symbol in the Kconfig search page.

### The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:

1. A **BOARD**-specific configuration file stored in boards/<architecture>/<BOARD>/
   <BOARD>_.defconfig

2. Any CMake cache entries prefix with CONFIG_

3. The application configuration

The application configuration can come from the sources below (each file is known as a Kconfig fragment, which are then merged to get the final configuration used for a particular build). By default, prj.conf is used.

1. If CONF_FILE is set, the configuration file(s) specified in it are merged and used as the application configuration. CONF_FILE can be set in various ways:
1. In CMakeLists.txt, before calling `find_package(Zephyr)`
2. By passing `-DCONF_FILE=<conf file(s)>`, either directly or via `west`
3. From the CMake variable cache

   2. Otherwise if `CONF_FILE` is set, and a single configuration file of the form `prj_<build>.conf` is used, then if file `boards/<BOARD>_<build>.conf` exists in same folder as file `prj_<build>.conf`, the result of merging `prj_<build>.conf` and `boards/<BOARD>_<build>.conf` is used.
3. Otherwise, `prj_<BOARD>.conf` is used if it exists in the application configuration directory.
4. Otherwise, if `boards/<BOARD>.conf` exists in the application configuration directory, the result of merging it with `prj.conf` is used.
5. Otherwise, if board revisions are used and `boards/<BOARD>_<revision>.conf` exists in the application configuration directory, the result of merging it with `prj.conf` and `boards/<BOARD>.conf` is used.
6. Otherwise, `prj.conf` is used from the application configuration directory. If it does not exist then a fatal error will be emitted.

   All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the `CONF_FILE`, `EXTRA_CONF_FILE`, `DTC_OVERLAY_FILE`, and `EXTRA_DTC_OVERLAY_FILE` arguments. For these, a file in a Zephyr module can be referred by escaping the Zephyr module dir variable like this `\${ZEPHYR_<module>_MODULE_DIR}/<path-to>/<file>` when setting any of said variables in the application's CMakeLists.txt.

   See Application Configuration Directory on how the application configuration directory is defined.

   If a symbol is assigned both in `<BOARD>_defconfig` and in the application configuration, the value set in the application configuration takes precedence.

   The merged configuration is saved to `zephyr/.config` in the build directory.

   As long as `zephyr/.config` exists and is up-to-date (is newer than any `<BOARD>` and application configuration files), it will be used in preference to producing a new merged configuration. `zephyr/.config` is also the configuration that gets modified when making changes in the interactive configuration interfaces.

### Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible symbols. This is done in `boards/<architecture>/<BOARD>/Kconfig.defconfig`, which is a regular Kconfig file.

**Note:** Assignments in `.config` files have no effect on invisible symbols, so this scheme is not just an organizational issue.

Assigning values in `Kconfig.defconfig` relies on defining a Kconfig symbol in multiple locations. As an example, say we want to set `FOO_WIDTH` below to 32:

```c
config FOO_WIDTH
    int
```

To do this, we extend the definition of `FOO_WIDTH` as follows, in `Kconfig.defconfig`:

```c
if BOARD_MY_BOARD
    config FOO_WIDTH
        default 32
endif
```
Note: Since the type of the symbol (int) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the “base” definition of the symbol is a good idea for reasons explained in Common Kconfig shorthands.

default values in Kconfig.defconfig files have priority over default values given on the “base” definition of a symbol. Internally, this is implemented by including the Kconfig.defconfig files first. Kconfig uses the first default with a satisfied condition, where an empty condition corresponds to if y (is always satisfied).

Note that conditions from surrounding top-level if's are propagated to symbol properties, so the above default is equivalent to default 32 if BOARD_MY_BOARD.

Warning: When defining a symbol in multiple locations, dependencies are ORed together rather than ANDed together. It is not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the direct dependencies of the symbol below becomes DEP1 || DEP2:

```
config FOO
  ...
  depends on DEP1
config FOO
  ...
  depends on DEP2
```

When making changes to Kconfig.defconfig files, always check the symbol's direct dependencies in one of the interactive configuration interfaces afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol's dependencies.

Motivation for Kconfig.defconfig files One motivation for this configuration scheme is to avoid making fixed BOARD-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via <BOARD>_defconfig, all symbols would have to be visible, as values given in <BOARD>_defconfig have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via devicetree instead.

Configuring choices There are two ways to configure a Kconfig choice:

1. By setting one of the choice symbols to y in a configuration file.

   Setting one choice symbol to y automatically gives all other choice symbols the value n.

   If multiple choice symbols are set to y, only the last one set to y will be honored (the rest will get the value n). This allows a choice selection from a board defconfig file to be overridden from an application prj.conf file.

2. By changing the default of the choice in Kconfig.defconfig.

   As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

   As an example, assume that a choice has the following base definition (here, the name of the choice is FOO):

   ```
   config FOO
     ...
     depends on DEP1
   config FOO
     ...
     depends on DEP2
   ```

   When making changes to Kconfig.defconfig files, always check the symbol's direct dependencies in one of the interactive configuration interfaces afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol's dependencies.
To change the default symbol of `FOO` to `A`, you would add the following definition to `Kconfig`.

```c
choice FOO
    bool "Foo choice"
    default B
config A
    bool "A"
config B
    bool "B"
endchoice
```

The `Kconfig.defconfig` method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

**More Kconfig resources**  The `Kconfig - Tips and Best Practices` page has some tips for writing Kconfig files.

The `kconfiglib.py` docstring (at the top of the file) goes over how symbol values are calculated in detail.

### 5.3.3 Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

**Note:** The official Kconfig documentation is `kconfig-language.rst` and `kconfig-macro-language.rst`.
• menuconfig symbols
• Commas in macro arguments
• Checking changes in menuconfig/guiconfig
• Checking changes with scripts/kconfig/lint.py
• Style recommendations and shorthands
  – Factoring out common dependencies
  – Redundant defaults
  – Common Kconfig shorthands
  – Prompt strings
  – Header comments and other nits
• Lesser-known/used Kconfig features
  – The \texttt{imply} statement
  – Optional prompts
  – Optional choices
  – \texttt{visible if} conditions
• Other resources

What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don’t.

If a symbol has a prompt (e.g. \texttt{bool "Enable foo"}), then the user can change the symbol’s value in the menuconfig or guiconfig interface (see Interactive Kconfig interfaces), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called \textit{hidden} or \textit{invisible} symbols, because they don’t show up in menuconfig and guiconfig. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can’t be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the \textit{optional prompts} section for a way to deal with settings that are fixed on some machines and configurable on other machines.

What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via \texttt{devicetree} instead.

In particular, avoid adding new Kconfig options of the following types:
Options that specify a device in the system by name  For example, if you are writing an I2C device driver, avoid creating an option named MY_DEVICE_I2C_BUS_NAME for specifying the bus node your device is controlled by. See Device drivers that depend on other devices for alternatives.

Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like MY_PWM_DEVICE_NAME. See Applications that depend on board-specific devices for alternatives.

Options that specify fixed hardware configuration  For example, avoid Kconfig options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type phandle-array in the device binding, and using the GPIO devicetree API from C. Similar advice applies to other cases where devicetree.h provides Hardware specific APIs for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree binding to identify board specific properties may be appropriate. See tests/drivers/gpio/gpio_basic_api for an example.

For applications, see blinky-sample for a devicetree-based alternative.

select statements

The select statement is used to force one symbol to y whenever another symbol is y. For example, the following code forces CONSOLE to y whenever USB_CONSOLE is y:

```c
config CONSOLE
  bool "Console support"

...

cfgi USB_CONSOLE
  bool "USB console support"
  select CONSOLE
```

This section covers some pitfalls and good uses for select.

select pitfalls  select might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the CONSOLE symbol above, by a developer who is unaware of the USB_CONSOLE symbol (or simply forgot about it):

```c
config CONSOLE
  bool "Console support"
  depends on STRING_ROUTINES
```

Enabling USB_CONSOLE now forces CONSOLE to y, even if STRING_ROUTINES is n.

To fix the problem, the STRING_ROUTINES dependency needs to be added to USB_CONSOLE as well:

```c
config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
  depends on STRING_ROUTINES

... (continues on next page)```
More insidious cases with dependencies inherited from `if` and `menu` statements are common.

An alternative attempt to solve the issue might be to turn the `depends on` into another `select`:

```plaintext
config CONSOLE
  bool "Console support"
select STRING_ROUTINES

... 

config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
```

In practice, this often amplifies the problem, because any dependencies added to `STRING_ROUTINES` now need to be copied to both `CONSOLE` and `USB_CONSOLE`.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.

Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in Using select for helper symbols.

Liberal use of `select` also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of `select`, which hides ways in which a symbol might get enabled.

**Alternatives to select** For the example in the previous section, a better solution is usually to turn the `select` into a `depends on`:

```plaintext
config CONSOLE
  bool "Console support"

... 

config USB_CONSOLE
  bool "USB console support"
  depends on CONSOLE
```

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using `depends on` here might be that configuration files that enable `USB_CONSOLE` now also need to enable `CONSOLE`:

```
CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y
```

This comes down to a trade-off, but if enabling `CONSOLE` is the norm, then a mitigation is to make `CONSOLE` default to `y`:

```plaintext
config CONSOLE
  bool "Console support"
  default y
```

This gives just a single assignment in configuration files:
Note that configuration files that do not want CONSOLE enabled now have to explicitly disable it:

```
CONFIG_CONSOLE=n
```

**Using `select` for helper symbols** A good and safe use of `select` is for setting “helper” symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

```
config CPU_HAS_FPU
    bool
    help
        If y, the CPU has an FPU
...
config SOC_FOO
    bool "FOO SoC"
    select CPU_HAS_FPU
...
config SOC_BAR
    bool "BAR SoC"
    select CPU_HAS_FPU
```

This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

```
config FPU
    bool "Support floating point operations"
    depends on CPU_HAS_FPU
```

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

```
config FPU
    bool "Support floating point operations"
    depends on SOC_FOO || SOC_BAR || ...
```

Invisible helper symbols can also be useful without `select`. For example, the following code defines a helper symbol that has the value `y` if the machine has some arbitrarily-defined “large” amount of memory:

```
config LARGE_MEM
    def_bool MEM_SIZE >= 64
```

**Note:** This is short for the following:

```
config LARGE_MEM
    bool
    default MEM_SIZE >= 64
```

**select recommendations** In summary, here are some recommended practices for `select`:
• Avoid selecting symbols with prompts or dependencies. Prefer \texttt{depends on}. If \texttt{depends on} causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

Rare exceptions might include cases where you're sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same \texttt{if}.

Common sense applies, but be aware that \texttt{select} often causes issues in practice. \texttt{depends on} is usually a cleaner and safer solution.

• Select simple helper symbols without prompts and dependencies however much you like. They're a great tool for simplifying Kconfig files.

(Lack of) conditional includes

\texttt{if} blocks add dependencies to each item within the \texttt{if}, as \texttt{if \ depends on} was used.

A common misunderstanding related to \texttt{if} is to think that the following code conditionally includes the file \texttt{Kconfig.other}:

\begin{verbatim}
if DEP
source "Kconfig.other"
endif
\end{verbatim}

In reality, there are no conditional includes in Kconfig. \texttt{if} has no special meaning around a \texttt{source}.

\textbf{Note:} Conditional includes would be impossible to implement, because \texttt{if} conditions may contain (either directly or indirectly) forward references to symbols that haven't been defined yet.

Say that \texttt{Kconfig.other} above contains this definition:

\begin{verbatim}
config FOO
  bool "Support foo"
\end{verbatim}

In this case, \texttt{FOO} will end up with this definition:

\begin{verbatim}
config FOO
  bool "Support foo"
  depends on DEP
\end{verbatim}

Note that it is redundant to add \texttt{depends on} \texttt{DEP} to the definition of \texttt{FOO} in \texttt{Kconfig.other}, because the \texttt{DEP} dependency has already been added by \texttt{if DEP}.

In general, try to avoid adding redundant dependencies. They can make the structure of the Kconfig files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

“Stuck” symbols in menuconfig and guiconfig

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:

\begin{verbatim}
config FOO
  bool "Foo"

config STACK SIZE
  hex "Stack size"
  default 0x200 if FOO
  default 0x100
\end{verbatim}
Assume that the intention here is to use a larger stack whenever FOO is enabled, and that the configuration initially has FOO disabled. Also, remember that Zephyr creates an initial configuration in zephyr/.config in the build directory by merging configuration files (including e.g. prj.conf). This configuration file exists before menuconfig or guiconfig is run.

When first entering the configuration interface, the value of STACK_SIZE is 0x100, as expected. After enabling FOO, you might reasonably expect the value of STACK_SIZE to change to 0x200, but it stays as 0x100.

To understand what's going on, remember that STACK_SIZE has a prompt, meaning it is user-configurable, and consider that all Kconfig has to go on from the initial configuration is this:

```
CONFIG_STACK_SIZE=0x100
```

Since Kconfig can't know if the 0x100 value came from a default or was typed in by the user, it has to assume that it came from the user. Since STACK_SIZE is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of STACK_SIZE appears to be “frozen” at 0x100 when toggling FOO.

The right fix depends on what the intention is. Here’s some different scenarios with suggestions:

- If STACK_SIZE can always be derived automatically and does not need to be user-configurable, then just remove the prompt:

  ```
  config STACK_SIZE
  hex
  default 0x200 if FOO
  default 0x100
  ```

  Symbols without prompts ignore any value from the saved configuration.

- If STACK_SIZE should usually be user-configurable, but needs to be set to 0x200 when FOO is enabled, then disable its prompt when FOO is enabled, as described in optional prompts:

  ```
  config STACK_SIZE
  hex "Stack size" if !FOO
  default 0x200 if FOO
  default 0x100
  ```

- If STACK_SIZE should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making STACK_SIZE user-configurable:

  ```
  config CUSTOM_STACK_SIZE
  bool "Use a custom stack size"
  help
  Enable this if you need to use a custom stack size. When disabled, a suitable stack size is calculated automatically.

  config STACK_SIZE
  hex "Stack size" if CUSTOM_STACK_SIZE
  default 0x200 if FOO
  default 0x100
  ```

  As long as CUSTOM_STACK_SIZE is disabled, STACK_SIZE will ignore the value from the saved configuration.

It is a good idea to try out changes in the menuconfig or guiconfig interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.
Assignments to promptless symbols in configuration files

Assignments to hidden (promptless, also called invisible) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. default and select.

A common source of confusion is opening the output configuration file (zephyr/.config), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in zephyr/.config are ignored by Kconfig, like for other configuration files.

To understand why zephyr/.config still includes assignments to hidden symbols, it helps to realize that zephyr/.config serves two separate purposes:

1. It holds the saved configuration, and
2. it holds configuration output. zephyr/.config is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in zephyr/.config are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

Note: A minimal configuration, which can be generated from within the menuconfig and guiconfig interfaces, could be considered closer to just a saved configuration, without the full configuration output.

depends on and string/int/hex symbols

depends on works not just for bool symbols, but also for string, int, and hex symbols (and for choices).

The Kconfig definitions below will hide the FOO_DEVICE_FREQUENCY symbol and disable any configuration output for it when FOO_DEVICE is disabled.

```
config FOO_DEVICE
  bool "Foo device"

config FOO_DEVICE_FREQUENCY
  int "Foo device frequency"
  depends on FOODEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the menuconfig/guiconfig interface. Having FOO_DEVICE_FREQUENCY show up when FOO_DEVICE is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at FOO_DEVICE_FREQUENCY when FOO_DEVICE is disabled.

menuconfig symbols

If the definition of a symbol FOO is immediately followed by other symbols that depend on FOO, then those symbols become children of FOO. If FOO is defined with config FOO, then the children are shown indented relative to FOO. Defining FOO with menuconfig FOO instead puts the children in a separate menu root at FOO.

menuconfig has no effect on evaluation. It’s just a display option.

menuconfig can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```
menu "Foo subsystem"
config FOO_SUBSYSTEM
```

(continues on next page)
bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM
endmenu

In this case, it's probably better to get rid of the menu and turn FOO_SUBSYSTEM into a menuconfig symbol:

menuconfig FOO_SUBSYSTEM
    bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM
endmenu

In the menuconfig interface, this will be displayed as follows:

[•] Foo subsystem --->

Note that making a symbol without children a menuconfig is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

[•] I have no children ----
[•] All my children are invisible ----

Commas in macro arguments

Kconfig uses commas to separate macro arguments. This means a construct like this will fail:

config FOO
    bool
    default y if $(dt_chosen_enabled,"zephyr,bar")
To solve this problem, create a variable with the text and use this variable as argument, as follows:

```c
DT_CHOSEN_ZEPHYR_BAR := zephyr,bar

config FOO
    bool
default y if $(dt_chosen_enabled,$(DT_CHOSEN_ZEPHYR_BAR))
```

### Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in `menuconfig` or `guiconfig` afterwards. To get to a symbol quickly, use the jump-to feature (press `/`).

Here are some things to check:

- Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.

  If one symbol depends on another, then it’s often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the `menuconfig` interface, and in a separate menu rooted at the symbol in `guiconfig`. This also works if several symbols are placed after the symbol they depend on.

- Is it easy to guess what the symbols do from their prompts?

- If many symbols are added, do all combinations of values they can be set to make sense?

  For example, if two symbols `FOO_SUPPORT` and `NO_FOO_SUPPORT` are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it’s probably better to have a single `FOO_SUPPORT` symbol.

- Are there any duplicated dependencies?

  This can be checked by selecting a symbol and pressing `?` to view the symbol information. If there are duplicated dependencies, then use the `Included via ...` path shown in the symbol information to figure out where they come from.

### Checking changes with `scripts/kconfig/lint.py`

After you make Kconfig changes, you can use the `scripts/kconfig/lint.py` script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use `--help` to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there’s a problem. If a check returns a false positive e.g. due to token pasting in C (CONFG_FOO_##index##_BAR), just ignore it.

When investigating an unknown symbol `FOO_BAR`, it is a good idea to run `git grep FOO_BAR` to look for references. It is also a good idea to search for some components of the symbol name with e.g. `git grep FOO` and `git grep BAR`, as it can help uncover token pasting.

### Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.
Factoring out common dependencies  If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an if.

As an example, consider the following code:

```plaintext
config FOO
    bool "Foo"
    depends on DEP

config BAR
    bool "Bar"
    depends on DEP

choice
    prompt "Choice"
    depends on DEP

config BAZ
    bool "Baz"

config QAZ
    bool "Qaz"
endchoice
```

Here, the DEP dependency can be factored out like this:

```plaintext
if DEP
    config FOO
        bool "Foo"
    config BAR
        bool "Bar"
    choice
        prompt "Choice"
    config BAZ
        bool "Baz"
    config QAZ
        bool "Qaz"
endchoice
endif # DEP
```

Note: Internally, the second version of the code is transformed into the first.

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

```plaintext
menu "Foo features"
    depends on FOO_SUPPORT

config FOO_FEATURE_1
```

(continues on next page)
If FOO_SUPPORT is n, the entire menu disappears.

**Redundant defaults**  bool symbols implicitly default to n, and string symbols implicitly default to the empty string. Therefore, default n and default "" are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for bool and string symbols. That also generates clearer documentation: *(Implicitly defaults to n instead of n if <dependencies, possibly inherited>).*

Defaults *should* always be given for int and hex symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit 0 default might be less likely to be what was intended compared to other symbol types as well.

The one case where default n/default "" is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a default y on a later definition. Note that a default n does not override a previously defined default y.

That is, FOO will be set to n in the example below. If the default n was omitted in the first definition, FOO would have been set to y.

```plaintext
config FOO
    bool "foo"
    default n
config FOO
    bool "foo"
    default y
```

In the following example FOO will get the value y.

```plaintext
config FOO
    bool "foo"
    default y
config FOO
    bool "foo"
    default n
```

**Common Kconfig shorthands**  Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```plaintext
config FOO
    bool "foo"
```

```plaintext
config FOO
    bool
    prompt "foo"
```

The first style, with the shorthand, is preferred in Zephyr.
• `def_<type>` `<value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```kconfig
config FOO
  def_bool BAR && BAZ
```

```kconfig
config FOO
  bool
  default BAR && BAZ
```

Using both the `<type>` "prompt" and the `def_<type>` `<value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type>` `<value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.

**Note:** For a symbol defined in multiple locations (e.g., in a `Kconfig.defconfig` file in Zephyr), it is best to only give the symbol type for the “base” definition of the symbol, and to use `default` (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

**Prompt strings** For a Kconfig symbol that enables a driver/subsystem FOO, consider having just “Foo” as the prompt, instead of “Enable Foo support” or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

**Header comments and other nits** A few formatting nits, to help keep things consistent:

• Use this format for any header comments at the top of Kconfig files:

```kconfig
# <Overview of symbols defined in the file, preferably in plain English>
(Blank line)
# Copyright (c) 2019 ...
# SPDX-License-Identifier: <License>
(Blank line)
(Kconfig definitions)
```

• Format comments as `# Comment` rather than `#Comment`

• Put a blank line before/after each top-level `if` and `endif`

• Use a single tab for each indentation

• Indent help text with two extra spaces

**Lesser-known/used Kconfig features**

This section lists some more obscure Kconfig behaviors and features that might still come in handy.

**The `imply` statement** The `imply` statement is similar to `select`, but respects dependencies and doesn’t force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:
config SOC_FOO
    bool "FOO SoC"
    imply USB_KEYBOARD
...

config USB_KEYBOARD
    bool "USB keyboard support"

implies acts like a suggestion, whereas select forces a value.

Optional prompts A condition can be put on a symbol’s prompt to make it optionally configurable by the user. For example, a value \texttt{MASK} that’s hardcoded to 0xFF on some boards and configurable on others could be expressed as follows:

\begin{verbatim}
config MASK
    hex "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
\end{verbatim}

\textbf{Note:} This is short for the following:

\begin{verbatim}
config MASK
    hex
    prompt "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
\end{verbatim}

The \texttt{HAS_CONFIGURABLE_MASK} helper symbol would get selected by boards to indicate that \texttt{MASK} is configurable. When \texttt{MASK} is configurable, it will also default to 0xFF.

Optional choices Defining a choice with the \texttt{optional} keyword allows the whole choice to be toggled off to select none of the symbols:

\begin{verbatim}
choice
    prompt "Use legacy protocol"
    optional

config LEGACY_PROTOCOL_1
    bool "Legacy protocol 1"

cfgi LEGACY_PROTOCOL_2
    bool "Legacy protocol 2"
endchoice
\end{verbatim}

In the menuconfig interface, this will be displayed e.g. as [\*] Use legacy protocol (Legacy protocol 1) --->, where the choice can be toggled off to enable neither of the symbols.

visible if conditions Putting a \texttt{visible if} condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

\begin{verbatim}
menu "Foo subsystem"
    depends on HAS_CONFIGURABLE_FOO
\end{verbatim}

(continues on next page)
When HAS_CONFIGURABLE_FOO is n, no configuration output is generated for FOO_SETTING_1 and FOO_SETTING_2, as the code above is logically equivalent to the following code:

```plaintext
config FOO_SETTING_1
    int "Foo setting 1"
    default 1
    depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
    depends on HAS_CONFIGURABLE_FOO
endmenu
```

If we want the symbols to still get their default values even when HAS_CONFIGURABLE_FOO is n, but not be configurable by the user, then we can use `visible if` instead:

```plaintext
menu "Foo subsystem"
    visible if HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
    int "Foo setting 1"
    default 1

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
endmenu
```

This is logically equivalent to the following:

```plaintext
config FOO_SETTING_1
    int "Foo setting 1" if HAS_CONFIGURABLE_FOO
    default 1

config FOO_SETTING_2
    int "Foo setting 2" if HAS_CONFIGURABLE_FOO
    default 2
```

**Note:** See the optional prompts section for the meaning of the conditions on the prompts.

When HAS_CONFIGURABLE is n, we now get the following configuration output for the symbols, instead of no output:
Other resources

The *Intro to symbol values* section in the Kconfiglib docstring goes over how symbols values are calculated in more detail.

### 5.3.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in `scripts/kconfig/kconfigfunctions.py`.

**Note:** The official Kconfig preprocessor documentation can be found [here](#).

Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree `reg` property.

#### Devicetree-related Functions

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in `scripts/kconfig/kconfigfunctions.py` for detailed documentation.

The `*_int` version of each function returns the value as a decimal integer, while the `*_hex` version returns a hexadecimal value starting with `0x`.

```latex
$(dt_has_compat,<compatible string>)
$(dt_compat_enabled,<compatible string>)
$(dt_compat_on_bus,<compatible string>,<bus>)
$(dt_chosen_label,<property in /chosen>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_chosen_path,<property in /chosen>)
$(dt_chosen_has_compat,<property in /chosen>)
$(dt_path_enabled,<node path>)
$(dt_alias_enabled,<node alias>)
$(dt_nodelabel_enabled,<node label>)
$(dt_nodelabel_enabled_with_compat,<node label>,<compatible string>)
$(dt_chosen_reg_addr_int,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_addr_hex,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_size_int,<property in /chosen>[,<index>,<unit>])
$(dt_chosen_reg_size_hex,<property in /chosen>[,<index>,<unit>])
$(dt_node_reg_addr_int,<node path>[,<index>,<unit>])
$(dt_node_reg_addr_hex,<node path>[,<index>,<unit>])
$(dt_node_reg_size_int,<node path>[,<index>,<unit>])
$(dt_node_reg_size_hex,<node path>[,<index>,<unit>])
$(dt_nodelabel_reg_addr_int,<node label>[,<index>,<unit>])
$(dt_nodelabel_reg_addr_hex,<node label>[,<index>,<unit>])
$(dt_nodelabel_reg_size_int,<node label>[,<index>,<unit>])
$(dt_nodelabel_reg_size_hex,<node label>[,<index>,<unit>])
$(dt_compat_enabled,<compatible string>)
$(dt_chosen_enabled,<property in /chosen>)
```
Example Usage  Assume that the devicetree for some board looks like this:

```c
{
    soc {
        #address-cells = <1>;
        #size-cells = <1>;

        spi0: spi@0014000 {
            compatible = "sifive,spi0";
            reg = <0x0014000 0x1000 0x20010000 0x3c0900>;
            reg-names = "control", "mem";
            ...
        }
    }
}
```

The second entry in `reg` in `spi@0014000 (<0x20010000 0x3c0900>)` corresponds to `mem`, and has the address `0x20010000`. This address can be inserted into Kconfig as follows:

```kconfig
config FLASH_BASE_ADDRESS
    default $(dt_node_reg_addr_hex,/soc/spi@0014000,1)
```

After preprocessor expansion, this turns into the definition below:

```kconfig
config FLASH_BASE_ADDRESS
    default 0x20010000
```

### 5.3.5 Kconfig extensions

Zephyr uses the Kconfiglib implementation of Kconfig, which includes some Kconfig extensions:

- Environment variables in source statements are expanded directly, meaning no “bounce” symbols with option `env="ENV_VAR"` need to be defined.

  **Note:** option `env` has been removed from the C tools as of Linux 4.18 as well.

The recommended syntax for referencing environment variables is `${F00}` rather than `$F00`. This uses the new Kconfig preprocessor. The `$F00` syntax for expanding environment variables is only supported for backwards compatibility.
The `source` statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.

Consider the following example:

```
source "foo/bar/*/Kconfig"
```

If the pattern `foo/bar/*/Kconfig` matches the files `foo/bar/baz/Kconfig` and `foo/bar/qaz/Kconfig`, the statement above is equivalent to the following two `source` statements:

```
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

If no files match the pattern, an error is generated.

The wildcard patterns accepted are the same as for the Python `glob` module.

For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate `osource` (optional `source`) statement is available. `osource` is a no-op if no file matches.

**Note:** `source` and `osource` are analogous to `include` and `-include` in Make.

• An `rsource` statement is available for including files specified with a relative path. The path is relative to the directory of the `Kconfig` file that contains the `rsource` statement.

As an example, assume that `foo/Kconfig` is the top-level `Kconfig` file, and that `foo/bar/Kconfig` has the following statements:

```
source "qaz/Kconfig1"
rsource "qaz/Kconfig2"
```

This will include the two files `foo/qaz/Kconfig1` and `foo/bar/qaz/Kconfig2`.

`rsource` can be used to create `Kconfig` “subtrees” that can be moved around freely.

`rsource` also supports glob patterns.

A drawback of `rsource` is that it can make it harder to figure out where a file gets included, so only use it if you need it.

• An `orsource` statement is available that combines `osource` and `rsource`.

For example, the following statement will include `Kconfig1` and `Kconfig2` from the current directory (if they exist):

```
orsource "Kconfig[12]"
```

• `def_int`, `def_hex`, and `def_string` keywords are available, analogous to `def_bool`. These set the type and add a default at the same time.

Users interested in optimizing their configuration for security should refer to the Zephyr Security Guide's section on the Hardening Tool.

## 5.4 Snippets

Snippets are a way to save build system settings in one place, and then use those settings when you build any Zephyr application. This lets you save common configuration separately when it applies to multiple different applications.

Some example use cases for snippets are:

• changing your board's console backend from a “real” UART to a USB CDC-ACM UART
• enabling frequently-used debugging options
• applying interrelated configuration settings to your “main” CPU and a co-processor core on an AMP SoC

The following pages document this feature.

5.4.1 Using Snippets

Tip: See Built-in snippets for a list of snippets that are provided by Zephyr.

Snippets have names. You use snippets by giving their names to the build system.

With west build

To use a snippet named foo when building an application app:

```
west build -S foo app
```

To use multiple snippets:

```
west build -S snippet1 -S snippet2 [...] app
```

With cmake

If you are running CMake directly instead of using west build, use the SNIPPET variable. This is a whitespace- or semicolon-separated list of snippet names you want to use. For example:

```
cmake -Sapp -Bbuild -DSNIPPET="snippet1;snippet2" [...] 
cmake --build build
```

5.4.2 Built-in snippets

CDC-ACM Console Snippet (cdc-acm-console)

```
west build -S cdc-acm-console [...] 
```

Overview This snippet redirects serial console output to a CDC ACM UART. The USB device which should be used is configured using Devicetree.

Requirements Hardware support for:

• CONFIG_USB_DEVICE_STACK
• CONFIG_SERIAL
• CONFIG_CONSOLE
• CONFIG_UART_CONSOLE
• CONFIG_UART_LINE_CTRL

A devicetree node with node label zephyr_udc0 that points to an enabled USB device node with driver support. This should look roughly like this in your devicetree:
5.4.3 Writing Snippets

Basics

Snippets are defined using YAML files named snippet.yml. A snippet.yml file contains the name of the snippet, along with additional build system settings, like this:

```
name: snippet-name
# ... build system settings go here ...
```

Build system settings go in other keys in the file as described later on in this page.

You can combine settings whenever they appear under the same keys. For example, you can combine a snippet-specific devicetree overlay and a .conf file like this:

```
name: foo
append:
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
  EXTRA_CONF_FILE: foo.conf
```

Namespace

When writing devicetree overlays in a snippet, use snippet_<name> or snippet-<name> as a namespace prefix when choosing names for node labels, node names, etc. This avoids namespace conflicts.

For example, if your snippet is named foo-bar, write your devicetree overlays like this:

```
chosen {
    zephyr, baz = &snippet_foo_bar_dev;
}
```

(continues on next page)
Where snippets are located

The build system looks for snippets in these places:

1. In directories configured by the `SNIPPET_ROOT` CMake variable. This always includes the zephyr repository (so `snippets/` is always a source of snippets) and the application source directory (so `<app>/snippets` is also).

   Additional directories can be added manually at CMake time.

   The variable is a whitespace- or semicolon-separated list of directories which may contain snippet definitions.

   For each directory in the list, the build system looks for `snippet.yml` files underneath a subdirectory named `snippets/`, if one exists.

   For example, if `SNIPPET_ROOT` is set to `/foo;/bar`, the build system will look for `snippet.yml` files underneath the following subdirectories:

   • `/foo/snippets/`
   • `/bar/snippets/`

   The `snippet.yml` files can be nested anywhere underneath these locations.

2. In any `module` whose `module.yml` file provides a `snippet_root` setting.

   For example, in a zephyr module named `baz`, you can add this to your `module.yml` file:

   ```
   settings:
       snippet_root: .
   ```

   And then any `snippet.yml` files in `baz/snippets` will automatically be discovered by the build system, just as if the path to `baz` had appeared in `SNIPPET_ROOT`.

Processing order

Snippets are processed in the order they are listed in the `SNIPPET` variable, or in the order of the `-S` arguments if using west.

To apply bar after foo:

```
cmake -Sapp -Bbuild -DSNIPPET="foo;bar" [...] 
cmake --build build
```

The same can be achieved with west as follows:

```
west build -S foo -S bar [...] app
```

When multiple snippets set the same configuration, the configuration value set by the last processed snippet ends up in the final configurations.

For instance, if `foo` sets `CONFIG_FOO=1` and `bar` sets `CONFIG_FOO=2` in the above example, the resulting final configuration will be `CONFIG_FOO=2` because `bar` is processed after `foo`.

This principle applies to both Kconfig fragments (`.conf` files) and devicetree overlays (`.overlay` files).
Devicetree overlays (.overlay)

This snippet.yml adds foo.overlay to the build:

```yaml
name: foo
append:
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
```

The path to foo.overlay is relative to the directory containing snippet.yml.

.conf files

This snippet.yml adds foo.conf to the build:

```yaml
name: foo
append:
  EXTRA_CONF_FILE: foo.conf
```

The path to foo.conf is relative to the directory containing snippet.yml.

DTS_EXTRA_CPPFLAGS

This snippet.yml adds DTS_EXTRA_CPPFLAGS CMake Cache variables to the build:

```yaml
name: foo
append:
  DTS_EXTRA_CPPFLAGS: -DMY_DTS_CONFIGURE
```

Adding these flags enables control over the content of a devicetree file.

Board-specific settings

You can write settings that only apply to some boards.

The settings described here are applied in addition to snippet settings that apply to all boards. (This is similar, for example, to the way that an application with both prj.conf and boards/foo.conf files will use both .conf files in the build when building for board foo, instead of just boards/foo.conf)

By name

```yaml
name: ...
boards:
  bar: # settings for board "bar" go here
      append:
        EXTRA_DTC_OVERLAY_FILE: bar.overlay
  baz: # settings for board "baz" go here
      append:
        EXTRA_DTC_OVERLAY_FILE: baz.overlay
```

The above example uses bar.overlay when building for board bar, and baz.overlay when building for baz.

By regular expression You can enclose the board name in slashes (/) to match the name against a regular expression in the CMake syntax. The regular expression must match the entire board name.

For example:
name: foo
boards:
  /my_vendor_.*/:
    append:
      EXTRA_DTC_OVERLAY_FILE: my_vendor.overlay

The above example uses devicetree overlay my_vendor.overlay when building for either board my_vendor_board1 or my_vendor_board2. It would not use the overlay when building for either another_vendor_board or x_my_vendor_board.

5.4.4 Snippets Design

This page documents design goals for the snippets feature. Further information can be found in Issue #51834.

- **extensible**: for example, it is possible to add board support for an existing built-in snippet without modifying the zephyr repository
- **composable**: it is possible to use multiple snippets at once, for example using:

  west build -S <snippet1> -S <snippet2> ...

- **able to combine multiple types of configuration**: snippets make it possible to store multiple different types of build system settings in one place, and apply them all together
- **specializable**: for example, it is possible to customize a snippet's behavior for a particular board, or board revision
- **future-proof and backwards-compatible**: arbitrary future changes to the snippets feature will be possible without breaking backwards compatibility for older snippets
- **applicable to purely “software” changes**: unlike the shields feature, snippets do not assume the presence of a “daughterboard”, “shield”, “hat”, or any other type of external assembly which is connected to the main board
- **DRY (don't repeat yourself)**: snippets allow you to skip unnecessary repetition; for example, you can apply the same board-specific configuration to boards foo and bar by specifying /((foo|bar)/ as a regular expression for the settings, which will then apply to both boards

5.5 Zephyr CMake Package

The Zephyr CMake package is a convenient way to create a Zephyr-based application.

**Note**: The Application types section introduces the application types used in this page.

The Zephyr CMake package ensures that CMake can automatically select a Zephyr installation to use for building the application, whether it is a Zephyr repository application, a Zephyr workspace application, or a Zephyr freestanding application.

When developing a Zephyr-based application, then a developer simply needs to write find_package(Zephyr) in the beginning of the application CMakeLists.txt file.

To use the Zephyr CMake package it must first be exported to the CMake user package registry. This is means creating a reference to the current Zephyr installation inside the CMake user package registry.

Ubuntu

In Linux, the CMake user package registry is found in:
In macOS, the CMake user package registry is found in:

```
~/.cmake/packages/Zephyr
```

In Windows, the CMake user package registry is found in:

```
HKEY_CURRENT_USER\Software\Kitware\CMake\Packages\Zephyr
```

The Zephyr CMake package allows CMake to automatically find a Zephyr base. One or more Zephyr installations must be exported. Exporting multiple Zephyr installations may be useful when developing or testing Zephyr freestanding applications, Zephyr workspace application with vendor forks, etc..

### 5.5.1 Zephyr CMake package export (west)

When installing Zephyr using `west` then it is recommended to export Zephyr using `west zephyr-export`.

### 5.5.2 Zephyr CMake package export (without west)

Zephyr CMake package is exported to the CMake user package registry using the following commands:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyr-package/cmake/zephyr_export.cmake
```

This will export the current Zephyr to the CMake user package registry.

To also export the Zephyr Unittest CMake package, run the following command in addition:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyrunittest-package/cmake/zephyr_export.cmake
```

### 5.5.3 Zephyr Base Environment Setting

The Zephyr CMake package search functionality allows for explicitly specifying a Zephyr base using an environment variable.

To do this, use the following `find_package()` syntax:

```
find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
```

This syntax instructs CMake to first search for Zephyr using the Zephyr base environment setting `ZEPHYR_BASE` and then use the normal search paths.

### 5.5.4 Zephyr CMake Package Search Order

When Zephyr base environment setting is not used for searching, the Zephyr installation matching the following criteria will be used:

- A Zephyr repository application will use the Zephyr in which it is located. For example:

  ```
  <projects>/zephyr-workspace/zephyr
  └── samples
  │   └── hello_world
  ```

  In this example, `hello_world` will use `<projects>/zephyr-workspace/zephyr`.

- Zephyr workspace application will use the Zephyr that share the same workspace. For example:
in this example, my_first_app will use `<projects>/zephyr-workspace/zephyr` as this Zephyr is located in the same workspace as the Zephyr workspace application.

**Note:** The root of a Zephyr workspace is identical to `west topdir` if the workspace was installed using `west`.

- Zephyr freestanding application will use the Zephyr registered in the CMake user package registry. For example:

  ```
  <projects>/zephyr-workspace-1
  ├── zephyr
  │    (Not exported to CMake)
  <projects>/zephyr-workspace-2
  ├── zephyr
  │    (Exported to CMake)
  <home>/app
  ├── CMakeLists.txt
  ├── prj.conf
  └── src
      └── main.c
  ```

  in this example, only `<projects>/zephyr-workspace-2/zephyr` is exported to the CMake package registry and therefore this Zephyr will be used by the Zephyr freestanding application `<home>/app`. If user wants to test the application with `<projects>/zephyr-workspace-1/zephyr`, this can be done by using the Zephyr Base environment setting, meaning set `ZEPHYR_BASE=<projects>/zephyr-workspace-1/zephyr`, before running CMake.

  **Note:** The Zephyr package selected on the first CMake invocation will be used for all subsequent builds. To change the Zephyr package, for example to test the application using Zephyr base environment setting, then it is necessary to do a pristine build first (See Rebuilding an Application).

### 5.5.5 Zephyr CMake Package Version

When writing an application then it is possible to specify a Zephyr version number `x.y.z` that must be used in order to build the application. Specifying a version is especially useful for a Zephyr freestanding application as it ensures the application is built with a minimal Zephyr version. It also helps CMake to select the correct Zephyr to use for building, when there are multiple Zephyr installations in the system. For example:

```
find_package(Zephyr 2.2.0)
project(app)
```

will require `app` to be built with Zephyr 2.2.0 as minimum. CMake will search all exported candidates to find a Zephyr installation which matches this version criteria.
Thus it is possible to have multiple Zephyr installations and have CMake automatically select between them based on the version number provided, see CMake package version for details.

For example:

```
<projects>/zephyr-workspace-2.a
    └ zephyr
        (Exported to CMake)

<projects>/zephyr-workspace-2.b
    └ zephyr
        (Exported to CMake)

<home>/app
    └ CMakeLists.txt
    └ prj.conf
        └ src
            └ main.c
```

In this case, there are two released versions of Zephyr installed at their own workspaces. Workspace 2.a and 2.b, corresponding to the Zephyr version.

To ensure app is built with minimum version 2.a the following find_package syntax may be used:

```
find_package(Zephyr 2.a)
project(app)
```

Note that both 2.a and 2.b fulfill this requirement.

CMake also supports the keyword EXACT, to ensure an exact version is used, if that is required. In this case, the application CMakeLists.txt could be written as:

```
find_package(Zephyr 2.a EXACT)
project(app)
```

In case no Zephyr is found which satisfies the version required, as example, the application specifies

```
find_package(Zephyr 2.z)
project(app)
```

then an error similar to below will be printed:

```
Could not find a configuration file for package "Zephyr" that is compatible with requested version "2.z".

The following configuration files were considered but not accepted:

    <projects>/zephyr-workspace-2.a/zephyr/share/zephyr-package/cmake/ZephyrConfig.
        → cmake, version: 2.a.0
        → cmake, version: 2.b.0
```

**Note:** It can also be beneficial to specify a version number for Zephyr repository applications and Zephyr workspace applications. Specifying a version in those cases ensures the application will only build if the Zephyr repository or workspace is matching. This can be useful to avoid accidental builds when only part of a workspace has been updated.
5.5.6 Multiple Zephyr Installations (Zephyr workspace)

Testing out a new Zephyr version, while at the same time keeping the existing Zephyr in the workspace untouched is sometimes beneficial.

Or having both an upstream Zephyr, Vendor specific, and a custom Zephyr in same workspace.

For example:

```
<projects>/zephyr-workspace
|-- zephyr
|-- zephyr-vendor
|-- zephyr-custom
|-- ...
|-- my_applications
   |-- my_first_app
```

in this setup, `find_package(Zephyr)` has the following order of precedence for selecting which Zephyr to use:

- Project name: `zephyr`
  - First project, when Zephyr projects are ordered lexicographical, in this case.
    - `zephyr-custom`
    - `zephyr-vendor`

This means that `my_first_app` will use `<projects>/zephyr-workspace/zephyr`.

It is possible to specify a Zephyr preference list in the application.

A Zephyr preference list can be specified as:

```
set(ZEPHYR_PREFER "zephyr-custom" "zephyr-vendor")
find_package(Zephyr)
project(my_first_app)
```

the `ZEPHYR_PREFER` is a list, allowing for multiple Zephyrs. If a Zephyr is specified in the list, but not found in the system, it is simply ignored and `find_package(Zephyr)` will continue to the next candidate.

This allows for temporary creation of a new Zephyr release to be tested, without touching current Zephyr. When testing is done, the `zephyr-test` folder can simply be removed. Such a CMakeLists.txt could look as:

```
set(ZEPHYR_PREFER "zephyr-test")
find_package(Zephyr)
project(my_first_app)
```

5.5.7 Zephyr Build Configuration CMake packages

There are two Zephyr Build configuration packages which provide control over the build settings in Zephyr in a more generic way. These packages are:

- **ZephyrBuildConfiguration**: Applies to all Zephyr applications in the workspace
- **ZephyrAppConfiguration**: Applies only to the application you are currently building

They are similar to the per-user `.zephyrrc` file that can be used to set *Environment Variables*, but they set CMake variables instead. They also allow you to automatically share the build configuration among all users through the project repository. They also allow more advanced use cases, such as loading of additional CMake boilerplate code.
The Zephyr Build Configuration CMake packages will be loaded in the Zephyr boilerplate code after initial properties and ZEPHYR_BASE has been defined, but before CMake code execution. The ZephyrBuildConfiguration is included first and ZephyrAppConfiguration afterwards. That means the application-specific package could override the workspace settings, if needed. This allows the Zephyr Build Configuration CMake packages to setup or extend properties such as: DTS_ROOT, BOARD_ROOT, TOOLCHAIN_ROOT / other toolchain setup, fixed overlays, and any other property that can be controlled. It also allows inclusion of additional boilerplate code.

To provide a ZephyrBuildConfiguration or ZephyrAppConfiguration, create ZephyrBuildConfig.cmake and/or ZephyrAppConfig.cmake respectively and place them in the appropriate location. The CMake find_package mechanism will search for these files with the steps below. Other default CMake package search paths and hints are disabled and there is no version checking implemented for these packages. This also means that these packages cannot be installed in the CMake package registry. The search steps are:

1. If ZephyrBuildConfiguration_ROOT, or ZephyrAppConfiguration_ROOT respectively, is set, search within this prefix path. If a matching file is found, execute this file. If no matching file is found, go to step 2.

2. Search within ${ZEPHYR_BASE}/../*, or ${APPLICATION_SOURCE_DIR} respectively. If a matching file is found, execute this file. If no matching file is found, abort the search.

It is recommended to place the files in the default paths from step 2, but with the <PackageName>_ROOT variables you have the flexibility to place them anywhere. This is especially necessary for freestanding applications, for which the default path to ZephyrBuildConfiguration usually does not work. In this case the <PackageName>_ROOT variables can be set on the CMake command line, before find_package(Zephyr ...), as environment variable or from a CMake cache initialization file with the -C command line option.

Note: The <PackageName>_ROOT variables, as well as the default paths, are just the prefixes to the search path. These prefixes get combined with additional path suffixes, which together form the actual search path. Any combination that honors the CMake package search procedure is valid and will work.

If you want to completely disable the search for these packages, you can use the special CMake CMAKE_DISABLE_FIND_PACKAGE_<PackageName> variable for that. Just set CMAKE_DISABLE_FIND_PACKAGE_ZephyrBuildConfiguration or CMAKE_DISABLE_FIND_PACKAGE_ZephyrAppConfiguration to TRUE to disable the package.

An example folder structure could look like this:

```
<projects>/zephyr-workspace
  └── zephyr
      ├── ...
      └── manifest repo (can be named anything)
          └── cmake/ZephyrBuildConfig.cmake
      └── ...
  └── zephyr application
      └── share/zephyrapp-package/cmake/ZephyrAppConfig.cmake
```

A sample ZephyrBuildConfig.cmake can be seen below.

```
# ZephyrBuildConfig.cmake sample code

# To ensure final path is absolute and does not contain ../.. in variable.
get_filename_component(APPLICATION_PROJECT_DIR
  ${CMAKE_CURRENT_LIST_DIR}/../../ABSOLUTE
)

# Add this project to list of board roots
```

(continues on next page)
list(APPEND BOARD_ROOT ${APPLICATION_PROJECT_DIR})

# Default to GNU Arm Embedded toolchain if no toolchain is set
if(NOT ENV{ZEPHYR_TOOLCHAIN_VARIANT})
  set(ZEPHYR_TOOLCHAIN_VARIANT gnuarmemb)
  find_program(GNU_ARM_GCC arm-none-eabi-gcc)
  if(NOT ${GNU_ARM_GCC} STREQUAL GNU_ARM_GCC-NOTFOUND)
    # The toolchain root is located above the path to the compiler.
    get_filename_component(GNUARMEMB_TOOLCHAIN_PATH ${GNU_ARM_GCC}/../.. ABSOLUTE)
  endif()
endif()

5.5.8 Zephyr CMake package source code

The Zephyr CMake package source code in share/zephyr-package/cmake and share/zephyrunittest-package/cmake contains the CMake config package which is used by the CMake find_package function.

It also contains code for exporting Zephyr as a CMake config package.

The following is an overview of the files in these directories:

- ZephyrConfigVersion.cmake
  The Zephyr package version file. This file is called by CMake to determine if this installation fulfills the requirements specified by user when calling find_package(Zephyr ...). It is also responsible for detection of Zephyr repository or workspace only installations.

- ZephyrUnittestConfigVersion.cmake
  Same responsibility as ZephyrConfigVersion.cmake, but for unit tests. Includes ZephyrConfigVersion.cmake.

- ZephyrConfig.cmake
  The Zephyr package file. This file is called by CMake to for the package meeting which fulfills the requirements specified by user when calling find_package(Zephyr ...). This file is responsible for sourcing of boilerplate code.

- ZephyrUnittestConfig.cmake
  Same responsibility as ZephyrConfig.cmade, but for unit tests. Includes ZephyrConfig.cmake.

- zephyr_package_search.cmake
  Common file used for detection of Zephyr repository and workspace candidates. Used by ZephyrConfigVersion.cmake and ZephyrConfig.cmake for common code.

- zephyr_export.cmake
  See Zephyr CMake package export (without west).

5.6 Sysbuild (System build)

Sysbuild is a higher-level build system that can be used to combine multiple other build systems together. It is a higher-level layer that combines one or more Zephyr build systems and optional additional build systems into a hierarchical build system.

For example, you can use sysbuild to build a Zephyr application together with the MCUboot bootloader, flash them both onto your device, and debug the results.

Sysbuild works by configuring and building at least a Zephyr application and, optionally, as many additional projects as you want. The additional projects can be either Zephyr applications or other types of builds you want to run.

Like Zephyr’s build system, sysbuild is written in CMake and uses Kconfig.
5.6.1 Definitions

The following are some key concepts used in this document:

**Single-image build**
When sysbuild is used to create and manage just one Zephyr application's build system.

**Multi-image build**
When sysbuild is used to manage multiple build systems. The word “image” is used because your main goal is usually to generate the binaries of the firmware application images from each build system.

**Domain**
Every Zephyr CMake build system managed by sysbuild.

**Multi-domain**
When more than one Zephyr CMake build system (domain) is managed by sysbuild.

5.6.2 Architectural Overview

This figure is an overview of sysbuild's inputs, outputs, and user interfaces:

The following are some key sysbuild features indicated in this figure:

- You can run sysbuild either with `west build` or directly via `cmake`.
- You can use sysbuild to generate application images from each build system, shown above as ELF, BIN, and HEX files.
- You can configure sysbuild or any of the build systems it manages using various configuration variables. These variables are namespaced so that sysbuild can direct them to the right build system. In some cases, such as the `BOARD` variable, these are shared among multiple build systems.
• Sysbuild itself is also configured using Kconfig. For example, you can instruct sysbuild to build the MCUboot bootloader, as well as to build and link your main Zephyr application as an MCUboot child image, using sysbuild’s Kconfig files.

• Sysbuild integrates with west’s Building, Flashing and Debugging commands. It does this by managing the Flash and debug runners, and specifically the runners.yaml files that each Zephyr build system will contain. These are packaged into a global view of how to flash and debug each build system in a domains.yaml file generated and managed by sysbuild.

• Build names are prefixed with the target name and an underscore, for example the sysbuild target is prefixed with sysbuild_ and if MCUboot is enabled as part of sysbuild, it will be prefixed with mcuboot_. This also allows for running things like menuconfig with the prefix, for example (if using ninja) ninja sysbuild_menuconfig to configure sysbuild or (if using make) make mcuboot_menuconfig.

5.6.3 Building with sysbuild

As mentioned above, you can run sysbuild via west build or cmake.

west build

Here is an example. For details, see Sysbuild (multi-domain builds) in the west build documentation.

west build -b reel_board --sysbuild samples/hello_world

Tip: To configure west build to use --sysbuild by default from now on, run:

west config build.sysbuild True

Since sysbuild supports both single- and multi-image builds, this lets you use sysbuild all the time, without worrying about what type of build you are running.

To turn this off, run this before generating your build system:

west config build.sysbuild False

To turn this off for just one west build command, run:

west build --no-sysbuild ...

cmake

Here is an example using CMake and Ninja.

cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild

ninja -Cbuild

To use sysbuild directly with CMake, you must specify the sysbuild project as the source folder, and give -DAPP_DIR=<path-to-sample> as an extra CMake argument. APP_DIR is the path to the main Zephyr application managed by sysbuild.

5.6.4 Configuration namespaces

When building a single Zephyr application without sysbuild, all CMake cache settings and Kconfig build options given on the command line as -D<var>=<value> or -DCONFIG_<var>=<value> are handled by the Zephyr build system.

However, when sysbuild combines multiple Zephyr build systems, there could be Kconfig settings exclusive to sysbuild (and not used by any of the applications). To handle this, sysbuild has namespaces for
configuration variables. You can use these namespaces to direct settings either to sysbuild itself or to a specific Zephyr application managed by sysbuild using the information in these sections.

The following example shows how to build hello_world with MCUboot enabled, applying to both images debug optimizations:

```
west build
west build --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y
```

```
cmake

```cmake
shared/build -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y -Cshare/sysbuild
```ninja -Cbuild
```
See the following subsections for more information.

**CMake variable namespacing**

CMake variable settings can be passed to CMake using `-D<var>=<value>` on the command line. You can also set Kconfig options via CMake as `-DCONFIG_<var>=<value>` or `-D<namespace>_CONFIG_<var>=<value>`.

Since sysbuild is the entry point for the build system, and sysbuild is written in CMake, all CMake variables are first processed by sysbuild.

Sysbuild creates a namespace for each domain. The namespace prefix is the domain’s application name. See [Adding Zephyr applications to sysbuild](#) for more information.

To set the variable `<var>` in the namespace `<namespace>`, use this syntax:

```
-D<namespace>_<var>=<value>
```

For example, to set the CMake variable `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```
wse build
west build --sysbuild ... -- -Dmy_sample_FOO=BAR
```

```
cmake
```
```
cmake -Dmy_sample_FOO=BAR ...
```

**Kconfig namespacing**

To set the sysbuild Kconfig option `<var>` to the value `<value>`, use this syntax:

```
-DSB_CONFIG_<var>=<value>
```

In the previous example, `SB_CONFIG` is the namespace prefix for sysbuild’s Kconfig options.

To set a Zephyr application’s Kconfig option instead, use this syntax:

```
-D<namespace>_CONFIG_<var>=<value>
```
In the previous example, `<namespace>` is the application name discussed above in CMake variable naming.

For example, to set the Kconfig option `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```shell
west build
west build --sysbuild ... --Dmy_sample_CONFIG_FOO=BAR

cmake

cmake -Dmy_sample_CONFIG_FOO=BAR ...
```

**Tip:** When no `<namespace>` is used, the Kconfig setting is passed to the main Zephyr application `my_sample`.

This means that passing `-DCONFIG_<var>=<value>` and `-Dmy_sample_CONFIG_<var>=<value>` are equivalent.

This allows you to build the same application with or without sysbuild using the same syntax for setting Kconfig values at CMake time. For example, the following commands will work in the same way:

```shell
west build -b <board> my_sample -- -DCONFIG_FOO=BAR
west build -b <board> --sysbuild my_sample -- -DCONFIG_FOO=BAR
```

### 5.6.5 Sysbuild flashing using `west flash`

You can use `west flash` to flash applications with sysbuild.

When invoking `west flash` on a build consisting of multiple images, each image is flashed in sequence. Extra arguments such as `--runner jlink` are passed to each invocation.

For more details, see *Multi-domain flashing*.

### 5.6.6 Sysbuild debugging using `west debug`

You can use `west debug` to debug the main application, whether you are using sysbuild or not. Just follow the existing `west debug` guide to debug the main sample.

To debug a different domain (Zephyr application), such as `mcuboot`, use the `--domain` argument, as follows:

```shell
west debug --domain mcuboot
```

For more details, see *Multi-domain debugging*.

### 5.6.7 Building a sample with MCUboot

Sysbuild supports MCUboot natively.

To build a sample like `hello_world` with MCUboot, enable MCUboot and build and flash the sample as follows:

```shell
west build
```
This builds `hello_world` and `mcuboot` for the `reel_board`, and then flashes both the `mcuboot` and `hello_world` application images to the board.

More detailed information regarding the use of MCUboot with Zephyr can be found in the [MCUboot with Zephyr documentation page on the MCUboot website](#).

**Note:** The deprecated MCUBoot Kconfig option `CONFIG_ZEPHYR_TRY_MASS_ERASE` will perform a full chip erase when flashed. If this option is enabled, then flashing only MCUBoot, for example using `west flash --domain mcuboot`, may erase the entire flash, including the main application image.

### 5.6.8 Sysbuild Kconfig file

You can set sysbuild's Kconfig options for a single application using configuration files. By default, sysbuild looks for a configuration file named `sysbuild.conf` in the application top-level directory.

In the following example, there is a `sysbuild.conf` file that enables building and flashing with MCUboot whenever sysbuild is used:

```
<home>/application
  └── CMakeLists.txt
  │   └── prj.conf
  └── sysbuild.conf

SB_CONFIG_BOOTLOADER_MCUBOOT=y
```

You can set a configuration file to use with the `-DSB_CONF_FILE=<sysbuild-conf-file>` CMake build setting.

For example, you can create `sysbuild-mcuboot.conf` and then specify this file when building with sysbuild, as follows:

```
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONF_FILE=sysbuild-mcuboot.conf
```

```
cmake
```

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONF_FILE=sysbuild-mcuboot.conf share/sysbuild
```

```
ninja -Cbuild
```

### 5.6.9 Sysbuild targets

Sysbuild creates build targets for each image (including sysbuild itself) for the following modes:

- menuconfig
- hardenconfig
- guiconfig

For the main application (as is the same without using sysbuild) these can be ran normally without any prefix. For other images (including sysbuild), these are ran with a prefix of the image name and an underscore e.g. `sysbuild_` or `mcuboot_`, using ninja or make - for details on how to run image build targets that do not have mapped build targets in sysbuild, see the Dedicated image build targets section.

### 5.6.10 Dedicated image build targets

Not all build targets for images are given equivalent prefixed build targets when sysbuild is used, for example build targets like `ram_report`, `rom_report`, `footprint`, `puncover` and `pahole` are not exposed. When using [Trusted Firmware](https://trusted-firmware.org), this includes build targets prefix with `tfm_` and `bl2_`, for example: `tfm_rom_report` and `bl2_ram_report`. To run these build targets, the build directory of the image can be provided to `west/ninja/make` along with the name of the build target to execute and it will run.

**west**

Assuming that a project has been configured and built using `west` using sysbuild with `mcuboot` enabled in the default build folder location, the `rom_report` build target for `mcuboot` can be ran with:

```
west build -d build/mcuboot -t rom_report
```

**ninja**

Assuming that a project has been configured using `cmake` and built using `ninja` using sysbuild with `mcuboot` enabled, the `rom_report` build target for `mcuboot` can be ran with:

```
ninja -C mcuboot rom_report
```

**make**

Assuming that a project has been configured using `cmake` and built using `make` using sysbuild with `mcuboot` enabled, the `rom_report` build target for `mcuboot` can be ran with:

```
make -C mcuboot rom_report
```

### 5.6.11 Adding Zephyr applications to sysbuild

You can use the `ExternalZephyrProject_Add()` function to add Zephyr applications as sysbuild domains. Call this CMake function from your application's `sysbuild.cmake` file, or any other CMake file you know will run as part sysbuild CMake invocation.

**Targeting the same board**

To include `my_sample` as another sysbuild domain, targeting the same board as the main image, use this example:

```cmake
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
)
```

This could be useful, for example, if your board requires you to build and flash an SoC-specific bootloader along with your main application.
Targeting a different board

In sysbuild and Zephyr CMake build system a board may refer to:

- A physical board with a single core SoC.
- A specific core on a physical board with a multi-core SoC, such as nrf5340dk_nrf5340.
- A specific SoC on a physical board with multiple SoCs, such as nrf9160dk_nrf9160 and nrf9160dk_nrf52840.

If your main application, for example, is built for mps2_an521, and your helper application must target the mps2_an521_remote board (cpu1), add a CMake function call that is structured as follows:

```cmake
ExternalZephyrProject_Add(
  APPLICATION my_sample
  SOURCE_DIR <path-to>/my_sample
  BOARD mps2_an521_remote
)
```

This could be useful, for example, if your main application requires another helper Zephyr application to be built and flashed alongside it, but the helper runs on another core in your SoC.

Targeting conditionally using Kconfig

You can control whether extra applications are included as sysbuild domains using Kconfig.

If the extra application image is specific to the board or an application, you can create two additional files: sysbuild.cmake and Kconfig.sysbuild.

For an application, this would look like this:

```bash
<home>/application
  CMakeLists.txt
  prj.conf
  Kconfig.sysbuild
  sysbuild.cmake
```

In the previous example, sysbuild.cmake would be structured as follows:

```cmake
if(SB_CONFIG_SECOND_SAMPLE)
  ExternalZephyrProject_Add(
    APPLICATION second_sample
    SOURCE_DIR <path-to>/second_sample
  )
endif()
```

Kconfig.sysbuild would be structured as follows:

```bash
source "sysbuild/Kconfig"
config SECOND_SAMPLE
  bool "Second sample"
  default y
```

This will include second_sample by default, while still allowing you to disable it using the Kconfig option SECOND_SAMPLE.

For more information on setting sysbuild Kconfig options, see Kconfig namespace.
Building without flashing

You can mark `my_sample` as a build-only application in this manner:

```c
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
    BUILD_ONLY TRUE
)
```

As a result, `my_sample` will be built as part of the sysbuild build invocation, but neither `west flash` nor `west debug` will be aware of this application. Instead, you may use the outputs of this domain for other purposes - for example, to produce a secondary image for DFU, or to merge multiple images together.

You can also replace `TRUE` with another boolean constant in CMake, such as a Kconfig option, which would make `my_sample` conditionally build-only.

Zephyr application configuration

When adding a Zephyr application to sysbuild, such as MCUboot, then the configuration files from the application (MCUboot) itself will be used.

When integrating multiple applications with each other, then it is often necessary to make adjustments to the configuration of extra images.

Sysbuild gives users the ability of creating Kconfig fragments or devicetree overlays that will be used together with the application’s default configuration. Sysbuild also allows users to change `Application Configuration Directory` in order to give users full control of an image's configuration.

Zephyr application Kconfig fragment and devicetree overlay  In the folder of the main application, create a Kconfig fragment or a devicetree overlay under a sysbuild folder, where the name of the file is `<image>.conf` or `<image>.overlay`, for example if your main application includes `my_sample` then create a `sysbuild/my_sample.conf` file or a devicetree overlay `sysbuild/my_sample.overlay`.

A Kconfig fragment could look as:

```c
# sysbuild/my_sample.conf
CONFIG_FOO=n
```

Zephyr application configuration directory  In the folder of the main application, create a new folder under `sysbuild/<image>/`. This folder will then be used as `APPLICATION_CONFIG_DIR` when building `<image>`. As an example, if your main application includes `my_sample` then create a `sysbuild/my_sample/` folder and place any configuration files in there as you would normally do:

```
<home>/application
    CMakeLists.txt
    prj.conf
    sysbuild
        my_sample
            prj.conf
            app.overlay
            boards
                <board_A>.conf
                <board_A>.overlay
                <board_B>.conf
                <board_B>.overlay
```
All configuration files under the `sysbuild/my_sample/` folder will now be used when `my_sample` is included in the build, and the default configuration files for `my_sample` will be ignored.

This gives you full control on how images are configured when integrating those with an application.

### Adding dependencies among Zephyr applications

Sometimes, in a multi-image build, you may want certain Zephyr applications to be configured or flashed in a specific order. For example, if you need some information from one application's build system to be available to another's, then the first thing to do is to add a configuration dependency between them. Separately, you can also add flashing dependencies to control the sequence of images used by `west flash`; this could be used if a specific flashing order is required by an SoC, a _runner_, or something else.

By default, `sysbuild` will configure and flash applications in the order that they are added, as `ExternalZephyrProject_Add()` calls are processed by CMake. You can use the `sysbuild_add_dependencies()` function to make adjustments to this order, according to your needs. Its usage is similar to the standard `add_dependencies()` function in CMake.

Here is an example of adding configuration dependencies for `my_sample`:

```bash
sysbuild_add_dependencies(IMAGE CONFIGURE my_sample sample_a sample_b)
```

This will ensure that `sysbuild` will run CMake for `sample_a` and `sample_b` (in some order) before doing the same for `my_sample`, when building these domains in a single invocation.

If you want to add flashing dependencies instead, then do it like this:

```bash
sysbuild_add_dependencies(IMAGE FLASH my_sample sample_a sample_b)
```

As a result, `my_sample` will be flashed after `sample_a` and `sample_b` (in some order), when flashing these domains in a single invocation.

**Note:** Adding flashing dependencies is not allowed for build-only applications. If `my_sample` had been created with `BUILD_ONLY TRUE`, then the above call to `sysbuild_add_dependencies()` would have produced an error.

### 5.6.12 Adding non-Zephyr applications to sysbuild

You can include non-Zephyr applications in a multi-image build using the standard CMake module `ExternalProject`. Please refer to the CMake documentation for usage details.

When using `ExternalProject`, the non-Zephyr application will be built as part of the `sysbuild` build invocation, but `west flash` or `west debug` will not be aware of the application. Instead, you must manually flash and debug the application.

### 5.6.13 Extending sysbuild

`Sysbuild` can be extended by other modules to give it additional functionality or include other configurations or images, an example could be to add support for another bootloader or external signing method.

Modules can be extended by adding custom CMake or Kconfig files as normal modules do, this will cause the files to be included in each image that is part of a project. Alternatively, there are `sysbuild-specific module extension` files which can be used to include CMake and Kconfig files for the overall `sysbuild` image itself, this is where e.g. a custom image for a particular board or SoC can be added.
5.7 Application version management

Zephyr supports an application version management system for applications which is built around the system that Zephyr uses for its own version system management. This allows applications to define a version file and have application (or module) code include the auto-generated file and be able to access it, just as they can with the kernel version. This version information is available from multiple scopes, including:

- Code (C/C++)
- Kconfig
- CMake

which makes it a very versatile system for lifecycle management of applications. In addition, it can be used when building applications which target supported bootloaders (e.g. MCUboot) allowing images to be signed with correct version of the application automatically - no manual signing steps are required.

5.7.1 VERSION file

Application version information is set on a per-application basis in a file named VERSION, which must be placed at the base directory of the application, where the CMakeLists.txt file is located. This is a simple text file which contains the various version information fields, each on a newline. The basic VERSION file has the following structure:

```
VERSION_MAJOR =
VERSION_MINOR =
PATCHLEVEL =
VERSION_TWEAK =
EXTRAVERSION =
```

Each field and the values it supports is described below (note that there may be further restrictions depending upon what the version is used for, e.g. bootloaders might only support some of these fields or might place limits on the maximum values of fields):

<table>
<thead>
<tr>
<th>Field</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VERSION_MAJOR</td>
<td>Numerical</td>
</tr>
<tr>
<td>VERSION_MINOR</td>
<td>Numerical</td>
</tr>
<tr>
<td>PATCHLEVEL</td>
<td>Numerical</td>
</tr>
<tr>
<td>VERSION_TWEAK</td>
<td>Numerical</td>
</tr>
<tr>
<td>EXTRAVERSION</td>
<td>Alphanumerical (Lowercase a-z and 0-9)</td>
</tr>
</tbody>
</table>

When an application is configured using CMake, the version file will be automatically processed, and will be checked automatically each time the version is changed, so CMake does not need to be manually re-ran for changes to this file.

For the sections below, examples are provided for the following VERSION file:

```
VERSION_MAJOR = 1
VERSION_MINOR = 2
PATCHLEVEL = 3
VERSION_TWEAK = 4
EXTRAVERSION = unstable
```
5.7.2 Use in code

To use the version information in application code, the version file must be included, then the fields can be freely used. The include file name is `app_version.h` (no path is needed), the following defines are available:

<table>
<thead>
<tr>
<th>Define</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPVERSION</td>
<td>Numeri-</td>
<td>VERSION_MAJOR (left shifted by 24 bits), VERSION_MINOR (left shifted by 16 bits), PATCHLEVEL (left shifted by 8 bits), VERSION_TWEAK</td>
<td>0x1020304</td>
</tr>
<tr>
<td>APP_VERSION</td>
<td>Numeri-</td>
<td>VERSION_MAJOR (left shifted by 16 bits), VERSION_MINOR (left shifted by 8 bits), PATCHLEVEL</td>
<td>0x10203</td>
</tr>
<tr>
<td>APP_VERSION</td>
<td>Numeri-</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>APP_VERSION</td>
<td>Numeri-</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>APP_PATCHLEVEL</td>
<td>Numeri-</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>APP_VERSION</td>
<td>String (quoted)</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>“1.2.3-unstable”</td>
</tr>
<tr>
<td>APP_BUILD_VERSION</td>
<td>String (unquoted)</td>
<td>None (value of git describe --abbrev=12 --always from application repository)</td>
<td>v3.3.0-18-g2c85d9224fca</td>
</tr>
</tbody>
</table>

5.7.3 Use in Kconfig

The following variables are available for usage in Kconfig files:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(VERSION_MAJOR)</td>
<td>Numeri-</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>$(VERSION_MINOR)</td>
<td>Numeri-</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>$(PATCHLEVEL)</td>
<td>Numeri-</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>$(VERSION_TWEAK)</td>
<td>Numeri-</td>
<td>VERSION_TWEAK</td>
<td>4</td>
</tr>
<tr>
<td>$(APPVERSION)</td>
<td>String</td>
<td>VERSION_MAJOR, EXTRAVERSION, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>1.2.3-unstable</td>
</tr>
</tbody>
</table>

5.7.4 Use in CMake

The following variable are available for usage in CMake files:
### Table 5.7.5 Use in MCUboot-supported applications

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Field(s)</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPVERSION</td>
<td>Numerical (hex)</td>
<td>VERSION_MAJOR (left shifted by 24 bits), VERSION_MINOR (left shifted by 16 bits), PATCHLEVEL (left shifted by 8 bits), VERSION_TWEAK</td>
<td>0x1020304</td>
</tr>
<tr>
<td>APP_VERSION</td>
<td>Numerical (hex)</td>
<td>VERSION_MAJOR (left shifted by 16 bits), VERSION_MINOR (left shifted by 8 bits), PATCHLEVEL</td>
<td>0x10203</td>
</tr>
<tr>
<td>APP_VERSION_MAJOR</td>
<td>Numerical</td>
<td>VERSION_MAJOR</td>
<td>1</td>
</tr>
<tr>
<td>APP_VERSION_MINOR</td>
<td>Numerical</td>
<td>VERSION_MINOR</td>
<td>2</td>
</tr>
<tr>
<td>APP_PATCHLEVEL</td>
<td>Numerical</td>
<td>PATCHLEVEL</td>
<td>3</td>
</tr>
<tr>
<td>APP_VERSION_TWEAK</td>
<td>Numerical</td>
<td>VERSION_TWEAK</td>
<td>4</td>
</tr>
<tr>
<td>APP_VERSION_STRING</td>
<td>String</td>
<td>VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION</td>
<td>1.2.3-unstable</td>
</tr>
</tbody>
</table>

#### 5.7.5 Use in MCUboot-supported applications

No additional configuration needs to be done to the target application so long as it is configured to support MCUboot and a signed image is generated, the version information will be automatically included in the image data.

The format used for signing is `VERSION_MAJOR . VERSION_MINOR . PATCHLEVEL`, the tweak version field is not currently used.
Chapter 6

Connectivity

6.1 Bluetooth

This section contains information regarding the Bluetooth stack of the Zephyr OS. You can use this information to understand the principles behind the operation of the layers and how they were implemented.

Zephyr includes a complete Bluetooth Low Energy stack from application to radio hardware, as well as portions of a Classical Bluetooth (BR/EDR) Host layer.

6.1.1 Overview

**Supported Features**

Since its inception, Zephyr has had a strong focus on Bluetooth and, in particular, on Bluetooth Low Energy (BLE). Through the contributions of several companies and individuals involved in existing open source implementations of the Bluetooth specification (Linux’s BlueZ) as well as the design and development of BLE radio hardware, the protocol stack in Zephyr has grown to be mature and feature-rich, as can be seen in the section below.

**Supported Features**

Zephyr comes integrated with a feature-rich and highly configurable Bluetooth stack.

- Bluetooth v5.3 compliant
  - Highly configurable
    * Features, buffer sizes/counts, stack sizes, etc.
  - Portable to all architectures supported by Zephyr (including big and little endian, alignment flavors and more)
  - Support for all combinations of Host and Controller builds:
    * Controller-only (HCI) over UART, SPI, USB and IPC physical transports
    * Host-only over UART, SPI, and IPC (shared memory)
    * Combined (Host + Controller)
- Bluetooth-SIG qualified
  - Controller on Nordic Semiconductor hardware
Conformance tests run regularly on all layers

- Bluetooth Low Energy Controller support (LE Link Layer)
  - Unlimited role and connection count, all roles supported
  - All v5.3 specification features supported (except a few minor items)
  - Concurrent multi-protocol support ready
  - Intelligent scheduling of roles to minimize overlap
  - Portable design to any open BLE radio, currently supports Nordic Semiconductor nRF51 and nRF52, as well as proprietary radios
  - Supports little and big endian architectures, and abstracts the hard real-time specifics so that they can be encapsulated in a hardware-specific module
  - Support for Controller (HCI) builds over different physical transports

- Bluetooth Host support
  - Generic Access Profile (GAP) with all possible LE roles
    - Peripheral & Central
    - Observer & Broadcaster
    - Multiple PHY support (2Mbit/s, Coded)
    - Extended Advertising
    - Periodic Advertising (including Sync Transfer)
  - GATT (Generic Attribute Profile)
    - Server (to be a sensor)
    - Client (to connect to sensors)
    - Enhanced ATT (EATT)
    - GATT Database Hash
    - GATT Multiple Notifications
  - Pairing support, including the Secure Connections feature from Bluetooth 4.2
  - Non-volatile storage support for permanent storage of Bluetooth-specific settings and data
  - Bluetooth mesh support
    - Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
    - Both Provisioning roles and bearers supported (PB-ADV & PB-GATT)
    - Foundation Models included
    - Highly configurable, fits as small as 16k RAM devices
  - IPSP/6LoWPAN for IPv6 connectivity over Bluetooth LE
    - IPSP node sample application
  - Basic Bluetooth BR/EDR (Classic) support
    - Generic Access Profile (GAP)
    - Logical Link Control and Adaptation Protocol (L2CAP)
    - Serial Port emulation (RFCOMM protocol)
    - Service Discovery Protocol (SDP)
  - Clean HCI driver abstraction
    - 3-Wire (H:5) & 5-Wire (H:4) UART
6.1.2 Bluetooth Stack Architecture

Overview

This page describes the software architecture of Zephyr’s Bluetooth protocol stack.

**Note:** Zephyr supports mainly Bluetooth Low Energy (BLE), the low-power version of the Bluetooth specification. Zephyr also has limited support for portions of the BR/EDR Host. Throughout this architecture document we use BLE interchangeably for Bluetooth except when noted.

**BLE Layers** There are 3 main layers that together constitute a full Bluetooth Low Energy protocol stack:

- **Host:** This layer sits right below the application, and is comprised of multiple (non real-time) network and transport protocols enabling applications to communicate with peer devices in a standard and interoperable way.

- **Controller:** The Controller implements the Link Layer (LE LL), the low-level, real-time protocol which provides, in conjunction with the Radio Hardware, standard-interoperable over-the-air communication. The LL schedules packet reception and transmission, guarantees the delivery of data, and handles all the LL control procedures.

- **Radio Hardware:** Hardware implements the required analog and digital baseband functional blocks that permit the Link Layer firmware to send and receive in the 2.4GHz band of the spectrum.
Host Controller Interface  The Bluetooth Specification describes the format in which a Host must communicate with a Controller. This is called the Host Controller Interface (HCI) protocol. HCI can be implemented over a range of different physical transports like UART, SPI, or USB. This protocol defines the commands that a Host can send to a Controller and the events that it can expect in return, and also the format for user and protocol data that needs to go over the air. The HCI ensures that different Host and Controller implementations can communicate in a standard way making it possible to combine Hosts and Controllers from different vendors.

Configurations  The three separate layers of the protocol and the standardized interface make it possible to implement the Host and Controller on different platforms. The two following configurations are commonly used:

- **Single-chip configuration**: In this configuration, a single microcontroller implements all three layers and the application itself. This can also be called a system-on-chip (SoC) implementation. In this case the BLE Host and the BLE Controller communicate directly through function calls and queues in RAM. The Bluetooth specification does not specify how HCI is implemented in this single-chip configuration and so how HCI commands, events, and data flows between the two can be implementation-specific. This configuration is well suited for those applications and designs that require a small footprint and the lowest possible power consumption, since everything runs on a single IC.

- **Dual-chip configuration**: This configuration uses two separate ICs, one running the Application and the Host, and a second one with the Controller and the Radio Hardware. This is sometimes also called a connectivity-chip configuration. This configuration allows for a wider variety of combinations of Hosts when using the Zephyr OS as a Controller. Since HCI ensures interoperability among Host and Controller implementations, including of course Zephyr's very own BLE Host and Controller, users of the Zephyr Controller can choose to use whatever Host running on any platform they prefer. For example, the host can be the Linux BLE Host stack (BlueZ) running on any processor capable of supporting Linux. The Host processor may of course also run Zephyr and the Zephyr OS BLE Host. Conversely, combining an IC running the Zephyr Host with an external Controller that does not run Zephyr is also supported.

Build Types  The Zephyr software stack as an RTOS is highly configurable, and in particular, the BLE subsystem can be configured in multiple ways during the build process to include only the features and layers that are required to reduce RAM and ROM footprint as well as power consumption. Here's a short list of the different BLE-enabled builds that can be produced from the Zephyr project codebase:

- **Controller-only build**: When built as a BLE Controller, Zephyr includes the Link Layer and a special application. This application is different depending on the physical transport chosen for HCI:
  - hci_uart
  - hci_usb
  - hci_spi

This application acts as a bridge between the UART, SPI or USB peripherals and the Controller subsystem, listening for HCI commands, sending application data and responding with events and received data. A build of this type sets the following Kconfig option values:

- CONFIG_BT =y
- CONFIG_BT_HCI =y
- CONFIG_BT_HCI_RAW =y
- CONFIG_BT_CTLR =y
- CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)
**Host-only build**: A Zephyr OS Host build will contain the Application and the BLE Host, along with an HCI driver (UART or SPI) to interface with an external Controller chip. A build of this type sets the following Kconfig option values:

- `CONFIG_BT =y`
- `CONFIG_BT_HCI =y`
- `CONFIG_BT_CTLR =n`

All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Host-only.

**Combined build**: This includes the Application, the Host and the Controller, and it is used exclusively for single-chip (SoC) configurations. A build of this type sets the following Kconfig option values:

- `CONFIG_BT =y`
- `CONFIG_BT_HCI =y`
- `CONFIG_BT_CTLR =y`
- `CONFIG_BT_LL_SW_SPLIT =y` (if using the open source Link Layer)

All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Combined.

The picture below shows the SoC or single-chip configuration when using a Zephyr combined build (a build that includes both a BLE Host and a Controller in the same firmware image that is programmed onto the chip):

![Fig. 1: A Combined build on a Single-Chip configuration](image)

When using connectivity or dual-chip configurations, several Host and Controller combinations are possible, some of which are depicted below:

When using a Zephyr Host (left side of image), two instances of Zephyr OS must be built with different configurations, yielding two separate images that must be programmed into each of the chips respectively. The Host build image contains the application, the BLE Host and the selected HCI driver (UART...
or SPI), while the Controller build runs either the hci_uart, or the hci_spi app to provide an interface to the BLE Controller.

This configuration is not limited to using a Zephyr OS Host, as the right side of the image shows. One can indeed take one of the many existing GNU/Linux distributions, most of which include Linux’s own BLE Host (BlueZ), to connect it via UART or USB to one or more instances of the Zephyr OS Controller build. BlueZ as a Host supports multiple Controllers simultaneously for applications that require more than one BLE radio operating at the same time but sharing the same Host stack.

Source tree layout

The stack is split up as follows in the source tree:

subsys/bluetooth/host
The host stack. This is where the HCI command and event handling as well as connection tracking happens. The implementation of the core protocols such as L2CAP, ATT, and SMP is also here.

subsys/bluetooth/controller
Bluetooth Controller implementation. Implements the controller-side of HCI, the Link Layer as well as access to the radio transceiver.

include/bluetooth/
Public API header files. These are the header files applications need to include in order to use Bluetooth functionality.

drivers/bluetooth/
HCI transport drivers. Every HCI transport needs its own driver. For example, the two common types of UART transport protocols (3-Wire and 5-Wire) have their own drivers.
samples/bluetooth/
Sample Bluetooth code. This is a good reference to get started with Bluetooth application development.

tests/bluetooth/
Test applications. These applications are used to verify the functionality of the Bluetooth stack, but are not necessarily the best source for sample code (see samples/bluetooth instead).

doc/guides/bluetooth/
Extra documentation, such as PICS documents.

Host

The Bluetooth Host implements all the higher-level protocols and profiles, and most importantly, provides a high-level API for applications. The following diagram depicts the main protocol & profile layers of the host.

![Bluetooth Host protocol & profile layers](image)

Fig. 3: Bluetooth Host protocol & profile layers.

Lowest down in the host stack sits a so-called HCI driver, which is responsible for abstracting away the details of the HCI transport. It provides a basic API for delivering data from the controller to the host, and vice-versa.

Perhaps the most important block above the HCI handling is the Generic Access Profile (GAP). GAP simplifies Bluetooth LE access by defining four distinct roles of BLE usage:

- Connection-oriented roles
  - Peripheral (e.g. a smart sensor, often with a limited user interface)
  - Central (typically a mobile phone or a PC)

- Connection-less roles
  - Broadcaster (sending out BLE advertisements, e.g. a smart beacon)
  - Observer (scanning for BLE advertisements)

Each role comes with its own build-time configuration option: `CONFIG_BT_PERIPHERAL`, `CONFIG_BT_CENTRAL`, `CONFIG_BT_BROADCASTER` & `CONFIG_BT_OBSERVER`. Of the connection-oriented roles central implicitly enables observer role, and peripheral implicitly enables broadcaster role. Usually the first step when creating an application is to decide which roles are needed and go from there. Bluetooth mesh is a slightly special case, requiring at least the observer and broadcaster roles, and possibly also the Peripheral role. This will be described in more detail in a later section.

Peripheral role Most Zephyr-based BLE devices will most likely be peripheral-role devices. This means that they perform connectable advertising and expose one or more GATT services. After registering services using the `bt_gatt_service_register()` API the application will typically start connectable advertising using the `bt_le_adv_start()` API.

6.1. Bluetooth
There are several peripheral sample applications available in the tree, such as samples/bluetooth/peripheral_hr.

Central role  Central role may not be as common for Zephyr-based devices as peripheral role, but it is still a plausible one and equally well supported in Zephyr. Rather than accepting connections from other devices a central role device will scan for available peripheral device and choose one to connect to. Once connected, a central will typically act as a GATT client, first performing discovery of available services and then accessing one or more supported services.

To initially discover a device to connect to the application will likely use the `bt_le_scan_start()` API, wait for an appropriate device to be found (using the scan callback), stop scanning using `bt_le_scan_stop()` and then connect to the device using `bt_conn_le_create()`. If the central wants to keep automatically reconnecting to the peripheral it should use the `bt_le_set_auto_conn()` API.

There are some sample applications for the central role available in the tree, such as samples/bluetooth/central_hr.

Observer role  An observer role device will use the `bt_le_scan_start()` API to scan for device, but it will not connect to any of them. Instead it will simply utilize the advertising data of found devices, combining it optionally with the received signal strength (RSSI).

Broadcaster role  A broadcaster role device will use the `bt_le_adv_start()` API to advertise specific advertising data, but the type of advertising will be non-connectable, i.e. other device will not be able to connect to it.

Connections  Connection handling and the related APIs can be found in the Connection Management section.

Security  To achieve a secure relationship between two Bluetooth devices a process called pairing is used. This process can either be triggered implicitly through the security properties of GATT services, or explicitly using the `bt_conn_security()` API on a connection object.

To achieve a higher security level, and protect against Man-In-The-Middle (MITM) attacks, it is recommended to use some out-of-band channel during the pairing. If the devices have a sufficient user interface this "channel" is the user itself. The capabilities of the device are registered using the `bt_conn_auth_cb_register()` API. The `bt_conn_auth_cb` struct that's passed to this API has a set of optional callbacks that can be used during the pairing - if the device lacks some feature the corresponding callback may be set to NULL. For example, if the device does not have an input method but does have a display, the `passkey_entry` and `passkey_confirm` callbacks would be set to NULL, but the `passkey_display` would be set to a callback capable of displaying a passkey to the user.

Depending on the local and remote security requirements & capabilities, there are four possible security levels that can be reached:

- **BT_SECURITY_L1**
  No encryption and no authentication.

- **BT_SECURITY_L2**
  Encryption but no authentication (no MITM protection).

- **BT_SECURITY_L3**
  Encryption and authentication using the legacy pairing method from Bluetooth 4.0 and 4.1.

- **BT_SECURITY_L4**
  Encryption and authentication using the LE Secure Connections feature available since Bluetooth 4.2.
Note: Mesh has its own security solution through a process called provisioning. It follows a similar procedure as pairing, but is done using separate mesh-specific APIs.

L2CAP L2CAP stands for the Logical Link Control and Adaptation Protocol. It is a common layer for all communication over Bluetooth connections, however an application comes in direct contact with it only when using it in the so-called Connection-oriented Channels (CoC) mode. More information on this can be found in the L2CAP API section.

GATT The Generic Attribute Profile is the most common means of communication over LE connections. A more detailed description of this layer and the API reference can be found in the GATT API reference section.

Mesh Mesh is a little bit special when it comes to the needed GAP roles. By default, mesh requires both observer and broadcaster role to be enabled. If the optional GATT Proxy feature is desired, then peripheral role should also be enabled.

The API reference for mesh can be found in the Mesh API reference section.

LE Audio The LE audio is a set of profiles and services that utilizes GATT and Isochronous Channel to provide audio over Bluetooth Low Energy. The architecture and API references can be found in Bluetooth Audio Architecture.

Persistent storage The Bluetooth host stack uses the settings subsystem to implement persistent storage to flash. This requires the presence of a flash driver and a designated “storage” partition on flash. A typical set of configuration options needed will look something like the following:

```plaintext
CONFIG_BT_SETTINGS=y
CONFIG_FLASH=y
CONFIG_FLASH_PAGE_LAYOUT=y
CONFIG_FLASH_MAP=y
CONFIG_NVS=y
CONFIG_SETTINGS=y
```

Once enabled, it is the responsibility of the application to call settings_load() after having initialized Bluetooth (using the bt_enable() API).

6.1.3 Bluetooth Low Energy Controller
Overview

1. HCI
   - Host Controller Interface, Bluetooth standard
   - Provides Zephyr Bluetooth HCI Driver

2. HAL
   - Hardware Abstraction Layer
   - Vendor Specific, and Zephyr Driver usage

3. Ticker
   - Soft real time radio/resource scheduling

4. LL_SW
   - Software-based Link Layer implementation
   - States and roles, control procedures, packet controller

5. Util
   - Bare metal memory pool management
   - Queues of variable count, lockless usage
   - FIFO of fixed count, lockless usage
   - Mayfly concept based deferred ISR executions
Architecture

Execution Overview

Architecture Overview

6.1. Bluetooth
Upper Link Layer and Lower Link Layer

Slot reservation protects full event (event execution fully resolved by ULL schedule)

Slot reservation partly protects event (occasional part of event execution is resolved by LLL)

Several slot reservations protects event (occasional part of event execution is fully resolved by ULL schedule)

Scheduling Variants

ULL and LLL Timing
Event Handling

The ULL is unaware of the offset time domain and delayed execution in LLL:
1) The ULL can only queue prepare/abort commands.
2) The LLL returns event done for executed commands.
3) The ULL cannot peek into the LLL activity.

ULL Scheduling

LLL Event Handling
Scheduling Closely Spaced Events

Aborting Active Event
Cancelling Pending Event

Pre-emption of Active Event
Data Flow

Transmit Data Flow
Receive Data Flow
Execution Priorities

- Event handle (0, 1) < Event preparation (2, 3) < Event/Rx done (4) < Tx request (5) < Role management (6) < Host (7).
- LLL is vendor ISR, ULL is Mayfly ISR concept, Host is kernel thread.

Lower Link Layer

LLL Execution
LLL Resume

Bare metal utilities

Memory FIFO and Memory Queue

Mayfly
- Mayfly are multi-instance scalable ISR execution contexts
• What a Work is to a Thread, Mayfly is to an ISR
• List of functions executing in ISRs
• Execution priorities map to IRQ priorities
• Facilitate cross execution context scheduling
• Race-to-idle execution
• Lock-less, bare metal

Legacy Controller

Bluetooth Low Energy Controller - Vendor Specific Details

Hardware Requirements

Nordic Semiconductor  The Nordic Semiconductor Bluetooth Low Energy Controller implementation requires the following hardware peripherals.
### Table 1: SoC Peripheral Use

<table>
<thead>
<tr>
<th>Resource</th>
<th>Peripheral</th>
<th># instances</th>
<th>Zephyr Driver Accessible</th>
<th>Description</th>
</tr>
</thead>
</table>
| Clock    | NRF_CLOCK | 1           | Yes                      | • A Low Frequency Clock (LFCLOCK) or sleep clock, for low power consumption between Bluetooth radio events  
|          |            |             |                          | • A High Frequency Clock (HFCLOCK) or active clock, for high precision packet timing and software based transceiver state switching with inter-frame space (tIFS) timing inside Bluetooth radio events |
| RTC [a]  | NRF_RTC0  | 1           | No                       | • Uses 2 capture/compare registers |
| Timer    | NRF_TIMER0 or NRF_TIMER4 and NRF_TIMER1 | 2 or 1 | No | • 2 instances, one each for packet timing and tIFS software switching, respectively  
|          |            |             |                          | • 7 capture/compare registers (3 mandatory, 1 optional for ISR profiling, 4 for single timer tIFS switching) on first instance  
|          |            |             |                          | • 4 capture/compare registers for second instance, if single tIFS timer is not used. |
| PPI [b]  | NRF_PPI   | 21 channels (20\(^2\)), and 2 channel groups\(^3\) | Yes\(^4\) | • Used for radio mode switching to achieve tIFS timings, for PA/LNA control |
| DPPI [c] | NRF_DPPI  | 20 channels, and 2 channel groups\(^3\) | Yes Page 1390 | • Used for radio mode switching to achieve tIFS timings, for PA/LNA control |
| SWI [d]  | NRF_SWI4 and NRF_SWI5, or NRF_SWI2 and NRF_SWI3\(^3\) | 2 | No | • 2 instances, for Lower Link Layer and Upper Link Layer Low priority execution context |
| Radio    | NRF_RADIO | 1           | No                       | • 2.4 GHz radio transceiver with multiple radio standards such as 1 Mbps, 2 Mbps and Coded PHY S2/S8 Long Range Bluetooth Low Energy technology |
| RNG [e]  | NRF_RNG   | 1           | Yes                      | |
| ECB [f] | NRF_ECB   | 1           | No                       | |
| CBC-CCM | NRF_CCM   | 1           | No                       | |
| AAR [h] | NRF_AAR   | 1           | No                       | |
| GPIO [i] | NRF_GPIO  | 2 GPIO pins for PA and LNA, 1 each | Yes | • Additionally, 10 Debug GPIO pins (optional) |
| GPIOTE [j] | NRF_GPIOTE | 1 | Yes | • Used for PA/LNA |
| TEMP [k] | NRF_TEMP  | 1           | Yes                      | • For RC sourced LFCLOCK calibration |
| HAPT [l] | NRF_HAPT0 | 1           | Yes                      | |
### 6.1.4 Bluetooth Audio Architecture

| TMAP | HAP | PBP | ...
|------|-----|-----|-----
| GAF  |     |     |     
| GATT | SMP | GAP | ISO |
| Low-level protocols (L2CAP, ATT, etc) |     |     |     |
| ISO  |     |     |     |

Fig. 4: Bluetooth Audio Architecture

**Generic Audio Framework (GAF)**

The Generic Audio Framework (GAF) is considered the middleware of the Bluetooth LE Audio architecture. The GAF contains the profiles and services that allow higher layer applications and profiles to set up streams, change volume, control media and telephony and more. The GAF builds on GATT, GAP and isochronous channels (ISO).

GAF uses GAP to connect, advertise and synchronize to other devices. GAF uses GATT to configure streams, associate streams with content (e.g. media or telephony), control volume and more. GAF uses ISO for the audio streams themselves, both as unicast (connected) audio streams or broadcast (unconnected) audio streams.

GAF mandates the use of the LC3 codec, but also supports other codecs.

The top-level profiles TMAP and HAP are not part of the GAF, but rather provide top-level requirements for how to use the GAF.

GAF has been implemented in Zephyr with the following structure.

**Using the Bluetooth Audio Stack** To use any of the profiles in the Bluetooth Audio Stack, including the top-level profiles outside of GAF, `CONFIG_BT_AUDIO` shall be enabled. This Kconfig option allows the enabling of the individual profiles inside of the Bluetooth Audio Stack. Each profile can generally be enabled on its own, but enabling higher-layer profiles (such as CAP, TMAP and HAP) will typically require enabling some of the lower layer profiles.

It is, however, possible to create a device that uses e.g. only Stream Control (with just the BAP), without using any of the content control or rendering/capture control profiles, or vice versa. Using the higher layer profiles will however typically provide a better user experience and better interoperability with other devices.

---

1 `CONFIG_BT_CTLR_SW_SWITCH_SINGLE_TIMER =y`
2 `CONFIG_BT_CTLR_TIFS_HW =n`
3 When not using pre-defined PPI channels
4 For software-based tIFS switching
5 For nRF5x Series
Fig. 5: Generic Audio Framework

Fig. 6: Zephyr Generic Audio Framework
Common Audio Profile (CAP)  The Common Audio Profile introduces restrictions and requirements on the lower layer profiles. The procedures in CAP works on one or more streams for one or more devices. Is it thus possible via CAP to do a single function call to setup multiple streams across multiple devices.

The figure below shows a complete structure of the procedures in CAP and how they correspond to procedures from the other profiles. The circles with I, A and C show whether the procedure has active involvement or requirements from the CAP Initiator, CAP Accept and CAP Commander roles respectively.

The API reference for CAP can be found in Common Audio Profile.

Stream Control (BAP)  Stream control is implemented by the Basic Audio Profile. This profile defines multiple roles:
- Unicast Client
- Unicast Server
- Broadcast Source
- Broadcast Sink
- Scan Delegator (not yet implemented)
- Broadcast assistant (not yet implemented)

Each role can be enabled individually, and it is possible to support more than one role.

The API reference for stream control can be found in Bluetooth Audio.

Rendering and Capture Control  Rendering and capture control is implemented by the Volume Control Profile (VCP) and Microphone Control Profile (MICP).

The VCP implementation supports the following roles
- Volume Control Service (VCS) Server
- Volume Control Service (VCS) Client

The MICP implementation supports the following roles
- Microphone Control Profile (MICP) Microphone Device (server)
- Microphone Control Profile (MICP) Microphone Controller (client)

The API reference for volume control can be found in Bluetooth Volume Control.

The API reference for Microphone Control can be found in Bluetooth Microphone Control.

Content Control  Content control is implemented by the Call Control Profile (CCP) and Media Control Profile (MCP).

The CCP implementation is not yet implemented in Zephyr.

The MCP implementation supports the following roles
- Media Control Service (MCS) Server via the Media Proxy module
- Media Control Client (MCC)

The API reference for media control can be found in Bluetooth Media Control.

Coordinated Sets  Coordinated Sets is implemented by the Coordinated Sets Identification Profile (CSIP).

The CSIP implementation supports the following roles
- Coordinated Set Identification Service (CSIP) Set Member
• Coordinated Set Identification Service (CSIP) Set Coordinator

The API reference for media control can be found in Bluetooth Coordinated Sets.

6.1.5 Bluetooth Qualification

Qualification Listings

The Zephyr BLE stack has obtained qualification listings for both the Host and the Controller. See the tables below for a list of qualification listings

<table>
<thead>
<tr>
<th>Host qualifications</th>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
</tr>
</thead>

### Configurable Parameters

6.1. Bluetooth
### Parameter Name | Selected | Description
--- | --- | ---
TSPC_L2CAP_3_1 | True | Support of RTX timer (M)
TSPC_L2CAP_3_2 | False | Support of ERTX timer (C.4)
TSPC_L2CAP_3_3 | False | Support minimum MTU size 48 octets (C.4)
TSPC_L2CAP_3_4 | False | Support MTU size larger than 48 octets (C.5)
TSPC_L2CAP_3_5 | False | Support of flush timeout value for reliable channel (C.4)
TSPC_L2CAP_3_6 | False | Support of flush timeout value for unreliable channel (C.5)
TSPC_L2CAP_3_7 | False | Support of bi-directional quality of service (QoS) option field (C.1)
TSPC_L2CAP_3_8 | False | Negotiate QoS service type (C.5)
TSPC_L2CAP_3_9 | False | Negotiate and support service type 'No Traffic' (C.2)
TSPC_L2CAP_3_10 | False | Negotiate and support service type 'Best effort' (C.3)
TSPC_L2CAP_3_11 | False | Negotiate and support service type 'Guaranteed' (C.2)
TSPC_L2CAP_3_12 | True | Support minimum MTU size 23 octets (C.6)
TSPC_L2CAP_3_13 | False | Negotiate and support service type 'No traffic' for Extended Flow Specification (C.7)
TSPC_L2CAP_3_14 | False | Negotiate and support service type 'Best Effort' for Extended Flow Specification (C.8)
TSPC_L2CAP_3_15 | False | Negotiate and support service type 'Guaranteed' for Extended Flow Specification (C.9)
TSPC_L2CAP_3_16 | True | Support Multiple Simultaneous LE Data Channels (C.10)

### 6.1.6 Bluetooth tools

This page lists and describes tools that can be used to assist during Bluetooth stack or application development in order to help, simplify and speed up the development process.

#### Mobile applications

It is often useful to make use of existing mobile applications to interact with hardware running Zephyr, to test functionality without having to write any additional code or requiring extra hardware.

The recommended mobile applications for interacting with Zephyr are:

- Android:
  - nRF Connect for Android
  - nRF Mesh for Android
  - LightBlue for Android
- iOS:
  - nRF Connect for iOS
  - nRF Mesh for iOS
Using BlueZ with Zephyr

The Linux Bluetooth Protocol Stack, BlueZ, comes with a very useful set of tools that can be used to debug and interact with Zephyr's BLE Host and Controller. In order to benefit from these tools you will need to make sure that you are running a recent version of the Linux Kernel and BlueZ:

- Linux Kernel 4.10+
- BlueZ 4.45+

Additionally, some of the BlueZ tools might not be bundled by default by your Linux distribution. If you need to build BlueZ from scratch to update to a recent version or to obtain all of its tools you can follow the steps below:

```bash
git clone git://git.kernel.org/pub/scm/bluetooth/bluez.git
cd bluez
./bootstrap-configure --disable-android --disable-midi
make
```

You can then find `btattach`, `btmgmt` and `btproxy` in the `tools/` folder and `btmon` in the `monitor/` folder.

You'll need to enable BlueZ's experimental features so you can access its most recent BLE functionality. Do this by editing the file `/lib/systemd/system/bluetooth.service` and making sure to include the `-E` option in the daemon's execution start line:

```
ExecStart=/usr/libexec/bluetooth/bluetoothd -E
```

Finally, reload and restart the daemon:

```bash
sudo systemctl daemon-reload
sudo systemctl restart bluetooth
```

Running on QEMU and Native POSIX

It's possible to run Bluetooth applications using either the QEMU emulator or Native POSIX. In either case, a Bluetooth controller needs to be exported from the host OS (Linux) to the emulator. For this purpose you will need some tools described in the Using BlueZ with Zephyr section.

Using the Host System Bluetooth Controller

The host OS's Bluetooth controller is connected in the following manner:

- To the second QEMU serial line using a UNIX socket. This socket gets used with the help of the `QEMU` option `-serial unix:/tmp/bt-server-bredr`. This option gets passed to QEMU through `QEMU_EXTRA_FLAGS` automatically whenever an application has enabled Bluetooth support.
- To a serial port in Native POSIX through the use of a command-line option passed to the Native POSIX executable: `--bt-dev=hci0`

On the host side, BlueZ allows you to export its Bluetooth controller through a so-called user channel for QEMU and Native POSIX to use.

**Note:** You only need to run `btproxy` when using QEMU. Native POSIX handles the UNIX socket proxying automatically

If you are using QEMU, in order to make the Controller available you will need one additional step using `btproxy`:
1. Make sure that the Bluetooth controller is down

2. Use the btproxy tool to open the listening UNIX socket, type:

```
sudo tools/btproxy -u -i 0
Listening on /tmp/bt-server-bredr
```

You might need to replace `-i 0` with the index of the Controller you wish to proxy.

If you see `Received unknown host packet type 0x00` when running QEMU, then add `-z` to the `btproxy` command line to ignore any null bytes transmitted at startup.

Once the hardware is connected and ready to use, you can then proceed to building and running a sample:

- Choose one of the Bluetooth sample applications located in `samples/bluetooth`.
- To run a Bluetooth application in QEMU, type:

```
west build -b qemu_x86 samples/bluetooth/<sample>
wst build -t run
```

Running QEMU now results in a connection with the second serial line to the `bt-server-bredr` UNIX socket, letting the application access the Bluetooth controller.

- To run a Bluetooth application in Native POSIX, first build it:

```
wst build -b native_posix samples/bluetooth/<sample>
```

And then run it with:

```
$ sudo ./build/zephyr/zephyr.exe --bt-dev=hci0
```

**Using a Zephyr-based BLE Controller** Depending on which hardware you have available, you can choose between two transports when building a single-mode, Zephyr-based BLE Controller:

- UART: Use the `hci_uart` sample and follow the instructions in `bluetooth-hci-uart-qemu-posix`.
- USB: Use the `hci_usb` sample and then treat it as a Host System Bluetooth Controller (see previous section)

**HCI Tracing** When running the Host on a computer connected to an external Controller, it is very useful to be able to see the full log of exchanges between the two, in the format of a Host Controller Interface log. In order to see those logs, you can use the built-in `btmon` tool from BlueZ:

```
$ btmon
```

**Running on a Virtual Controller and Native POSIX**

An alternative to a Bluetooth physical controller is the use of a virtual controller. This controller can be connected over an HCI TCP server. This TCP server must support the HCI H4 protocol. In comparison to the physical controller variant, the virtual controller allows to test a Zephyr application running on the native boards without a physical Bluetooth controller.

The main use case for a virtual controller is to do Bluetooth connectivity tests without the need of Bluetooth hardware. This allows to automate Bluetooth integration tests with external applications such as a Bluetooth gateway or a mobile application.

To demonstrate this functionality an example is given to interact with a virtual controller. For this purpose, the experimental python module `Bumble` from Google is used as it allows to create a TCP
Bluetooth virtual controller and connect with the Zephyr Bluetooth host. To install bumble follow the Bumble Getting Started Guide.

**Note:** If your Zephyr application requires the use of the HCI LE Set extended commands, install the branch controller-extended-advertising from Bumble.

### Android Emulator

You can test the virtual controller by connecting a Bluetooth Zephyr application to the **Android Emulator**.

To connect your application to the Android Emulator follow the next steps:

1. Build your Zephyr application and disable the HCI ACL flow control (i.e. `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n`) as the the virtual controller from android does not support it at the moment.

2. Install Android Emulator version >= 33.1.4.0. The easiest way to do this is by installing the latest [Android Studio Preview](https://developer.android.com/studio/index) version.

3. Create a new Android Virtual Device (AVD) with the [Android Device Manager](https://developer.android.com/studio/software/emulator). The AVD should use at least SDK API 34.

4. Run the Android Emulator via terminal as follows:

   ```
   emulator avd YOUR_AVD -packet-streamer-endpoint default
   ```

5. Create a Bluetooth bridge between the Zephyr application and the virtual controller from Android Emulator with the Bumble utility `hci-bridge`.

   ```
   bumble-hci-bridge tcp-server::1234 android-netsim
   ```

   This command will create a TCP server bridge on the local host IP address 127.0.0.1 and port number 1234.

6. Run the Zephyr application and connect to the TCP server created in the last step.

   ```
   ./zephyr.exe --bt-dev=127.0.0.1:1234
   ```

After following these steps the Zephyr application will be available to the Android Emulator over the virtual Bluetooth controller that was bridged with Bumble. You can verify that the Zephyr application can communicate over Bluetooth by opening the Bluetooth settings in your AVD and scanning for your Zephyr application device. To test this you can build the Bluetooth peripheral samples such as Peripheral HR or Peripheral DIS

### Using Zephyr-based Controllers with BlueZ

If you want to test a Zephyr-powered BLE Controller using BlueZ’s Bluetooth Host, you will need a few tools described in the [Using BlueZ with Zephyr](https://zephyrproject.org/documentation/) section. Once you have installed the tools you can then use them to interact with your Zephyr-based controller:

```bash
sudo tools/btmgmt --index 0
[hci0]# auto-power
[hci0]# find -l
```

You might need to replace `--index 0` with the index of the Controller you wish to manage. Additional information about `btmgmt` can be found in its manual pages.

### 6.1.7 Developing Bluetooth Applications

Bluetooth applications are developed using the common infrastructure and approach that is described in the [Application Development](https://zephyrproject.org/documentation/) section of the documentation.
Thread safety

Calling into the Bluetooth API is intended to be thread safe, unless otherwise noted in the documentation of the API function. The effort to ensure that this is the case for all API calls is an ongoing one, but the overall goal is formally stated in this paragraph. Bug reports and Pull Requests that move the subsystem in the direction of such goal are welcome.

Hardware setup

This section describes the options you have when building and debugging Bluetooth applications with Zephyr. Depending on the hardware that is available to you, the requirements you have and the type of development you prefer you may pick one or another setup to match your needs.

There are 4 possible hardware setups to use with Zephyr and Bluetooth:

1. Embedded
2. QEMU with an external Controller
3. Native POSIX with an external Controller
4. Simulated nRF52 with BabbleSim

Embedded  This setup relies on all software running directly on the embedded platform(s) that the application is targeting. All the Configurations and Build Types are supported but you might need to build Zephyr more than once if you are using a dual-chip configuration or if you have multiple cores in your SoC each running a different build type (e.g., one running the Host, the other the Controller).

To start developing using this setup follow the Getting Started Guide, choose one (or more if you are using a dual-chip solution) boards that support Bluetooth and then run the application).

Embedded HCI tracing  When running both Host and Controller in actual Integrated Circuits, you will only see normal log messages on the console by default, without any way of accessing the HCI traffic between the Host and the Controller. However, there is a special Bluetooth logging mode that converts the console to use a binary protocol that interleaves both normal log messages as well as the HCI traffic. Set the following Kconfig options to enable this protocol before building your application:

```
CONFIG_BT_DEBUG_MONITOR_UART=y
CONFIG_UART_CONSOLE=n
```

Setting CONFIG_BT_DEBUG_MONITOR_UART to y replaces the CONFIG_BT_DEBUG_LOG option, and setting CONFIG_UART_CONSOLE to n disables the default printk/printf hooks.

To decode the binary protocol that will now be sent to the console UART you need to use the btmon tool from BlueZ:

```
$ btmon --tty <console TTY> --tty-speed 115200
```

Host on Linux with an external Controller

Note:  This is currently only available on GNU/Linux

This setup relies on a “dual-chip” configuration which is comprised of the following devices:

1. A Host-only application running in the QEMU emulator or the native posix native port of Zephyr
2. A Controller, which can be one of the following types:
• A commercially available Controller
• A Controller-only build of Zephyr
• A Virtual controller

**Warning:** Certain external Controllers are either unable to accept the Host to Controller flow control parameters that Zephyr sets by default (Qualcomm), or do not transmit any data from the Controller to the Host (Realtek). If you see a message similar to:

```<wrn> bt_hci_core: opcode 0x0c33 status 0x12```

when booting your sample of choice (make sure you have enabled `CONFIG_LOG` in your `prj.conf` before running the sample), or if there is no data flowing from the Controller to the Host, then you need to disable Host to Controller flow control. To do so, set `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n` in your `prj.conf`.

**QEMU** You can run the Zephyr Host on the QEMU emulator and have it interact with a physical external Bluetooth Controller. Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application in this setup.

**Native POSIX**

*Note:* This is currently only available on GNU/Linux

The Native POSIX target builds your Zephyr application with the Zephyr kernel, and some minimal HW emulation as a native Linux executable. This executable is a normal Linux program, which can be debugged and instrumented like any other, and it communicates with a physical or virtual external Controller.

Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application with a physical controller. For the virtual controller refer to Running on a Virtual Controller and Native POSIX.

**Simulated nRF52 with BabbleSim**

*Note:* This is currently only available on GNU/Linux

The nrf52_bsim board, is a simulated target board which emulates the necessary peripherals of a nrf52 SOC to be able to develop and test BLE applications. This board, uses:

• BabbleSim to simulate the nrf52 modem and the radio environment.
• The POSIX arch to emulate the processor.
• Models of the nrf52 HW

Just like with the native_posix target, the build result is a normal Linux executable. You can find more information on how to run simulations with one or several devices in this board’s documentation.

Currently, only Combined builds are possible, as this board does not yet have any models of a UART, or USB which could be used for an HCI interface towards another real or simulated device.

**Initialization**

The Bluetooth subsystem is initialized using the `bt_enable()` function. The caller should ensure that function succeeds by checking the return code for errors. If a function pointer is passed to `bt_enable()`, the initialization happens asynchronously, and the completion is notified through the given function.

6.1. Bluetooth
Bluetooth Application Example

A simple Bluetooth beacon application is shown below. The application initializes the Bluetooth Subsystem and enables non-connectable advertising, effectively acting as a Bluetooth Low Energy broadcaster.

```c
/*
 * Set Advertisement data. Based on the Eddystone specification:
 * https://github.com/google/eddystone/blob/master/protocol-specification.md
 * https://github.com/google/eddystone/tree/master/eddystone-url
 */
static const struct bt_data ad[] = {
    BT_DATA_BYTES(BT_DATA_FLAGS, BT_LE_AD_NO_BREDR),
    BT_DATA_BYTES(BT_DATA_UUID16_ALL, 0xaa, 0xfe),
    BT_DATA_BYTES(BT_DATA_SVC_DATA16,
        0xaa, 0xfe, /* Eddystone UUID */
        0x10, /* Eddystone-URL frame type */
        0x00, /* Calibrated Tx power at 0m */
        0x00, /* URL Scheme Prefix http://www. */
        'z', 'e', 'p', 'h', 'y', 'r',
        'p', 'r', 'o', 'j', 'e', 'c', 't',
        0x08) /* .org */
};

/* Set Scan Response data */
static const struct bt_data sd[] = {
    BT_DATA(BT_DATA_NAME_COMPLETE, DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
    char addr_s[BT_ADDR_LE_STR_LEN];
    bt_addr_le_t addr = {0};
    size_t count = 1;

    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
        return;
    }

    printk("Bluetooth initialized\n");

    /* Start advertising */
    err = bt_le_adv_start(BT_LE_ADV_NCONN_IDENTITY, ad, ARRAY_SIZE(ad),
        sd, ARRAY_SIZE(sd));
    if (err) {
        printk("Advertising failed to start (err %d)\n", err);
        return;
    }

    /* For connectable advertising you would use
     * bt_le_oob_get_local(). For non-connectable non-identity
     * advertising an non-resolvable private address is used;
     * there is no API to retrieve that.
     */
}
```

(continues on next page)
bt_id_get(&addr, &count);
bt_addr_le_to_str(&addr, addr_s, sizeof(addr_s));

printk("Beacon started, advertising as %s\n", addr_s);
}

int main(void)
{
    int err;

    printk("Starting Beacon Demo\n");

    /* Initialize the Bluetooth Subsystem */
    err = bt_enable(bt_ready);
    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
    } else {
        printk("Beacon started, advertising as %s\n", addr_s);
    }
    return 0;
}

The key APIs employed by the beacon sample are `bt_enable()` that's used to initialize Bluetooth and then `bt_le_adv_start()` that's used to start advertising a specific combination of advertising and scan response data.

### 6.1.8 AutoPTS on Windows 10 with nRF52 board

**Overview**

This tutorial shows how to setup AutoPTS client and server to run both on Windows 10. We use WSL1 with Ubuntu only to build a Zephyr project to an elf file, because Zephyr SDK is not available on Windows yet. Tutorial covers only nrf52840dk.

#### Update Windows and drivers

Update Windows in:
Start -> Settings -> Update & Security -> Windows Update

Update drivers, following the instructions from your hardware vendor.

#### Install Python 3

Download and install Python 3. Setup was tested with versions >=3.8. Let the installer add the Python installation directory to the PATH and disable the path length limitation.
Install Git

Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
**Install PTS 8**

Install latest PTS from [https://www.bluetooth.org](https://www.bluetooth.org). Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”.

**Note:** Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

**Setup Zephyr project for Windows**

Perform Windows setup from Getting Started Guide.

**Install nrftools**

Connect devices
Flash board

In Device Manager find COM port of your nrf board. In my case it is COM3.
In Git Bash, go to zephyrproject

```bash
cd ~/zephyrproject
```

Build the auto-pts tester app

```bash
west build -p auto -b nrf52840dk_nrf52840 zephyr/tests/bluetooth/tester/
```

You can display flashing options with:

```bash
west flash --help
```

and flash board with built earlier elf file:

```bash
west flash --skip-rebuild --board-dir /dev/ttyS2 --elf-file ~/zephyrproject/build/zephyr/zephyr.elf
```

Note that west does not accept COMs, so use /dev/ttyS2 as the COM3 equivalent, /dev/ttyS2 as the COM3 equivalent, etc. (/dev/ttyS + decremented COM number).

**Setup auto-pts project**

In Git Bash, clone project repo:

```bash
git clone https://github.com/intel/auto-pts.git
```

Go into the project folder:

```bash
cd auto-pts
```

Install required python modules:
Install socat.exe

Download and extract socat.exe from https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/ into folder ~/socat-1.7.3.2-1-x86_64/.

Add path to directory of socat.exe to PATH:
Running AutoPTS

Server and client by default will run on localhost address. Run server:

```bash
codecoup@rakiet3:~$ python ./autoptsserver.py -S 65000
```

Note: If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```bash
pip install --upgrade --force-reinstall pywin32
```

Run client:

```bash
codecoup@rakiet3:~$ python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t COM3 -b nrf52 -S 65000 -C 65001
```
At the first run, when Windows asks, enable connection through firewall:

Troubleshooting

- “When running actual hardware test mode, I have only BTP TIMEOUTs.”

This is a problem with connection between auto-pts client and board. There are many possible causes. Try:
- Clean your auto-pts and zephyr repos with

  Warning: This command will force the irreversible removal of all uncommitted files in the repo.

  
  git clean -fdx

then build and flash tester elf again.
- If you have set up Windows on virtual machine, check if guest extensions are installed properly or change USB compatibility mode in VM settings to USB 2.0.
- Check, if firewall is not blocking python.exe or socat.exe.
- Check, if board sends ready event after restart (hex 00 00 80 ff 00 00). Open serial connection to board with e.g. PuTTY with proper COM and baud rate. After board reset you should see some strings in console.
- Check if socat.exe creates tunnel to board. Run in console

```
socat.exe -x -v tcp-listen:65123 /dev/ttyS2,raw,b115200
```

where /dev/ttyS2 is the COM3 equivalent. Open PuTTY, set connection type to Raw, IP to 127.0.0.1, port to 65123. After board reset you should see some strings in console.

### 6.1.9 AutoPTS on Linux

**Overview**

This tutorial shows how to setup AutoPTS client on Linux with AutoPTS server running on Windows 10 virtual machine. Tested with Ubuntu 20.4 and Linux Mint 20.4.

You must have a Zephyr development environment set up. See *Getting Started Guide* for details.

Supported methods to test zephyr bluetooth host:

- Testing Zephyr Host Stack on QEMU
- Testing Zephyr Host Stack on native posix
- Testing Zephyr combined (controller + host) build on Real hardware (such as nRF52)

For running with QEMU or native posix, see *Running on QEMU and Native POSIX*.

**Setup Linux**

Install nrftools (only required in the actual hardware test mode)

After you extract archive, you will see 2 .deb files, e.g.:

- JLink_Linux_V688a_x86_64.deb
- nRF-Command-Line-Tools_10_12_1_Linux-amd64.deb

and README.md. To install the tools, double click on each .deb file or follow instructions from README.md.

Setup Windows 10 virtual machine

Choose and install your hypervisor like VMWare Workstation(preferred) or VirtualBox. On VirtualBox could be some issues, if your host has fewer than 6 CPU.

Create Windows virtual machine instance. Make sure it has at least 2 cores and installed guest extensions.

Setup tested with VirtualBox 6.1.18 and VMWare Workstation 16.1.1 Pro.

Update Windows  
Update Windows in:
Start -> Settings -> Update & Security -> Windows Update

Setup static IP

WMWare Works  
On Linux, open Virtual Network Editor app and create network:
Open virtual machine network settings. Add custom adapter:

If you type `ifconfig` in terminal, you should be able to find your host IP:
VirtualBox  Go to:
File -> Host Network Manager
and create network:

Open virtual machine network settings. On adapter 1 you will have created by default NAT. Add adapter 2:
**Windows**  Setup static IP on Windows virtual machine. Go to
Settings -> Network & Internet -> Ethernet -> Unidentified network -> Edit and set:
**Install Python 3**  Download and install latest Python 3 on Windows. Let the installer add the Python installation directory to the PATH and disable the path length limitation.

**Install Git**  Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8  On Windows virtual machine, install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

Note:  Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Connect PTS dongle  With VirtualBox there should be no problem. Just find dongle in Devices -> USB and connect.

With VMWare you might need to use some trick, if you cannot find dongle in VM -> Removable Devices. Type in Linux terminal:

```
usb-devices
```

and find in output your PTS Bluetooth USB dongle
Note Vendor and ProdID number. Close VMWare Workstation and open .vmx of your virtual machine (path similar to /home/codecoup/vmware/Windows 10/Windows 10.vmx) in text editor. Write anywhere in the file following line:

```
usb.autoConnect.device0 = "0x0a12:0x0001"
```

just replace 0x0a12 with Vendor number and 0x0001 with ProdID number you found earlier.

**Connect devices (only required in the actual hardware test mode)**
Flash board (only required in the actual hardware test mode)

On Linux, go to ~/zephyrproject. There should be already ~/zephyrproject/build directory. Flash board:

```bash
west flash
```

Setup auto-pts project

**AutoPTS client on Linux**  
Clone auto-pts project:
git clone https://github.com/intel/auto-pts.git

Install socat, that is used to transfer BTP data stream from UART's try file:
sudo apt-get install python-setuptools socat

Install required python modules:
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsclient_requirements.txt

**Autopts server on Windows virtual machine**  In Git Bash, clone auto-pts project repo:
git clone https://github.com/intel/auto-pts.git

Install required python modules:
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt

Restart virtual machine.

**Running AutoPTS**

Server and client by default will run on localhost address. Run server:

```bash
python ./autoptsserver.py
```

```
|Local IP address: ('10.0.2.15', 'Fe80::20ca:62:5ac:2855:8f86') DNS 'home' |
|Local IP address: ('192.168.2.2', 'Fe80::f8d1:5d5:2d2b:9147') DNS 'None' |
|Serving on port 65000 ...
```

Testing Zephyr Host Stack on QEMU:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
|samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart

python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_PROJECT\PTS_PROJECT.pqw6" \
"/zephyrproject/build/zephyr/zephyr.elf -i SERVER_IP -l LOCAL_IP
```

Testing Zephyr Host Stack on native posix:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
|samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart

west build -b native_posix zephyr/tests/bluetooth/tester/ -DEXTRA_CONF_FILE=overlay-
|native.conf
```

(continues on next page)
Testing Zephyr combined (controller + host) build on nRF52:

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```bash
pip install --upgrade --force-reinstall pywin32
```

Run client:

```bash
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t /dev/ACM0 -b nrf52 -l 192.168.2.1 -i 192.168.2.2
```

At the first run, when Windows asks, enable connection through firewall:
Troubleshooting

- “After running one test, I need to restart my Windows virtual machine to run another, because of fail verdict from APICOM in PTS logs.”

It means your virtual machine has not enough processor cores or memory. Try to add more in settings. Note that a host with 4 CPUs could be not enough with VirtualBox as hypervisor. In this case, choose rather VMWare Workstation.

- “I cannot start autoptsserver-zephyr.py. I always got error:"

![Python error message]

One or more of the following steps should help:

- Close all PTS Windows.
- Replug PTS bluetooth dongle.
- Delete temporary workspace. You will find it in auto-pts-code/workspaces/zephyr/zephyr-master/ as temp_zephyr-master. Be careful, do not remove the original one zephyr-master.pqw6.
- Restart Windows virtual machine.

6.1.10 Bluetooth APIs

Attribute Protocol (ATT)

API Reference

codegroup bt_att

Attribute Protocol (ATT)

Defines

BT_ATT_ERR_SUCCESS

The ATT operation was successful.

BT_ATT_ERR_INVALID_HANDLE

The attribute handle given was not valid on the server.
BT_ATT_ERR_READ_NOT_PERMITTED
The attribute cannot be read.

BT_ATT_ERR_WRITE_NOT_PERMITTED
The attribute cannot be written.

BT_ATT_ERR_INVALID_PDU
The attribute PDU was invalid.

BT_ATT_ERR_AUTHENTICATION
The attribute requires authentication before it can be read or written.

BT_ATT_ERR_NOT_SUPPORTED
The ATT Server does not support the request received from the client.

BT_ATT_ERR_INVALID_OFFSET
Offset specified was past the end of the attribute.

BT_ATT_ERR_AUTHORIZATION
The attribute requires authorization before it can be read or written.

BT_ATT_ERR_PREPARE_QUEUE_FULL
Too many prepare writes have been queued.

BT_ATT_ERR_ATTRIBUTE_NOT_FOUND
No attribute found within the given attribute handle range.

BT_ATT_ERR_ATTRIBUTE_NOT_LONG
The attribute cannot be read using the ATT_READ_BLOB_REQ PDU.

BT_ATT_ERR_ENCRYPTION_KEY_SIZE
The Encryption Key Size used for encrypting this link is too short.

BT_ATT_ERR_INVALID_ATTRIBUTE_LEN
The attribute value length is invalid for the operation.

BT_ATT_ERR_UNLIKELY
The attribute request that was requested has encountered an error that was unlikely.
The attribute request could therefore not be completed as requested.

BT_ATT_ERR_INSUFFICIENT_ENCRYPTION
The attribute requires encryption before it can be read or written.

BT_ATT_ERR_UNSUPPORTED_GROUP_TYPE
The attribute type is not a supported grouping attribute.
The attribute type is not a supported grouping attribute as defined by a higher layer specification.
BT_ATT_ERR_INSUFFICIENT_RESOURCES
   Insufficient Resources to complete the request.

BT_ATT_ERR_DB_OUT_OF_SYNC
   The server requests the client to rediscover the database.

BT_ATT_ERR_VALUE_NOT_ALLOWED
   The attribute parameter value was not allowed.

BT_ATT_ERR_WRITE_REQ_REJECTED
   Write Request Rejected.

BT_ATT_ERR_CCC_IMPROPER_CONF
   Client Characteristic Configuration Descriptor Improperly Configured.

BT_ATT_ERR_PROCEDURE_IN_PROGRESS
   Procedure Already in Progress.

BT_ATT_ERR_OUT_OF_RANGE
   Out of Range.

BT_ATT_MAX_ATTRIBUTE_LEN

BT_ATT_FIRST_ATTRIBUTE_HANDLE

BT_ATT_LAST_ATTRIBUTE_HANDLE

BT_ATT_LASTATTRIBUTE_HANDLE

Enums

enum bt_att_chan_opt
   ATT channel option bit field values.

   Note: BT_ATT_CHAN_OPT_UNENHANCED_ONLY and BT_ATT_CHAN_OPT_ENHANCED_ONLY
       are mutually exclusive and both bits may not be set.

   Values:

   enumerator BT_ATT_CHAN_OPT_NONE = 0x0
      Both Enhanced and Unenhanced channels can be used

   enumerator BT_ATT_CHAN_OPT_UNENHANCED_ONLY = BIT(0)
      Only Unenhanced channels will be used
enumerator BT_ATT_CHAN_OPT_ENHANCED_ONLY = BIT(1)

Only Enhanced channels will be used

Functions

int bt_eatt_connect(struct bt_conn *conn, size_t num_channels)
Connect Enhanced ATT channels.
Sends a series of Credit Based Connection Requests to connect num_channels Enhanced ATT channels. The peer may have limited resources and fewer channels may be created.

Parameters
• conn – The connection to send the request on
• num_channels – The number of Enhanced ATT beares to request. Must be in the range 1 - CONFIG_BT_EATT_MAX, inclusive.

Return values
• -EINVAL – if num_channels is not in the allowed range or conn is NULL.
• -ENOMEM – if less than num_channels are allocated.
• 0 – in case of success

Returns
0 in case of success or negative value in case of error.

size_t bt_eatt_count(struct bt_conn *conn)
Get number of EATT channels connected.

Parameters
• conn – The connection to get the number of EATT channels for.

Returns
The number of EATT channels connected. Returns 0 if conn is NULL or not connected.

Bluetooth Audio

API Reference

group bt_audio
Bluetooth Audio.

Defines

BT_AUDIO_BROADCAST_ID_SIZE

BT_AUDIO_BROADCAST_ID_MAX
Maximum broadcast ID value.

BT_AUDIO_PD_PREF_NONE
Indicates that the server have no preference for the presentation delay.
BT_AUDIO_PD_MAX
   Maximum presentation delay in microseconds.

BT_AUDIO_BROADCAST_CODE_SIZE

BT_AUDIO_CONTEXT_TYPE_ANY
   Any known context.

BT_AUDIO_METADATA_TYPE_IS_KNOWN(_type)
   Helper to check whether metadata type is known by the stack.

BT_AUDIO_UNICAST_ANNOUNCEMENT_GENERAL

BT_AUDIO_UNICAST_ANNOUNCEMENT_TARGETED

BT_AUDIO_CODEC_DATA(_type, _bytes...)
   Helper to declare elements of bt_audio_codec_cap arrays.
   This macro is mainly for creating an array of struct bt_audio_codec_cap data arrays.

   Parameters
   • _type – Type of advertising data field
   • _bytes – Variable number of single-byte parameters

BT_AUDIO_CODEC_CFG(_id, _cid, _vid, _data, _meta)
   Helper to declare Codec config parsing APIs.

   Parameters
   • _id – Codec ID
   • _cid – Company ID
   • _vid – Vendor ID
   • _data – Codec Specific Data in LVT format
   • _meta – Codec Specific Metadata in LVT format

BT_AUDIO_CODEC_CAP(_id, _cid, _vid, _data, _meta)
   Helper to declare bt_audio_codec_cap structure.

   Parameters
   • _id – Codec ID
   • _cid – Company ID
   • _vid – Vendor ID
   • _data – Codec Specific Data in LVT format
   • _meta – Codec Specific Metadata in LVT format

BT_AUDIO_LOCATION_ANY
   Any known location.

BT_AUDIO_CODEC_QOS(_interval, _framing, _phy, _sdru, _rtn, _latency, _pd)
   Helper to declare elements of bt_audio_codec_qos.

   Parameters
   • _interval – SDU interval (usec)
- _framing – Framing
- _phy – Target PHY
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

```c
BT_AUDIO_CODEC_QOS_UNFRAMED(_interval, _sdu, _rtn, _latency, _pd)
```
Helper to declare Input Unframed `bt_audio_codec_qos`.

**Parameters**
- _interval – SDU interval (usec)
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

```c
BT_AUDIO_CODEC_QOS_FRAMED(_interval, _sdu, _rtn, _latency, _pd)
```
Helper to declare Input Framed `bt_audio_codec_qos`.

**Parameters**
- _interval – SDU interval (usec)
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

```c
BT_AUDIO_CODEC_QOS_PREF(_unframed_supported, _phy, _rtn, _latency, _pd_min, _pd_max, _pref_pd_min, _pref_pd_max)
```
Helper to declare elements of `bt_audio_codec_qos_pref`.

**Parameters**
- _unframed_supported – Unframed PDUs supported
- _phy – Preferred Target PHY
- _rtn – Preferred Retransmission number
- _latency – Preferred Maximum Transport Latency (msec)
- _pd_min – Minimum Presentation Delay (usec)
- _pd_max – Maximum Presentation Delay (usec)
- _pref_pd_min – Preferred Minimum Presentation Delay (usec)
- _pref_pd_max – Preferred Maximum Presentation Delay (usec)

** Enums**
enum bt_audio_context
    Audio Context Type for Generic Audio.
These values are defined by the Generic Audio Assigned Numbers, bluetooth.com
Values:

enumerator BT_AUDIO_CONTEXT_TYPE_PROHIBITED = 0
enumerator BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED = BIT(0)
enumerator BT_AUDIO_CONTEXT_TYPE_CONVERSATIONAL = BIT(1)
enumerator BT_AUDIO_CONTEXT_TYPE_MEDIA = BIT(2)
enumerator BT_AUDIO_CONTEXT_TYPE_GAME = BIT(3)
enumerator BT_AUDIO_CONTEXT_TYPE_INSTRUCTIONAL = BIT(4)
enumerator BT_AUDIO_CONTEXT_TYPE_VOICE_ASSISTANTS = BIT(5)
enumerator BT_AUDIO_CONTEXT_TYPE_LIVE = BIT(6)
enumerator BT_AUDIO_CONTEXT_TYPE_SOUND_EFFECTS = BIT(7)
enumerator BT_AUDIO_CONTEXT_TYPE_NOTIFICATIONS = BIT(8)

enumerator BT_AUDIO_CONTEXT_TYPE_ALERTS = BIT(10)
enumerator BT_AUDIO_CONTEXT_TYPE_EMERGENCY_ALARM = BIT(11)

enum bt_audio_parental_rating
    Parental rating defined by the Generic Audio assigned numbers (bluetooth.com).
The numbering scheme is aligned with Annex F of EN 300 707 v1.2.1 which defined parental
rating for viewing.
Values:

enumerator BT_AUDIO_PARENTAL_RATING_NO_RATING = 0x00
enumerator BT_AUDIO_PARENTAL_RATING_AGE_ANY = 0x01
enumerator BT_AUDIO_PARENTAL_RATING_AGE_5_OR_ABOVE = 0x02
enumerator BT_AUDIO_PARENTAL_RATING_AGE_6_OR_ABOVE = 0x03
enumerator BT_AUDIO_PARENTAL_RATING_AGE_7_OR_ABOVE = 0x04
enumerator BT_AUDIO_PARENTAL_RATING_AGE_8_OR_ABOVE = 0x05
enumerator BT_AUDIO_PARENTAL_RATING_AGE_9_OR_ABOVE = 0x06
enumerator BT_AUDIO_PARENTAL_RATING_AGE_10_OR_ABOVE = 0x07
enumerator BT_AUDIO_PARENTAL_RATING_AGE_11_OR_ABOVE = 0x08
enumerator BT_AUDIO_PARENTAL_RATING_AGE_12_OR_ABOVE = 0x09
enumerator BT_AUDIO_PARENTAL_RATING_AGE_13_OR_ABOVE = 0x0A
enumerator BT_AUDIO_PARENTAL_RATING_AGE_14_OR_ABOVE = 0x0B
enumerator BT_AUDIO_PARENTAL_RATING_AGE_15_OR_ABOVE = 0x0C
enumerator BT_AUDIO_PARENTAL_RATING_AGE_16_OR_ABOVE = 0x0D
enumerator BT_AUDIO_PARENTAL_RATING_AGE_17_OR_ABOVE = 0x0E
enumerator BT_AUDIO_PARENTAL_RATING_AGE_18_OR_ABOVE = 0x0F

enum bt_audio_active_state
  Audio Active State defined by the Generic Audio assigned numbers (bluetooth.com).
  Values:
  enumerator BT_AUDIO_ACTIVE_STATE_DISABLED = 0x00
  enumerator BT_AUDIO_ACTIVE_STATE_ENABLED = 0x01

enum bt_audio_metadata_type
  Codec metadata type IDs.
  Metadata types defined by the Generic Audio assigned numbers (bluetooth.com).
  Values:
  enumerator BT_AUDIO_METADATA_TYPE_PREF_CONTEXT = 0x01
    Preferred audio context.
    Bitfield of preferred audio contexts.
    If 0, the context type is not a preferred use case for this codec configuration.
    See the BT_AUDIO_CONTEXT_* for valid values.
enumerator BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT = 0x02
   Streaming audio context.

   Bitfield of streaming audio contexts.

   If 0, the context type is not a preferred use case for this codec configuration.

   See the BT_AUDIO_CONTEXT_* for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO = 0x03
   UTF-8 encoded title or summary of stream content.

enumerator BT_AUDIO_METADATA_TYPE_STREAM_LANG = 0x04
   Stream language.

   3 octet lower case language code defined by ISO 639-3

enumerator BT_AUDIO_METADATA_TYPE_CCID_LIST = 0x05
   Array of 8-bit CCID values.

enumerator BT_AUDIO_METADATA_TYPE_PARENTAL_RATING = 0x06
   Parental rating.

   See @ref bt_audio_parental_rating for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI = 0x07
   UTF-8 encoded URI for additional Program information.

enumerator BT_AUDIO_METADATA_TYPE_AUDIO_STATE = 0x08
   Audio active state.

   See @ref bt_audio_active_state for valid values.

enumerator BT_AUDIO_METADATA_TYPE_BROADCAST_IMMEDIATE = 0x09
   Broadcast Audio Immediate Rendering flag

enumerator BT_AUDIO_METADATA_TYPE_EXTENDED = 0xFE
   Extended metadata.

enumerator BT_AUDIO_METADATA_TYPE_VENDOR = 0xFF
   Vendor specific metadata.

enum bt_audio_location
   Location values for BT Audio.

   These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

   Values:

   enumerator BT_AUDIO_LOCATION_PROHIBITED = 0
enumerator BT_AUDIO_LOCATION_FRONT_LEFT = BIT(0)
enumerator BT_AUDIO_LOCATION_FRONT_RIGHT = BIT(1)
enumerator BT_AUDIO_LOCATION_FRONT_CENTER = BIT(2)
enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_1 = BIT(3)
enumerator BT_AUDIO_LOCATION_BACK_LEFT = BIT(4)
enumerator BT_AUDIO_LOCATION_BACK_RIGHT = BIT(5)
enumerator BT_AUDIO_LOCATION_FRONT_LEFT_OF_CENTER = BIT(6)
enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_OF_CENTER = BIT(7)
enumerator BT_AUDIO_LOCATION_BACK_CENTER = BIT(8)
enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_2 = BIT(9)
enumerator BT_AUDIO_LOCATION_SIDE_LEFT = BIT(10)
enumerator BT_AUDIO_LOCATION_SIDE_RIGHT = BIT(11)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_LEFT = BIT(12)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_RIGHT = BIT(13)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_CENTER = BIT(14)
enumerator BT_AUDIO_LOCATION_TOP_CENTER = BIT(15)
enumerator BT_AUDIO_LOCATION_TOP_BACK_LEFT = BIT(16)
enumerator BT_AUDIO_LOCATION_TOP_BACK_RIGHT = BIT(17)
enumerator BT_AUDIO_LOCATION_TOP_SIDE_LEFT = BIT(18)
enumerator BT_AUDIO_LOCATION_TOP_SIDE_RIGHT = BIT(19)
enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_CENTER = BIT(20)
enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_LEFT = BIT(21)
enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_RIGHT = BIT(23)
enumerator BT_AUDIO_LOCATION_FRONT_LEFT_WIDE = BIT(24)
enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_WIDE = BIT(25)
enumerator BT_AUDIO_LOCATION_LEFT_SURROUND = BIT(26)
enumerator BT_AUDIO_LOCATION_RIGHT_SURROUND = BIT(27)

enum bt_audio_dir
    Audio Capability type.
    Values:
    enumerator BT_AUDIO_DIR_SINK = 0x01
    enumerator BT_AUDIO_DIR_SOURCE = 0x02

denum bt_audio_codec_qos_framing
    Codec QoS Framing.
    Values:
    enumerator BT_AUDIO_CODEC_QOS_FRAMING_UNFRAMED = 0x00
    enumerator BT_AUDIO_CODEC_QOS_FRAMING_FRAMED = 0x01

denum [anonymous]
    Codec QoS Preferred PHY.
    Values:
    enumerator BT_AUDIO_CODEC_QOS_1M = BIT(0)
    enumerator BT_AUDIO_CODEC_QOS_2M = BIT(1)
    enumerator BT_AUDIO_CODEC_QOS_CODED = BIT(2)

Functions

int bt_audio_data_parse(const uint8_t ltv[], size_t size, bool (*func)(struct bt_data *data, void *user_data), void *user_data)

    Helper for parsing length-type-value data.

    Parameters
    • ltv – Length-type-value (LTV) encoded data.
    • size – Size of the ltv data.
• **func** – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.

• **user_data** – User data to be passed to the callback.

**Return values**

• 0 – if all entries were parsed.

• -EINVAL – if the data is incorrectly encoded

• -ECANCELED – if parsing was prematurely cancelled by the callback

```c
struct bt_audio_codec_cap
#include <audio.h> Codec capability structure.
```

**Public Members**

```c
tUint8_t path_id
   Data path ID.
   BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.

tUint8_t id
   Codec ID.

tUint16_t cid
   Codec Company ID.

tUint16_t vid
   Codec Company Vendor ID.
```

```c
struct bt_audio_codec_cfg
#include <audio.h> Codec specific configuration structure.
```

**Public Members**

```c
tUint8_t path_id
   Data path ID.
   BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.

tUint8_t id
   Codec ID.

tUint16_t cid
   Codec Company ID.

tUint16_t vid
   Codec Company Vendor ID.
```

```c
struct bt_audio_codec_qos
#include <audio.h> Codec QoS structure.
```
Public Members

uint8_t phy
    QoS PHY.

enum bt_audio_codec_qos_framing framing
    QoS Framing.

uint8_t rtn
    QoS Retransmission Number.

uint16_t sdu
    QoS SDU.

uint32_t interval
    QoS Frame Interval.

uint32_t pd
    QoS Presentation Delay in microseconds.
    Value range 0 to BT_AUDIO_PD_MAX.

struct bt_audio_codec_qos_pref
    #include <audio.h> Audio Stream Quality of Service Preference structure.

Public Members

bool unframed_supported
    Unframed PDUs supported.
    Unlike the other fields, this is not a preference but whether the codec supports unframed ISOAL PDUs.

uint8_t phy
    Preferred PHY.

uint8_t rtn
    Preferred Retransmission Number.

uint16_t latency
    Preferred Transport Latency.

uint32_t pd_min
    Minimum Presentation Delay in microseconds.
    Unlike the other fields, this is not a preference but a minimum requirement.
    Value range 0 to BT_AUDIO_PD_MAX, or BT_AUDIO_PD_PREF_NONE to indicate no preference.
uint32_t pd_max
Maximum Presentation Delay.
Unlike the other fields, this is not a preference but a maximum requirement.
Value range 0 to BT_AUDIO_PD_MAX, or BT_AUDIO_PD_PREF_NONE to indicate no preference.

uint32_t pref_pd_min
Preferred minimum Presentation Delay.
Value range 0 to BT_AUDIO_PD_MAX.

uint32_t pref_pd_max
Preferred maximum Presentation Delay.
Value range 0 to BT_AUDIO_PD_MAX.

group bt_audio_codec_cfg
Audio codec Config APIs.
Functions to parse codec config data when formatted as LTV wrapped into Codec config parsing APIs.

 Enums

 enum bt_audio_codec_cfg_parse_err
 Codec parser error codes for Codec config parsing APIs.
 Values:

  enumerator BT_AUDIO_CODEC_PARSE_ERR_SUCCESS = 0
  The requested type is not present in the data set.

  enumerator BT_AUDIO_CODEC_PARSE_ERR_TYPE_NOT_FOUND = -1
  The requested type is not present in the data set.

  enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_VALUE_FOUND = -2
  The value found is invalid.

  enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_PARAM = -3
  The parameters specified to the function call are not valid.

 Functions

 int bt_audioCodec_cfg_get_freq(const struct bt_audio_codec_cfg *codec_cfg)
 Extract the frequency from a codec configuration.

 Parameters
  * codec_cfg - The codec configuration to extract data from.

 Returns
  The frequency in Hz if found else a negative value of type bt_audio_codec_cfg_parse_err.
int bt_audio_codec_cfg_get_frame_duration_us(const struct bt_audio_codec_cfg *codec_cfg)

Extract frame duration from BT codec config.

Parameters
• codec_cfg – The codec configuration to extract data from.

Returns
Frame duration in microseconds if value is found else a negative value of type bt_audio_codec_cfg_parse_err.

int bt_audio_codec_cfg_get_chan_allocation_val(const struct bt_audio_codec_cfg *codec_cfg, enum bt_audio_location *chan_allocation)

Extract channel allocation from BT codec config.
The value returned is a bit field representing one or more audio locations as specified by bt_audio_location. Shall match one or more of the bits set in BT_PAC_SNK_LOC/BT_PAC_SRC_LOC.
Up to the configured BT_AUDIO_CODEC_LC3_CHAN_COUNT number of channels can be present.

Parameters
• codec_cfg – The codec configuration to extract data from.
• chan_allocation – Pointer to the variable to store the extracted value in.

Returns
BT_AUDIO_CODEC.Parse_SUCCESS if value is found and stored in the pointer provided else a negative value of type bt_audio_codec_cfg_parse_err.

int bt_audio_codec_cfg_get_octets_per_frame(const struct bt_audio_codec_cfg *codec_cfg)

Extract frame size in octets from BT codec config.
The overall SDU size will be octets_per_frame * blocks_per_sdu.
The Bluetooth specifications are not clear about this value - it does not state that the codec shall use this SDU size only. A codec like LC3 supports variable bit-rate (per SDU) hence it might be allowed for an encoder to reduce the frame size below this value. Hence it is recommended to use the received SDU size and divide by blocks_per_sdu rather than relying on this octets_per_sdu value to be fixed.

Parameters
• codec_cfg – The codec configuration to extract data from.

Returns
Frame length in octets if value is found else a negative value of type bt_audio_codec_cfg_parse_err.

int bt_audio_codec_cfg_get_frame_blocks_per_sdu(const struct bt_audio_codec_cfg *codec_cfg, bool fallback_to_default)

Extract number of audio frame blockss in each SDU from BT codec config.
The overall SDU size will be octets_per_frame * frame_blocks_per_sdu * number-of-channels.
If this value is not present a default value of 1 shall be used.
A frame block is one or more frames that represents data for the same period of time but for different channels. If the stream have two audio channels and this value is two there will be four frames in the SDU.

Parameters
• codec_cfg – The codec configuration to extract data from.
• fallback_to_default – If true this function will return the default value of 1 if the type is not found. In this case the function will only fail if a NULL pointer is provided.

**Returns**
The count of codec frames in each SDU if value is found else a negative value of type `bt_audio_codec_cfg_parse_err` unless when `fallback_to_default` is true then the value 1 is returned if frames per sdu is not found.

```c
uint8_t bt_audio_codec_cfg_get_val(const struct bt_audio_codec_cfg *codec_cfg, uint8_t type, const uint8_t **data)
```

Lookup a specific value based on type.

Depending on context `bt_audio_codec_cfg` will be either codec capabilities, codec configuration or meta data.

Typically types used are: `bt_audio_codec_capability_type` `bt_audio_codec_config_type` `bt_audio_metadata_type`

**Parameters**
- type – [in] The type id to look for
- data – [out] Pointer to the data-pointer to update when item is found

**Returns**
Length of found data or 0 if not found

---

**Basic Audio Profile**

**API Reference**

**group bt_bap**

Bluetooth Basic Audio Profile (BAP)

**Defines**

`BT_BAP_SCAN_DELEGATOR_MAX_METADATA_LEN`

`BT_BAP_SCAN_DELEGATOR_MAX_SUBGROUPS`

`BT_BAP_BASE_MIN_SIZE`

The minimum size of a Broadcast Audio Source Endpoint (BASE) 2 octets UUID 3 octets presentation delay 1 octet number of subgroups (which is minimum 1) 1 octet number of BIS (which is minimum 1) 5 octets codec_id 1 octet codec configuration length (which may be 0) 1 octet metadata length (which may be 0) 1 octet BIS index 1 octet BIS specific codec configuration length (which may be 0)

`BT_BAP_BASE_BIS_DATA_MIN_SIZE`

The minimum size of a `bt_bap_base_bis_data`.

`BT_BAP_PA_INTERVAL_UNKNOWN`

Value indicating that the periodic advertising interval is unknown.
**BT_BAP_BIS_SYNC_NO_PREF**

Broadcast Assistant no BIS sync preference.

Value indicating that the Broadcast Assistant has no preference to which BIS the Scan Delegator syncs to

**BROADCAST_SNK_STREAM_CNT**

**BROADCAST_SNK_SUBGROUP_CNT**

**BT_BAP_ASCS_RSP (c, r)**

Macro used to initialise the object storing values of ASE Control Point notification.

**Parameters**

- c – Response Code field
- r – Reason field - `bt_bap_asc_reason` or `bt_audio_metadata_type` (see notes in `bt_bap_asc_rsp`).

**Typedefs**

typedef bool (*bt_bap_scan_delegator_state_func_t)(const struct `bt_bap_scan_delegator_recv_state` *recv_state, void *user_data)

Callback function for Scan Delegator receive state search functions.

- **Param recv_state**
  
The receive state.

- **Param user_data**
  
User data.

- **Retval true**
  
to stop iterating. If this is used in the context of `bt_bap_scan_delegator_find_state()`, the recv_state will be returned by `bt_bap_scan_delegator_find_state()`.

- **Retval false**
  
to continue iterating.

typedef void (*bt_bap_broadcast_assistant_write_cb)(struct `bt_conn` *conn, int err)

Callback function for writes.

- **Param conn**
  
The connection to the peer device.

- **Param err**
  
Error value. 0 on success, GATT error on fail.

**Enums**

enum `bt_bap_pa_state`

Periodic advertising state reported by the Scan Delegator.

*Values:*
enumerator BT_BAP_PA_STATE_NOT_SYNCED = 0x00
    The periodic advertising has not been synchronized.

enumerator BT_BAP_PA_STATE_INFO_REQ = 0x01
    Waiting for SyncInfo from Broadcast Assistant.

enumerator BT_BAP_PA_STATE_SYNCED = 0x02
    Synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_FAILED = 0x03
    Failed to synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_NO_PAST = 0x04
    No periodic advertising sync transfer receiver from Broadcast Assistant.

definitions

enum bt_bap_big_enc_state
    Broadcast Isochronous Group encryption state reported by the Scan Delegator.
    Values:

    enumerator BT_BAP_BIG_ENC_STATE_NO_ENC = 0x00
        The Broadcast Isochronous Group not encrypted.

    enumerator BT_BAP_BIG_ENC_STATE_BCODE_REQ = 0x01
        The Broadcast Isochronous Group broadcast code requested.

    enumerator BT_BAP_BIG_ENC_STATE_DEC = 0x02
        The Broadcast Isochronous Group decrypted.

    enumerator BT_BAP_BIG_ENC_STATE_BAD_CODE = 0x03
        The Broadcast Isochronous Group bad broadcast code.

enum bt_bap_bass_att_err
    Broadcast Audio Scan Service (BASS) specific ATT error codes.
    Values:

    enumerator BT_BAP_BASS_ERR_OPCODE_NOT_SUPPORTED = 0x80
        Opcode not supported.

    enumerator BT_BAP_BASS_ERR_INVALID_SRC_ID = 0x81
        Invalid source ID supplied.

enum bt_bap_ep_state
    Endpoint states.
    Values:

    enumerator BT_BAP_EP_STATE_IDLE = 0x00
        Audio Stream Endpoint Idle state.
enumerator BT_BAP_EP_STATE_CODEC_CONFIGURED = 0x01
    Audio Stream Endpoint Codec Configured state.

enumerator BT_BAP_EP_STATE_QOS_CONFIGURED = 0x02
    Audio Stream Endpoint QoS Configured state.

enumerator BT_BAP_EP_STATE_ENABLING = 0x03
    Audio Stream Endpoint Enabling state.

enumerator BT_BAP_EP_STATE_STREAMING = 0x04
    Audio Stream Endpoint Streaming state.

enumerator BT_BAP_EP_STATE_DISABLEING = 0x05
    Audio Stream Endpoint Disabling state.

enumerator BT_BAP_EP_STATE_RELEASEING = 0x06
    Audio Stream Endpoint Streaming state.

definition
    enum bt_bap_ascs_rsp_code
        Response Status Code.
        These are sent by the server to the client when a stream operation is requested.
        Values:

        enumerator BT_BAP_ASCS_RSP_CODE_SUCCESS = 0x00
            Server completed operation successfully.

        enumerator BT_BAP_ASCS_RSP_CODE_NOT_SUPPORTED = 0x01
            Server did not support operation by client.

        enumerator BT_BAP_ASCS_RSP_CODE_INVALID_LENGTH = 0x02
            Server rejected due to invalid operation length.

        enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE = 0x03
            Invalid ASE ID.

        enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE_STATE = 0x04
            Invalid ASE state.

        enumerator BT_BAP_ASCS_RSP_CODE_INVALID_DIR = 0x05
            Invalid operation for direction.

        enumerator BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED = 0x06
            Capabilities not supported by server.

        enumerator BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED = 0x07
            Configuration parameters not supported by server.

6.1. Bluetooth
enumerator BT_BAP_ASCS_RSP_CODE_CONF_REJECTED = 0x08
  Configuration parameters rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_INVALID = 0x09
  Invalid Configuration parameters.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED = 0x0a
  Unsupported metadata.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED = 0x0b
  Metadata rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_INVALID = 0x0c
  Invalid metadata.

enumerator BT_BAP_ASCS_RSP_CODE_NO_MEM = 0x0d
  Server has insufficient resources.

enumerator BT_BAP_ASCS_RSP_CODE_UNSPECIFIED = 0x0e
  Unspecified error.

enum bt_bap_ascs_reason
  Response Reasons.
  These are used if the \texttt{bt\_bap\_asc\_rsp\_code} value is \texttt{BT\_BAP\_ASCS\__RSP\_CODE\_CONF\_UNSUPPORTED},
  \texttt{BT\_BAP\_ASCS\__RSP\_CODE\_CONF\_REJECTED} or \texttt{BT\_BAP\_ASCS\__RSP\_CODE\_CONF\_INVALID}.

Values:

enumerator BT_BAP_ASCS_REASON_NONE = 0x00
  No reason.

enumerator BT_BAP_ASCS_REASON_CODEC = 0x01
  Codec ID.

enumerator BT_BAP_ASCS_REASON_CODEC_DATA = 0x02
  Codec configuration.

enumerator BT_BAP_ASCS_REASON_INTERVAL = 0x03
  SDU interval.

enumerator BT_BAP_ASCS_REASON_FRAMING = 0x04
  Framing.

enumerator BT_BAP_ASCS_REASON_PHY = 0x05
  PHY.

enumerator BT_BAP_ASCS_REASON_SDU = 0x06
  Maximum SDU size.
enumerator BT_BAP_ASCS_REASON_RTN = 0x07
  RTN.
enumerator BT_BAP_ASCS_REASON_LATENCY = 0x08
  Max transport latency.
enumerator BT_BAP_ASCS_REASON_PD = 0x09
  Presentation delay.
enumerator BT_BAP_ASCS_REASON_CIS = 0x0a
  Invalid CIS mapping.

Functions

int bt_bap_ep_get_info(const struct bt_bap_ep *ep, struct bt_bap_ep_info *info)
  Return structure holding information of audio stream endpoint.

Parameters
  • ep – The audio stream endpoint object.
  • info – The structure object to be filled with the info.

Returns
  0 in case of success or negative value in case of error.

void bt_bap_stream_cb_register(struct bt_bap_stream *stream, struct bt_bap_stream_ops *ops)
  Register Audio callbacks for a stream.

Parameters
  • stream – Stream object.
  • ops – Stream operations structure.

int bt_bap_stream_config(struct bt_conn *conn, struct bt_bap_stream *stream, struct bt_bap_ep *ep, struct bt_audio_codec_cfg *codec_cfg)
  Configure Audio Stream.
  This procedure is used by a client to configure a new stream using the remote endpoint, local capability and codec configuration.

Parameters
  • conn – Connection object
  • stream – Stream object being configured
  • ep – Remote Audio Endpoint being configured
  • codec_cfg – Codec configuration

Returns
  Allocated Audio Stream object or NULL in case of error.

int bt_bap_stream_reconfig(struct bt_bap_stream *stream, struct bt_audio_codec_cfg *codec_cfg)
  Reconfigure Audio Stream.
  This procedure is used by a unicast client or unicast server to reconfigure a stream to use a different local codec configuration.
This can only be done for unicast streams.

**Parameters**
- `stream` – Stream object being reconfigured
- `codec_cfg` – Codec configuration

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_qos(struct bt_conn *conn, struct bt_bap_unicast_group *group)
```

Configure Audio Stream QoS.

This procedure is used by a client to configure the Quality of Service of streams in a unicast group. All streams in the group for the specified `conn` will have the Quality of Service configured. This shall only be used to configure unicast streams.

**Parameters**
- `conn` – Connection object
- `group` – Unicast group object

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_enable(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len)
```

Enable Audio Stream.

This procedure is used by a client to enable a stream. This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

**Parameters**
- `stream` – Stream object
- `meta` – Metadata
- `meta_len` – Metadata length

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_metadata(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len)
```

Change Audio Stream Metadata.

This procedure is used by a unicast client or unicast server to change the metadata of a stream.

**Parameters**
- `stream` – Stream object
- `meta` – Metadata
- `meta_len` – Metadata length

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_bap_stream_disable(struct bt_bap_stream *stream)
```

Disable Audio Stream.

This procedure is used by a unicast client or unicast server to disable a stream. This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

**Parameters**
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_start(struct bt_bap_stream *stream)
Start Audio Stream.
This procedure is used by a unicast client or unicast server to make a stream start streaming.
For the unicast client, this will connect the CIS for the stream before sending the start command.
For the unicast server, this will put a BT_AUDIO_DIR_SINK stream into the streaming state if the CIS is connected (initialized by the unicast client). If the CIS is not connected yet, the stream will go into the streaming state as soon as the CIS is connected. BT_AUDIO_DIR_SOURCE streams will go into the streaming state when the unicast client sends the Receiver Start Ready operation, which will trigger the bt_bap_unicast_server_cb::start() callback.
This shall only be called for unicast streams.
Broadcast sinks will always be started once synchronized, and broadcast source streams shall be started with bt_bap_broadcast_source_start().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_stop(struct bt_bap_stream *stream)
Stop Audio Stream.
This procedure is used by a client to make a stream stop streaming.
This shall only be called for unicast streams. Broadcast sinks cannot be stopped. Broadcast sources shall be stopped with bt_bap_broadcast_source_stop().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_release(struct bt_bap_stream *stream)
Release Audio Stream.
This procedure is used by a unicast client or unicast server to release a unicast stream.
Broadcast sink streams cannot be released, but can be deleted by bt_bap_broadcast_sink_delete(). Broadcast source streams cannot be released, but can be deleted by bt_bap_broadcast_source_delete().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_bap_stream_send(struct bt_bap_stream *stream, struct net_buf *buf, uint16_t seq_num, uint32_t ts)
Send data to Audio stream.
Send data from buffer to the stream.
Note: Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

Parameters

- stream – Stream object.
- buf – Buffer containing data to be sent.
- seq_num – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.
- ts – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG. Can be omitted by using BT_ISO_TIMESTAMP_NONE which will simply enqueue the ISO SDU in a FIFO manner.

Returns

Bytes sent in case of success or negative value in case of error.

```c
int bt_bap_stream_get_tx_sync(struct bt_bap_stream *stream, struct bt_iso_tx_info *info)
```

Get ISO transmission timing info for a Basic Audio Profile stream.

Note: An SDU must have already been successfully transmitted on the ISO channel for this function to return successfully. Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

Parameters

- info – [out] Transmit info object.

Return values

- 0 – on success
- -EINVAL – if the stream is invalid, if the stream is not configured for sending or if it is not connected with a isochronous stream
- Any – return value from bt_iso_chan_get_tx_sync()

```c
void bt_bap_scan_delegator_register_cb(struct bt_bap_scan_delegator_cb *cb)
```

Register the callbacks for the Basic Audio Profile Scan Delegator.

Parameters

- cb – Pointer to the callback struct

```c
int bt_bap_scan_delegator_set_pa_state(uint8_t src_id, enum bt_bap_pa_state pa_state)
```

Set the periodic advertising sync state to syncing.

Set the periodic advertising sync state for a receive state to syncing, notifying Broadcast Assistants.

Parameters

- src_id – The source id used to identify the receive state.
pa_state – The Periodic Advertising sync state to set. BT_BAP_PA_STATE_NOT_SYNCED and BT_BAP_PA_STATE_SYNCED is not necessary to provide, as they are handled internally.

Returns
int Error value. 0 on success, errno on fail.

int bt_bap_scan_delegator_set_bis_sync_state(uint8_t src_id, uint32_t bis_synced[0])
Set the sync state of a receive state in the server.

Parameters
• src_id – The source id used to identify the receive state.
• bis_synced – Array of bitfields to set the BIS sync state for each subgroup.

Returns
int Error value. 0 on success, ERRNO on fail.

int bt_bap_scan_delegator_add_src(const struct bt_bap_scan_delegator_add_src_param *param)
Add a receive state source locally.
This will notify any connected clients about the new source. This allows them to modify and even remove it.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are autonomously added.

Parameters
• param – The parameters for adding the new source

Returns
int errno on failure, or source ID on success.

int bt_bap_scan_delegator_mod_src(const struct bt_bap_scan_delegator_mod_src_param *param)
Add a receive state source locally.
This will notify any connected clients about the new source. This allows them to modify and even remove it.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are autonomously modified.

Parameters
• param – The parameters for adding the new source

Returns
int errno on failure, or source ID on success.

int bt_bap_scan_delegator_rem_src(uint8_t src_id)
Remove a receive state source.
This will remove the receive state. If the receive state periodic advertising is synced, bt_bap_scan_delegator_cb.pa_sync_term_req() will be called.
If CONFIG_BT_BAP_BROADCAST_SINK is enabled, any Broadcast Sink sources are autonomously removed.

Parameters
• src_id – The source ID to remove

Returns
int Error value. 0 on success, errno on fail.
void bt_bap_scan_delegator_foreach_state(bt_bap_scan_delegator_state_func_t func, void *user_data)

Iterate through all existing receive states.

Parameters
- func – The callback function
- user_data – User specified data that sent to the callback function

const struct bt_bap_scan_delegator_recv_state *bt_bap_scan_delegator_find_state(bt_bap_scan_delegator_state_func_t func, void *user_data)

Find and return a receive state based on a compare function.

Parameters
- func – The compare callback function
- user_data – User specified data that sent to the callback function

Returns
The first receive state where the func returned true, or NULL

int bt_bap_broadcast_assistant_discover(struct bt_conn *conn)

Discover Broadcast Audio Scan Service on the server.

Warning: Only one connection can be active at any time; discovering for a new connection, will delete all previous data.

Parameters
- conn – The connection

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_scan_start(struct bt_conn *conn, bool start_scan)

Scan start for BISes for a remote server.

This will let the Broadcast Audio Scan Service server know that this device is actively scanning for broadcast sources. The function can optionally also start scanning, if the caller does not want to start scanning itself.

Scan results, if start_scan is true, is sent to the bt_bap_broadcast_assistant_scan_cb callback.

Parameters
- conn – Connection to the Broadcast Audio Scan Service server. Used to let the server know that we are scanning.
- start_scan – Start scanning if true. If false, the application should enable scan itself.

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_scan_stop(struct bt_conn *conn)

Stop remote scanning for BISes for a server.

Parameters
- conn – Connection to the server.

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.
void bt_bap_broadcast_assistant_register_cb(struct bt_bap_broadcast_assistant_cb *cb)
Registers the callbacks used by Broadcast Audio Scan Service client.

int bt_bap_broadcast_assistant_add_src(struct bt_conn *conn, const struct bt_bap_broadcast_assistant_add_src_param *param)
Add a source on the server.

**Parameters**
- conn – Connection to the server.
- param – Parameter struct.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_mod_src(struct bt_conn *conn, const struct bt_bap_broadcast_assistant_mod_src_param *param)
Modify a source on the server.

**Parameters**
- conn – Connection to the server.
- param – Parameter struct.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_set_broadcast_code(struct bt_conn *conn, uint8_t src_id, const uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE])
Set a broadcast code to the specified receive state.

**Parameters**
- conn – Connection to the server.
- src_id – Source ID of the receive state.
- broadcast_code – The broadcast code.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_rem_src(struct bt_conn *conn, uint8_t src_id)
Remove a source from the server.

**Parameters**
- conn – Connection to the server.
- src_id – Source ID of the receive state.

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.

int bt_bap_broadcast_assistant_read_recv_state(struct bt_conn *conn, uint8_t idx)
Read the specified receive state from the server.

**Parameters**
- conn – Connection to the server.
- idx – The index of the receive start (0 up to the value from bt_bap_broadcast_assistant_discover_cb)

**Returns**
Error value. 0 on success, GATT error or ERRNO on fail.
struct bt_bap_ascs_rsp
    #include <bap.h> Structure storing values of fields of ASE Control Point notification.

Public Members

enum bt_bap_ascs_rsp_code code
    Value of the Response Code field.

enum bt_bap_ascs_reason reason
    Response reason.
    If the Response Code is one of the following:
    • BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED
    • BT_BAP_ASCS_RSP_CODE_CONF_REJECTED
    • BT_BAP_ASCS_RSP_CODE_CONF_INVALID all values from bt_bap_ascs_reason can be used.
    If the Response Code is one of the following:
    • BT_BAP_ASCS_RSP_CODE_SUCCESS
    • BT_BAP_ASCS_RSP_CODE_NOT_SUPPORTED
    • BT_BAP_ASCS_RSP_CODE_INVALID_LENGTH
    • BT_BAP_ASCS_RSP_CODE_INVALID_ASE
    • BT_BAP_ASCS_RSP_CODE_INVALID_ASE_STATE
    • BT_BAP_ASCS_RSP_CODE_INVALID_DIR
    • BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED
    • BT_BAP_ASCS_RSP_CODE_NO_MEM
    • BT_BAP_ASCS_RSP_CODE_UNSPECIFIED only value BT_BAP_ASCS_REASON_NONE shall be used.

enum bt_audio_metadata_type metadata_type
    Response metadata type.
    If the Response Code is one of the following:
    • BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED
    • BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED
    • BT_BAP_ASCS_RSP_CODE_METADATA_INVALID the value of the Metadata Type shall be used.

union bt_bap_ascs_rsp.[anonymous] [anonymous]
    Value of the Reason field.
    The meaning of this value depend on the Response Code field.

struct bt_bap_scan_delegator_subgroup
    #include <bap.h> Struct to hold subgroup specific information for the receive state.

Public Members

uint32_t bis_sync
    BIS synced bitfield.

uint8_t metadata_len
    Length of the metadata.
uint8_t metadata[0]
  The metadata.

struct bt_bap_scan_delegator_recv_state
#include <bap.h> Represents the Broadcast Audio Scan Service receive state.

Public Members

uint8_t src_id
  The source ID

bt_addr_le_t addr
  The Bluetooth address.

uint8_t adv_sid
  The advertising set ID.

enum bt_bap_pa_state pa_sync_state
  The periodic advertising sync state.

enum bt_bap_big_enc_state encrypt_state
  The broadcast isochronous group encryption state.

uint32_t broadcast_id
  The 24-bit broadcast ID.

uint8_t bad_code[BT_AUDIO_BROADCAST_CODE_SIZE]
  The bad broadcast code.
  Only valid if encrypt_state is BT_BAP_BIG_ENC_STATE_BCODE_REQ

uint8_t num_subgroups
  Number of subgroups.

struct bt_bap_scan_delegator_subgroup subgroups[0]
  Subgroup specific information.

struct bt_bap_scan_delegator_cb
#include <bap.h>

Public Members

void (*recv_state_updated)(struct bt_conn *conn, const struct
bt_bap_scan_delegator_recv_state *recv_state)
  Receive state updated.
  Param conn
    Pointer to the connection to a remote device if the change was caused by it,
    otherwise NULL.
**Param recv_state**
- Pointer to the receive state that was updated.

**Return**
- 0 in case of success or negative value in case of error.

```c
int (*pa_sync_req)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state, bool past_avail, uint16_t pa_interval)
```

Periodic advertising sync request.

Request from peer device to synchronize with the periodic advertiser denoted by the `recv_state`. To notify the Broadcast Assistant about any pending sync:

**Param conn**
- [in] Pointer to the connection requesting the periodic advertising sync.

**Param recv_state**
- [in] Pointer to the receive state that is being requested for periodic advertising sync.

**Param past_avail**
- [in] True if periodic advertising sync transfer is available.

**Param pa_interval**
- [in] The periodic advertising interval.

**Param past_sync**
- [out] Set to true if syncing via periodic advertising sync transfer, false otherwise. If `past_avail` is false, this value is ignored.

**Return**
- 0 in case of accept, or other value to reject.

```c
int (*pa_sync_term_req)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state)
```

Periodic advertising sync termination request.

Request from peer device to terminate the periodic advertiser sync denoted by the `recv_state`.

**Param conn**
- Pointer to the connection requesting the periodic advertising sync termination.

**Param recv_state**
- Pointer to the receive state that is being requested for periodic advertising sync.

**Return**
- 0 in case of success or negative value in case of error.

```c
void (*broadcast_code)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state, const uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE])
```

Broadcast code received.

Broadcast code received from a broadcast assistant

**Param conn**
- Pointer to the connection providing the broadcast code.

**Param recv_state**
- Pointer to the receive state the broadcast code is being provided for.

**Param broadcast_code**
- The 16-octet broadcast code

```c
int (*bis_sync_req)(struct bt_conn *conn, const struct bt_bap_scan_delegator_recv_state *recv_state, const uint32_t bis_sync_req[0])
```

Broadcast Isochronous Stream synchronize request.

Request from Broadcast Assistant device to modify the Broadcast Isochronous Stream states. The request shall be fulfilled with accordance to the `bis_sync_req` within reasonable time. The Broadcast Assistant may also request fewer, or none, indexes to be synchronized.
**Param conn**
[in] Pointer to the connection of the Broadcast Assistant requesting the sync.

**Param recv_state**
[in] Pointer to the receive state that is being requested for the sync.

**Param bis_sync_req**
[in] Array of bitfields of which BIS indexes that is requested to sync for each subgroup by the Broadcast Assistant.

**Return**
0 in case of accept, or other value to reject.

```c
struct bt_bap_ep_info
   #include <bap.h> Structure holding information of audio stream endpoint.

public Members

uint8_t id
   The ID of the endpoint.

denum bt_bap_ep_state state
   The state of the endpoint.

denum bt_audio_dir dir
   Capabilities type.

dbool can_send
   True if the stream associated with the endpoint is able to send data.

struct bt_bap_ep *paired_ep
   Pointer to paired endpoint if the endpoint is part of a bidirectional CIS, otherwise NULL.

struct bt_bap_stream
   #include <bap.h> Basic Audio Profile stream structure.
Streams represents a stream configuration of a Remote Endpoint and a Local Capability.

Note: Streams are unidirectional but can be paired with other streams to use a bidirectional connected isochronous stream.

Public Members

struct bt_conn *conn
   Connection reference.

struct bt_bap_ep *ep
   Endpoint reference.

struct bt_audio_codec_cfg *codec_cfg
   Codec Configuration.
```
struct bt_audio_codec_qos *qos
    QoS Configuration.

struct bt_bap_stream_ops *ops
    Audio stream operations.

void *group
    Unicast or Broadcast group - Used internally.

void *user_data
    Stream user data.

struct bt_bap_stream_ops
    #include <bap.h> Stream operation.

Public Members

void (*started)(struct bt_bap_stream *stream)
    Stream started callback.
    Started callback is called whenever an Audio Stream has been started and will be usable
    for streaming.
    \textbf{Param} stream
    Stream object that has been started.

void (*stopped)(struct bt_bap_stream *stream, uint8_t reason)
    Stream stopped callback.
    Stopped callback is called whenever an Audio Stream has been stopped.
    \textbf{Param} stream
    Stream object that has been stopped.
    \textbf{Param} reason
    BT_HCI_ERR_* reason for the disconnection.

struct bt_bap_scan_delegator_add_src_param
    #include <bap.h>

Public Members

struct bt_le_per_adv_sync *pa_sync
    The periodic advertising sync.

enum bt_bap_big_enc_state encrypt_state
    The broadcast isochronous group encryption state.

uint32_t broadcast_id
    The 24-bit broadcast ID.
uint8_t num_subgroups
   Number of subgroups.

struct bt_bap_scan_delegator_subgroup subgroups[0]
   Subgroup specific information.

struct bt_bap_scan_delegator_mod_src_param
#include <bap.h>

Public Members

uint8_t src_id
   The periodic advertising sync.

enum bt_bap_big_enc_state encrypt_state
   The broadcast isochronous group encryption state.

uint32_t broadcast_id
   The 24-bit broadcast ID.

uint8_t num_subgroups
   Number of subgroups.

struct bt_bap_scan_delegator_subgroup subgroups[0]
   Subgroup specific information.
   If a subgroup's metadata_len is set to 0, the existing metadata for the subgroup will
   remain unchanged

struct bt_bap_broadcast_assistant_cb
#include <bap.h>

Public Members

void (*discover)(struct bt_conn *conn, int err, uint8_t recv_state_count)
   Callback function for bt_bap_broadcast_assistant_discover.
   Param conn
      The connection that was used to discover Broadcast Audio Scan Service.
   Param err
      Error value. 0 on success, GATT error or ERRNO on fail.
   Param recv_state_count
      Number of receive states on the server.

void (*scan)(const struct bt_le_scan_recv_info *info, uint32_t broadcast_id)
   Callback function for Broadcast Audio Scan Service client scan results.
   Called when the scanner finds an advertiser that advertises the
   BT_UUID_BROADCAST_AUDIO UUID.
   Param info
      Advertiser information.
Param broadcast_id
24-bit broadcast ID.

```c
void (*recv_state)(struct bt_conn *conn, int err, const struct bt_bap_scan_delegator_recv_state *state)
```
Callback function for when a receive state is read or updated.
Called whenever a receive state is read or updated.

- **Param conn**
  The connection to the Broadcast Audio Scan Service server.
- **Param err**
  Error value. 0 on success, GATT error on fail.
- **Param state**
  The receive state or NULL if the receive state is empty.

```c
void (*recv_state_removed)(struct bt_conn *conn, int err, uint8_t src_id)
```
Callback function for when a receive state is removed.

- **Param conn**
  The connection to the Broadcast Audio Scan Service server.
- **Param err**
  Error value. 0 on success, GATT error on fail.
- **Param src_id**
  The receive state.

```c
void (*scan_start)(struct bt_conn *conn, int err)
```
Callback function for `bt_bap_broadcast_assistant_scan_start()`.

- **Param conn**
  The connection to the peer device.
- **Param err**
  Error value. 0 on success, GATT error on fail.

```c
void (*scan_stop)(struct bt_conn *conn, int err)
```
Callback function for `bt_bap_broadcast_assistant_scan_stop()`.

- **Param conn**
  The connection to the peer device.
- **Param err**
  Error value. 0 on success, GATT error on fail.

```c
void (*add_src)(struct bt_conn *conn, int err)
```
Callback function for `bt_bap_broadcast_assistant_add_src()`.

- **Param conn**
  The connection to the peer device.
- **Param err**
  Error value. 0 on success, GATT error on fail.

```c
void (*mod_src)(struct bt_conn *conn, int err)
```
Callback function for `bt_bap_broadcast_assistant_mod_src()`.

- **Param conn**
  The connection to the peer device.
- **Param err**
  Error value. 0 on success, GATT error on fail.

```c
void (*broadcast_code)(struct bt_conn *conn, int err)
```
Callback function for `bt_bap_broadcast_assistant_broadcast_code()`.
Param conn
The connection to the peer device.

Param err
Error value. 0 on success, GATT error on fail.

void (*rem_src)(struct bt_conn *conn, int err)
Callback function for bt_bap_broadcast_assistant_rem_src().

Param conn
The connection to the peer device.

Param err
Error value. 0 on success, GATT error on fail.

struct bt_bap_broadcast_assistant_add_src_param
#include <bap.h> Parameters for adding a source to a Broadcast Audio Scan Service server.

Public Members

bt_addr_le_t addr
Address of the advertiser.

uint8_t adv_sid
SID of the advertising set.

bool pa_sync
Whether to sync to periodic advertisements.

uint32_t broadcast_id
24-bit broadcast ID

uint16_t pa_interval
Periodic advertising interval in milliseconds.
  BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint8_t num_subgroups
Number of subgroups.

struct bt_bap_scan_delegator_subgroup *subgroups
Pointer to array of subgroups.

struct bt_bap_broadcast_assistant_mod_src_param
#include <bap.h> Parameters for modifying a source.

Public Members

uint8_t src_id
Source ID of the receive state.
bool pa_sync
   Whether to sync to periodic advertisements.

uint16_t pa_interval
   Periodic advertising interval.
   BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint8_t num_subgroups
   Number of subgroups.

struct bt_bap_scan_delegator_subgroup *subgroups
   Pointer to array of subgroups.

group bt_bap_unicast_client

Functions

int bt_bap_unicast_group_create(struct bt_bap_unicast_group_param *param, struct bt_bap_unicast_group **unicast_group)
Create audio unicast group.
Create a new audio unicast group with one or more audio streams as a unicast client. Streams in a unicast group shall share the same interval, framing and latency (see bt_audio_codec_qos).

Parameters
   • param – [in] The unicast group create parameters.
   • unicast_group – [out] Pointer to the unicast group created.

Returns
   Zero on success or (negative) error code otherwise.

int bt_bap_unicast_group_add_streams(struct bt_bap_unicast_group *unicast_group, struct bt_bap_unicast_group_stream_pair_param params[], size_t num_param)
Add streams to a unicast group as a unicast client.
This function can be used to add additional streams to a bt_bap_unicast_group.
This can be called at any time before any of the streams in the group has been started (see bt_bap_stream_ops.started()). This can also be called after the streams have been stopped (see bt_bap_stream_ops.stopped()).
Once a stream has been added to a unicast group, it cannot be removed. To remove a stream from a group, the group must be deleted with bt_bap_unicast_group_delete(), but this will require all streams in the group to be released first.

Parameters
   • unicast_group – Pointer to the unicast group
   • params – Array of stream parameters with streams being added to the group.
   • num_param – Number of parameters in params.

Returns
   0 in case of success or negative value in case of error.
int bt_bap_unicast_group_delete(struct bt_bap_unicast_group *unicast_group)
Delete audio unicast group.

Delete a audio unicast group as a client. All streams in the group shall be in the idle or configured state.

Parameters
• unicast_group – Pointer to the unicast group to delete

Returns
Zero on success or (negative) error code otherwise.

int bt_bap_unicast_client_register_cb(const struct bt_bap_unicast_client_cb *cb)
Register unicast client callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

Parameters
• cb – Unicast client callback structure.

Returns
0 in case of success or negative value in case of error.

int bt_bap_unicast_client_discover(struct bt_conn *conn, enum bt_audio_dir dir)
Discover remote capabilities and endpoints.

This procedure is used by a client to discover remote capabilities and endpoints and notifies via params callback.

Parameters
• conn – Connection object
• dir – The type of remote endpoints and capabilities to discover.

struct bt_bap_unicast_group_stream_param
#include <bap.h> Parameter struct for each stream in the unicast group.

Public Members

struct bt_bap_stream *stream
Pointer to a stream object.

struct bt_audio_codec_qos *qos
The QoS settings for the stream object.

struct bt_bap_unicast_group_stream_pair_param
#include <bap.h> Parameter struct for the unicast group functions.
Parameter struct for the bt_bap_unicast_group_create() and bt_bap_unicast_group_add_streams() functions.

Public Members

struct bt_bap_unicast_group_stream_param *rx_param
Pointer to a receiving stream parameters.
struct bt_bap_unicast_group_stream_param *tx_param
    Pointer to a transmitting stream parameters.

struct bt_bap_unicast_group_param
    #include <bap.h>

Public Members

size_t params_count
    The number of parameters in params.

struct bt_bap_unicast_group_stream_pair_param *params
    Array of stream parameters.

uint8_t packing
    Unicast Group packing mode.
    BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.

struct bt_bap_unicast_client_cb
    #include <bap.h> Unicast Client callback structure.

Public Members

void (*location)(struct bt_conn *conn, enum bt_audio_dir dir, enum bt_audio_location loc)
    Remote Unicast Server Audio Locations.
    This callback is called whenever the audio locations is read from the server or otherwise notified to the client.
    
    Param conn
        Connection to the remote unicast server.
    
    Param dir
        Direction of the location.
    
    Param loc
        The location bitfield value.
    
    Return
        0 in case of success or negative value in case of error.

void (*available_contexts)(struct bt_conn *conn, enum bt_audio_context snk_ctx, enum bt_audio_context src_ctx)
    Remote Unicast Server Available Contexts.
    This callback is called whenever the available contexts are read from the server or otherwise notified to the client.
    
    Param conn
        Connection to the remote unicast server.
    
    Param snk_ctx
        The sink context bitfield value.
**Param** src_ctx
The source context bitfield value.

**Return**
0 in case of success or negative value in case of error.

void (*config)(struct bt_bap_stream *stream, enum bt_bap_ascrsp_code rsp_code, enum bt_bap_asc_reason reason)

Callback function for bt_bap_stream_config() and bt_bap_stream_reconfig().
Called when the codec configure operation is completed on the server.

**Param** stream
Stream the operation was performed on.

**Param** rsp_code
Response code.

**Param** reason
Reason code.

void (*qos)(struct bt_bap_stream *stream, enum bt_bap_ascrsp_code rsp_code, enum bt_bap_asc_reason reason)

Callback function for bt_bap_stream_qos().
Called when the QoS configure operation is completed on the server. This will be called for each stream in the group that was being QoS configured.

**Param** stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

**Param** rsp_code
Response code.

**Param** reason
Reason code.

void (*enable)(struct bt_bap_stream *stream, enum bt_bap_ascrsp_code rsp_code, enum bt_bap_asc_reason reason)

Callback function for bt_bap_stream_enable().
Called when the enable operation is completed on the server.

**Param** stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

**Param** rsp_code
Response code.

**Param** reason
Reason code.

void (*start)(struct bt_bap_stream *stream, enum bt_bap_ascrsp_code rsp_code, enum bt_bap_asc_reason reason)

Callback function for bt_bap_stream_start().
Called when the start operation is completed on the server. This will only be called if the stream supplied to bt_bap_stream_start() is for a BT_AUDIO_DIR_SOURCE endpoint.

**Param** stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

**Param** rsp_code
Response code.

**Param** reason
Reason code.
void (*stop)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_stop().

Called when the stop operation is completed on the server. This will only be called if the stream supplied to bt_bap_stream_stop() is for a BT_AUDIO_DIR_SOURCE endpoint.

Param stream  
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

Param rsp_code  
Response code.

Param reason  
Reason code.

void (*disable)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_disable().

Called when the disable operation is completed on the server.

Param stream  
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

Param rsp_code  
Response code.

Param reason  
Reason code.

void (*metadata)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_metadata().

Called when the metadata operation is completed on the server.

Param stream  
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

Param rsp_code  
Response code.

Param reason  
Reason code.

void (*release)(struct bt_bap_stream *stream, enum bt_bap_ascs_rsp_code rsp_code, enum bt_bap_ascs_reason reason)

Callback function for bt_bap_stream_release().

Called when the release operation is completed on the server.

Param stream  
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

Param rsp_code  
Response code.

Param reason  
Reason code.

void (*pac_record)(struct bt_conn *conn, enum bt_audio_dir dir, const struct bt_audio_codec_cap *codec_cap)

Remote Published Audio Capability (PAC) record discovered.

Called when a PAC record has been discovered as part of the discovery procedure.
The `codec` is only valid while in the callback, so the values must be stored by the receiver if future use is wanted.

If discovery procedure has complete both `codec` and `ep` are set to NULL.

```c
Param conn
Connection to the remote unicast server.
Param dir
The type of remote endpoints and capabilities discovered.
Param codec_cap
Remote capabilities.
```

```c
void (*endpoint)(struct bt_conn *conn, enum bt_audio_dir dir, struct bt_bap_ep *ep)
```
Remote Audio Stream Endpoint (ASE) discovered.
Called when an ASE has been discovered as part of the discovery procedure.

If discovery procedure has complete both `codec` and `ep` are set to NULL.

```c
Param conn
Connection to the remote unicast server.
Param dir
The type of remote endpoints and capabilities discovered.
Param ep
Remote endpoint.
```

```c
void (*discover)(struct bt_conn *conn, int err, enum bt_audio_dir dir)
```
BAP discovery callback function.
If discovery procedure has completed `ep` is set to NULL and `err` is 0.

```c
Param conn
Connection to the remote unicast server.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param dir
The type of remote endpoints and capabilities discovered.
```

### group bt_bap_unicast_server

#### Typedefs

```c
typedef void (*bt_bap_ep_func_t)(struct bt_bap_ep *ep, void *user_data)
```
The callback function called for each endpoint.

```c
Param ep
The structure object with endpoint info.
Param user_data
Data to pass to the function.
```
Functions

int bt_bap_unicast_server_register_cb(const struct bt_bap_unicast_server_cb *cb)

Register unicast server callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

Parameters

• cb – Unicast server callback structure.

Returns

0 in case of success or negative value in case of error.

int bt_bap_unicast_server_unregister_cb(const struct bt_bap_unicast_server_cb *cb)

Unregister unicast server callbacks.

May only unregister a callback structure that has previously been registered by bt_bap_unicast_server_register_cb().

Parameters

• cb – Unicast server callback structure.

Returns

0 in case of success or negative value in case of error.

void bt_bap_unicast_server_foreach_ep(struct bt_conn *conn, bt_bap_ep_func_t func, void *user_data)

Iterate through all endpoints of the given connection.

Parameters

• conn – Connection object
• func – Function to call for each endpoint.
• user_data – Data to pass to the callback function.

int bt_bap_unicast_server_config_ase(struct bt_conn *conn, struct bt_bap_stream *stream, struct bt_audio_codec_cfg *codec_cfg, const struct bt_audio_codec_qos_pref *qos_pref)

Initialize and configure a new ASE.

Parameters

• conn – Connection object
• stream – Configured stream object to be attached to the ASE
• codec_cfg – Codec configuration
• qos_pref – Audio Stream Quality of Service Preference

Returns

0 in case of success or negative value in case of error.

struct bt_bap_unicast_server_cb

#include <bap.h> Unicast Server callback structure.

Public Members
int (*config)(struct bt_conn *conn, const struct bt_bap_ep *ep, enum bt_audio_dir dir, const struct bt_audio_codec_cfg *codec_cfg, struct bt_bap_stream **stream, struct bt_audio_codec_qos_pref *const pref, struct bt_bap_ascs_rsp *rsp)

Endpoint config request callback.
Config callback is called whenever an endpoint is requested to be configured

Param conn
[in] Connection object.

Param ep
[in] Local Audio Endpoint being configured.

Param dir
[in] Direction of the endpoint.

Param codec_cfg
[in] Codec configuration.

Param stream
[out] Pointer to stream that will be configured for the endpoint.

Param pref
[out] Pointer to a QoS preference object that shall be populated with values.
Invalid values will reject the codec configuration request.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*reconfig)(struct bt_bap_stream *stream, enum bt_audio_dir dir, const struct bt_audio_codec_cfg *codec_cfg, struct bt_audio_codec_qos_pref *const pref, struct bt_bap_ascs_rsp *rsp)

Stream reconfig request callback.
Reconfig callback is called whenever an Audio Stream needs to be reconfigured with different codec configuration.

Param stream
[in] Stream object being reconfigured.

Param dir
[in] Direction of the endpoint.

Param codec_cfg
[in] Codec configuration.

Param pref
[out] Pointer to a QoS preference object that shall be populated with values.
Invalid values will reject the codec configuration request.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*qos)(struct bt_bap_stream *stream, const struct bt_audio_codec_qos *qos, struct bt_bap_ascs_rsp *rsp)

Stream QoS request callback.
QoS callback is called whenever an Audio Stream Quality of Service needs to be configured.

Param stream
[in] Stream object being reconfigured.

Param qos
[in] Quality of Service configuration.
Param `rsp`  
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return  
0 in case of success or negative value in case of error.

```c
int (*enable)(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len, struct bt_bap_ascs_rsp *rsp)
```

Stream Enable request callback.

Enable callback is called whenever an Audio Stream is requested to be enabled to stream.

Param `stream`  
[in] Stream object being enabled.

Param `meta`  

Param `meta_len`  
[in] Length of metadata.

Param `rsp`  
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return  
0 in case of success or negative value in case of error.

```c
int (*start)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)
```

Stream Start request callback.

Start callback is called whenever an Audio Stream is requested to start streaming.

Param `stream`  
[in] Stream object.

Param `rsp`  
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return  
0 in case of success or negative value in case of error.

```c
int (*metadata)(struct bt_bap_stream *stream, const uint8_t meta[], size_t meta_len, struct bt_bap_ascs_rsp *rsp)
```

Stream Metadata update request callback.

Metadata callback is called whenever an Audio Stream is requested to update its metadata.

Param `stream`  
[in] Stream object.

Param `meta`  

Param `meta_len`  
[in] Length of metadata.

Param `rsp`  
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return  
0 in case of success or negative value in case of error.

```c
int (*disable)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)
```

Stream Disable request callback.

Disable callback is called whenever an Audio Stream is requested to disable the stream.
**Param stream**
[in] Stream object being disabled.

**Param rsp**
[out] Object for the ASE operation response. Only used if the return value is non-zero.

**Return**
0 in case of success or negative value in case of error.

```c
int (*stop)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)
```

Stream Stop callback.

Stop callback is called whenever an Audio Stream is requested to stop streaming.

**Param stream**
[in] Stream object.

**Param rsp**
[out] Object for the ASE operation response. Only used if the return value is non-zero.

**Return**
0 in case of success or negative value in case of error.

```c
int (*release)(struct bt_bap_stream *stream, struct bt_bap_ascs_rsp *rsp)
```

Stream release callback.

Release callback is called whenever a new Audio Stream needs to be released and thus deallocated.

**Param stream**
[in] Stream object.

**Param rsp**
[out] Object for the ASE operation response. Only used if the return value is non-zero.

**Return**
0 in case of success or negative value in case of error.

**group bt_bap_broadcast**

BAP Broadcast APIs.

**Functions**

```c
int bt_bap_decode_base(struct bt_data *data, struct bt_bap_base *base)
```

Decode a Broadcast Audio Source Endpoint (BASE) from advertising data.

The BASE is sent via periodic advertising, and can be decoded into a `bt_bap_base` using this function.

**Parameters**

- `data` – The periodic advertising data
- `base` – The output struct to put the decode BASE in

**Returns**

0 in case of success or negative errno value in case of error.

```c
struct bt_bap_base
#include <bap.h>
```

```c
struct bt_bap_base_subgroup
#include <bap.h>
```
Public Members

struct bt_audio_codec_cfg codec_cfg
    Codec information for the subgroup.
    If the data_len of the codec is 0, then codec specific data may be found for each BIS in
    the bis_data.

struct bt_bap_base
    #include <bap.h>

Public Members

uint32_t pd
    QoS Presentation Delay in microseconds.
    Value range 0 to BT_AUDIO_PD_MAX.

group bt_bap_broadcast_sink
    BAP Broadcast Sink APIs.

Functions

int bt_bap_broadcast_sink_register_cb(struct bt_bap_broadcast_sink_cb *cb)
    Register Broadcast sink callbacks.

    Parameters
    • cb – Broadcast sink callback structure.

int bt_bap_broadcast_sink_create(struct bt_le_per_adv_sync *pa_sync, uint32_t broadcast_id,
    struct bt_bap_broadcast_sink **sink)
    Create a Broadcast Sink from a periodic advertising sync.
    This should only be done after verifying that the periodic advertising sync is from a Broadcast
    Source.
    The created Broadcast Sink will need to be supplied to bt_bap_broadcast_sink_sync() in order
    to synchronize to the broadcast audio.
    bt_bap_broadcast_sink_cb.pa_synced() will be called with the Broadcast Sink object created
    if this is successful.

    Parameters
    • pa_sync – Pointer to the periodic advertising sync object.
    • broadcast_id – 24-bit broadcast ID.
    • sink – [out] Pointer to the Broadcast Sink created.

    Returns
    0 in case of success or errno value in case of error.

int bt_bap_broadcast_sink_sync(struct bt_bap_broadcast_sink *sink, uint32_t indexes_bitfield,
    struct bt_bap_stream *streams[], const uint8_t broadcast_code[16])
Sync to a broadcaster’s audio.

Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

**Parameters**
- **sink** – Pointer to the sink object from the base_recv callback.
- **indexes_bitfield** – Bitfield of the BIS index to sync to. To sync to e.g. BIS index 1 and 2, this should have the value of BIT(1) | BIT(2).
- **streams** – Stream object pointers to be used for the receiver. If multiple BIS indexes shall be synchronized, multiple streams shall be provided.
- **broadcast_code** – The 16-octet broadcast code. Shall be supplied if the broadcast is encrypted (see `bt_bap_broadcast_sink_cb::syncable`). If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

**Returns**
- 0 in case of success or negative value in case of error.

```c
int bt_bap_broadcast_sink_stop(struct bt_bap_broadcast_sink *sink)
```

Stop an audio broadcast sink. The broadcast sink will stop receiving BIGInfo, and audio data can no longer be streamed.

**Parameters**
- **sink** – Pointer to the broadcast sink

**Returns**
- Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_sink_delete(struct bt_bap_broadcast_sink *sink)
```

Release a broadcast sink.

Once a broadcast sink has been allocated after the pa_synced callback, it can be deleted using this function. If the sink has synchronized to any broadcast audio streams, these must first be stopped using `bt_bap_stream_stop`.

**Parameters**
- **sink** – Pointer to the sink object to delete.

**Returns**
- 0 in case of success or negative value in case of error.

```c
struct bt_bap_broadcast_sink_cb
```

#include `<bap.h>` Broadcast Audio Sink callback structure.

**Public Members**

```c
void (*base_recv)(struct bt_bap_broadcast_sink *sink, const struct bt_bap_base *base)
```

Broadcast Audio Source Endpoint (BASE) received.

**Param sink**
- Pointer to the sink structure.
Param base
Broadcast Audio Source Endpoint (BASE).

void (*syncable)(struct bt_bap_broadcast_sink *sink, bool encrypted)
Broadcast sink is syncable.
Called whenever a broadcast sink is not synchronized to audio, but the audio is synchro-
nizable. This is inferred when a BIGInfo report is received.
Once this callback has been called, it is possible to call bt_bap_broadcast_sink_sync() to
synchronize to the audio stream(s).
Param sink
Pointer to the sink structure.
Param encrypted
Whether or not the broadcast is encrypted

bt_bap_broadcast_source
BAP Broadcast Source APIs.

Functions

int bt_bap_broadcast_source_create(struct bt_bap_broadcast_source_create_param *param,
struct bt_bap_broadcast_source **source)
Create audio broadcast source.
Create a new audio broadcast source with one or more audio streams.
The broadcast source will be visible for scanners once this has been called, and the device will
advertise audio announcements.
No audio data can be sent until bt_bap_broadcast_source_start() has been called and no audio
information (BIGInfo) will be visible to scanners (see bt_le_per_adv_sync_cb).
Parameters
• param – [in] Pointer to parameters used to create the broadcast source.
• source – [out] Pointer to the broadcast source created

int bt_bap_broadcast_source_reconfig(struct bt_bap_broadcast_source *source, struct
bt_audio_codec_cfg *codec_cfg, struct
bt_audio_codec_qos *qos)
Reconfigure audio broadcast source.
Reconfigure an audio broadcast source with a new codec and codec quality of service param-
eters. This can only be done when the source is stopped.
Parameters
• source – Pointer to the broadcast source
• codec_cfg – Codec configuration.
• qos – Quality of Service configuration
Returns
Zero on success or (negative) error code otherwise.
int bt_bap_broadcast_source_update_metadata(struct bt_bap_broadcast_source *source, const uint8_t meta[], size_t meta_len)

Modify the metadata of an audio broadcast source.

Modify the metadata an audio broadcast source. This can only be done when the source is started. To update the metadata in the stopped state, use `bt_bap_broadcast_source_reconfig()`.

**Parameters**
- `source` – Pointer to the broadcast source.
- `meta` – Metadata.
- `meta_len` – Length of metadata.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_bap_broadcast_source_start(struct bt_bap_broadcast_source *source, struct bt_le_ext_adv *adv)

Start audio broadcast source.

Start an audio broadcast source with one or more audio streams. The broadcast source will start advertising BIGInfo, and audio data can be streamed.

**Parameters**
- `source` – Pointer to the broadcast source
- `adv` – Pointer to an extended advertising set with periodic advertising configured.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_bap_broadcast_source_stop(struct bt_bap_broadcast_source *source)

Stop audio broadcast source.

Stop an audio broadcast source. The broadcast source will stop advertising BIGInfo, and audio data can no longer be streamed.

**Parameters**
- `source` – Pointer to the broadcast source

**Returns**
Zero on success or (negative) error code otherwise.

int bt_bap_broadcast_source_delete(struct bt_bap_broadcast_source *source)

Delete audio broadcast source.

Delete an audio broadcast source. The broadcast source will stop advertising entirely, and the source can no longer be used.

**Parameters**
- `source` – Pointer to the broadcast source

**Returns**
Zero on success or (negative) error code otherwise.

int bt_bap_broadcast_source_get_id(const struct bt_bap_broadcast_source *source, uint32_t *const broadcast_id)

Get the broadcast ID of a broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with `BT_UUID_BROADCAST_AUDIO_VAL` as `BT_DATA_SVC_DATA16`.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.
Parameters

- source – [in] Pointer to the broadcast source.
- broadcast_id – [out] Pointer to the 3-octet broadcast ID.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_bap_broadcast_source_get_base(struct bt_bap_broadcast_source *source, struct net_buf_simple *base_buf)
```

Get the Broadcast Audio Stream Endpoint of a broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see `bt_le_per_adv_set_data()`).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters

- source – Pointer to the broadcast source.
- base_buf – Pointer to a buffer where the BASE will be inserted.

Returns

Zero on success or (negative) error code otherwise.

```c
struct bt_bap_broadcast_source_stream_param
```

#include <bap.h> Broadcast Source stream parameters.

Public Members

```c
struct bt_bap_stream *stream
```

Audio stream.

```c
struct bt_bap_broadcast_source_subgroup_param
```

#include <bap.h> Broadcast Source subgroup parameters.

Public Members

```c
size_t params_count
```

The number of parameters in stream_params.

```c
struct bt_bap_broadcast_source_stream_param *params
```

Array of stream parameters.

```c
struct bt_audio_codec_cfg *codec_cfg
```

Subgroup Codec configuration.

```c
struct bt_bap_broadcast_source_create_param
```

#include <bap.h> Broadcast Source create parameters.
Public Members

size_t params_count
The number of parameters in subgroup_params.

struct bt_bap_broadcast_source_subgroup_param *params
Array of stream parameters.

struct bt_audio_codec_qos *qos
Quality of Service configuration.

uint8_t packing
Broadcast Source packing mode.
BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.

bool encryption
Whether or not to encrypt the streams.

uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE]
Broadcast code.
If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.
Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

Common Audio Profile

API Reference

group bt_cap
Common Audio Profile (CAP)
[Experimental] Users should note that the APIs can change as a part of ongoing development.

Enums

definition bt_cap_set_type
Type of CAP set.

Values:

enumerator BT_CAP_SET_TYPE_AD_HOC
The set is an ad-hoc set.

enumerator BT_CAP_SET_TYPE_CSIP
The set is a CSIP Coordinated Set.
Functions

int bt_cap_acceptor_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)

Register the Common Audio Service.

This will register and enable the service and make it discoverable by clients. This will also register a Coordinated Set Identification Service instance.

This shall only be done as a server, and requires BT_CAP_ACCEPTOR_SET_MEMBER. If BT_CAP_ACCEPTOR_SET_MEMBER is not enabled, the Common Audio Service will be statically registered.

Parameters

- **svc_inst** – [out] Pointer to the registered Coordinated Set Identification Service.

Returns

0 if success, errno on failure.

int bt_cap_initiator_unicast_discover(struct bt_conn *conn)

Discovers audio support on a remote device.

This will discover the Common Audio Service (CAS) on the remote device, to verify if the remote device supports the Common Audio Profile.

Parameters

- **conn** – Connection to a remote server.

Returns

0 on success or negative error value on failure.

void bt_cap_stream_ops_register(struct bt_cap_stream *stream, struct bt_bap_stream_ops *ops)

Register Audio operations for a Common Audio Profile stream.

Parameters

- **stream** – Stream object.
- **ops** – Stream operations structure.

int bt_cap_stream_send(struct bt_cap_stream *stream, struct net_buf *buf, uint16_t seq_num, uint32_t ts)

Send data to Common Audio Profile stream.

See **bt_bap_stream_send()** for more information

**Note:** Support for sending must be supported, determined by **CONFIG_BT_AUDIO_TX**.

Parameters

- **stream** – Stream object.
- **buf** – Buffer containing data to be sent.
- **seq_num** – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.
• ts – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG. Can be omitted by using BT_ISO_TIMESTAMP_NONE which will simply enqueue the ISO SDU in a FIFO manner.

**Return values**

- -EINVAL – if stream object is NULL
- Any – return value from *bt_bap_stream_send()*

```
int bt_cap_stream_get_tx_sync(struct bt_cap_stream *stream, struct bt_iso_tx_info *info)
```

Get ISO transmission timing info for a Common Audio Profile stream.

See *bt_bap_stream_get_tx_sync()* for more information

**Note:** Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX.

**Parameters**

- info – [out] Transmit info object.

**Return values**

- -EINVAL – if stream object is NULL
- Any – return value from *bt_bap_stream_get_tx_sync()*

```
int bt_cap_initiator_register_cb(const struct bt_cap_initiator_cb *cb)
```

Register Common Audio Profile callbacks.

**Parameters**

- cb – The callback structure. Shall remain static.

**Returns**

0 on success or negative error value on failure.

```
int bt_cap_initiator_unicast_audio_start(const struct bt_cap_unicast_audio_start_param *param, struct bt_bap_unicast_group *unicast_group)
```

Setup and start unicast audio streams for a set of devices.

The result of this operation is that the streams in param will be initialized and will be usable for streaming audio data. The unicast_group value can be used to update and stop the streams.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

**Parameters**

- param – [in] Parameters to start the audio streams.
- unicast_group – [out] Pointer to the unicast group.

**Returns**

0 on success or negative error value on failure.
int bt_cap_initiator_unicast_audio_update(const struct bt_cap_unicast_audio_update_param params[], size_t count)

Update unicast audio streams.
This will update the metadata of one or more streams.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

**Parameters**
- params – Array of update parameters.
- count – The number of entries in params.

**Returns**
0 on success or negative error value on failure.

int bt_cap_initiator_unicast_audio_stop(struct bt_bap_unicast_group *unicast_group)
Stop unicast audio streams for a unicast group.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

**Parameters**
- unicast_group – The group of unicast devices to stop. The audio streams in this will be stopped and reset, and the unicast_group will be invalidated.

**Returns**
0 on success or negative error value on failure.

int bt_cap_initiator_unicast_audio_cancel(void)
Cancel any current Common Audio Profile procedure.
This will stop the current procedure from continuing and making it possible to run a new Common Audio Profile procedure.
It is recommended to do this if any existing procedure take longer time than expected, which could indicate a missing response from the Common Audio Profile Acceptor.
This does not send any requests to any Common Audio Profile Acceptors involved with the current procedure, and thus notifications from the Common Audio Profile Acceptors may arrive after this has been called. It is thus recommended to either only use this if a procedure has stalled, or wait a short while before starting any new Common Audio Profile procedure after this has been called to avoid getting notifications from the cancelled procedure. The wait time depends on the connection interval, the number of devices in the previous procedure and the behavior of the Common Audio Profile Acceptors.
The respective callbacks of the procedure will be called as part of this with the connection pointer set to 0 and the err value set to -ECANCELED.

**Return values**
- 0 – on success
- -EALREADY – if no procedure is active

int bt_cap_initiator_broadcast_audio_create(const struct bt_cap_initiator_broadcast_create_param *param, struct bt_cap_broadcast_source **broadcast_source)
Create a Common Audio Profile broadcast source.

Create a new audio broadcast source with one or more audio streams.

* •

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**

- **param** – [in] Parameters to start the audio streams.
- **broadcast_source** – [out] Pointer to the broadcast source created.

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_audio_start(
    struct bt_cap_broadcast_source *broadcast_source,
    struct bt_le_ext_adv *adv)
```

Start Common Audio Profile broadcast source.

The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

This will allow the streams in the broadcast source to send audio by calling `bt_bap_stream_send()`.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**

- **broadcast_source** – Pointer to the broadcast source.
- **adv** – Pointer to an extended advertising set with periodic advertising configured.

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_audio_update(
    struct bt_cap_broadcast_source *broadcast_source,
    const uint8_t meta[],
    size_t meta_len)
```

Update broadcast audio streams for a Common Audio Profile broadcast source.

**Note:** CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**

- **broadcast_source** – The broadcast source to update.
- **meta** – The new metadata. The metadata shall contain a list of CCIDs as well as a non-0 context bitfield.
- **meta_len** – The length of `meta`.  

6.1. Bluetooth
Returns
0 on success or negative error value on failure.

int bt_cap_initiator_broadcast_audio_stop(struct bt_cap_broadcast_source *broadcast_source)
Stop broadcast audio streams for a Common Audio Profile broadcast source.

Note: CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters
• broadcast_source – The broadcast source to stop. The audio streams in this will be stopped and reset.

Returns
0 on success or negative error value on failure.

int bt_cap_initiator_broadcast_audio_delete(struct bt_cap_broadcast_source *broadcast_source)

int bt_cap_initiator_broadcast_get_id(const struct bt_cap_broadcast_source *broadcast_source, uint32_t * const broadcast_id)
Get the broadcast ID of a Common Audio Profile broadcast source.
This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with BT_UUID_BROADCAST_AUDIO_VAL as BT_DATA_SVC_DATA16.
See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
• broadcast_source – [in] Pointer to the broadcast source.
• broadcast_id – [out] Pointer to the 3-octet broadcast ID.

Returns
int 0 if on success, errno on error.

int bt_cap_initiator_broadcast_get_base(struct bt_cap_broadcast_source *broadcast_source, struct net_buf_simple *base_buf)
Get the Broadcast Audio Stream Endpoint of a Common Audio Profile broadcast source.
This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see bt_le_per_adv_set_data()).
See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
• broadcast_source – Pointer to the broadcast source.
• base_buf – Pointer to a buffer where the BASE will be inserted.

Returns
int 0 if on success, errno on error.

int bt_cap_initiator_unicast_to_broadcast(const struct bt_cap_unicast_to_broadcast_param *param, struct bt_cap_broadcast_source **source)
Hands over the data streams in a unicast group to a broadcast source.
The streams in the unicast group will be stopped and the unicast group will be deleted. This can only be done for source streams.

**Note:** CONFIG_BT_CAP_INITIATOR, CONFIG_BT_BAP_UNICAST_CLIENT and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**

- **param** – The parameters for the handover.
- **source** – The resulting broadcast source.

**Returns**

0 on success or negative error value on failure.

```c
int bt_cap_initiator_broadcast_to_unicast(const struct bt_cap_broadcast_to_unicast_param *param, struct bt_bap_unicast_group **unicast_group)
```

Hands over the data streams in a broadcast source to a unicast group.

The streams in the broadcast source will be stopped and the broadcast source will be deleted.

**Note:** CONFIG_BT_CAP_INITIATOR, CONFIG_BT_BAP_UNICAST_CLIENT and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

**Parameters**

- **param** – [in] The parameters for the handover.
- **unicast_group** – [out] The resulting broadcast source.

**Returns**

0 on success or negative error value on failure.

```c
struct bt_cap_initiator_cb
#include "cap.h" Callback structure for CAP procedures.
```

```c
union bt_cap_set_member
#include "cap.h" Represents a Common Audio Set member that are either in a Coordinated or ad-hoc set.
```

**Public Members**

```c
struct bt_conn *member
Connection pointer if the type is BT_CAP_SET_TYPE_AD_HOC.
```

```c
struct bt_csip_set_coordinator_csis_inst *csip
CSIP Coordinated Set struct used if type is BT_CAP_SET_TYPE_CSIP.
```

```c
struct bt_cap_stream
#include "cap.h"
```

```c
struct bt_cap_unicast_audio_start_stream_param
#include "cap.h"
```

**6.1. Bluetooth**

1499
union `bt_cap_set_member` member
  Coordinated or ad-hoc set member.

struct `bt_cap_stream` *stream
  Stream for the member.

struct `bt_bap_ep` *ep
  Endpoint reference for the stream.

struct `bt_audio_codec_cfg` *codec_cfg
  Codec configuration.
  The `codec_cfg.meta` shall include a list of CCIDs
  (`BT_AUDIO_METADATA_TYPE_CCID_LIST`) as well as a non-0 stream context
  (`BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT`) bitfield.

struct `bt_cap_unicast_audio_start_param`
  
  #include <cap.h>

Public Members

enum `bt_cap_set_type` type
  The type of the set.

size_t count
  The number of parameters in `stream_params`.

struct `bt_cap_unicast_audio_start_stream_param` *stream_params
  Array of stream parameters.

struct `bt_cap_unicast_audio_update_param`
  
  #include <cap.h>

Public Members

struct `bt_cap_stream` *stream
  Stream for the member.

size_t meta_len
  The length of `meta`.

uint8_t *meta
  The new metadata.
  The metadata shall a list of CCIDs as well as a non-0 context bitfield.

struct `bt_cap_initiator_broadcast_stream_param`
  
  #include <cap.h>
Public Members

struct bt_cap_stream *stream
    Audio stream.

size_t data_len
    The length of the data array.
    The BIS specific data may be omitted and this set to 0.

uint8_t *data
    BIS Codec Specific Configuration.

struct bt_cap_initiator_broadcast_subgroup_param
    #include <cap.h>

Public Members

size_t stream_count
    The number of parameters in stream_params.

struct bt_cap_initiator_broadcast_stream_param *stream_params
    Array of stream parameters.

struct bt_audio_codec_cfg *codec_cfg
    Subgroup Codec configuration.

struct bt_cap_initiator_broadcast_create_param
    #include <cap.h>

Public Members

size_t subgroup_count
    The number of parameters in subgroup_params.

struct bt_cap_initiator_broadcast_subgroup_param *subgroup_params
    Array of stream parameters.

struct bt_audio_codec_qos *qos
    Quality of Service configuration.

uint8_t packing
    Broadcast Source packing mode.
    BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

Note: This is a recommendation to the controller, which the controller may ignore.
bool encryption
    Whether or not to encrypt the streams.

uint8_t broadcast_code[BT_AUDIO_BROADCAST_CODE_SIZE]
    16-octet broadcast code.
    Only valid if encrypt is true.
    If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.
    Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

struct bt_cap_unicast_to_broadcast_param
    #include <cap.h>

Public Members

struct bt_bap_unicast_group *unicast_group
    The source unicast group with the streams.

bool encrypt
    Whether or not to encrypt the streams.
    If set to true, then the broadcast code in broadcast_code will be used to encrypt the streams.

uint8_t broadcast_code[BT_ISO_BROADCAST_CODE_SIZE]
    16-octet broadcast code.
    Only valid if encrypt is true.
    If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.
    Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

struct bt_cap_broadcast_to_unicast_param
    #include <cap.h>

Public Members

struct bt_cap_broadcast_source *broadcast_source
    The source broadcast source with the streams.
    The broadcast source will be stopped and deleted.

enum bt_cap_set_type type
    The type of the set.
size_t count

The number of set members in members.

This value shall match the number of streams in the broadcast_source.

union bt_cap_set_member **members

Coordinated or ad-hoc set members.

Connection Management

The Zephyr Bluetooth stack uses an abstraction called bt_conn to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the bt_conn_get_info() API. Connection objects are reference counted, and the application is expected to use the bt_conn_ref() API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the bt_conn_unref() API is to be used when releasing a reference to a connection.

An application may track connections by registering a bt_conn_cb struct using the bt_conn_cb_register() or BT_CONN_CB_DEFINE APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the bt_conn_le_create() API.

API Reference

group bt_conn

Connection management.

Defines

BT_LE_CONN_PARAM_INIT(int_min, int_max, lat, to)
Initialize connection parameters.

Parameters

• int_min – Minimum Connection Interval (N * 1.25 ms)
• int_max – Maximum Connection Interval (N * 1.25 ms)
• lat – Connection Latency
• to – Supervision Timeout (N * 10 ms)

BT_LE_CONN_PARAM(int_min, int_max, lat, to)
Helper to declare connection parameters inline.

Parameters

• int_min – Minimum Connection Interval (N * 1.25 ms)
• int_max – Maximum Connection Interval (N * 1.25 ms)
• lat – Connection Latency
• to – Supervision Timeout (N * 10 ms)

BT_LE_CONN_PARAM_DEFAULT
Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s.
Initialize PHY parameters.

Parameters

- _pref_tx_phy – Bitmask of preferred transmit PHYs.
- _pref_rx_phy – Bitmask of preferred receive PHYs.

Helper to declare PHY parameters inline.

Parameters

- _pref_tx_phy – Bitmask of preferred transmit PHYs.
- _pref_rx_phy – Bitmask of preferred receive PHYs.

Only LE 1M PHY.

Only LE 2M PHY.

Only LE Coded PHY.

All LE PHYs.

Initialize transmit data length parameters.

Parameters

- _tx_max_len – Maximum Link Layer transmission payload size in bytes.
- _tx_max_time – Maximum Link Layer transmission payload time in us.

Helper to declare transmit data length parameters inline.

Parameters

- _tx_max_len – Maximum Link Layer transmission payload size in bytes.
- _tx_max_time – Maximum Link Layer transmission payload time in us.

Default LE data length parameters.

Maximum LE data length parameters.

Convert connection interval to milliseconds.

Multiply by 1.25 to get milliseconds.

Note that this may be inaccurate, as something like 7.5 ms cannot be accurately presented with integers.
**BT_CONN_INTERVAL_TO_US**

Convert connection interval to microseconds.

Multiply by 1250 to get microseconds.

**BT_CONN_ROLE_MASTER**

Connection role (central or peripheral)

**BT_CONN_ROLE_SLAVE**

**BT_CONN_LE_CREATE_PARAM_INIT**(_options, _interval, _window)

Initialize create connection parameters.

**Parameters**

- _options – Create connection options.
- _interval – Create connection scan interval (N * 0.625 ms).
- _window – Create connection scan window (N * 0.625 ms).

**BT_CONN_LE_CREATE_PARAM**(_options, _interval, _window)

Helper to declare create connection parameters inline.

**Parameters**

- _options – Create connection options.
- _interval – Create connection scan interval (N * 0.625 ms).
- _window – Create connection scan window (N * 0.625 ms).

**BT_CONN_LE_CREATE_CONN**

Default LE create connection parameters.

Scan continuously by setting scan interval equal to scan window.

**BT_CONN_LE_CREATE_CONN_AUTO**

Default LE create connection using filter accept list parameters.

Scan window: 30 ms. Scan interval: 60 ms.

**BT_CONN_CB_DEFINE**(_name)

Register a callback structure for connection events.

**Parameters**

- _name – Name of callback structure.

**BT_PASSKEY_INVALID**

Special passkey value that can be used to disable a previously set fixed passkey.

**BT_BR_CONN_PARAM_INIT**(role_switch)

Initialize BR/EDR connection parameters.

**Parameters**

- role_switch – True if role switch is allowed

**BT_BR_CONN_PARAM**(role_switch)

Helper to declare BR/EDR connection parameters inline.

**Parameters**

- role_switch – True if role switch is allowed
BT_BR_CONN_PARAM_DEFAULT
Default BR/EDR connection parameters: Role switch allowed.

Enums

data type [anonymous]
Connection PHY options.
Values:

enumerator BT_CONN_LE_PHY_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_CONN_LE_PHY_OPT_CODED_S2 = BIT(0)
LE Coded using S=2 coding preferred when transmitting.

enumerator BT_CONN_LE_PHY_OPT_CODED_S8 = BIT(1)
LE Coded using S=8 coding preferred when transmitting.

data type bt_conn_type
Connection Type.
Values:

enumerator BT_CONN_TYPE_LE = BIT(0)
LE Connection Type.

enumerator BT_CONN_TYPE_BR = BIT(1)
BR/EDR Connection Type.

enumerator BT_CONN_TYPE_SCO = BIT(2)
SCO Connection Type.

enumerator BT_CONN_TYPE_ISO = BIT(3)
ISO Connection Type.

enumerator BT_CONN_TYPE_ALL = BT_CONN_TYPE_LE | BT_CONN_TYPE_BR | BT_CONN_TYPE_SCO | BT_CONN_TYPE_ISO
All Connection Type.

data type [anonymous]
Values:

enumerator BT_CONN_ROLE_CENTRAL = 0

enumerator BT_CONN_ROLE_PERIPHERAL = 1

data type bt_conn_state
Values:
enumerator BT_CONN_STATE_DISCONNECTED
    Channel disconnected.

enumerator BT_CONN_STATE_CONNECTING
    Channel in connecting state.

enumerator BT_CONN_STATE_CONNECTED
    Channel connected and ready for upper layer traffic on it.

enumerator BT_CONN_STATE_DISCONNECTING
    Channel in disconnecting state.

enum bt_security_t
    Security level.
    Values:
    
    enumerator BT_SECURITY_L0
        Level 0: Only for BR/EDR special cases, like SDP.

    enumerator BT_SECURITY_L1
        Level 1: No encryption and no authentication.

    enumerator BT_SECURITY_L2
        Level 2: Encryption and no authentication (no MITM).

    enumerator BT_SECURITY_L3
        Level 3: Encryption and authentication (MITM).

    enumerator BT_SECURITY_L4
        Level 4: Authenticated Secure Connections and 128-bit key.

    enumerator BT_SECURITY_FORCE_PAIR = BIT(7)
        Bit to force new pairing procedure, bit-wise OR with requested security level.

enum bt_security_flag
    Security Info Flags.
    Values:
    
    enumerator BT_SECURITY_FLAG_SC = BIT(0)
        Paired with Secure Connections.

    enumerator BT_SECURITY_FLAG_OOB = BIT(1)
        Paired with Out of Band method.

enum bt_conn_le_tx_power_phy
    Values:
enumerator BT_CONN_LE_TX_POWER_PHY_NONE
   Convenience macro for when no PHY is set.

enumerator BT_CONN_LE_TX_POWER_PHY_1M
   LE 1M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_2M
   LE 2M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
   LE Coded PHY using S=8 coding.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
   LE Coded PHY using S=2 coding.

enum bt_conn_auth_keypress
   Passkey Keypress Notification type.
   The numeric values are the same as in the Core specification for Pairing Keypress Notification PDU.
   Values:

   enumerator BT_CONN_AUTH_KEYPRESS_ENTRY_STARTED = 0x00

   enumerator BT_CONN_AUTH_KEYPRESS_DIGIT_ENTERED = 0x01

   enumerator BT_CONN_AUTH_KEYPRESS_DIGIT_ERASED = 0x02

   enumerator BT_CONN_AUTH_KEYPRESS_CLEARED = 0x03

   enumerator BT_CONN_AUTH_KEYPRESS_ENTRY_COMPLETED = 0x04

enum [anonymous]
   Values:

   enumerator BT_CONN_LE_OPT_NONE = 0
      Convenience value when no options are specified.

   enumerator BT_CONN_LE_OPT_CODED = BIT(0)
      Enable LE Coded PHY.
       Enable scanning on the LE Coded PHY.

   enumerator BT_CONN_LE_OPT_NO_1M = BIT(1)
      Disable LE 1M PHY.
       Disable scanning on the LE 1M PHY.
       @note Requires @ref BT_CONN_LE_OPT_CODED.
enum bt_security_err

Values:

enumerator BT_SECURITY_ERR_SUCCESS
  Security procedure successful.

enumerator BT_SECURITY_ERR_AUTH_FAIL
  Authentication failed.

enumerator BT_SECURITY_ERR_PIN_OR_KEY_MISSING
  PIN or encryption key is missing.

enumerator BT_SECURITY_ERR_OOB_NOT_AVAILABLE
  OOB data is not available.

enumerator BT_SECURITY_ERR_AUTH_REQUIREMENT
  The requested security level could not be reached.

enumerator BT_SECURITY_ERR_PAIR_NOT_SUPPORTED
  Pairing is not supported.

enumerator BT_SECURITY_ERR_PAIR_NOT_ALLOWED
  Pairing is not allowed.

enumerator BT_SECURITY_ERR_INVALID_PARAM
  Invalid parameters.

enumerator BT_SECURITY_ERR_KEY_REJECTED
  Distributed Key Rejected.

enumerator BT_SECURITY_ERR_UNSPECIFIED
  Pairing failed but the exact reason could not be specified.

Functions

struct bt_conn *bt_conn_ref(struct bt_conn *conn)

Increment a connection's reference count.
Increment the reference count of a connection object.

Note: Will return NULL if the reference count is zero.

Parameters

- conn – Connection object.

Returns

Connection object with incremented reference count, or NULL if the reference count is zero.
void bt_conn_unref(struct bt_conn *conn)

Decrement a connection's reference count.
Decrement the reference count of a connection object.

Parameters

- conn – Connection object.

void bt_conn_foreach(enum bt_conn_type type, void (*)(struct bt_conn *conn, void *data), void *data)

Iterate through all bt_conn objects.
Iterate through all bt_conn objects that are alive in the Host allocator.
To find established connections, combine this with bt_conn_get_info. Check that bt_conn_info::state is BT_CONN_STATE_CONNECTED.

Thread safety: This API is thread safe, but it does not guarantee a sequentially-consistent view for objects allocated during the current invocation of this API. E.g. If preempted while allocations A then B then C happen then results may include A and C but miss B.

Parameters

- type – Connection Type
- func – Function to call for each connection.
- data – Data to pass to the callback function.

struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const bt_addr_le_t *peer)

Look up an existing connection by address.
Look up an existing connection based on the remote address.
The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

Parameters

- id – Local identity (in most cases BT_ID_DEFAULT).
- peer – Remote address.

Returns

Connection object or NULL if not found.

const bt_addr_le_t *bt_conn_get_dst(const struct bt_conn *conn)

Get destination (peer) address of a connection.

Parameters

- conn – Connection object.

Returns

Destination address.

uint8_t bt_conn_index(const struct bt_conn *conn)

Get array index of a connection.

This function is used to map bt_conn to index of an array of connections. The array has CONFIG_BT_MAX_CONN elements.

Parameters

- conn – Connection object.

Returns

Index of the connection object. The range of the returned value is 0..CONFIG_BT_MAX_CONN-1
int bt_conn_get_info(const struct bt_conn *conn, struct bt_conn_info *info)
Get connection info.

Parameters
• conn – Connection object.
• info – Connection info object.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_get_remote_info(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)
Get connection info for the remote device.

Note: In order to retrieve the remote version (version, manufacturer and subversion) CONFIG_BT_REMOTE_VERSION must be enabled

Note: The remote information is exchanged directly after the connection has been established. The application can be notified about when the remote information is available through the remote_info_available callback.

Parameters
• conn – Connection object.
• remote_info – Connection remote info object.

Returns
Zero on success or (negative) error code on failure.

Returns
-EBUSY The remote information is not yet available.

int bt_conn_le_get_tx_power_level(struct bt_conn *conn, struct bt_conn_le_tx_power *tx_power_level)
Get connection transmit power level.

Parameters
• conn – Connection object.
• tx_power_level – Transmit power level descriptor.

Returns
Zero on success or (negative) error code on failure.

Returns
-ENOBUSFS HCI command buffer is not available.

int bt_conn_le_param_update(struct bt_conn *conn, const struct bt_le_conn_param *param)
Update the connection parameters.

If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the CONFIG_BT_CONN_PARAM_UPDATE_TIMEOUT option.

Parameters
• conn – Connection object.
• param – Updated connection parameters.
Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_data_len_update(struct bt_conn *conn, const struct bt_conn_le_data_len_param *param)
Update the connection transmit data length parameters.

Parameters
• conn – Connection object.
• param – Updated data length parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_phy_update(struct bt_conn *conn, const struct bt_conn_le_phy_param *param)
Update the connection PHY parameters.

Parameters
• conn – Connection object.
• param – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_disconnect(struct bt_conn *conn, uint8_t reason)
Disconnect from a remote device or cancel pending connection.

Disconnect an active connection with the specified reason code or cancel pending outgoing connection.

The disconnect reason for a normal disconnect should be:
BT_HCI_ERR_REMOTE_USER_TERM_CONN.

The following disconnect reasons are accepted:
• BT_HCI_ERR_AUTH_FAIL
• BT_HCI_ERR_REMOTE_USER_TERM_CONN
• BT_HCI_ERR_REMOTE_LOW_RESOURCES
• BT_HCI_ERR_REMOTE_POWER_OFF
• BT_HCI_ERR_UNSUPP_REMOTE_FEATURE
• BT_HCI_ERR_PAIRING_NOT_SUPPORTED
• BT_HCI_ERR_UNACCEPT_CONN_PARAM

Parameters
• conn – Connection to disconnect.
• reason – Reason code for the disconnection.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_create(const bt_addr_le_t *peer, const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)
Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection.

**Parameters**

- **peer** – [in] Remote address.
- **create_param** – [in] Create connection parameters.
- **conn_param** – [in] Initial connection parameters.
- **conn** – [out] Valid connection object on success.

**Returns**

Zero on success or (negative) error code on failure.

```c
int bt_conn_le_create_synced(const struct bt_le_ext_adv *adv, const struct bt_conn_le_create_synced_param *synced_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)
```

Create a connection to a synced device.

Initiate a connection to a synced device from a Periodic Advertising with Responses (PAwR) train.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

This uses the Periodic Advertising Connection Procedure.

**Parameters**

- **adv** – [in] The advertising set the PAwR advertiser belongs to.
- **synced_param** – [in] Create connection parameters.
- **conn_param** – [in] Initial connection parameters.
- **conn** – [out] Valid connection object on success.

**Returns**

Zero on success or (negative) error code on failure.

```c
int bt_conn_le_create_auto(const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param)
```

Automatically connect to remote devices in the filter accept list.

This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through `bt_conn_create_auto_stop`.

To establish connections to all devices in the the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

**Parameters**

- **create_param** – Create connection parameters
- **conn_param** – Initial connection parameters.

**Returns**

Zero on success or (negative) error code on failure.

**Returns**

-ENOMEM No free connection object available.
int bt_conn_create_auto_stop(void)
    Stop automatic connect creation.

    Returns
    Zero on success or (negative) error code on failure.

int bt_le_set_auto_conn(const bt_addr_le_t *addr,
                        const struct bt_le_conn_param *param)
    Automatically connect to remote device if it’s in range.

    This function enables/disables automatic connection initiation. Every time the device loses
the connection with peer, this connection will be re-established if connectable advertisement
from peer is received.

    Note: Auto connect is disabled during explicit scanning.

Parameters
    • addr – Remote Bluetooth address.
    • param – If non-NULL, auto connect is enabled with the given parameters. If
      NULL, auto connect is disabled.

    Returns
    Zero on success or error code otherwise.

int bt_conn_set_security(struct bt_conn *conn, bt_security_t sec)
    Set security level for a connection.

    This function enable security (encryption) for a connection. If the device has bond information
for the peer with sufficiently strong key encryption will be enabled. If the connection is already
encrypted with sufficiently strong key this function does nothing.

If the device has no bond information for the peer and is not already paired then the pair-
ing procedure will be initiated. Note that sec has no effect on the security level selected
for the pairing process. The selection is instead controlled by the values of the registered
bt_conn_auth_cb. If the device has bond information or is already paired and the keys are too
weak then the pairing procedure will be initiated.

This function may return error if required level of security is not possible to achieve due to
local or remote device limitation (e.g., input output capabilities), or if the maximum number
of paired devices has been reached.

This function may return error if the pairing procedure has already been initiated by the local
device or the peer device.

    Note: When CONFIG_BT_SMP_SC_ONLY is enabled then the security level will always be level
4.

    Note: When CONFIG_BT_SMP_OOB_LEGACY_PAIR_ONLY is enabled then the security level will
always be level 3.

Parameters
    • conn – Connection object.
    • sec – Requested security level.

Returns
    0 on success or negative error
bt_security_t bt_conn_get_security(const struct bt_conn *conn)
Get security level for a connection.

Returns
Connection security level

uint8_t bt_conn_enc_key_size(const struct bt_conn *conn)
Get encryption key size.
This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

Parameters
• conn – Existing connection object.

Returns
Encryption key size.

void bt_conn_cb_register(struct bt_conn_cb *cb)
Register connection callbacks.
Register callbacks to monitor the state of connections.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

void bt_set_bondable(bool enable)
Enable/disable bonding.
Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn’t be needed.

Parameters
• enable – Value allowing/disallowing to be bondable.

int bt_conn_set_bondable(struct bt_conn *conn, bool enable)
Set/clear the bonding flag for a given connection.
Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data for a given connection.
The bonding flag for a given connection cannot be set/cleared if security procedures in the SMP module have already started. This function can be called only once per connection.
If the bonding flag is not set/cleared for a given connection, the value will depend on global configuration which is set using bt_set_bondable. The default value of the global configuration is defined using CONFIG_BT_BONDABLE Kconfig option.

Parameters
• conn – Connection object.
• enable – Value allowing/disallowing to be bondable.

void bt_le_oob_set_sc_flag(bool enable)
Allow/disallow remote LE SC OOB data to be used for pairing.
Set/clear the OOB data flag for LE SC SMP Pairing Request/Response data.

Parameters
• enable – Value allowing/disallowing remote LE SC OOB data.
void bt_le_oob_set_legacy_flag(bool enable)
    Allow/disallow remote legacy OOB data to be used for pairing.
    Set/clear the OOB data flag for legacy SMP Pairing Request/Response data.

    **Parameters**
    • enable – Value allowing/disallowing remote legacy OOB data.

int bt_le_oob_set_legacy_tk(struct bt_conn *conn, const uint8_t *tk)
    Set OOB Temporary Key to be used for pairing.
    This function allows to set OOB data for the LE legacy pairing procedure. The function should
    only be called in response to the oob_data_request() callback provided that the legacy method
    is user pairing.

    **Parameters**
    • conn – Connection object
    • tk – Pointer to 16 byte long TK array

    **Returns**
    Zero on success or -EINVAL if NULL

int bt_le_oob_set_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data *oobd_local,
                         const struct bt_le_oob_sc_data *oobd_remote)
    Set OOB data during LE Secure Connections (SC) pairing procedure.
    This function allows to set OOB data during the LE SC pairing procedure. The function should
    only be called in response to the oob_data_request() callback provided that LE SC method is
    used for pairing.

    The user should submit OOB data according to the information received in the callback. This
    may yield three different configurations: with only local OOB data present, with only remote
    OOB data present or with both local and remote OOB data present.

    **Parameters**
    • conn – Connection object
    • oobd_local – Local OOB data or NULL if not present
    • oobd_remote – Remote OOB data or NULL if not present

    **Returns**
    Zero on success or error code otherwise, positive in case of protocol error or
    negative (POSIX) in case of stack internal error.

int bt_le_oob_get_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data **oobd_local,
                          const struct bt_le_oob_sc_data **oobd_remote)
    Get OOB data used for LE Secure Connections (SC) pairing procedure.
    This function allows to get OOB data during the LE SC pairing procedure that were set by the
    bt_le_oob_set_sc_data() API.

    **Note:** The OOB data will only be available as long as the connection object associated with
    it is valid.

    **Parameters**
    • conn – Connection object
    • oobd_local – Local OOB data or NULL if not set
    • oobd_remote – Remote OOB data or NULL if not set
Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_passkey_set(unsigned int passkey)
Set a fixed passkey to be used for pairing.

This API is only available when the CONFIG_BT_FIXED_PASSKEY configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the pairing_confirm() callback will be called for all incoming pairings.

Parameters
• passkey – A valid passkey (0 - 999999) or BT_PASSKEY_INVALID to disable a previously set fixed passkey.

Returns
0 on success or a negative error code on failure.

int bt_conn_auth_cb_register(const struct bt_conn_auth_cb *cb)
Register authentication callbacks.

Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

Parameters
• cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_cb_overlay(struct bt_conn *conn, const struct bt_conn_auth_cb *cb)
Overlay authentication callbacks used for a given connection.

This function can be used only for Bluetooth LE connections. The CONFIG_BT_SMP must be enabled for this function.

The authentication callbacks for a given connection cannot be overlaid if security procedures in the SMP module have already started. This function can be called only once per connection.

Parameters
• conn – Connection object.
• cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_register(struct bt_conn_auth_info_cb *cb)
Register authentication information callbacks.

Register callbacks to get authenticated pairing information. Multiple registrations can be done.

Parameters
• cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_unregister(struct bt_conn_auth_info_cb *cb)
Unregister authentication information callbacks.

Unregister callbacks to stop getting authenticated pairing information.
Parameters
  • \texttt{cb} – Callback struct.

Returns
  Zero on success or negative error code otherwise

\begin{verbatim}
int bt_conn_auth_passkey_entry(struct bt_conn *conn, unsigned int passkey)
\end{verbatim}

Reply with entered passkey.
This function should be called only after passkey_entry callback from \texttt{bt_conn_auth_cb} structure was called.

Parameters
  • \texttt{conn} – Connection object.
  • \texttt{passkey} – Entered passkey.

Returns
  Zero on success or negative error code otherwise

\begin{verbatim}
int bt_conn_auth_keypress_notify(struct bt_conn *conn, enum bt_conn_auth_keypress type)
\end{verbatim}

Send Passkey Keypress Notification during pairing.
This function may be called only after passkey_entry callback from \texttt{bt_conn_auth_cb} structure was called.
Requires \texttt{CONFIG_BT_PASSKEY_KEYPRESS}.

See also:
\texttt{bt_conn_auth_keypress}.

Parameters
  • \texttt{conn} – Destination for the notification.
  • \texttt{type} – What keypress event type to send.

Return values
  • 0 – Success
  • -EINVAL – Improper use of the API.
  • -ENOMEM – Failed to allocate.
  • -ENOBUFFS – Failed to allocate.

\begin{verbatim}
int bt_conn_auth_cancel(struct bt_conn *conn)
\end{verbatim}

Cancel ongoing authenticated pairing.
This function allows to cancel ongoing authenticated pairing.

Parameters
  • \texttt{conn} – Connection object.

Returns
  Zero on success or negative error code otherwise

\begin{verbatim}
int bt_conn_auth_passkey_confirm(struct bt_conn *conn)
\end{verbatim}

Reply if passkey was confirmed to match by user.
This function should be called only after passkey_confirm callback from \texttt{bt_conn_auth_cb} structure was called.

Parameters
• conn – Connection object.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_pairing_confirm(struct bt_conn *conn)
Reply if incoming pairing was confirmed by user.
This function should be called only after pairing_confirm callback from `bt_conn_auth_cb` structure was called if user confirmed incoming pairing.

Parameters
• conn – Connection object.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_pincode_entry(struct bt_conn *conn, const char *pin)
Reply with entered PIN code.
This function should be called only after PIN code callback from `bt_conn_auth_cb` structure was called. It's for legacy 2.0 devices.

Parameters
• conn – Connection object.
• pin – Entered PIN code.

Returns
Zero on success or negative error code otherwise

struct bt_conn *bt_conn_create_br(const bt_addr_t *peer, const struct bt_br_conn_param *param)
Initiate an BR/EDR connection to a remote device.
Allows initiate new BR/EDR link to remote peer using its address.
The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

Parameters
• peer – Remote address.
• param – Initial connection parameters.

Returns
Valid connection object on success or NULL otherwise.

struct bt_conn *bt_conn_create_sco(const bt_addr_t *peer)
Initiate an SCO connection to a remote device.
Allows initiate new SCO link to remote peer using its address.
The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

Parameters
• peer – Remote address.

Returns
Valid connection object on success or NULL otherwise.

struct bt_le_conn_param
#include <conn.h> Connection parameters for LE connections.
struct bt_conn_le_phy_info
#include <conn.h> Connection PHY information for LE connections.

Public Members

uint8_t rx_phy
Connection transmit PHY.

struct bt_conn_le_phy_param
#include <conn.h> Preferred PHY parameters for LE connections.

Public Members

uint16_t options
Connection PHY options.

uint8_t pref_tx_phy
Bitmask of preferred transmit PHYs.

uint8_t pref_rx_phy
Bitmask of preferred receive PHYs.

struct bt_conn_le_data_len_info
#include <conn.h> Connection data length information for LE connections.

Public Members

uint16_t tx_max_len
Maximum Link Layer transmission payload size in bytes.

uint16_t tx_max_time
Maximum Link Layer transmission payload time in us.

uint16_t rx_max_len
Maximum Link Layer reception payload size in bytes.

uint16_t rx_max_time
Maximum Link Layer reception payload time in us.

struct bt_conn_le_data_len_param
#include <conn.h> Connection data length parameters for LE connections.

Public Members
uint16_t tx_max_len
    Maximum Link Layer transmission payload size in bytes.

uint16_t tx_max_time
    Maximum Link Layer transmission payload time in us.

struct bt_conn_le_info
    #include <conn.h> LE Connection Info Structure.

Public Members

const bt_addr_le_t *src
    Source (Local) Identity Address.

const bt_addr_le_t *dst
    Destination (Remote) Identity Address or remote Resolvable Private Address (RPA) before identity has been resolved.

const bt_addr_le_t *local
    Local device address used during connection setup.

const bt_addr_le_t *remote
    Remote device address used during connection setup.

uint16_t interval
    Connection interval.

uint16_t latency
    Connection peripheral latency.

uint16_t timeout
    Connection supervision timeout.

struct bt_conn_br_info
    #include <conn.h> BR/EDR Connection Info Structure.

Public Members

const bt_addr_t *dst
    Destination (Remote) BR/EDR address.

struct bt_security_info
    #include <conn.h> Security Info Structure.

6.1. Bluetooth
Public Members

bt_security_t level
Security Level.

uint8_t enc_key_size
Encryption Key Size.

enum bt_security_flag flags
Flags.

struct bt_conn_info
#include <conn.h> Connection Info Structure.

Public Members

enum bt_conn_type type
Connection Type.

uint8_t role
Connection Role.

uint8_t id
Which local identity the connection was created with.

struct bt_conn_le_info le
LE Connection specific Info.

struct bt_conn_br_info br
BR/EDR Connection specific Info.

union bt_conn_info.[anonymous] [anonymous]
Connection Type specific Info.

enum bt_conn_state state
Connection state.

struct bt_security_info security
Security specific info.

struct bt_conn_le_remote_info
#include <conn.h> LE Connection Remote Info Structure.

Public Members

const uint8_t *features
Remote LE feature set (bitmask).

```c
struct bt_conn_br_remote_info
#include <conn.h> BR/EDR Connection Remote Info structure.

Public Members

const uint8_t *features
    Remote feature set (pages of bitmasks).

uint8_t num_pages
    Number of pages in the remote feature set.
```

```c
struct bt_conn_remote_info
#include <conn.h> Connection Remote Info Structure.

Note: The version, manufacturer and subversion fields will only contain valid data if CONFIG_BT_REMOTE_VERSION is enabled.

Public Members

uint8_t type
    Connection Type.

uint8_t version
    Remote Link Layer version.

uint16_t manufacturer
    Remote manufacturer identifier.

uint16_t subversion
    Per-manufacturer unique revision.

struct bt_conn_le_remote_info le
    LE connection remote info.

struct bt_conn_br_remote_info br
    BR/EDR connection remote info.
```

```c
struct bt_conn_le_tx_power
#include <conn.h> LE Transmit Power Level Structure.

Public Members

uint8_t phy
    Input: 1M, 2M, Coded S2 or Coded S8.
```
int8_t current_level  
Output: current transmit power level.

int8_t max_level  
Output: maximum transmit power level.

struct bt_conn_le_create_param  
#include <conn.h>

Public Members

uint32_t options  
Bit-field of create connection options.

uint16_t interval  
Scan interval (N * 0.625 ms)

uint16_t window  
Scan window (N * 0.625 ms)

uint16_t interval_coded  
Scan interval LE Coded PHY (N * 0.625 MS)  
Set zero to use same as LE 1M PHY scan interval

uint16_t window_coded  
Scan window LE Coded PHY (N * 0.625 MS)  
Set zero to use same as LE 1M PHY scan window.

uint16_t timeout  
Connection initiation timeout (N * 10 MS)  
Set zero to use the default CONFIG_BT_CREATE_CONN_TIMEOUT timeout.

Note: Unused in bt_conn_le_create_auto

struct bt_conn_le_create_synced_param  
#include <conn.h>

Public Members

const bt_addr_le_t *peer  
Remote address.  
The peer must be synchronized to the PAwR train.

uint8_t subevent  
The subevent where the connection will be initiated.
struct bt_conn_cb

#include <conn.h> Connection callback structure.

This structure is used for tracking the state of a connection. It is registered with the help of the bt_conn_cb_register() API. It's permissible to register multiple instances of this bt_conn_cb type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

Public Members

void (*connected)(struct bt_conn *conn, uint8_t err)
A new connection has been established.
This callback notifies the application of a new connection. In case the err parameter is non-zero it means that the connection establishment failed.
err can mean either of the following:
• BT_HCI_ERR_UNKNOWN_CONN_ID Creating the connection started by bt_conn_le_create was canceled either by the user through bt_conn_disconnect or by the timeout in the host through bt_conn_le_create_param timeout parameter, which defaults to CONFIG_BT_CREATE_CONN_TIMEOUT seconds.
• BT_HCI_ERR_ADV_TIMEOUT High duty cycle directed connectable advertiser started by bt_le_adv_start failed to be connected within the timeout.

Note: If the connection was established from an advertising set then the advertising set cannot be restarted directly from this callback. Instead use the connected callback of the advertising set.

Param conn
New connection object.
Param err
HCI error. Zero for success, non-zero otherwise.

void (*disconnected)(struct bt_conn *conn, uint8_t reason)
A connection has been disconnected.
This callback notifies the application that a connection has been disconnected.
When this callback is called the stack still has one reference to the connection object. If the application in this callback tries to start either a connectable advertiser or create a new connection this might fail because there are no free connection objects available. To avoid this issue it is recommended to either start connectable advertise or create a new connection using k_work_submit or increase CONFIG_BT_MAX_CONN.

Param conn
Connection object.
Param reason
BT_HCI_ERR_* reason for the disconnection.

bool (*le_param_req)(struct bt_conn *conn, struct bt_le_conn_param *param)
LE connection parameter update request.
This callback notifies the application that a remote device is requesting to update the connection parameters. The application accepts the parameters by returning true, or rejects them by returning false. Before accepting, the application may also adjust the parameters to better suit its needs.
It is recommended for an application to have just one of these callbacks for simplicity. However, if an application registers multiple it needs to manage the potentially different requirements for each callback. Each callback gets the parameters as returned by previous callbacks, i.e. they are not necessarily the same ones as the remote originally sent.

If the application does not have this callback then the default is to accept the parameters.

**Param conn**
Connection object.

**Param param**
Proposed connection parameters.

**Return**
true to accept the parameters, or false to reject them.

```c
void (*)(le_param_updated)(struct bt_conn *conn, uint16_t interval, uint16_t latency, uint16_t timeout)
```

The parameters for an LE connection have been updated.

This callback notifies the application that the connection parameters for an LE connection have been updated.

**Param conn**
Connection object.

**Param interval**
Connection interval.

**Param latency**
Connection latency.

**Param timeout**
Connection supervision timeout.

```c
void (*)(identity_resolved)(struct bt_conn *conn, const bt_addr_le_t *rpa, const bt_addr_le_t *identity)
```

Remote Identity Address has been resolved.

This callback notifies the application that a remote Identity Address has been resolved.

**Param conn**
Connection object.

**Param rpa**
Resolvable Private Address.

**Param identity**
Identity Address.

```c
void (*)(security_changed)(struct bt_conn *conn, bt_security_t level, enum bt_security_err err)
```

The security level of a connection has changed.

This callback notifies the application that the security of a connection has changed.

The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

**Param conn**
Connection object.

**Param level**
New security level of the connection.

**Param err**

```c
void (*)(remote_info_available)(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)
```
Remote information procedures has completed.
This callback notifies the application that the remote information has been retrieved from
the remote peer.

**Param conn**
Connection object.

**Param remote_info**
Connection information of remote device.

```c
void (*le_phy_updated)(struct bt_conn *conn, struct bt_conn_le_phy_info *param)
```
The PHY of the connection has changed.
This callback notifies the application that the PHY of the connection has changed.

**Param conn**
Connection object.

**Param info**
Connection LE PHY information.

```c
void (*le_data_len_updated)(struct bt_conn *conn, struct bt_conn_le_data_len_info *info)
```
The data length parameters of the connection has changed.
This callback notifies the application that the maximum Link Layer payload length or
transmission time has changed.

**Param conn**
Connection object.

**Param info**
Connection data length information.

```c
struct bt_conn_oob_info
#include <conn.h> Info Structure for OOB pairing.
```

**Public Types**

```c
enum [anonymous]
```
Type of OOB pairing method.

**Values:**

- `BT_CONN_OOB_LE_LEGACY`
  LE legacy pairing.

- `BT_CONN_OOB_LE_SC`
  LE SC pairing.

**Public Members**

```c
enum bt_conn_oob_info.[anonymous] type
```
Type of OOB pairing method.

```c
enum bt_conn_oob_info.[anonymous].[anonymous].[anonymous] oob_config
```
OOB data configuration.
struct bt_conn_oob_info {
    LE Secure Connections OOB pairing parameters.
}

struct bt_conn_pairing_feat
#include <conn.h> Pairing request and pairing response info structure.
This structure is the same for both smp_pairing_req and smp_pairing_rsp and a subset of the packet data, except for the initial Code octet. It is documented in Core Spec. Vol. 3, Part H, 3.5.1 and 3.5.2.

struct bt_conn_auth_cb
#include <conn.h> Authenticated pairing callback structure.

Public Members

enum bt_security_err (*pairing_accept)(struct bt_conn *conn, const struct bt_conn_pairing_feat *const feat)
    Query to proceed incoming pairing or not.
    On any incoming pairing req/rsp this callback will be called for the application to decide whether to allow for the pairing to continue.
The pairing info received from the peer is passed to assist making the decision.

As this callback is synchronous the application should return a response value immediately. Otherwise it may affect the timing during pairing. Hence, this information should not be conveyed to the user to take action.

The remaining callbacks are not affected by this, but do notice that other callbacks can be called during the pairing. Eg. if pairing_confirm is registered both will be called for Just-Works pairings.

This callback may be unregistered in which case pairing continues as if the Kconfig flag was not set.

This callback is not called for BR/EDR Secure Simple Pairing (SSP).

**Param conn**
Connection where pairing is initiated.

**Param feat**
Pairing req/resp info.

```c
void (*passkey_display)(struct bt_conn *conn, unsigned int passkey)
```

Display a passkey to the user.

When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability do display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

**Param conn**
Connection where pairing is currently active.

**Param passkey**
Passkey to show to the user.

```c
void (*passkey_entry)(struct bt_conn *conn)
```

Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that’s how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the `bt_conn_auth_passkey_entry()` API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.

**Param conn**
Connection where pairing is currently active.

```c
void (*passkey_confirm)(struct bt_conn *conn, unsigned int passkey)
```

Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the `bt_conn_auth_passkey_confirm()` API should be called. If the user concluded that the passkey doesn’t match the `bt_conn_auth_cancel()` API should be called.
This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.

**Param conn**
Connection where pairing is currently active.

**Param passkey**
Passkey to be confirmed.

```c
void (*oob_data_request)(struct bt_conn *conn, struct bt_conn_oob_info *info)
```
Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the `bt_le_oob_set_sc_data()` API.

This callback must be set to non-NULL in order to support OOB pairing.

**Param conn**
Connection where pairing is currently active.

**Param info**
OOB pairing information.

```c
void (*cancel)(struct bt_conn *conn)
```
Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the passkey_display, passkey_entry passkey_confirm or pairing_confirm callback has been provided.

**Param conn**
Connection where pairing is currently active.

```c
void (*pairing_confirm)(struct bt_conn *conn)
```
Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the `bt_conn_auth_pairing_confirm()` API should be called. If the user decides to reject the pairing the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

**Param conn**
Connection where pairing is currently active.

```c
void (*pincode_entry)(struct bt_conn *conn, bool highsec)
```
Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the `highsec` parameter is set to true the PIN code must be 16 digits long.
Once entered, the PIN code should be given to the stack using the `bt_conn_auth_pincode_entry()` API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

**Param conn**
- Connection where pairing is currently active.

**Param highsec**
- true if 16 digit PIN is required.

```
#include <conn.h>
```

Authenticated pairing information callback structure.

**Public Members**

```
void (*pairing_complete)(struct bt_conn *conn, bool bonded)
```

This callback notifies the application that the pairing procedure has been completed.

**Param conn**
- Connection object.

**Param bonded**
- Bond information has been distributed during the pairing procedure.

```
void (*pairing_failed)(struct bt_conn *conn, enum bt_security_err reason)
```

This callback notifies the application that the pairing process has failed.

**Param conn**
- Connection object.

**Param reason**
- Pairing failed reason

```
void (*bond_deleted)(uint8_t id, const bt_addr_le_t *peer)
```

Notify that bond has been deleted.

**Param id**
- Which local identity had the bond.

**Param peer**
- Remote address.

```
sys_snode_t node
```

Internally used field for list handling.

```
#include <conn.h>
```

Connection parameters for BR/EDR connections.

**Bluetooth Controller**

**API Reference**

**group bt_ctrl**
- Bluetooth Controller.
Functions

void bt_ctlr_set_public_addr(const uint8_t *addr)
    Set public address for controller.
    Should be called before bt_enable().

Parameters
    • addr – Public address

Bluetooth Coordinated Sets

API Reference

group bt_gatt_csip

Coordinated Set Identification Profile (CSIP)

• [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_CSIP_SET_COORDINATOR_DISCOVER_TIMER_VALUE
    Recommended timer for member discovery.

BT_CSIP_SET_COORDINATOR_MAX_CSIS_INSTANCES

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT
    Accept the request to read the SIRK as plaintext.

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT_ENC
    Accept the request to read the SIRK, but return encrypted SIRK.

BT_CSIP_READ_SIRK_REQ_RSP_REJECT
    Reject the request to read the SIRK.

BT_CSIP_READ_SIRK_REQ_RSP_OOB_ONLY
    SIRK is available only via an OOB procedure.

BT_CSIP_SET_SIRK_SIZE
    Size of the Set Identification Resolving Key (SIRK)

BT_CSIP_RSI_SIZE
    Size of the Resolvable Set Identifier (RSI)

BT_CSIP_ERROR_LOCK_DENIED
    Service is already locked.
BT_CSIP_ERROR_LOCK_RELEASE_DENIED
    Service is not locked.

BT_CSIP_ERROR_LOCK_INVAL_VALUE
    Invalid lock value.

BT_CSIP_ERROR_SIRK_OOB_ONLY
    SIRK only available out-of-band.

BT_CSIP_ERROR_LOCK_ALREADY_GRANTED
    Client is already owner of the lock.

BT_CSIP_DATA_RSI(_rsi)
    Helper to declare bt_data array including RSI.
    This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_ext_adv_start().

    Parameters
    • _rsi – Pointer to the RSI value

**Typedefs**

typedef void (*bt_csip_set_coordinator_discover_cb)(struct bt_conn *conn, const struct bt_csip_set_coordinator_set_member *member, int err, size_t set_count)
    Callback for discovering Coordinated Set Identification Services.

    Param conn
    Pointer to the remote device.

    Param member
    Pointer to the set member.

    Param err
    0 on success, or an errno value on error.

    Param set_count
    Number of sets on the member.

typedef void (*bt_csip_set_coordinator_lock_set_cb)(int err)
    Callback for locking a set across one or more devices.

    Param err
    0 on success, or an errno value on error.

typedef void (*bt_csip_set_coordinator_lock_changed_cb)(struct bt_csip_set_coordinator_csis_inst *inst, bool locked)
    Callback when the lock value on a set of a connected device changes.

    Param inst
    The Coordinated Set Identification Service instance that was changed.

    Param locked
    Whether the lock is locked or release.

    Return
    int Return 0 on success, or an errno value on error.
typedef void (*bt_csip_set_coordinator_ordered_access_cb_t)(const struct bt_csip_set_coordinator_set_info *set_info, int err, bool locked, struct bt_csip_set_coordinator_set_member *member)

Callback for bt_csip_set_coordinator_ordered_access()

If any of the set members supplied to bt_csip_set_coordinator_ordered_access() is in the locked state, this will be called with locked true and member will be the locked member, and the ordered access procedure is cancelled. Likewise, if any error occurs, the procedure will also be aborted.

**Param set_info**
Pointer to the a specific set_info struct.

**Param err**
Error value. 0 on success, GATT error or errno on fail.

**Param locked**
Whether the lock is locked or release.

**Param member**
The locked member if locked is true, otherwise NULL.

typedef bool (*bt_csip_set_coordinator_ordered_access_t)(const struct bt_csip_set_coordinator_set_info *set_info, struct bt_csip_set_coordinator_set_member *members[], size_t count)

Callback function definition for bt_csip_set_coordinator_ordered_access()

**Param set_info**
Pointer to the a specific set_info struct.

**Param members**
Array of members ordered by rank. The procedure shall be done on the members in ascending order.

**Param count**
Number of members in members.

**Return**
true if the procedures can be successfully done, or false to stop the procedure.

**Functions**

void *bt_csip_set_member_svc_decl_get(const struct bt_csip_set_member_svc_inst *svc_inst)

Get the service declaration attribute.

The first service attribute can be included in any other GATT service.

**Parameters**

- svc_inst – Pointer to the Coordinated Set Identification Service.

**Returns**
The first CSIS attribute instance.

int bt_csip_set_member_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)

Register a Coordinated Set Identification Service instance.

This will register and enable the service and make it discoverable by clients.

This shall only be done as a server.

**Parameters**
• **param** – Coordinated Set Identification Service register parameters.

• **svc_inst** – [out] Pointer to the registered Coordinated Set Identification Service.

**Returns**
0 if success, errno on failure.

```c
void bt_csip_set_member_print_sirk(const struct bt_csip_set_member_svc_inst *svc_inst)

Print the SIRK to the debug output.
```

**Parameters**
• **svc_inst** – Pointer to the Coordinated Set Identification Service.

```c
int bt_csip_set_member_generate_rsi(const struct bt_csip_set_member_svc_inst *svc_inst, uint8_t rsi[6])

Generate the Resolvable Set Identifier (RSI) value.
This will generate RSI for given svc_inst instance.
```

**Parameters**
• **svc_inst** – Pointer to the Coordinated Set Identification Service.
• **rsi** – Pointer to the 6-octet newly generated RSI data in little-endian.

**Returns**
int 0 if on success, errno on error.

```c
int bt_csip_set_member_lock(struct bt_csip_set_member_svc_inst *svc_inst, bool lock, bool force)

Locks a specific Coordinated Set Identification Service instance on the server.
```

**Parameters**
• **svc_inst** – Pointer to the Coordinated Set Identification Service.
• **lock** – If true lock the set, if false release the set.
• **force** – This argument only have meaning when lock is false (release) and will force release the lock, regardless of who took the lock.

**Returns**
0 on success, GATT error on error.

```c
int bt_csip_set_coordinator_discover(struct bt_conn *conn)

Initialise the csip_set_coordinator instance for a connection.
This will do a discovery on the device and prepare the instance for following commands.
```

**Parameters**
• **conn** – Pointer to remote device to perform discovery on.

**Returns**
int Return 0 on success, or an errno value on error.

```c
bool bt_csip_set_coordinator_is_set_member(const uint8_t *set_sirk[16], struct bt_data *data)

Check if advertising data indicates a set member.
```

**Parameters**
• **set_sirk** – The SIRK of the set to check against
• **data** – The advertising data

**Returns**
true if the advertising data indicates a set member, false otherwise
int bt_csip_set_coordinator_register_cb(struct bt_csip_set_coordinator_cb *cb)

Registers callbacks for csip_set_coordinator.

**Parameters**

• `cb` – Pointer to the callback structure.

**Returns**

Return 0 on success, or an errno value on error.

int bt_csip_set_coordinator_ordered_access(const struct bt_csip_set_coordinator_set_member *members[], uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info, bt_csip_set_coordinator_ordered_access_t cb)

Access Coordinated Set devices in an ordered manner as a client.

This function will read the lock state of all devices and if all devices are in the unlocked state, then `cb` will be called with the same members as provided by `members`, but where the members are ordered by rank (if present). Once this procedure is finished or an error occurs, `bt_csip_set_coordinator_cb::ordered_access` will be called.

This procedure only works if all the members have the lock characteristic, and all either has rank = 0 or unique ranks.

If any of the members are in the locked state, the procedure will be cancelled.

This can only be done on members that are bonded.

**Parameters**

• `members` – Array of set members to access.

• `count` – Number of set members in `members`.

• `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

• `cb` – The callback function to be called for each member.

int bt_csip_set_coordinator_lock(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)

Lock an array of set members.

The members will be locked starting from lowest rank going up.

TODO: If locking fails, the already locked members will not be unlocked.

**Parameters**

• `members` – Array of set members to lock.

• `count` – Number of set members in `members`.

• `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**

Return 0 on success, or an errno value on error.

int bt_csip_set_coordinator_release(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)

Release an array of set members.

The members will be released starting from highest rank going down.

**Parameters**
• **members** – Array of set members to lock.
• **count** – Number of set members in **members**.
• **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**
Return 0 on success, or an errno value on error.

```c
struct bt_csip_set_member_cb
#include <csip.h> Callback structure for the Coordinated Set Identification Service.
```

**Public Members**

```c
void (*lock_changed)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst, bool locked)
Callback whenever the lock changes on the server.
```

- **Param conn**
  The connection to the client that changed the lock. NULL if server changed it, either by calling `bt_csip_set_member_lock()` or by timeout.

- **Param svc_inst**
  Pointer to the Coordinated Set Identification Service.

- **Param locked**
  Whether the lock was locked or released.

```c
uint8_t (*sirk_read_req)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst)
Request from a peer device to read the sirk.
```

If this callback is not set, all clients will be allowed to read the SIRK unencrypted.

- **Param conn**
  The connection to the client that requested to read the SIRK.

- **Param svc_inst**
  Pointer to the Coordinated Set Identification Service.

- **Return**
  A BT_CSIP_READ_SIRK_REQ_RSP_* response code.

```c
struct bt_csip_set_member_register_param
#include <csip.h> Register structure for Coordinated Set Identification Service.
```

**Public Members**

```c
uint8_t set_size
Size of the set.
```

If set to 0, the set size characteristic won't be initialized.

```c
uint8_t set_sirk[16]
The unique Set Identity Resolving Key (SIRK)
```

This shall be unique between different sets, and shall be the same for each set member for each set.
bool lockable
    Boolean to set whether the set is lockable by clients.
    Setting this to false will disable the lock characteristic.

uint8_t rank
    Rank of this device in this set.
    If the lockable parameter is set to true, this shall be > 0 and <= to the set_size. If the
    lockable parameter is set to false, this may be set to 0 to disable the rank characteristic.

struct bt_csip_set_member_cb *cb
    Pointer to the callback structure.

struct bt_csip_set_coordinator_set_info
    #include <csip.h> Information about a specific set.

Public Members

uint8_t set_sirk[16]
    The 16 octet set Set Identity Resolving Key (SIRK)
    The Set SIRK may not be exposed by the server over Bluetooth, and may require an out-
    of-band solution.

uint8_t set_size
    The size of the set.
    Will be 0 if not exposed by the server.

uint8_t rank
    The rank of the set on on the remote device.
    Will be 0 if not exposed by the server.

bool lockable
    Whether or not the set can be locked on this device.

struct bt_csip_set_coordinator_csis_inst
    #include <csip.h> Struct representing a coordinated set instance on a remote device.
    The values in this struct will be populated during discovery of sets
    (bt_csip_set_coordinator_discover()).

Public Members

void *svc_inst
    Internally used pointer value.

struct bt_csip_set_coordinator_set_member
    #include <csip.h> Struct representing a remote device as a set member.
Public Members

```c
struct bt_csip_set_coordinator_csis_inst insts[0]
```

Array of Coordinated Set Identification Service instances for the remote device.

```c
struct bt_csip_set_coordinator_cb
```

#include <csip.h>

Cryptography API Reference

cryptography

group bt_crypto

Cryptography.

Functions

```c
int bt_rand(void *buf, size_t len)
```

Generate random data.

A random number generation helper which utilizes the Bluetooth controller's own RNG.

**Parameters**

- `buf` – Buffer to insert the random data
- `len` – Length of random data to generate

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_encrypt_le(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
```

AES encrypt little-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

**Parameters**

- `key` – 128 bit LS byte first key for the encryption of the plaintext
- `plaintext` – 128 bit LS byte first plaintext data block to be encrypted
- `enc_data` – 128 bit LS byte first encrypted data block

**Returns**

Zero on success or error code otherwise.

```c
int bt_encrypt_be(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])
```

AES encrypt big-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

**Parameters**

- `key` – 128 bit MS byte first key for the encryption of the plaintext
- `plaintext` – 128 bit MS byte first plaintext data block to be encrypted
- `enc_data` – 128 bit MS byte first encrypted data block
Returns
Zero on success or error code otherwise.

int bt_ccm_decrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)

Decrypt big-endian data with AES-CCM.

Deciphers and authorizes enc_data with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Assumes that the MIC follows directly after the encrypted data.

Parameters
• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• enc_data – Encrypted data
• len – Length of the encrypted data
• aad – Additional authenticated data
• aad_len – Additional authenticated data length
• plaintext – Plaintext buffer to place result in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully decrypted the data.
• -EINVAL – Invalid parameters.
• -EBADMSG – Authentication failed.

int bt_ccm_encrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)

Encrypt big-endian data with AES-CCM.

Encrypts and generates a MIC from plaintext with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Places the MIC directly after the encrypted data.

Parameters
• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• plaintext – Plaintext buffer to encrypt
• len – Length of the encrypted data
• aad – Additional authenticated data
• aad_len – Additional authenticated data length
• enc_data – Buffer to place encrypted data in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully encrypted the data.
• -EINVAL – Invalid parameters.
Data Buffers

API Reference

group bt_buf

Data buffers.

Defines

BT_BUF_RESERVE

BT_BUF_SIZE(size)
    Helper to include reserved HCI data in buffer calculations.

BT_BUF_ACL_SIZE(size)
    Helper to calculate needed buffer size for HCI ACL packets.

BT_BUF_EVT_SIZE(size)
    Helper to calculate needed buffer size for HCI Event packets.

BT_BUF_CMD_SIZE(size)
    Helper to calculate needed buffer size for HCI Command packets.

BT_BUF_ISO_SIZE(size)
    Helper to calculate needed buffer size for HCI ISO packets.

BT_BUF_ACL_RX_SIZE
    Data size needed for HCI ACL RX buffers.

BT_BUF_EVT_RX_SIZE
    Data size needed for HCI Event RX buffers.

BT_BUF_ISO_RX_SIZE

BT_BUF_ISO_RX_COUNT

BT_BUF_RX_SIZE
    Data size needed for HCI ACL, HCI ISO or Event RX buffers.

BT_BUF_RX_COUNT
    Buffer count needed for HCI ACL, HCI ISO or Event RX buffers.

BT_BUF_CMD_TX_SIZE
    Data size needed for HCI Command buffers.

 Enums

enum bt_buf_type

   Possible types of buffers passed around the Bluetooth stack.

   Values:
enumerator BT_BUF_CMD
    HCI command.

enumerator BT_BUF_EVT
    HCI event.

enumerator BT_BUF_ACL_OUT
    Outgoing ACL data.

enumerator BT_BUF_ACL_IN
    Incoming ACL data.

enumerator BT_BUF_ISO_OUT
    Outgoing ISO data.

enumerator BT_BUF_ISO_IN
    Incoming ISO data.

enumerator BT_BUF_H4
    H:4 data.

Functions

struct net_buf *bt_buf_get_rx(enum bt_buf_type type, k_timeout_t timeout)
    Allocate a buffer for incoming data.
    This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
    • type – Type of buffer. Only BT_BUF_EVT, BT_BUF_ACL_IN and BT_BUF_ISO_IN are allowed.
    • timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
    A new buffer.

struct net_buf *bt_buf_get_tx(enum bt_buf_type type, k_timeout_t timeout, const void *data, size_t size)
    Allocate a buffer for outgoing data.
    This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_send().

Parameters
    • type – Type of buffer. Only BT_BUF_CMD, BT_BUF_ACL_OUT or BT_BUF_H4, when operating on H:4 mode, are allowed.
    • timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.
    • data – Initial data to append to buffer.
    • size – Initial data size.
Returns
A new buffer.

struct net_buf *bt_buf_get_cmd_complete(k_timeout_t timeout)
Allocate a buffer for an HCI Command Complete/Status Event.
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
• timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct net_buf *bt_buf_get_evt(uint8_t evt, bool discardable, k_timeout_t timeout)
Allocate a buffer for an HCI Event.
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio() or bt_recv().

Parameters
• evt – HCI event code
• discardable – Whether the driver considers the event discardable.
• timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

static inline void bt_buf_set_type(struct net_buf *buf, enum bt_buf_type type)
Set the buffer type.

Parameters
• buf – Bluetooth buffer
• type – The BT_* type to set the buffer to

static inline enum bt_buf_type bt_buf_get_type(struct net_buf *buf)
Get the buffer type.

Parameters
• buf – Bluetooth buffer

Returns
The BT_* type to of the buffer

struct bt_buf_data
#include <buf.h> This is a base type for bt_buf user data.

Generic Access Profile (GAP)

API Reference

*group bt_gap
Generic Access Profile (GAP)*
Defines

**BT_ID_DEFAULT**

Convenience macro for specifying the default identity.

This helps make the code more readable, especially when only one identity is supported.

**BT_DATA_SERIALIZED_SIZE(data_len)**

Bluetooth data serialized size.

Get the size of a serialized *bt_data* given its data length.

Size of 'AD Structure'->'Length' field, equal to 1. Size of 'AD Structure'->'Data'->'AD Type' field, equal to 1. Size of 'AD Structure'->'Data'->'AD Data' field, equal to data_len.

See Core Specification Version 5.4 Vol. 3 Part C, 11, Figure 11.1.

**BT_DATA(_type, _data, _data_len)**

Helper to declare elements of *bt_data* arrays.

This macro is mainly for creating an array of struct *bt_data* elements which is then passed to e.g. *bt_le_adv_start()*.

**Parameters**

- **_type** – Type of advertising data field
- **_data** – Pointer to the data field payload
- **_data_len** – Number of bytes behind the _data pointer

**BT_DATA_BYTES(_type, _bytes...)**

Helper to declare elements of *bt_data* arrays.

This macro is mainly for creating an array of struct *bt_data* elements which is then passed to e.g. *bt_le_adv_start()*.

**Parameters**

- **_type** – Type of advertising data field
- **_bytes** – Variable number of single-byte parameters

**BT_LE_ADV_PARAM_INIT(_options, _int_min, _int_max, _peer)**

Initialize advertising parameters.

**Parameters**

- **_options** – Advertising Options
- **_int_min** – Minimum advertising interval
- **_int_max** – Maximum advertising interval
- **_peer** – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

**BT_LE_ADV_PARAM(_options, _int_min, _int_max, _peer)**

Helper to declare advertising parameters inline.

**Parameters**

- **_options** – Advertising Options
- **_int_min** – Minimum advertising interval
- **_int_max** – Maximum advertising interval
- **_peer** – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.
BT_LE_ADV_CONN_DIR(_peer)

BT_LE_ADV_CONN

BT_LE_ADV_CONN_NAME

BT_LE_ADV_CONN_NAME_AD

BT_LE_ADV_CONN_DIR_LOW_DUTY(_peer)

BT_LE_ADV_NCONN
  Non-connectable advertising with private address.

BT_LE_ADV_NCONN_NAME
  Non-connectable advertising with \texttt{BT_LE_ADV_OPT_USE_NAME}.

BT_LE_ADV_NCONN_IDENTITY
  Non-connectable advertising with \texttt{BT_LE_ADV_OPT_USE_IDENTITY}.

BT_LE_EXT_ADV_CONN_NAME
  Connectable extended advertising with \texttt{BT_LE_ADV_OPT_USE_NAME}.

BT_LE_EXT_ADV_SCAN_NAME
  Scannable extended advertising with \texttt{BT_LE_ADV_OPT_USE_NAME}.

BT_LE_EXT_ADV_NCONN
  Non-connectable extended advertising with private address.

BT_LE_EXT_ADV_NCONN_NAME
  Non-connectable extended advertising with \texttt{BT_LE_ADV_OPT_USE_NAME}.

BT_LE_EXT_ADV_NCONN_IDENTITY
  Non-connectable extended advertising with \texttt{BT_LE_ADV_OPT_USE_IDENTITY}.

BT_LE_EXT_ADV_CODED_NCONN
  Non-connectable extended advertising on coded PHY with private address.

BT_LE_EXT_ADV_CODED_NCONN_NAME
  Non-connectable extended advertising on coded PHY with \texttt{BT_LE_ADV_OPT_USE_NAME}.

BT_LE_EXT_ADV_CODED_NCONN_IDENTITY
  Non-connectable extended advertising on coded PHY with \texttt{BT_LE_ADV_OPT_USE_IDENTITY}.

BT_LE_EXT_ADV_START_PARAM_INIT(_timeout, _n_evts)
  Helper to initialize extended advertising start parameters inline.

\textbf{Parameters}

- \_timeout – Advertiser timeout
- \_nEvts – Number of advertising events
BT_LE_EXT_ADV_START_PARAM(_timeout, _n_evts)
Helper to declare extended advertising start parameters inline.

**Parameters**

- `_timeout` – Advertiser timeout
- `_n_evts` – Number of advertising events

BT_LE_EXT_ADV_START_DEFAULT

BT_LE_PER_ADV_PARAM_INIT(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline.

**Parameters**

- `_int_min` – Minimum periodic advertising interval
- `_int_max` – Maximum periodic advertising interval
- `_options` – Periodic advertising properties bitfield.

BT_LE_PER_ADV_PARAM(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline.

**Parameters**

- `_int_min` – Minimum periodic advertising interval
- `_int_max` – Maximum periodic advertising interval
- `_options` – Periodic advertising properties bitfield.

BT_LE_PER_ADV_DEFAULT

BT_LE_SCAN_OPT_FILTER_WHITELIST

BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)
Initialize scan parameters.

**Parameters**

- `_type` – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
- `_options` – Scan options
- `_interval` – Scan Interval (N * 0.625 ms)
- `_window` – Scan Window (N * 0.625 ms)

BT_LE_SCAN_PARAM(_type, _options, _interval, _window)
Helper to declare scan parameters inline.

**Parameters**

- `_type` – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
- `_options` – Scan options
- `_interval` – Scan Interval (N * 0.625 ms)
- `_window` – Scan Window (N * 0.625 ms)

BT_LE_SCAN_ACTIVE
Helper macro to enable active scanning to discover new devices.
**BT_LE_SCAN_PASSIVE**

Helper macro to enable passive scanning to discover new devices.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

**BT_LE_SCAN_CODED_ACTIVE**

Helper macro to enable active scanning to discover new devices.

Include scanning on Coded PHY in addition to 1M PHY.

**BT_LE_SCAN_CODED_PASSIVE**

Helper macro to enable passive scanning to discover new devices.

Include scanning on Coded PHY in addition to 1M PHY.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

### Typedefs

typedef void (*bt_ready_cb_t)(int err)

Callback for notifying that Bluetooth has been enabled.

**Param err**
zero on success or (negative) error code otherwise.

typedef void bt_le_scan_cb_t(const bt_addr_le_t *addr, int8_t rssi, uint8_t adv_type, struct net_buf_simple *buf)

Callback type for reporting LE scan results.

A function of this type is given to the `bt_le_scan_start()` function and will be called for any discovered LE device.

**Param addr**
Advertiser LE address and type.

**Param rssi**
Strength of advertiser signal.

**Param adv_type**
Type of advertising response from advertiser. Uses the BT_GAP_ADV_TYPE_* values.

**Param buf**
Buffer containing advertiser data.

typedef void bt_br_discovery_cb_t(struct bt_br_discovery_result *results, size_t count)

Callback type for reporting BR/EDR discovery (inquiry) results.

A callback of this type is given to the `bt_br_discovery_start()` function and will be called at the end of the discovery with information about found devices populated in the results array.

**Param results**
Storage used for discovery results

**Param count**
Number of valid discovery results.
Enums

```c
enum [anonymous]
    Advertising options.

Values:

enumerator BT_LE_ADV_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_ADV_OPT_CONNECTABLE = BIT(0)
    Advertise as connectable.
    Advertise as connectable. If not connectable then the type of advertising is determined
    by providing scan response data. The advertiser address is determined by the type of
    advertising and/or enabling privacy CONFIG_BT_PRIVACY.

enumerator BT_LE_ADV_OPT_ONE_TIME = BIT(1)
    Advertise one time.
    Don't try to resume connectable advertising after a connection. This option is only mean-
    ingful when used together with BT_LE_ADV_OPT_CONNECTABLE. If set the advertising
    will be stopped when bt_le_adv_stop() is called or when an incoming (peripheral) con-
    nection happens. If this option is not set the stack will take care of keeping advertising
    enabled even as connections occur. If Advertising directed or the advertiser was started
    with bt_le_ext_adv_start then this behavior is the default behavior and this flag has no
    effect.

enumerator BT_LE_ADV_OPT_USE_IDENTITY = BIT(2)
    Advertise using identity address.
    Advertise using the identity address as the advertiser address.

Note: The address used for advertising will not be the same as returned by
bt_le_oob_get_local, instead bt_id_get should be used to get the LE address.

Warning: This will compromise the privacy of the device, so care must be taken when
using this option.

enumerator BT_LE_ADV_OPT_USE_NAME = BIT(3)
    Advertise using GAP device name.
    Include the GAP device name automatically when advertising.
    By default the GAP device name is put at the end of the scan response data.
    When advertising using @ref BT_LE_ADV_OPT_EXT_ADV and not
    @ref BT_LE_ADV_OPT_SCANNABLE then it will be put at the end of the
    advertising data.
    If the GAP device name does not fit into advertising data it will be
    converted to a shortened name if possible.
    @ref BT_LE_ADV_OPT_FORCE_NAME_IN_AD can be used to force the device
    name to appear in the advertising data of an advert with scan
```

(continues on next page)
The application can set the device name itself by including the following in the advertising data.

```c
@code
BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
@endcode
```

enumerator `BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY` = `BIT`(4)

Low duty cycle directed advertising.

Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator `BT_LE_ADV_OPT_DIR_ADDR_RPA` = `BIT`(5)

Directed advertising to privacy-enabled peer.

Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator `BT_LE_ADV_OPT_FILTER_SCAN_REQ` = `BIT`(6)

Use filter accept list to filter devices that can request scan response data.

enumerator `BT_LE_ADV_OPT_FILTER_CONN` = `BIT`(7)

Use filter accept list to filter devices that can connect.

enumerator `BT_LE_ADV_OPT_NOTIFY_SCAN_REQ` = `BIT`(8)

Notify the application when a scan response data has been sent to an active scanner.

enumerator `BT_LE_ADV_OPT_SCANNABLE` = `BIT`(9)

Support scan response data.

When used together with `BT_LE_ADV_OPT_EXT_ADV` then this option cannot be used together with the `BT_LE_ADV_OPT_CONNECTABLE` option. When used together with `BT_LE_ADV_OPT_EXT_ADV` then scan response data must be set.

enumerator `BT_LE_ADV_OPT_EXT_ADV` = `BIT`(10)

Advertise with extended advertising.

This option enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.

Without this option the advertiser will send advertising data on the three primary advertising channels.

Note: Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.
enumerator BT_LE_ADV_OPT_NO_2M = BIT (11)

Disable use of LE 2M PHY on the secondary advertising channel.

Disabling the use of LE 2M PHY could be necessary if scanners don’t support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

**Note:** Cannot be set if BT_LE_ADV_OPT_CODED is set.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`.

enumerator BT_LE_ADV_OPT_CODED = BIT (12)
Advertise on the LE Coded PHY (Long Range).

The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`.

enumerator BT_LE_ADV_OPT_ANONYMOUS = BIT (13)
Advertise without a device address (identity or RPA).

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`.

enumerator BT_LE_ADV_OPT_USE_TX_POWER = BIT (14)
Advertise with transmit power.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_37 = BIT (15)
Disable advertising on channel index 37.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_38 = BIT (16)
Disable advertising on channel index 38.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_39 = BIT (17)
Disable advertising on channel index 39.

enumerator BT_LE_ADV_OPT_FORCE_NAME_IN_AD = BIT (18)
Put GAP device name into advert data.

Will place the GAP device name into the advertising data rather than the scan response data.

**Note:** Requires `BT_LE_ADV_OPT_USE_NAME`
enumerator BT_LE_ADV_OPT_USE_NRPA = BIT

Advertise using a Non-Resolvable Private Address.
A new NRPA is set when updating the advertising parameters.
This is an advanced feature; most users will want to enable CONFIG_BT_EXT_ADV instead.

Note: Not implemented when CONFIG_BT_PRIVACY.

Note: Mutually exclusive with BT_LE_ADV_OPT_USE_IDENTITY.

enum [anonymous]
Periodic Advertising options.

Values:

enumerator BT_LE_PER_ADV_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_OPT_USE_TX_POWER = BIT
Advertise with transmit power.

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enumerator BT_LE_PER_ADV_OPT_INCLUDE_ADI = BIT
Advertise with included AdvDataInfo (ADI).

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enum [anonymous]
Periodic advertising sync options.

Values:

enumerator BT_LE_PER_ADV_SYNC_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST = BIT
Use the periodic advertising list to sync with advertiser.
When this option is set, the address and SID of the parameters are ignored.

enumerator BT_LE_PER_ADV_SYNC_OPT_REPORTING_INITIALLY_DISABLED = BIT
Disables periodic advertising reports.
No advertisement reports will be handled until enabled.

enumerator BT_LE_PER_ADV_SYNC_OPT_FILTER_DUPLICATE = BIT
Filter duplicate Periodic Advertising reports.

6.1. Bluetooth
enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOA = BIT (3)
    Sync with Angle of Arrival (AoA) constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_1US = BIT (4)
    Sync with Angle of Departure (AoD) 1 us constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_2US = BIT (5)
    Sync with Angle of Departure (AoD) 2 us constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_SYNC_ONLY_CONST_TONE_EXT = BIT (6)
    Do not sync to packets without a constant tone extension.

text

enum [anonymous]
    Periodic Advertising Sync Transfer options.

Values:

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOA = BIT (0)
    No Angle of Arrival (AoA)
    Do not sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_1US = BIT (1)
    No Angle of Departure (AoD) 1 us.
    Do not sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_2US = BIT (2)
    No Angle of Departure (AoD) 2.
    Do not sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_ONLY_CTE = BIT (3)
    Only sync to packets with constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTINGINITALLY_DISABLED = BIT (4)
    Sync to received PAST packets but don’t generate sync reports.
    This option must not be set at the same time as
    BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES = BIT (5)
    Sync to received PAST packets and generate sync reports with duplicate filtering.
    This option must not be set at the same time as
    BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTINGINITALLY_DISABLED.

text
enumerator BT_LE_SCAN_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_SCAN_OPT_FILTER_DUPLICATE = BIT(0)
    Filter duplicates.

enumerator BT_LE_SCAN_OPT_FILTER_ACCEPT_LIST = BIT(1)
    Filter using filter accept list.

enumerator BT_LE_SCAN_OPT_CODED = BIT(2)
    Enable scan on coded PHY (Long Range).

enumerator BT_LE_SCAN_OPT_NO_1M = BIT(3)
    Disable scan on 1M phy.

Note: Requires BT_LE_SCAN_OPT_CODED.

enum [anonymous]
    Values:

enumerator BT_LE_SCAN_TYPE_PASSIVE = 0x00
    Scan without requesting additional information from advertisers.

enumerator BT_LE_SCAN_TYPE_ACTIVE = 0x01
    Scan and request additional information from advertisers.

    Using this scan type will automatically send scan requests to all devices. Scan responses
    are received in the same manner and using the same callbacks as advertising reports.

Functions

int bt_enable(bt_ready_cb_t cb)
    Enable Bluetooth.

    Enable Bluetooth. Must be the called before any calls that require communication with the
    local Bluetooth hardware.

    When CONFIG_BT_SETTINGS is enabled, the application must load the Bluetooth settings after
    this API call successfully completes before Bluetooth APIs can be used. Loading the settings
    before calling this function is insufficient. Bluetooth settings can be loaded with settings_load()
    or settings_load_subtree() with argument “bt”. The latter selectively loads only Bluetooth set-
    tings and is recommended if settings_load() has been called earlier.

    Parameters
        • cb – Callback to notify completion or NULL to perform the enabling syn-
              chronously.

    Returns
        Zero on success or (negative) error code otherwise.
int bt_disable(void)
    Disable Bluetooth.
    Disable Bluetooth. Can't be called before bt_enable has completed.
    Close and release HCI resources. Result is architecture dependent.
    **Returns**
    Zero on success or (negative) error code otherwise.

bool bt_is_ready(void)
    Check if Bluetooth is ready.
    **Returns**
    true when Bluetooth is ready, false otherwise

int bt_set_name(const char *name)
    Set Bluetooth Device Name.
    Set Bluetooth GAP Device Name.
    When advertising with device name in the advertising data the name should be updated by
    calling bt_le_adv_update_data or bt_le_ext_adv_set_data.

    **See also:**
    CONFIG_BT_DEVICE_NAME_MAX.

    **Note:** Requires CONFIG_BTDEVICE_NAME_DYNAMIC.

    **Parameters**
    * name – New name

    **Returns**
    Zero on success or (negative) error code otherwise.

const char *bt_get_name(void)
    Get Bluetooth Device Name.
    Get Bluetooth GAP Device Name.

    **Returns**
    Bluetooth Device Name

uint16_t bt_get_appearance(void)
    Get local Bluetooth appearance.
    Bluetooth Appearance is a description of the external appearance of a device in terms of an
    Appearance Value.

    **See also:**
    https:// specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

    **Returns**
    Appearance Value of local Bluetooth host.
int bt_set_appearance(uint16_t new_appearance)

Set local Bluetooth appearance.

Automatically preserves the new appearance across reboots if CONFIG_BT_SETTINGS is enabled.

This symbol is linkable if CONFIG_BT_DEVICE_APPEARANCE_DYNAMIC is enabled.

Parameters
• new_appearance – Appearances Value

Return values
• 0 – Success.
• other – Persistent storage failed. Appearance was not updated.

void bt_id_get(bt_addr_le_t *addrs, size_t *count)

Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all available identities can be retrieved, the number of elements in the addrs array should be CONFIG_BT_ID_MAX. The identity identifier that some APIs expect (such as advertising parameters) is simply the index of the identity in the addrs array.

If addrs is passed as NULL, then returned count contains the count of all available identities that can be retrieved with a subsequent call to this function with non-NULL addrs parameter.

Note: Deleted identities may show up as BT_ADDR_LE_ANY in the returned array.

Parameters
• addrs – Array where to store the configured identities.
• count – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

int bt_id_create(bt_addr_le_t *addr, uint8_t *irk)

Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling bt_enable(). However, the new identity will only be stored persistently in flash when this API is used after bt_enable(). The reason is that the persistent settings are loaded after bt_enable() and would therefore cause potential conflicts with the stack blindly overwriting what’s stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before bt_enable().

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using bt_enable), then call settings_load(), and after that check with bt_id_get() how many identities were recovered. If an insufficient amount of identities were recovered the app may then call bt_id_create() to create new ones.

Parameters
• addr – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
• **irk** – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

**Returns**

*Identity identifier\ (>= 0)* in case of success, or a negative error code on failure.

```c
int bt_id_reset(uint8_t id, bt_addr_le_t *addr, uint8_t *irk)
```

Reset/reclaim an identity for reuse.

The semantics of the *addr* and *irk* parameters of this function are the same as with *bt_id_create()* . The difference is the first *id* parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the *addr* and *irk* parameters.

**Note:** the default identity (BT_ID_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

**Parameters**

- **id** – Existing identity identifier.
- **addr** – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- **irk** – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

**Returns**

*Identity identifier\ (>= 0)* in case of success, or a negative error code on failure.

```c
int bt_id_delete(uint8_t id)
```

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag is as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the *bt_id_reset()* API needs to be used.

**Note:** the default identity (BT_ID_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

**Parameters**

- **id** – Existing identity identifier.

**Returns**

0 in case of success, or a negative error code on failure.
size_t bt_data_get_len(const struct bt_data data[], size_t data_count)
Get the total size (in bytes) of a given set of bt_data structures.

Parameters
• data_count – [in] Number of bt_data structures in data.

Returns
Size of the concatenated data, built from the bt_data structure set.

size_t bt_data_serialize(const struct bt_data *input, uint8_t *output)
Serialize a bt_data struct into an advertising structure (a flat byte array).
The data are formatted according to the Bluetooth Core Specification v. 5.4, vol. 3, part C, 11.

Parameters
• input – [in] Single bt_data structure to read from.
• output – [out] Buffer large enough to store the advertising structure in input.
The size of it must be at least the size of the input->data_len + 2 (for the type and the length).

Returns
Number of bytes written in output.

int bt_le_adv_start(const struct bt_le_adv_param *param, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
Start advertising.
Set advertisement data, scan response data, advertisement parameters and start advertising.
When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT.

Parameters
• param – Advertising parameters.
• ad – Data to be used in advertisement packets.
• ad_len – Number of elements in ad
• sd – Data to be used in scan response packets.
• sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

Returns
-ENOMEM No free connection objects available for connectable advertiser.

Returns
-ECONNREFUSED When connectable advertising is requested and there is already maximum number of connections established in the controller. This error code is only guaranteed when using Zephyr controller, for other controllers code returned in this case may be -EIO.

int bt_le_adv_update_data(const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
Update advertising.
Update advertisement and scan response data.

6.1. Bluetooth
Parameters

- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in ad.
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in sd.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_le_adv_stop(void)
```

Stop advertising.

Stops ongoing advertising.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_le_ext_adv_create(const struct bt_le_adv_param *param, const struct bt_le_ext_adv_cb *cb, struct bt_le_ext_adv **adv)
```

Create advertising set.

Create a new advertising set and set advertising parameters. Advertising parameters can be updated with `bt_le_ext_adv_update_param`.

Parameters

- `cb` – [in] Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
- `adv` – [out] Valid advertising set object on success.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_le_ext_adv_start(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_start_param *param)
```

Start advertising with the given advertising set.

If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

Parameters

- `adv` – Advertising set object.
- `param` – Advertise start parameters.

```c
int bt_le_ext_adv_stop(struct bt_le_ext_adv *adv)
```

Stop advertising with the given advertising set.

Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

Parameters

- `adv` – Advertising set object.

Returns

Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_set_data(struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)

Set an advertising set's advertising or scan response data.

Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.

When both BT_LE_ADV_OPT_EXT_ADV and BT_LE_ADV_OPT_SCANNABLE are enabled then advertising data is ignored. When BT_LE_ADV_OPT_SCANNABLE is not enabled then scan response data is ignored.

If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is BT_GAP_ADV_MAX_ADV_DATA_LEN bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN bytes.

Note: Not all scanners support extended data length advertising data.

Note: When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

Parameters
- adv – Advertising set object.
- ad – Data to be used in advertisement packets.
- ad_len – Number of elements in ad
- sd – Data to be used in scan response packets.
- sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_update_param(struct bt_le_ext_adv *adv, const struct bt_le_adv_param *param)

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

Note: When changing the option BT_LE_ADV_OPT_USE_NAME then bt_le_ext_adv_set_data needs to be called in order to update the advertising data and scan response data.

Parameters
- adv – Advertising set object.
- param – Advertising parameters.

Returns
Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_delete(struct bt_le_ext_adv *adv)
Delete advertising set.
Delete advertising set. This will free up the advertising set and make it possible to create a
new advertising set.

Returns
Zero on success or (negative) error code otherwise.

uint8_t bt_le_ext_adv_get_index(struct bt_le_ext_adv *adv)
Get array index of an advertising set.
This function is used to map bt_adv to index of an array of advertising sets. The array has
CONFIG_BT_EXT_ADV_MAX_ADV_SET elements.

Parameters
• adv – Advertising set.

Returns
Index of the advertising set object. The range of the returned value is
0..CONFIG_BT_EXT_ADV_MAX_ADV_SET-1

int bt_le_ext_adv_get_info(const struct bt_le_ext_adv *adv, struct bt_le_ext_adv_info *info)
Get advertising set info.

Parameters
• adv – Advertising set object
• info – Advertising set info object

Returns
Zero on success or (negative) error code on failure.

int bt_le_per_adv_set_param(struct bt_le_ext_adv *adv, const struct bt_le_per_adv_param *param)
Set or update the periodic advertising parameters.
The periodic advertising parameters can only be set or updated on an extended advertisement
set which is neither scannable, connectable nor anonymous.

Parameters
• adv – Advertising set object.
• param – Advertising parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_data(const struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len)
Set or update the periodic advertising data.
The periodic advertisement data can only be set or updated on an extended advertisement set
which is neither scannable, connectable nor anonymous.

Parameters
• adv – Advertising set object.
• ad – Advertising data.
• ad_len – Advertising data length.

Returns
Zero on success or (negative) error code otherwise.
int bt_le_per_adv_set_subevent_data(const struct bt_le_ext_adv *adv, uint8_t num_subevents, const struct bt_le_per_adv_subevent_data_params *params)

Set the periodic advertising with response subevent data.
Set the data for one or more subevents of a Periodic Advertising with Responses Advertiser in reply data request.

Parameters
- **adv** – The extended advertiser the PAwR train belongs to.
- **num_subevents** – The number of subevents to set data for.
- **params** – Subevent parameters.

Pre
- There are `num_subevents` elements in `params`.
- The controller has requested data for the subevents in `params`.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_start(struct bt_le_ext_adv *adv)

Starts periodic advertising.

Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.

Once periodic advertising has been enabled, it will continue advertising until `bt_le_per_adv_stop()` has been called, or if the advertising set is deleted by `bt_le_ext_adv_delete()`. Calling `bt_le_ext_adv_stop()` will not stop the periodic advertising.

Parameters
- **adv** – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_stop(struct bt_le_ext_adv *adv)

Stops periodic advertising.

Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

Parameters
- **adv** – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

uint8_t bt_le_per_adv_sync_get_index(struct bt_le_per_adv_sync *per_adv_sync)

Get array index of an periodic advertising sync object.

This function is get the index of an array of periodic advertising sync objects. The array has `CONFIG_BT_PER_ADV_SYNC_MAX` elements.

Parameters
- **per_adv_sync** – The periodic advertising sync object.
struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_index(uint8_t index)
Get a periodic advertising sync object from the array index.
This function is to get the periodic advertising sync object from the array index. The array has
CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters
- index – The index of the periodic advertising sync object. The range of the
  index value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

Returns
The periodic advertising sync object of the array index or NULL if invalid index.

int bt_le_per_adv_sync_get_info(struct bt_le_per_adv_sync *per_adv_sync, struct
bt_le_per_adv_sync_info *info)
Get periodic adv sync information.

Parameters
- per_adv_sync – Periodic advertising sync object.
- info – Periodic advertising sync info object

Returns
Zero on success or (negative) error code on failure.

struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_addr(const
bt_addr_le_t *adv_addr, uint8_t_t sid)
Look up an existing periodic advertising sync object by advertiser address.

Parameters
- adv_addr – Advertiser address.
- sid – The advertising set ID.

Returns
Periodic advertising sync object or NULL if not found.

int bt_le_per_adv_sync_create(const struct bt_le_per_adv_sync_param *param, struct
bt_le_per_adv_sync **out_sync)
Create a periodic advertising sync object.
Create a periodic advertising sync object that can try to synchronize to periodic advertising
reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

Parameters
- out_sync – [out] Periodic advertising sync object on.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_delete(struct bt_le_per_adv_sync *per_adv_sync)
Delete periodic advertising sync.
Delete the periodic advertising sync object. Can be called regardless of the state of the sync.
If the syncing is currently syncing, the syncing is cancelled. If the sync has been established,
it is terminated. The periodic advertising sync object will be invalidated afterwards.
If the state of the sync object is syncing, then a new periodic advertising sync object may not
be created until the controller has finished canceling this object.
Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

```c
void bt_le_per_adv_sync_cb_register(struct bt_le_per_adv_sync_cb *cb)
```
Register periodic advertising sync callbacks.

Adds the callback structure to the list of callback structures for periodic advertising syncs.

This callback will be called for all periodic advertising sync activity, such as synced, terminated and when data is received.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

```c
int bt_le_per_adv_sync_recv_enable(struct bt_le_per_adv_sync *per_adv_sync)
```
Enables receiving periodic advertising reports for a sync.

If the sync is already receiving the reports, -EALREADY is returned.

Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_sync_recv_disable(struct bt_le_per_adv_sync *per_adv_sync)
```
Disables receiving periodic advertising reports for a sync.

If the sync report receiving is already disabled, -EALREADY is returned.

Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_sync_transfer(const struct bt_le_per_adv_sync *per_adv_sync, const struct bt_conn *conn, uint16_t service_data)
```
Transfer the periodic advertising sync information to a peer device.

This will allow another device to quickly synchronize to the same periodic advertising train that this device is currently synced to.

Parameters
• per_adv_sync – The periodic advertising sync to transfer.
• conn – The peer device that will receive the sync information.
• service_data – Application service data provided to the remote host.

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_set_info_transfer(const struct bt_le_ext_adv *adv, const struct bt_conn *conn, uint16_t service_data)
```
Transfer the information about a periodic advertising set.

This will allow another device to quickly synchronize to periodic advertising set from this device.

Parameters
• adv – The periodic advertising set to transfer info of.
• conn – The peer device that will receive the information.
• service_data – Application service data provided to the remote host.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_sync_transfersubscribe(const struct bt_conn *conn, const struct bt_le_per_adv_sync_transfer_param *param)
```

Subscribe to periodic advertising sync transfers (PASTs).

Sets the parameters and allow other devices to transfer periodic advertising syncs.

**Parameters**
• conn – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
• param – The periodic advertising sync transfer parameters.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_sync_transferunsubscribe(const struct bt_conn *conn)
```

Unsubscribe from periodic advertising sync transfers (PASTs).

Remove the parameters that allow other devices to transfer periodic advertising syncs.

**Parameters**
• conn – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_list_add(const bt_addr_le_t *addr, uint8_t sid)
```

Add a device to the periodic advertising list.

Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

**Parameters**
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the `bt_le_scan_recv_info` in the scan callback.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_list_remove(const bt_addr_le_t *addr, uint8_t sid)
```

Remove a device from the periodic advertising list.

Removes peer device LE address from the periodic advertising list.

**Parameters**
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the `bt_le_scan_recv_info` in the scan callback.

**Returns**
Zero on success or (negative) error code otherwise.
int bt_le_per_adv_list_clear(void)
Clear the periodic advertising list.
Clears the entire periodic advertising list.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_le_scan_start(const struct bt_le_scan_param *param, bt_le_scan_cb_t cb)
Start (LE) scanning.
Start LE scanning with given parameters and provide results through the specified callback.

**Note:** The LE scanner by default does not use the Identity Address of the local device when CONFIG_BT_PRIVACY is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then CONFIG_BT_SCAN_WITH_IDENTITY must be enabled.

**Parameters**
- param – Scan parameters.
- cb – Callback to notify scan results. May be NULL if callback registration through `bt_le_scan_cb_register` is preferred.

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_scan_stop(void)
Stop (LE) scanning.
Stops ongoing LE scanning.

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

void bt_le_scan_cb_register(struct bt_le_scan_cb *cb)
Register scanner packet callbacks.
Adds the callback structure to the list of callback structures that monitors scanner activity.
This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

**Parameters**
- cb – Callback struct. Must point to memory that remains valid.

void bt_le_scan_cb_unregister(struct bt_le_scan_cb *cb)
Unregister scanner packet callbacks.
Remove the callback structure from the list of scanner callbacks.

**Parameters**
- cb – Callback struct. Must point to memory that remains valid.

int bt_le_filter_accept_list_add(const bt_addr_le_t *addr)
Add device (LE) to filter accept list.
Add peer device LE address to the filter accept list.
**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

### Parameters
- `addr` – Bluetooth LE identity address.

### Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_add(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_remove(const bt_addr_le_t *addr)
Remove device (LE) from filter accept list.
Remove peer device LE address from the filter accept list.

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

### Parameters
- `addr` – Bluetooth LE identity address.

### Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_rem(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_clear(void)
Clear filter accept list.
Clear all devices from the filter accept list.

**Note:** The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

### Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_clear(void)

int bt_le_set_chan_map(uint8_t chan_map[5])
Set (LE) channel map.

**Parameters**
- `chan_map` – Channel map.

### Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.
int bt_le_set_rpa_timeout(uint16_t new_rpa_timeout)
Set the Resolvable Private Address timeout in runtime.
The new RPA timeout value will be used for the next RPA rotation and all subsequent rotations
until another override is scheduled with this API.
Initially, the if CONFIG_BT_RPA_TIMEOUT is used as the RPA timeout.
This symbol is linkable if CONFIG_BT_RPA_TIMEOUT_DYNAMIC is enabled.

Parameters
• new_rpa_timeout – Resolvable Private Address timeout in seconds

Return values
• 0 – Success.
• -EINVAL – RPA timeout value is invalid. Valid range is 1s - 3600s.

void bt_data_parse(struct net_buf_simple *ad, bool (*func)(struct bt_data *data, void *user_data), void *user_data)
Helper for parsing advertising (or EIR or OOB) data.
A helper for parsing the basic data types used for Extended Inquiry Response (EIR), Advertising
Data (AD), and OOB data blocks. The most common scenario is to call this helper on the
advertising data received in the callback that was given to bt_le_scan_start().

Warning: This helper function will consume ad when parsing. The user should make a
copy if the original data is to be used afterwards

Parameters
• ad – Advertising data as given to the bt_le_scan_cb_t callback.
• func – Callback function which will be called for each element that’s found in
  the data. The callback should return true to continue parsing, or false to stop
  parsing.
• user_data – User data to be passed to the callback.

int bt_le_oob_get_local(uint8_t id, struct bt_le_oob *oob)
Get local LE Out of Band (OOB) information.
This function allows to get local information that are useful for Out of Band pairing or con-
nection creation.
If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private
Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used
for advertising started by bt_le_adv_start, active scanning and connection creation.

Note: If privacy is enabled the RPA cannot be refreshed in the following cases:
• Creating a connection in progress, wait for the connected callback. In addition when ex-
tended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller:
• Advertiser is enabled using a Random Static Identity Address for a different local identity.
• The local identity conflicts with the local identity used by other roles.

Parameters
• id – [in] Local identity, in most cases BT_ID_DEFAULT.
Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_ext_adv_oob_get_local(struct bt_le_ext_adv *adv, struct bt_le_oob *oob)
Get local LE Out of Band (OOB) information.
This function allows to get local information that are useful for Out of Band pairing or connection creation.
If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used by the advertising set.

Note: When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

Note: If privacy is enabled the RPA cannot be refreshed in the following cases:
• Creating a connection in progress, wait for the connected callback.

Parameters
• adv – [in] The advertising set object
• oob – [out] LE OOB information

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_start(const struct bt_br_discovery_param *param, struct bt_br_discovery_result *results, size_t count, bt_br_discovery_cb_t cb)
Start BR/EDR discovery.
Start BR/EDR discovery (inquiry) and provide results through the specified callback. When bt_br_discovery_cb_t is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

Parameters
• param – Discovery parameters.
• results – Storage for discovery results.
• count – Number of results in storage. Valid range: 1-255.
• cb – Callback to notify discovery results.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_stop(void)
Stop BR/EDR discovery.
Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won’t be reported.
Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_br_oob_get_local(struct bt_br_oob *oob)
```

Get BR/EDR local Out Of Band information.

This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

Parameters
- `oob` – Out Of Band information

```c
int bt_br_set_discoverable(bool enable)
```

Enable/disable set controller in discoverable state.

Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it’s mandatory to first be in connectable state.

Parameters
- `enable` – Value allowing/disallowing controller to become discoverable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

```c
int bt_br_set_connectable(bool enable)
```

Enable/disable set controller in connectable state.

Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

Parameters
- `enable` – Value allowing/disallowing controller to be connectable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

```c
int bt_unpair(uint8_t id, const bt_addr_le_t *addr)
```

Clear pairing information.

Parameters
- `id` – Local identity (mostly just BT_ID_DEFAULT).
- `addr` – Remote address, NULL or BT_ADDR_LE_ANY to clear all remote devices.

Returns
0 on success or negative error value on failure.

```c
void bt_foreach_bond(uint8_t id, void (*func)(const struct bt_bond_info *info, void *user_data), void *user_data)
```

Iterate through all existing bonds.

Parameters
- `id` – Local identity (mostly just BT_ID_DEFAULT).
- `func` – Function to call for each bond.
- `user_data` – Data to pass to the callback function.
int bt_configure_data_path(uint8_t dir, uint8_t id, uint8_t vs_config_len, const uint8_t *vs_config)

Configure vendor data path.
Request the Controller to configure the data transport path in a given direction between the Controller and the Host.

Parameters
- dir – Direction to be configured, BT_HCI_DATAPATH_DIR_HOST_TO_CTLR or BT_HCI_DATAPATH_DIR_CTLR_TO_HOST
- id – Vendor specific logical transport channel ID, range [BT_HCI_DATAPATH_ID_VS..BT_HCI_DATAPATH_ID_VS_END]
- vs_config_len – Length of additional vendor specific configuration data
- vs_config – Pointer to additional vendor specific configuration data

Returns
0 in case of success or negative value in case of error.

int bt_le_per_adv_sync_subevent(struct bt_le_per_adv_sync *per_adv_sync, struct bt_le_per_adv_sync_subevent_params *params)

Synchronize with a subset of subevents.
Until this command is issued, the subevent(s) the controller is synchronized to is unspecified.

Parameters
- per_adv_sync – The periodic advertising sync object.
- params – Parameters.

Returns
0 in case of success or negative value in case of error.

int bt_le_per_adv_set_response_data(struct bt_le_per_adv_sync *per_adv_sync, const struct bt_le_per_adv_response_params *params, const struct net_buf_simple *data)

Set the data for a response slot in a specific subevent of the PAwR.
This function is called by the application to set the response data. The data for a response slot shall be transmitted only once.

Parameters
- per_adv_sync – The periodic advertising sync object.
- params – Parameters.
- data – The response data to send.

Returns
Zero on success or (negative) error code otherwise.

struct bt_le_ext_adv_sent_info
#include <bluetooth.h>

Public Members

uint8_t num_sent
The number of advertising events completed.
struct bt_le_ext_adv_connected_info
#include <bluetooth.h>

Public Members

struct bt_conn *conn
   Connection object of the new connection.

struct bt_le_ext_adv_scanned_info
#include <bluetooth.h>

Public Members

bt_addr_le_t *addr
   Active scanner LE address and type.

struct bt_le_per_adv_data_request
#include <bluetooth.h>

Public Members

uint8_t start
   The first subevent data can be set for.

uint8_t count
   The number of subevents data can be set for.

struct bt_le_per_adv_response_info
#include <bluetooth.h>

Public Members

uint8_t subevent
   The subevent the response was received in.

uint8_t tx_status
   Status of the subevent indication.
   0 if subevent indication was transmitted. 1 if subevent indication was not transmitted. All other values RFU.

int8_t tx_power
   The TX power of the response in dBm.

int8_t rssi
   The RSSI of the response in dBm.
The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

The slot the response was received in.

#include <bluetooth.h>

Public Members

uint8_t cte_type

uint8_t response_slot

struct bt_le_ext_adv_cb

Public Members

void (*sent)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_sent_info *info)

This callback notifies the application that the advertising set has finished sending advertising data. The advertising set can either have been stopped by a timeout or because the specified number of advertising events has been reached.

Param adv
The advertising set object.

Param info
Information about the sent event.

void (*connected)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_connected_info *info)

This callback notifies the application that the advertising set has accepted a new connection.

Param adv
The advertising set object.

Param info
Information about the connected event.

void (*scanned)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_scanned_info *info)

This callback notifies the application that the advertising set has has received a Scan Request packet, and has sent a Scan Response packet.

Param adv
The advertising set object.

Param addr
Information about the scanned event.

#include <bluetooth.h> Bluetooth data.

Description of different data types that can be encoded into advertising data. Used to form arrays that are passed to the bt_le_adv_start() function.

#include <bluetooth.h> LE Advertising Parameters.
uint8_t id
Local identity.

**Note:** When extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller it is not possible to scan and advertise simultaneously using two different random addresses.

uint8_t sid
Advertising Set Identifier, valid range 0x00 - 0xf.

**Note:** Requires **BT_LE_ADV_OPT_EXT_ADV**

uint8_t secondary_max_skip
Secondary channel maximum skip count.
Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

**Note:** Requires **BT_LE_ADV_OPT_EXT_ADV**

uint32_t options
Bit-field of advertising options.

uint32_t interval_min
Minimum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

uint32_t interval_max
Maximum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

const bt_addr_le_t *peer
Directed advertising to peer.

When this parameter is set the advertiser will send directed advertising to the remote device.

The advertising type will either be high duty cycle, or low duty cycle if the **BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY** option is enabled. When using **BT_LE_ADV_OPT_EXT_ADV** then only low duty cycle is allowed.

In case of connectable high duty cycle if the connection could not be established within the timeout the connected() callback will be called with the status set to **BT_HCI_ERR_ADV_TIMEOUT**.
struct bt_le_per_adv_param
#include <bluetooth.h>

Public Members

uint16_t interval_min
Minimum Periodic Advertising Interval (N * 1.25 ms)
Shall be greater or equal to BT_GAP_PER_ADV_MIN_INTERVAL and less or equal to interval_max.

uint16_t interval_max
Maximum Periodic Advertising Interval (N * 1.25 ms)
Shall be less or equal to BT_GAP_PER_ADV_MAX_INTERVAL and greater or equal to interval_min.

uint32_t options
Bit-field of periodic advertising options.

struct bt_le_ext_adv_start_param
#include <bluetooth.h>

Public Members

uint16_t timeout
Advertiser timeout (N * 10 ms).
Application will be notified by the advertiser sent callback. Set to zero for no timeout.
When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT.
If privacy CONFIG_BT_PRIVACY is enabled then the timeout must be less than CONFIG_BT_RPA_TIMEOUT.

uint8_t num_events
Number of advertising events.
Application will be notified by the advertiser sent callback. Set to zero for no limit.

struct bt_le_ext_adv_info
#include <bluetooth.h> Advertising set info structure.

Public Members

int8_t tx_power
Currently selected Transmit Power (dBm).
const bt_addr_le_t *addr
    Current local advertising address used.

struct bt_le_per_adv_subevent_data_params
    #include <bluetooth.h>

Public Members

uint8_t subevent
    The subevent to set data for.

uint8_t response_slot_start
    The first response slot to listen to.

uint8_t response_slot_count
    The number of response slots to listen to.

const struct net_buf_simple *data
    The data to send.

struct bt_le_per_adv_sync_synced_info
    #include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
    Advertiser LE address and type.

uint8_t sid
    Advertiser SID.

uint16_t interval
    Periodic advertising interval (N * 1.25 ms)

uint8_t phy
    Advertiser PHY.

bool recv_enabled
    True if receiving periodic advertisements, false otherwise.

uint16_t service_data
    Service Data provided by the peer when sync is transferred.
    Will always be 0 when the sync is locally created.

struct bt_conn *conn
    Peer that transferred the periodic advertising sync.
    Will always be 0 when the sync is locally created.
struct bt_le_per_adv_sync_term_info
#include <bluetooth.h>

Public Members

cost bt_addr_le_t *addr
    Advertiser LE address and type.

uint8_t sid
    Advertiser SID.

uint8_t reason
    Cause of periodic advertising termination.

struct bt_le_per_adv_sync_recv_info
#include <bluetooth.h>

Public Members

cost bt_addr_le_t *addr
    Advertiser LE address and type.

uint8_t sid
    Advertiser SID.

int8_t tx_power
    The TX power of the advertisement.

int8_t rssi
    The RSSI of the advertisement excluding any CTE.

uint8_t cte_type
    The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

struct bt_le_per_adv_sync_state_info
#include <bluetooth.h>

Public Members

bool recv_enabled
    True if receiving periodic advertisements, false otherwise.

struct bt_le_per_adv_sync_cb
#include <bluetooth.h>
Public Members

void (*synced)(struct bt_le_per_adv_sync *sync, struct bt_le_per_adv_sync_synced_info *info)

The periodic advertising has been successfully synced.
This callback notifies the application that the periodic advertising set has been successfully synced, and will now start to receive periodic advertising reports.

- **Param sync**
  The periodic advertising sync object.
- **Param info**
  Information about the sync event.

void (*term)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_term_info *info)

The periodic advertising sync has been terminated.
This callback notifies the application that the periodic advertising sync has been terminated, either by local request, remote request or because due to missing data, e.g. by being out of range or sync.

- **Param sync**
  The periodic advertising sync object.

void (*recv)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_recv_info *info, struct net_buf_simple *buf)

Periodic advertising data received.
This callback notifies the application of an periodic advertising report.

- **Param sync**
  The advertising set object.
- **Param info**
  Information about the periodic advertising event.
- **Param buf**
  Buffer containing the periodic advertising data. NULL if the controller failed to receive a subevent indication. Only happens if CONFIG_BT_PER_ADV_SYNC_RSP is enabled.

void (*state_changed)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_state_info *info)

The periodic advertising sync state has changed.
This callback notifies the application about changes to the sync state. Initialize sync and termination is handled by their individual callbacks, and won't be notified here.

- **Param sync**
  The periodic advertising sync object.
- **Param info**
  Information about the state change.

void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)

BIGInfo advertising report received.
This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

- **Param sync**
  The advertising set object.
- **Param biginfo**
  The BIGInfo report.
Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

**Param sync**
The periodic advertising sync object.

**Param info**
Information about the sync event.

```c
struct bt_le_per_adv_sync
#include <bluetooth.h>
```

### Public Members

**bt_addr_le_t addr**
Periodic Advertiser Address.

- Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

**uint8_t sid**
Advertiser SID.

- Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

**uint32_t options**
Bit-field of periodic advertising sync options.

**uint16_t skip**
Maximum event skip.

- Maximum number of periodic advertising events that can be skipped after a successful receive. Range: 0x0000 to 0x01F3

**uint16_t timeout**
Synchronization timeout (N * 10 ms)

- Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

```c
struct bt_le_per_adv_sync_info
#include <bluetooth.h> Advertising set info structure.
```

### Public Members

**bt_addr_le_t addr**
Periodic Advertiser Address.

**uint8_t sid**
Advertiser SID.
struct bt_le_per_adv_sync_transfer_param
#include <bluetooth.h>

Public Members

uint16_t interval
   Periodic advertising interval (N * 1.25 ms)

uint8_t phy
   Advertiser PHY.

struct bt_le_per_adv_sync_transfer_param
#include <bluetooth.h>

Public Members

uint16_t skip
   Maximum event skip.
   The number of periodic advertising packets that can be skipped after a successful receive.

uint16_t timeout
   Synchronization timeout (N * 10 ms)
   Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

uint32_t options
   Periodic Advertising Sync Transfer options.

struct bt_le_scan_param
#include <bluetooth.h> LE scan parameters.

Public Members

uint8_t type
   Scan type (BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE)

uint32_t options
   Bit-field of scanning options.

uint16_t interval
   Scan interval (N * 0.625 ms)

uint16_t window
   Scan window (N * 0.625 ms)

uint16_t timeout
   Scan timeout (N * 10 ms)
   Application will be notified by the scan timeout callback. Set zero to disable timeout.
uint16_t interval_coded  
Scan interval LE Coded PHY (N * 0.625 MS)  
Set zero to use same as LE 1M PHY scan interval.

uint16_t window_coded  
Scan window LE Coded PHY (N * 0.625 MS)  
Set zero to use same as LE 1M PHY scan window.

struct bt_le_scan_recv_info  
#include <bluetooth.h> LE advertisement and scan response packet information.

Public Members

const bt_addr_le_t *addr  
Advertiser LE address and type.  
If advertiser is anonymous then this address will be BT_ADDR_LE_ANY.

uint8_t sid  
Advertising Set Identifier.

int8_t rssi  
Strength of advertiser signal.

int8_t tx_power  
Transmit power of the advertiser.

uint8_t adv_type  
Advertising packet type.  
Uses the BT_GAP_ADV_TYPE_* value.  
May indicate that this is a scan response if the type is BT_GAP_ADV_TYPE_SCAN_RSP.

uint16_t adv_props  
Advertising packet properties bitfield.  
Uses the BT_GAP_ADV_PROP_* values. May indicate that this is a scan response if the value contains the BT_GAP_ADV_PROP_SCAN_RESPONSE bit.

uint16_t interval  
Periodic advertising interval.  
If 0 there is no periodic advertising.

uint8_t primary_phy  
Primary advertising channel PHY.

uint8_t secondary_phy  
Secondary advertising channel PHY.
struct bt_le_scan_cb

#include <bluetooth.h> Listener context for (LE) scanning.

Public Members

void (*recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *buf)
Advertisement packet and scan response received callback.

  Param info
  Advertiser packet and scan response information.

  Param buf
  Buffer containing advertiser data.

void (*timeout)(void)
The scanner has stopped scanning after scan timeout.

struct bt_le_oob_sc_data

#include <bluetooth.h> LE Secure Connections pairing Out of Band data.

Public Members

uint8_t r[16]
  Random Number.

uint8_t c[16]
  Confirm Value.

struct bt_le_oob

#include <bluetooth.h> LE Out of Band information.

Public Members

bt_addr_le_t addr
  LE address.
  If privacy is enabled this is a Resolvable Private Address.

struct bt_le_oob_sc_data le_sc_data
  LE Secure Connections pairing Out of Band data.

struct bt_br_discovery_result

#include <bluetooth.h> BR/EDR discovery result structure.

Public Members

bt_addr_t addr
  Remote device address.
int8_t rssi
    RSSI from inquiry.

uint8_t cod[3]
    Class of Device.

uint8_t eir[240]
    Extended Inquiry Response.

struct bt_br_discovery_param
#include <bluetooth.h> BR/EDR discovery parameters.

Public Members

uint8_t length
    Maximum length of the discovery in units of 1.28 seconds.
    Valid range is 0x01 - 0x30.

bool limited
    True if limited discovery procedure is to be used.

struct bt_br_oob
#include <bluetooth.h>

Public Members

bt_addr_t addr
    BR/EDR address.

struct bt_bond_info
#include <bluetooth.h> Information about a bond with a remote device.

Public Members

bt_addr_le_t addr
    Address of the remote device.

struct bt_le_per_adv_sync_subevent_params
#include <bluetooth.h>

Public Members

uint16_t properties
    Periodic Advertising Properties.
    Bit 6 is include TxPower, all others RFU.
uint8_t num_subevents
   Number of subevents to sync to.

uint8_t *subevents
   The subevent(s) to synchronize with.
   The array must have num_subevents elements.

struct bt_le_per_adv_response_params
   #include <bluetooth.h>

Public Members

uint16_t request_event
   The periodic event counter of the request the response is sent to.

   bt_le_per_adv_sync_recv_info

   Note: The response can be sent up to one periodic interval after the request was received.

uint8_t request_subevent
   The subevent counter of the request the response is sent to.

   bt_le_per_adv_sync_recv_info

uint8_t response_subevent
   The subevent the response shall be sent in.

uint8_t response_slot
   The response slot the response shall be sent in.

group bt_addr
   Bluetooth device address definitions and utilities.

BT_ADDR_LE_PUBLIC_ID

BT_ADDR_LE_RANDOM_ID

BT_ADDR_LE_UNRESOLVED

BT_ADDR_LE_ANONYMOUS

6.1. Bluetooth
BT_ADDR_SIZE
   Length in bytes of a standard Bluetooth address.

BT_ADDR_LE_SIZE
   Length in bytes of an LE Bluetooth address.
   Not packed, so no sizeof()

BT_ADDR_ANY
   Bluetooth device “any” address, not a valid address.

BT_ADDR_NONE
   Bluetooth device “none” address, not a valid address.

BT_ADDR_LE_ANY
   Bluetooth LE device “any” address, not a valid address.

BT_ADDR_LE_NONE
   Bluetooth LE device “none” address, not a valid address.

BT_ADDR_IS_RPA(a)
   Check if a Bluetooth LE random address is resolvable private address.

BT_ADDR_IS_NRPA(a)
   Check if a Bluetooth LE random address is a non-resolvable private address.

BT_ADDR_IS_STATIC(a)
   Check if a Bluetooth LE random address is a static address.

BT_ADDR_SET_RPA(a)
   Set a Bluetooth LE random address as a resolvable private address.

BT_ADDR_SET_NRPA(a)
   Set a Bluetooth LE random address as a non-resolvable private address.

BT_ADDR_SET_STATIC(a)
   Set a Bluetooth LE random address as a static address.

BT_ADDR_STR_LEN
   Recommended length of user string buffer for Bluetooth address.
   The recommended length guarantee the output of address conversion will not lose valuable
   information about address being processed.

BT_ADDR_LE_STR_LEN
   Recommended length of user string buffer for Bluetooth LE address.
   The recommended length guarantee the output of address conversion will not lose valuable
   information about address being processed.

Functions

static inline int bt_addr_cmp(const bt_addr_t *a, const bt_addr_t *b)
   Compare Bluetooth device addresses.

Parameters
• a – First Bluetooth device address to compare
• b – Second Bluetooth device address to compare

**Returns**
negative value if \( a < b \), 0 if \( a == b \), else positive

static inline bool bt_addr_eq(const bt_addr_t *a, const bt_addr_t *b)
Determine equality of two Bluetooth device addresses.

**Return values**
• true – if the two addresses are equal
• false – otherwise

static inline int bt_addr_le_cmp(const bt_addr_le_t *a, const bt_addr_le_t *b)
Compare Bluetooth LE device addresses.

See also:

*bt_addr_le_eq*

**Parameters**
• a – First Bluetooth LE device address to compare
• b – Second Bluetooth LE device address to compare

**Returns**
negative value if \( a < b \), 0 if \( a == b \), else positive

static inline bool bt_addr_le_eq(const bt_addr_le_t *a, const bt_addr_le_t *b)
Determine equality of two Bluetooth LE device addresses.

The Bluetooth LE addresses are equal iff both the types and the 48-bit addresses are numerically equal.

**Return values**
• true – if the two addresses are equal
• false – otherwise

static inline void bt_addr_copy(bt_addr_t *dst, const bt_addr_t *src)
Copy Bluetooth device address.

**Parameters**
• dst – Bluetooth device address destination buffer.
• src – Bluetooth device address source buffer.

static inline void bt_addr_le_copy(bt_addr_le_t *dst, const bt_addr_le_t *src)
Copy Bluetooth LE device address.

**Parameters**
• dst – Bluetooth LE device address destination buffer.
• src – Bluetooth LE device address source buffer.

int bt_addr_le_create_nrpa(bt_addr_le_t *addr)
Create a Bluetooth LE random non-resolvable private address.

int bt_addr_le_create_static(bt_addr_le_t *addr)
Create a Bluetooth LE random static address.
static inline bool bt_addr_le_is_rpa(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is a random private resolvable address.

Parameters
• addr – Bluetooth LE device address.

Returns
true if address is a random private resolvable address.

static inline bool bt_addr_le_is_identity(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is valid identity address.

Valid Bluetooth LE identity addresses are either public address or random static address.

Parameters
• addr – Bluetooth LE device address.

Returns
true if address is a valid identity address.

static inline int bt_addr_to_str(const bt_addr_t *addr, char *str, size_t len)
Converts binary Bluetooth address to string.

Parameters
• addr – Address of buffer containing binary Bluetooth address.
• str – Address of user buffer with enough room to store formatted string containing binary address.
• len – Length of data to be copied to user string buffer. Refer to BT_ADDR_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

static inline int bt_addr_le_to_str(const bt_addr_le_t *addr, char *str, size_t len)
Converts binary LE Bluetooth address to string.

Parameters
• addr – Address of buffer containing binary LE Bluetooth address.
• str – Address of user buffer with enough room to store formatted string containing binary LE address.
• len – Length of data to be copied to user string buffer. Refer to BT_ADDR_LE_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

int bt_addr_from_str(const char *str, bt_addr_t *addr)
Convert Bluetooth address from string to binary.

Parameters
• str – [in] The string representation of a Bluetooth address.
• addr – [out] Address of buffer to store the Bluetooth address

Return values
0 – Success. The parsed address is stored in addr.

Returns
-EINVAL Invalid address string. str is not a well-formed Bluetooth address.
int bt_addr_le_from_str(const char *str, const char *type, bt_addr_le_t *addr)

Convert LE Bluetooth address from string to binary.

**Parameters**

- `type` – [in] The string representation of the LE Bluetooth address type.
- `addr` – [out] Address of buffer to store the LE Bluetooth address

**Returns**

Zero on success or (negative) error code otherwise.

**Variables**

```c
const bt_addr_t bt_addr_any
const bt_addr_t bt_addr_none
const bt_addr_le_t bt_addr_le_any
const bt_addr_le_t bt_addr_le_none
```

```c
#include <addr.h>
Bluetooth Device Address.
```

```c
#include <addr.h>
Bluetooth LE Device Address.
```

**group bt_gap_defines**

Bluetooth Generic Access Profile defines and Assigned Numbers.

**Company Identifiers (see Bluetooth Assigned Numbers)**

```c
BT_COMP_ID_LF
The Linux Foundation.
```

**EIR/AD data type definitions**

```c
BT_DATA_FLAGS
AD flags.
```

```c

```c
BT_DATA_UUID16_ALL
16-bit UUID, all listed
```
BT_DATA_UUID32_SOME
32-bit UUID, more available

BT_DATA_UUID32_ALL
32-bit UUID, all listed

BT_DATA_UUID128_SOME
128-bit UUID, more available

BT_DATA_UUID128_ALL
128-bit UUID, all listed

BT_DATA_NAME_SHORTENED
Shortened name.

BT_DATA_NAME_COMPLETE
Complete name.

BT_DATA_TX_POWER
Tx Power.

BT_DATA_SM_TK_VALUE
Security Manager TK Value.

BT_DATA_SM_OOB_FLAGS
Security Manager OOB Flags.

BT_DATA_PERIPHERAL_INT_RANGE
Peripheral Connection Interval Range.

BT_DATA_SOLICIT16
Solicit UUIDs, 16-bit.

BT_DATA_SOLICIT128
Solicit UUIDs, 128-bit.

BT_DATA_SVC_DATA16
Service data, 16-bit UUID.

BT_DATA_PUB_TARGET_ADDR
Public Target Address.

BT_DATA_RAND_TARGET_ADDR
Random Target Address.

BT_DATA_GAP_APPEARANCE
GAP appearance.
BT_DATA_ADV_INT
Advertise Interval.

BT_DATA_LE_BT_DEVICE_ADDRESS
LE Bluetooth Device Address.

BT_DATA_LE_ROLE
LE Role.

BT_DATA_SIMPLE_PAIRING_HASH
Simple Pairing Hash C256.

BT_DATA_SIMPLE_PAIRING_RAND
Simple Pairing Randomizer R256.

BT_DATA_SOLICIT32
Solicit UUIDs, 32-bit.

BT_DATA_SVC_DATA32
Service data, 32-bit UUID.

BT_DATA_SVC_DATA128
Service data, 128-bit UUID.

BT_DATA_LE_SC_CONFIRM_VALUE
LE SC Confirmation Value.

BT_DATA_LE_SC_RANDOM_VALUE
LE SC Random Value.

BT_DATA_URI
URI.

BT_DATA_INDOOR_POS
Indoor Positioning.

BT_DATA_TRANS_DISCOVER_DATA
Transport Discovery Data.

BT_DATA_LE_SUPPORTED_FEATURES
LE Supported Features.

BT_DATA_CHANNEL_MAP_UPDATE_IND
Channel Map Update Indication.

BT_DATA_MESH_PROV
Mesh Provisioning PDU.
BT_DATA_MESH_MESSAGE
    Mesh Networking PDU.

BT_DATA_MESH_Beacon
    Mesh Beacon.

BT_DATA_BIG_INFO
    BIGInfo.

BT_DATA_BROADCAST_CODE
    Broadcast Code.

BT_DATA_CSIS_RSI
    CSIS Random Set ID type.

BT_DATA_ADV_INT_LONG
    Advertising Interval long.

BT_DATA_BROADCAST_NAME
    Broadcast Name.

BT_DATA_ENCRYPTED_AD_DATA
    Encrypted Advertising Data.

BT_DATA_3D_INFO
    3D Information Data

BT_DATA_MANUFACTURER_DATA
    Manufacturer Specific Data.

BT_LE_AD_LIMITED
    Limited Discoverable.

BT_LE_AD_GENERAL
    General Discoverable.

BT_LE_AD_NO_BREDR
    BR/EDR not supported.

   Generic Eye-glasses.

BT_APPEARANCE_GENERIC_TAG
   Generic Tag.

BT_APPEARANCE_GENERIC_KEYRING
   Generic Keyring.

BT_APPEARANCE_GENERIC_MEDIA_PLAYER
   Generic Media Player.

BT_APPEARANCE_GENERIC_BARCODE.Scanner
   Generic Barcode Scanner.

BT_APPEARANCE_GENERIC_THERMOMETER
   Generic Thermometer.

BT_APPEARANCE_THERMOMETER_EAR
   Ear Thermometer.

BT_APPEARANCE_GENERIC_HEART_RATE
   Generic Heart Rate Sensor.

BT_APPEARANCE_HEART_RATE_BELT
   Heart Rate Belt.

BT_APPEARANCE_GENERIC_BLOOD_PRESSURE
   Generic Blood Pressure.
BT_APPEARANCE_BLOOD_PRESSURE_ARM
  Arm Blood Pressure.

BT_APPEARANCE_BLOOD_PRESSURE_WRIST
  Wrist Blood Pressure.

BT_APPEARANCE GENERIC HID
  Generic Human Interface Device.

BT_APPEARANCE HID_KEYBOARD
  Keyboard.

BT_APPEARANCE HID_MOUSE
  Mouse.

BT_APPEARANCE HID_JOYSTICK
  Joystick.

BT_APPEARANCE HID GAMEPAD
  Gamepad.

BT_APPEARANCE HID DIGITIZER TABLET
  Digitizer Tablet.

BT_APPEARANCE HID CARD READER
  Card Reader.

BT_APPEARANCE HID DIGITAL PEN
  Digital Pen.

BT_APPEARANCE HID Barcode Scanner
  Barcode Scanner.

BT_APPEARANCE HID TOUCHPAD
  Touchpad.

BT_APPEARANCE HID PRESENTATION_REMOTE
  Presentation Remote.

BT_APPEARANCE GENERIC_GLUCOSE
  Generic Glucose Meter.

BT_APPEARANCE GENERIC WALKING
  Generic Running Walking Sensor.

BT_APPEARANCE WALKING IN SHOE
  In-Shoe Running Walking Sensor.
BT_APPEARANCE_WALKING_ON_SHOE
On-Shoe Running Walking Sensor.

BT_APPEARANCE_WALKING_ON_HIP

BT_APPEARANCE_GENERIC_CYCLING
Generic Cycling.

BT_APPEARANCE_CYCLING_COMPUTER
Cycling Computer.

BT_APPEARANCE_CYCLING_SPEED
Speed Sensor.

BT_APPEARANCE_CYCLING_CADENCE
Cadence Sensor.

BT_APPEARANCE_CYCLING_POWER
Power Sensor.

BT_APPEARANCE_CYCLING_SPEED_CADENCE
Speed and Cadence Sensor.

BT_APPEARANCE_GENERIC_CONTROL_DEVICE
Generic Control Device.

BT_APPEARANCE_CONTROL_SWITCH
Switch.

BT_APPEARANCE_CONTROL_MULTI_SWITCH
Multi-switch.

BT_APPEARANCE_CONTROL_BUTTON
Button.

BT_APPEARANCE_CONTROL_SLIDER
Slider.

BT_APPEARANCE_CONTROL_ROTARY_SWITCH
Rotary Switch.

BT_APPEARANCE_CONTROL_TOUCH_PANEL
Touch Panel.

BT_APPEARANCE_CONTROL_SINGLE_SWITCH
Single Switch.
BT_APPEARANCE_CONTROL_DOUBLE_SWITCH
  Double Switch.

BT_APPEARANCE_CONTROL_TRIPLE_SWITCH
  Triple Switch.

BT_APPEARANCE_CONTROL_BATTERY_SWITCH
  Battery Switch.

BT_APPEARANCE_CONTROL_ENERGY_HARVESTING_SWITCH
  Energy Harvesting Switch.

BT_APPEARANCE_CONTROL_PUSH_BUTTON
  Push Button.

BT_APPEARANCE_GENERIC_NETWORK_DEVICE
  Generic Network Device.

BT_APPEARANCE_NETWORK_ACCESS_POINT
  Access Point.

BT_APPEARANCE_NETWORK_MESHDEVICE
  Mesh Device.

BT_APPEARANCE_NETWORK_MESH_PROXY
  Mesh Network Proxy.

BT_APPEARANCE_GENERIC_SENSOR
  Generic Sensor.

BT_APPEARANCE_SENSOR_MOTION
  Motion Sensor.

BT_APPEARANCE_SENSOR_AIR_QUALITY
  Air quality Sensor.

BT_APPEARANCE_SENSOR_TEMPERATURE
  Temperature Sensor.

BT_APPEARANCE_SENSOR_HUMIDITY
  Humidity Sensor.

BT_APPEARANCE_SENSOR_LEAK
  Leak Sensor.

BT_APPEARANCE_SENSOR_SMOKE
  Smoke Sensor.
**BT_APPEARANCE_SENSOR_OCCUPANCY**
Occupancy Sensor.

**BT_APPEARANCE_SENSOR_CONTACT**
Contact Sensor.

**BT_APPEARANCE_SENSOR_CARBOON_MONOXIDE**
Carbon Monoxide Sensor.

**BT_APPEARANCE_SENSOR_CARBOON_DIOXIDE**
Carbon Dioxide Sensor.

**BT_APPEARANCE_SENSOR_AMBIENT_LIGHT**
Ambient Light Sensor.

**BT_APPEARANCE_SENSOR_ENERGY**
Energy Sensor.

**BT_APPEARANCE_SENSOR_COLOR_LIGHT**
Color Light Sensor.

**BT_APPEARANCE_SENSOR_RAIN**
Rain Sensor.

**BT_APPEARANCE_SENSOR_FIRE**
Fire Sensor.

**BT_APPEARANCE_SENSOR_WIND**
Wind Sensor.

**BT_APPEARANCE_SENSOR_PROXIMITY**
Proximity Sensor.

**BT_APPEARANCE_SENSOR_MULTI**
Multi-Sensor.

**BT_APPEARANCE_SENSOR_FLUSH_MOUNTED**
Flush Mounted Sensor.

**BT_APPEARANCE_SENSOR_CEILING_MOUNTED**
Ceiling Mounted Sensor.

**BT_APPEARANCE_SENSOR_WALL_MOUNTED**
Wall Mounted Sensor.

**BT_APPEARANCE_MULTISENSOR**
Multisensor.
BT_APPEARANCE_SENSOR_ENERGY_METER
   Energy Meter.

BT_APPEARANCE_SENSOR_FLAME_DETECTOR
   Flame Detector.

BT_APPEARANCE_SENSOR_VEHICLE_TIRE_PRESSURE
   Vehicle Tire Pressure Sensor.

BT_APPEARANCE_GENERIC_LIGHT_FIXTURES
   Generic Light Fixtures.

BT_APPEARANCE_LIGHT_FIXTURES_WALL
   Wall Light.

BT_APPEARANCE_LIGHT_FIXTURES_CEILING
   Ceiling Light.

BT_APPEARANCE_LIGHT_FIXTURES_FLOOR
   Floor Light.

BT_APPEARANCE_LIGHT_FIXTURES_CABINET
   Cabinet Light.

BT_APPEARANCE_LIGHT_FIXTURES_DESK
   Desk Light.

BT_APPEARANCE_LIGHT_FIXTURES_TROFFER
   Troffer Light.

BT_APPEARANCE_LIGHT_FIXTURES_PENDANT
   Pendant Light.

BT_APPEARANCE_LIGHT_FIXTURES_IN_GROUND
   In-ground Light.

BT_APPEARANCE_LIGHT_FIXTURES_FLOOD
   Flood Light.

BT_APPEARANCE_LIGHT_FIXTURES_UNDERWATER
   Underwater Light.

BT_APPEARANCE_LIGHT_FIXTURES_BOLLARD_WITH
   Bollard with Light.

BT_APPEARANCE_LIGHT_FIXTURES_PATHWAY
   Pathway Light.
BT_APPEARANCE_LIGHT_FIXTURES_GARDEN
   Garden Light.

BT_APPEARANCE_LIGHT_FIXTURES_POLE_TOP
   Pole-top Light.

BT_APPEARANCE_SPOT_LIGHT
   Spotlight.

BT_APPEARANCE_LIGHT_FIXTURES_LINEAR
   Linear Light.

BT_APPEARANCE_LIGHT_FIXTURES_STREET
   Street Light.

BT_APPEARANCE_LIGHT_FIXTURES_SHELVES
   Shelves Light.

BT_APPEARANCE_LIGHT_FIXTURES_BAY
   Bay Light.

BT_APPEARANCE_LIGHT_FIXTURES_EMERGENCY_EXIT
   Emergency Exit Light.

BT_APPEARANCE_LIGHT_FIXTURES_CONTROLLER
   Light Controller.

BT_APPEARANCE_LIGHT_FIXTURES_DRIVER
   Light Driver.

BT_APPEARANCE_LIGHT_FIXTURES_BULB
   Bulb.

BT_APPEARANCE_LIGHT_FIXTURES_LOW_BAY
   Low-bay Light.

BT_APPEARANCE_LIGHT_FIXTURES_HIGH_BAY
   High-bay Light.

BT_APPEARANCE_GENERIC_FAN
   Generic Fan.

BT_APPEARANCE_FAN_CEILING
   Ceiling Fan.

BT_APPEARANCE_FAN_AXIAL
   Axial Fan.
BT_APPEARANCE_FAN_EXHAUST
Exhaust Fan.

BT_APPEARANCE_FAN_PEDESTAL
Pedestal Fan.

BT_APPEARANCE_FAN_DESK
Desk Fan.

BT_APPEARANCE_FAN_WALL
Wall Fan.

BT_APPEARANCE_GENERIC_HVAC
Generic HVAC.

BT_APPEARANCE_HVAC_THERMOSTAT
Thermostat.

BT_APPEARANCE_HVAC_HUMIDIFIER
Humidifier.

BT_APPEARANCE_HVAC_DEHUMIDIFIER
De-humidifier.

BT_APPEARANCE_HVAC_HEATER
Heater.

BT_APPEARANCE_HVAC_RADIATOR
Radiator.

BT_APPEARANCE_HVAC_BOILER
Boiler.

BT_APPEARANCE_HVAC_HEAT_PUMP
Heat Pump.

BT_APPEARANCE_HVAC_INFRARED_HEATER
Infrared Heater.

BT_APPEARANCE_HVAC_RADIANT_PANEL_HEATER
Radiant Panel Heater.

BT_APPEARANCE_HVAC_FAN_HEATER
Fan Heater.

BT_APPEARANCE_HVAC_AIR_CURTAIN
Air Curtain.
BT_APPEARANCE_GENERIC_AIR_CONDITIONING
  Generic Air Conditioning.

BT_APPEARANCE_GENERIC_HUMIDIFIER
  Generic Humidifier.

BT_APPEARANCE_GENERIC_HEATING
  Generic Heating.

BT_APPEARANCE_HEATING_RADIATOR
  Radiator.

BT_APPEARANCE_HEATING_BOILER
  Boiler.

BT_APPEARANCE_HEATING_HEAT_PUMP
  Heat Pump.

BT_APPEARANCE_HEATING_INFRARED_HEATER
  Infrared Heater.

BT_APPEARANCE_HEATING_RADIANT_PANEL_HEATER
  Radiant Panel Heater.

BT_APPEARANCE_HEATING_FAN_HEATER
  Fan Heater.

BT_APPEARANCE_HEATING_AIR_CURTAIN
  Air Curtain.

BT_APPEARANCE_GENERIC_ACCESS_CONTROL
  Generic Access Control.

BT_APPEARANCE_CONTROL_ACCESS_DOOR
  Access Door.

BT_APPEARANCE_CONTROL_GARAGE_DOOR
  Garage Door.

BT_APPEARANCE_CONTROL_EMERGENCY_EXIT_DOOR
  Emergency Exit Door.

BT_APPEARANCE_CONTROL_ACCESS_LOCK
  Access Lock.

BT_APPEARANCE_CONTROL_ELEVATOR
  Elevator.
BT_APPEARANCE_CONTROL_WINDOW
Window.

BT_APPEARANCE_CONTROL_ENTRANCE_GATE
Entrance Gate.

BT_APPEARANCE_CONTROL_DOOR_LOCK
Door Lock.

BT_APPEARANCE_CONTROL_LOCKER
Locker.

BT_APPEARANCE_GENERIC_MOTORIZED_DEVICE
Generic Motorized Device.

BT_APPEARANCE_MOTORIZED_GATE
Motorized Gate.

BT_APPEARANCE_MOTORIZED_AWNING
Awning.

BT_APPEARANCE_MOTORIZED_BLINDS_OR_SHADES
Blinds or Shades.

BT_APPEARANCE_MOTORIZED_CURTAINS
Curtains.

BT_APPEARANCE_MOTORIZED_SCREEN
Screen.

BT_APPEARANCE_GENERIC_POWER_DEVICE
Generic Power Device.

BT_APPEARANCE_POWER_OUTLET
Power Outlet.

BT_APPEARANCE_POWER_STRIP
Power Strip.

BT_APPEARANCE_POWER_PLUG
Plug.

BT_APPEARANCE_POWER_SUPPLY
Power Supply.

BT_APPEARANCE_POWER_LED_DRIVER
LED Driver.
Fluorescent Lamp Gear.

HID Lamp Gear.

Charge Case.

Power Bank.

Generic Light Source.

Incandescent Light Bulb.

LED Lamp.

HID Lamp.

Fluorescent Lamp.

LED Array.

Multi-Color LED Array.

Low voltage halogen.

Organic light emitting diode.

Generic Window Covering.

Window Shades.

Window Blinds.
BT_APPEARANCE_WINDOW_AWNING
Window Awning.

BT_APPEARANCE_WINDOW_CURTAIN
Window Curtain.

BT_APPEARANCE_WINDOW_EXTERIOR_SHUTTER
Exterior Shutter.

BT_APPEARANCE_WINDOW_EXTERIOR_SCREEN
Exterior Screen.

BT_APPEARANCE GENERIC_AUDIO_SINK
Generic Audio Sink.

BT_APPEARANCE_AUDIO_SINK_STANDALONE_SPEAKER
Standalone Speaker.

BT_APPEARANCE_AUDIO_SINK_SOUNDBAR
Soundbar.

BT_APPEARANCE_AUDIO_SINK_BOOKSHELF_SPEAKER
Bookshelf Speaker.

BT_APPEARANCE_AUDIO_SINK_STANDMOUNTED_SPEAKER
Standmounted Speaker.

BT_APPEARANCE_AUDIO_SINK_SPEAKERPHONE
Speakerphone.

BT_APPEARANCE_GENERIC_AUDIO_SOURCE
Generic Audio Source.

BT_APPEARANCE_AUDIO_SOURCE_MICROPHONE
Microphone.

BT_APPEARANCE_AUDIO_SOURCE_ALARM
Alarm.

BT_APPEARANCE_AUDIO_SOURCE_BELL
Bell.

BT_APPEARANCE_AUDIO_SOURCE_HORN
Horn.

BT_APPEARANCE_AUDIO SOURCE_BROADCASTING DEVICE
Broadcasting Device.
BT_APPEARANCE_AUDIO_SOURCE_SERVICE_DESK
  Service Desk.

BT_APPEARANCE_AUDIO_SOURCE_KIOSK
  Kiosk.

BT_APPEARANCE_AUDIO_SOURCE_BROADCASTING_ROOM
  Broadcasting Room.

BT_APPEARANCE_AUDIO_SOURCE_AUDITORIUM
  Auditorium.

BT_APPEARANCE_GENERIC_MOTORIZED_VEHICLE
  Generic Motorized Vehicle.

BT_APPEARANCE_VEHICLE_CAR
  Car.

BT_APPEARANCE_VEHICLE_LARGE_GOODS
  Large Goods Vehicle.

BT_APPEARANCE_VEHICLE_TWOWHEELED
  2-Wheeled Vehicle

BT_APPEARANCE_VEHICLE_MOTORBIKE
  Motorbike.

BT_APPEARANCE_VEHICLE_SCOOTER
  Scooter.

BT_APPEARANCE_VEHICLE_MOPED
  Moped.

BT_APPEARANCE_VEHICLE_THREEWHEELED
  3-Wheeled Vehicle

BT_APPEARANCE_VEHICLE_LIGHT
  Light Vehicle.

BT_APPEARANCE_VEHICLE_QUADBIKE
  Quad Bike.

BT_APPEARANCE_VEHICLE_MINIBUS
  Minibus.

BT_APPEARANCE_VEHICLE_BUS
  Bus.
6.1. Bluetooth
BT_APPEARANCE_APPLIANCE_VACUUM_CLEANER
Vacuum cleaner.

BT_APPEARANCE_APPLIANCE_ROBOTIC_VACUUM_CLEANER
Robotic vacuum cleaner.

BT_APPEARANCE_APPLIANCE_RICE_COOKER
Rice cooker.

BT_APPEARANCE_APPLIANCE_CLOTHES_STEAMER
Clothes steamer.

BT_APPEARANCE_GENERIC_WEARABLE_AUDIO_DEVICE
Generic Wearable Audio Device.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_EARBUD
Earbud.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADSET
Headset.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADPHONES
Headphones.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_NECK_BAND
Neck Band.

BT_APPEARANCE_GENERIC_AIRCRAFT
Generic Aircraft.

BT_APPEARANCE_AIRCRAFT_LIGHT
Light Aircraft.

BT_APPEARANCE_AIRCRAFT_MICROLIGHT
Microlight.

BT_APPEARANCE_AIRCRAFT_PARAGLIDER
Paraglider.

BT_APPEARANCE_AIRCRAFT_LARGE_PASSENGER
Large Passenger Aircraft.

BT_APPEARANCE_GENERIC_AV_EQUIPMENT
Generic AV Equipment.

BT_APPEARANCE_AV_EQUIPMENT_AMPLIFIER
Amplifier.
BT_APPEARANCE_AV_EQUIPMENT_RECEIVER
   Receiver.

BT_APPEARANCE_AV_EQUIPMENT_RADIO
   Radio.

BT_APPEARANCE_AV_EQUIPMENT_TUNER
   Tuner.

BT_APPEARANCE_AV_EQUIPMENT_TURNTABLE
   Turntable.

BT_APPEARANCE_AV_EQUIPMENT_CD_PLAYER
   CD Player.

BT_APPEARANCE_AV_EQUIPMENT_DVD_PLAYER
   DVD Player.

BT_APPEARANCE_AV_EQUIPMENT_BLURAY_PLAYER
   Bluray Player.

BT_APPEARANCE_AV_EQUIPMENT_OPTICAL_DISC_PLAYER
   Optical Disc Player.

BT_APPEARANCE_GENERIC_DISPLAY_EQUIPMENT
   Generic Display Equipment.

BT_APPEARANCE_DISPLAY_EQUIPMENT_TELEVISION
   Television.

BT_APPEARANCE_DISPLAY_EQUIPMENT_MONITOR
   Monitor.

BT_APPEARANCE_DISPLAY_EQUIPMENT_PROJECTOR
   Projector.

BT_APPEARANCE_GENERIC_HEARING_AID
   Generic Hearing aid.

BT_APPEARANCE_HEARING_AID_IN_EAR
   In-ear hearing aid.

BT_APPEARANCE_HEARING_AID_BEHIND_EAR
   Behind-ear hearing aid.
BT_APPEARANCE_HEARING_AID_COCHLEAR_Implant
Cochlear Implant.

BT_APPEARANCE_GENERIC_GAMING
Generic Gaming.

BT_APPEARANCE_HOME_VIDEO_GAME_CONSOLE
Home Video Game Console.

BT_APPEARANCE_PORTABLE_HANDHELD_CONSOLE
Portable handheld console.

BT_APPEARANCE_GENERIC_SIGNAGE
Generic Signage.

BT_APPEARANCE_SIGNAGE_DIGITAL
Digital Signage.

BT_APPEARANCE_SIGNAGE ELECTRONIC_LABEL
Electronic Label.

BT_APPEARANCE_GENERIC_PULSE_OXIMETER
Generic Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_FINGERTIP
Fingertip Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_WRIST
Wrist Worn Pulse Oximeter.

BT_APPEARANCE_GENERIC_WEIGHT_SCALE
Generic Weight Scale.

BT_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
Generic Personal Mobility Device.

BT_APPEARANCE_MOBILITY_POWERED_WHEELCHAIR
Powered Wheelchair.

BT_APPEARANCE_MOBILITY_SCOOTER
Mobility Scooter.

BT_APPEARANCE_CONTINUOUS_GLUCOSE_MONITOR
Continuous Glucose Monitor.

BT_APPEARANCE_GENERIC_INSULIN_PUMP
Generic Insulin Pump.
Insulin Pump, durable pump.

Insulin Pump, patch pump.

Insulin Pen.

Generic Medication Delivery.

Generic Spirometer.

Handheld Spirometer.

Generic Outdoor Sports Activity.

Location Display.

Location and Navigation Display.

Location Pod.

Location and Navigation Pod.

Defined GAP timers

BT_GAP_SCAN_FAST_INTERVAL

BT_GAP_SCAN_FAST_WINDOW

BT_GAP_SCAN_SLOW_INTERVAL_1

BT_GAP_SCAN_SLOW_WINDOW_1

BT_GAP_SCAN_SLOW_INTERVAL_2

BT_GAP_SCAN_SLOW_WINDOW_2
BT_GAP_ADV_FAST_INT_MIN_1

BT_GAP_ADV_FAST_INT_MAX_1

BT_GAP_ADV_FAST_INT_MIN_2

BT_GAP_ADV_FAST_INT_MAX_2

BT_GAP_ADV_SLOW_INT_MIN

BT_GAP_ADV_SLOW_INT_MAX

BT_GAP_PER_ADV_FAST_INT_MIN_1

BT_GAP_PER_ADV_FAST_INT_MAX_1

BT_GAP_PER_ADV_FAST_INT_MIN_2

BT_GAP_PER_ADV_FAST_INT_MAX_2

BT_GAP_PER_ADV_SLOW_INT_MIN

BT_GAP_PER_ADV_SLOW_INT_MAX

BT_GAP_INIT_CONN_INT_MIN

BT_GAP_INIT_CONN_INT_MAX

Defines

BT_GAP_ADV_MAX_ADV_DATA_LEN
  Maximum advertising data length.

BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN
  Maximum extended advertising data length.

Note: The maximum advertising data length that can be sent by an extended advertiser is defined by the controller.

BT_GAP_TX_POWER_INVALID

BT_GAP_RSSI_INVALID

BT_GAP_SID_INVALID
BT_GAP_NO_TIMEOUT

BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT

BT_GAP_DATA_LEN_DEFAULT
    Default data length.

BT_GAP_DATA_LEN_MAX
    Maximum data length.

BT_GAP_DATA_TIME_DEFAULT
    Default data time.

BT_GAP_DATA_TIME_MAX
    Maximum data time.

BT_GAP_SID_MAX
    Maximum advertising set number.

BT_GAP_PER_ADV_MAX_SKIP
    Maximum number of consecutive periodic advertisement events that can be skipped after a successful receive.

BT_GAP_PER_ADV_MIN_TIMEOUT
    Minimum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MAX_TIMEOUT
    Maximum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MIN_INTERVAL
    Minimum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_MAX_INTERVAL
    Maximum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_INTERVAL_TO_MS(interval)
    Convert periodic advertising interval (N * 1.25 ms) to milliseconds.
    5 / 4 represents 1.25 ms unit.

BT_LE_SUPP_FEAT_40_ENCODE(w64)
    Encode 40 least significant bits of 64-bit LE Supported Features into array values in little-endian format.

    Helper macro to encode 40 least significant bits of 64-bit LE Supported Features value into advertising data. The number of bits that are encoded is a number of LE Supported Features defined by BT 5.3 Core specification.

    Example of how to encode the 0x000000DFF00DF00D into advertising data.

BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_40_ENCODE(0x000000DFF00DF00D))
Parameters

- \( w64 \) – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for \( \text{BT\_DATA\_BYTES} \).

\text{BT\_LE\_SUPP\_FEAT\_32\_ENCODE}(w64)

Encode 4 least significant bytes of 64-bit LE Supported Features into 4 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 4 least significant bytes into advertising data. Other 4 bytes are not encoded.

Example of how to encode the \( 0x000000DFF00DF00D \) into advertising data.

\text{BT\_DATA\_BYTES}(\text{BT\_DATA\_LE\_SUPPORTED\_FEATURES}, \text{BT\_LE\_SUPP\_FEAT\_32\_ENCODE}(0x000000DFF00DF00D))

Parameters

- \( w64 \) – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for \( \text{BT\_DATA\_BYTES} \).

\text{BT\_LE\_SUPP\_FEAT\_24\_ENCODE}(w64)

Encode 3 least significant bytes of 64-bit LE Supported Features into 3 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 5 bytes are not encoded.

Example of how to encode the \( 0x000000DFF00DF00D \) into advertising data.

\text{BT\_DATA\_BYTES}(\text{BT\_DATA\_LE\_SUPPORTED\_FEATURES}, \text{BT\_LE\_SUPP\_FEAT\_24\_ENCODE}(0x000000DFF00DF00D))

Parameters

- \( w64 \) – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for \( \text{BT\_DATA\_BYTES} \).

\text{BT\_LE\_SUPP\_FEAT\_16\_ENCODE}(w64)

Encode 2 least significant bytes of 64-bit LE Supported Features into 2 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 6 bytes are not encoded.

Example of how to encode the \( 0x000000DFF00DF00D \) into advertising data.

\text{BT\_DATA\_BYTES}(\text{BT\_DATA\_LE\_SUPPORTED\_FEATURES}, \text{BT\_LE\_SUPP\_FEAT\_16\_ENCODE}(0x000000DFF00DF00D))
**Returns**
The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_8_ENCODE(w64)`
Encode the least significant byte of 64-bit LE Supported Features into single byte long array.
Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes the least significant byte into advertising data. Other 7 bytes are not encoded.
Example of how to encode the `0x000000DFF00DF00D` into advertising data.

`BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_8_ENCODE(0x000000DFF00DF00D))`

**Parameters**
- `w64` – LE Supported Features value (64-bits)

**Returns**
The value of least significant byte of LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_VALIDATE(w64)`
Validate whether LE Supported Features value does not use bits that are reserved for future use.
Helper macro to check if `w64` has zeros as bits 40-63. The macro is compliant with BT 5.3 Core Specification where bits 0-40 has assigned values. In case of invalid value, build time error is reported.

**Enums**

enum [anonymous]
LE PHY types.

*Values*:

enumerator BT_GAP_LE_PHY_NONE = 0
Convenience macro for when no PHY is set.

enumerator BT_GAP_LE_PHY_1M = BIT(0)
LE 1M PHY.

enumerator BT_GAP_LE_PHY_2M = BIT(1)
LE 2M PHY.

enumerator BT_GAP_LE_PHY_CODED = BIT(2)
LE Coded PHY.

enum [anonymous]
Advertising PDU types.

*Values*:
enumerator BT_GAP_ADV_TYPE_ADV_IND = 0x00
    Scannable and connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_DIRECT_IND = 0x01
    Directed connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_SCAN_IND = 0x02
    Non-connectable and scannable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_NONCONN_IND = 0x03
    Non-connectable and non-scannable advertising.

enumerator BT_GAP_ADV_TYPE_SCAN_RSP = 0x04
    Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_TYPE_EXT_ADV = 0x05
    Extended advertising, see advertising properties.

defined enum [anonymous]
    Advertising PDU properties.
    Values:

enumerator BT_GAP_ADV_PROP_CONNECTABLE = BIT(0)
    Connectable advertising.

enumerator BT_GAP_ADV_PROP_SCANNABLE = BIT(1)
    Scannable advertising.

enumerator BT_GAP_ADV_PROP_DIRECTED = BIT(2)
    Directed advertising.

enumerator BT_GAP_ADV_PROP_SCAN_RESPONSE = BIT(3)
    Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_PROP_EXT_ADV = BIT(4)
    Extended advertising.

defined enum [anonymous]
    Constant Tone Extension (CTE) types.
    Values:

enumerator BT_GAP_CTE_AOA = 0x00
    Angle of Arrival.

enumerator BT_GAP_CTE_AOD_1US = 0x01
    Angle of Departure with 1 us slots.
enumerator BT_GAP_CTE_AOD_2US = 0x02
   Angle of Departure with 2 us slots.

enumerator BT_GAP_CTE_NONE = 0xFF
   No extensions.

enum [anonymous]
   Peripheral sleep clock accuracy (SCA) in ppm (parts per million)
Values:

enumerator BT_GAP_SCA_UNKNOWN = 0
   Unknown.

enumerator BT_GAP_SCA_251_500 = 0
   251 ppm to 500 ppm

enumerator BT_GAP_SCA_151_250 = 1
   151 ppm to 250 ppm

enumerator BT_GAP_SCA_101_150 = 2
   101 ppm to 150 ppm

enumerator BT_GAP_SCA_76_100 = 3
   76 ppm to 100 ppm

enumerator BT_GAP_SCA_51_75 = 4
   51 ppm to 75 ppm

enumerator BT_GAP_SCA_31_50 = 5
   31 ppm to 50 ppm

enumerator BT_GAP_SCA_21_30 = 6
   21 ppm to 30 ppm

enumerator BT_GAP_SCA_0_20 = 7
   0 ppm to 20 ppm

**Generic Attribute Profile (GATT)**

GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using `bt_gatt_service_register()` API which takes the `bt_gatt_service` struct that provides the list of attributes the service contains. The helper macro `BT_GATT_SERVICE()` can be used to declare a service.

Attributes can be declared using the `bt_gatt_attr` struct or using one of the helper macros:

`BT_GATT_PRIMARY_SERVICE`
   Declares a Primary Service.
BT_GATT_SECONDARY_SERVICE
Declares a Secondary Service.

BT_GATT_INCLUDE_SERVICE
Declares a Include Service.

BT_GATT_CHARACTERISTIC
Declares a Characteristic.

BT_GATT_DESCRIPTOR
Declares a Descriptor.

BT_GATT_ATTRIBUTE
Declares an Attribute.

BT_GATT_CCC
Declares a Client Characteristic Configuration.

BT_GATT_CEP
Declares a Characteristic Extended Properties.

BT_GATT_CUD
Declares a Characteristic User Format.

Each attribute contain a uuid, which describes their type, a read callback, a write callback and a set of permission. Both read and write callbacks can be set to NULL if the attribute permission don't allow their respective operations.

**Note:** 32-bit UUIDs are not supported in GATT. All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU.

Attribute read and write callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

Attribute value changes can be notified using `bt_gatt_notify()` API, alternatively there is `bt_gatt_notify_cb()` where is is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by `bt_gatt_indicate()` API.

Client procedures can be enabled with the configuration option: `CONFIG_BT_GATT_CLIENT`

Discover procedures can be initiated with the use of `bt_gatt_discover()` API which takes the `bt_gatt_discover_params` struct which describes the type of discovery. The parameters also serves as a filter when setting the uuid field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

**Note:** Caching discovered attributes is not supported.

Read procedures are supported by `bt_gatt_read()` API which takes the `bt_gatt_read_params` struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: `CONFIG_BT_GATT_READ_MULTIPLE`

Write procedures are supported by `bt_gatt_write()` API and takes `bt_gatt_write_params` struct as parameters. In case the write operation don't require a response `bt_gatt_write_without_response()` or `bt_gatt_write_without_response_cb()` APIs can be used, with the later working similarly to `bt_gatt_notify_cb()`.

Subscriptions to notification and indication can be initiated with use of `bt_gatt_subscribe()` API which takes `bt_gatt_subscribe_params` as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple notify callback being triggered for the same attribute. Subscriptions can be removed with use of `bt_gatt_unsubscribe()` API.
**Note:** When subscriptions are removed `notify` callback is called with the data set to `NULL`.

### API Reference

**group** bt_gatt

Generic Attribute Profile (GATT)

**Defines**

```c
BT_GATT_ERR(_att_err)
```

Construct error return value for attribute read and write callbacks.

**Parameters**

- `_att_err` – ATT error code

**Returns**

Appropriate error code for the attribute callbacks.

- `BT_GATT_CHRC_BROADCAST`
  Characteristic Properties Bit field values.
  Characteristic broadcast property.
  If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

- `BT_GATT_CHRC_READ`
  Characteristic read property.
  If set, permits reads of the Characteristic Value.

- `BT_GATT_CHRC_WRITE_WITHOUT_RESP`
  Characteristic write without response property.
  If set, permits write of the Characteristic Value without response.

- `BT_GATT_CHRC_WRITE`
  Characteristic write with response property.
  If set, permits write of the Characteristic Value with response.

- `BT_GATT_CHRC_NOTIFY`
  Characteristic notify property.
  If set, permits notifications of a Characteristic Value without acknowledgment.

- `BT_GATT_CHRC_INDICATE`
  Characteristic indicate property.
  If set, permits indications of a Characteristic Value with acknowledgment.

- `BT_GATT_CHRC_AUTH`
  Characteristic Authenticated Signed Writes property.
  If set, permits signed writes to the Characteristic Value.
BT_GATT_CHRC_EXT_PROP
Characteristic Extended Properties property.
If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

BT_GATT_CEP_RELIABLE_WRITE
Characteristic Extended Properties Bit field values.

BT_GATT_CEP_WRITABLE_AUX

BT_GATT_CCC_NOTIFY
Client Characteristic Configuration Values.
Client Characteristic Configuration Notification.
If set, changes to Characteristic Value shall be notified.

BT_GATT_CCC_INDICATE
Client Characteristic Configuration Indication.
If set, changes to Characteristic Value shall be indicated.

BT_GATT_SCC_BROADCAST
Server Characteristic Configuration Values.
Server Characteristic Configuration Broadcast
If set, the characteristic value shall be broadcast in the advertising data when the server is advertising.

**Typedefs**

typedef ssize_t (*bt_gatt_attr_read_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
Attribute read callback.
The callback can also be used locally to read the contents of the attribute in which case no connection will be set.

**Param conn**
The connection that is requesting to read

**Param attr**
The attribute that's being read

**Param buf**
Buffer to place the read result in

**Param len**
Length of data to read

**Param offset**
Offset to start reading from

**Return**
Number of bytes read, or in case of an error `BT_GATT_ERR()` with a specific BT_ATT_ERR_* error code.
typedef ssize_t (*bt_gatt_attr_write_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Attribute write callback.

**Param conn**
The connection that is requesting to write

**Param attr**
The attribute that's being written

**Param buf**
Buffer with the data to write

**Param len**
Number of bytes in the buffer

**Param offset**
Offset to start writing from

**Param flags**
Flags (BT_GATT_WRITE_FLAG_*)

**Return**
Number of bytes written, or in case of an error BT_GATT_ERR() with a specific BT_ATT_ERR_* error code.

**Enums**

```c
enum bt_gatt_perm
    GATT attribute permission bit field values.

Values:

enumerator BT_GATT_PERM_NONE = 0
    No operations supported, e.g.
    for notify-only

nenumerator BT_GATT_PERM_READ = BIT(0)
    Attribute read permission.

nenumerator BT_GATT_PERM_WRITE = BIT(1)
    Attribute write permission.

nenumerator BT_GATT_PERM_READ_ENCRYPT = BIT(2)
    Attribute read permission with encryption.
    If set, requires encryption for read access.

enumerator BT_GATT_PERM_WRITE_ENCRYPT = BIT(3)
    Attribute write permission with encryption.
    If set, requires encryption for write access.

enumerator BT_GATT_PERM_READ_AUTHEN = BIT(4)
    Attribute read permission with authentication.
```
If set, requires encryption using authenticated link-key for read access.

enumerator BT_GATT_PERM_WRITE_AUTHEN = \textit{BIT}(5)

Attribute write permission with authentication.

If set, requires encryption using authenticated link-key for write access.

enumerator BT_GATT_PERM_PREPARE_WRITE = \textit{BIT}(6)

Attribute prepare write permission.

If set, allows prepare writes with use of BT_GATT_WRITE_FLAG_PREPARE passed to write callback.

enumerator BT_GATT_PERM_READ_LESC = \textit{BIT}(7)

Attribute read permission with LE Secure Connection encryption.

If set, requires that LE Secure Connections \textit{is} used for read access.

enumerator BT_GATT_PERM_WRITE_LESC = \textit{BIT}(8)

Attribute write permission with LE Secure Connection encryption.

If set, requires that LE Secure Connections \textit{is} used for write access.

eenum [\texttt{anonymous}]

GATT attribute write flags.

\textbf{Values:}

enumerator BT_GATT_WRITE_FLAG_PREPARE = \textit{BIT}(0)

Attribute prepare write flag.

If set, write callback should only check if the device is authorized but no data shall be written.

enumerator BT_GATT_WRITE_FLAG_CMD = \textit{BIT}(1)

Attribute write command flag.

If set, indicates that write operation \textit{is} a command (Write without response) which doesn't generate any response.

enumerator BT_GATT_WRITE_FLAG_EXECUTE = \textit{BIT}(2)

Attribute write execute flag.

If set, indicates that write operation \textit{is} a execute, which indicates the end of a long write, \textit{and} will come after 1 or more @ref BT_GATT_WRITE_FLAG_PREPARE.

\begin{verbatim}
struct bt_gatt_attr
  
#include <gatt.h> GATT Attribute structure.
\end{verbatim}

Chapter 6. Connectivity
Public Members

const struct btuuid *uuid
Attribute UUID.

bt_gatt_attr_write_func_t write
Attribute write callback.

void *user_data
Attribute user data.

uint16_t handle
Attribute handle.

uint16_t perm
Attribute permissions.
Will be 0 if returned from bt_gatt_discover().

struct bt_gatt_service_static
#include <gatt.h> GATT Service structure.

Public Members

const struct bt_gatt_attr *attrs
Service Attributes.

size_t attr_count
Service Attribute count.

struct bt_gatt_service
#include <gatt.h> GATT Service structure.

Public Members

struct bt_gatt_attr *attrs
Service Attributes.

size_t attr_count
Service Attribute count.

struct bt_gatt_service_val
#include <gatt.h> Service Attribute Value.

Public Members
const struct bt_uuid *uuid
    Service UUID.

uint16_t end_handle
    Service end handle.

struct bt_gatt_include
    #include <gatt.h> Include Attribute Value.

Public Members

const struct bt_uuid *uuid
    Service UUID.

uint16_t start_handle
    Service start handle.

uint16_t end_handle
    Service end handle.

struct bt_gatt_cb
    #include <gatt.h> GATT callback structure.

Public Members

void (*att_mtu_updated)(struct bt_conn *conn, uint16_t tx, uint16_t rx)
    The maximum ATT MTU on a connection has changed.
    This callback notifies the application that the maximum TX or RX ATT MTU has increased.
    Param conn
        Connection object.
    Param tx
        Updated TX ATT MTU.
    Param rx
        Updated RX ATT MTU.

struct bt_gatt_chrc
    #include <gatt.h> Characteristic Attribute Value.

Public Members

const struct bt_uuid *uuid
    Characteristic UUID.

uint16_t value_handle
    Characteristic Value handle.
```c
uint8_t properties
    Characteristic properties.

struct bt_gatt_cep
    #include <gatt.h> Characteristic Extended Properties Attribute Value.

Public Members

uint16_t properties
    Characteristic Extended properties.

struct bt_gatt_ccc
    #include <gatt.h> Client Characteristic Configuration Attribute Value.

Public Members

uint16_t flags
    Client Characteristic Configuration flags.

struct bt_gatt_scc
    #include <gatt.h> Server Characteristic Configuration Attribute Value.

Public Members

uint16_t flags
    Server Characteristic Configuration flags.

struct bt_gatt_cpf
    #include <gatt.h> GATT Characteristic Presentation Format Attribute Value.

Public Members

uint8_t format
    Format of the value of the characteristic.

int8_t exponent
    Exponent field to determine how the value of this characteristic is further formatted.

uint16_t unit
    Unit of the characteristic.

uint8_t name_space
    Name space of the description.

uint16_t description
    Description of the characteristic as defined in a higher layer profile.
```
GATT Server

group bt_gatt_server

Defines

BT_GATT_SERVICE_DEFINE(_name, ...)
Statically define and register a service.
Helper macro to statically define and register a service.

Parameters
• _name – Service name.

BT_GATT_SERVICE_INSTANCE_DEFINE(_name, _instances, _instance_num, _attrs_def)
Statically define service structure array.
Helper macro to statically define service structure array. Each element of the array is linked
to the service attribute array which is also defined in this scope using _attrs_def macro.

Parameters
• _name – Name of service structure array.
• _instances – Array of instances to pass as user context to the attribute call-
backs.
• _instance_num – Number of elements in instance array.
• _attrs_def – Macro provided by the user that defines attribute array for the
service. This macro should accept single parameter which is the instance con-
text.

BT_GATT_SERVICE(_attrs)
Service Structure Declaration Macro.
Helper macro to declare a service structure.

Parameters
• _attrs – Service attributes.

BT_GATT_PRIMARY_SERVICE(_service)
Primary Service Declaration Macro.
Helper macro to declare a primary service attribute.

Parameters
• _service – Service attribute value.

BT_GATT_SECONDARY_SERVICE(_service)
Secondary Service Declaration Macro.
Helper macro to declare a secondary service attribute.

Note: A secondary service is only intended to be included from a primary service or another
secondary service or other higher layer specification.

Parameters
• _service – Service attribute value.
BT_GATT_INCLUDE_SERVICE(_service_incl)
Include Service Declaration Macro.
Helper macro to declare database internal include service attribute.

Parameters
- _service_incl – the first service attribute of service to include

BT_GATT_CHRC_INIT(_uuid, _handle, _props)

BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)
Characteristic and Value Declaration Macro.
Helper macro to declare a characteristic attribute along with its attribute value.

Parameters
- _uuid – Characteristic attribute uuid.
- _props – Characteristic attribute properties, a bitmap of BT_GATT_CHRC_* macros.
- _perm – Characteristic Attribute access permissions, a bitmap of bt_gatt_perm values.
- _read – Characteristic Attribute read callback (bt_gatt_attr_read_func_t).
- _write – Characteristic Attribute write callback (bt_gatt_attr_write_func_t).
- _user_data – Characteristic Attribute user data.

BT_GATT_CCC_MAX

BT_GATT_CCC_INITIALIZER(_changed, _write, _match)
Initialize Client Characteristic Configuration Declaration Macro.
Helper macro to initialize a Managed CCC attribute value.

Parameters
- _changed – Configuration changed callback.
- _write – Configuration write callback.
- _match – Configuration match callback.

BT_GATT_CCC_MANAGED(_ccc, _perm)
Managed Client Characteristic Configuration Declaration Macro.
Helper macro to declare a Managed CCC attribute.

Parameters
- _ccc – CCC attribute user data, shall point to a _bt_gatt_ccc.
- _perm – CCC access permissions, a bitmap of bt_gatt_perm values.

BT_GATT_CCC(_changed, _perm)
Client Characteristic Configuration Declaration Macro.
Helper macro to declare a CCC attribute.

Parameters
- _changed – Configuration changed callback.
- _perm – CCC access permissions, a bitmap of bt_gatt_perm values.
BT_GATT_CEP(_value)
Characteristics Extended Properties Declaration Macro.
Helper macro to declare a CEP attribute.

Parameters
- _value – Pointer to a struct `bt_gatt_cep`.

BT_GATT_CUD(_value, _perm)
Characteristic User Format Descriptor Declaration Macro.
Helper macro to declare a CUD attribute.

Parameters
- _value – User description NULL-terminated C string.
- _perm – Descriptor attribute access permissions, a bitmap of `bt_gatt_perm` values.

BT_GATT_CPF(_value)
Characteristic Presentation Format Descriptor Declaration Macro.
Helper macro to declare a CPF attribute.

Parameters
- _value – Pointer to a struct `bt_gatt_cpf`.

BT_GATT_DESCRIPTOR(_uuid, _perm, _read, _write, _user_data)
Descriptor Declaration Macro.
Helper macro to declare a descriptor attribute.

Parameters
- _uuid – Descriptor attribute uuid.
- _perm – Descriptor attribute access permissions, a bitmap of `bt_gatt_perm` values.
- _read – Descriptor attribute read callback (`bt_gatt_attr_read_func_t`).
- _write – Descriptor attribute write callback (`bt_gatt_attr_write_func_t`).
- _user_data – Descriptor attribute user data.

BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)
Attribute Declaration Macro.
Helper macro to declare an attribute.

Parameters
- _uuid – Attribute uuid.
- _perm – Attribute access permissions, a bitmap of `bt_gatt_perm` values.
- _read – Attribute read callback (`bt_gatt_attr_read_func_t`).
- _write – Attribute write callback (`bt_gatt_attr_write_func_t`).
- _user_data – Attribute user data.

Typedefs
typedef uint8_t (*bt_gatt_attr_func_t)(const struct bt_gatt_attr *attr, uint16_t handle, void *user_data)

    Attribute iterator callback.

    **Param attr**
    Attribute found.

    **Param handle**
    Attribute handle found.

    **Param user_data**
    Data given.

    **Return**
    BT_GATT_ITER_CONTINUE if should continue to the next attribute.

    **Return**
    BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_complete_func_t)(struct bt_conn *conn, void *user_data)

    Notification complete result callback.

    **Param conn**
    Connection object.

    **Param user_data**
    Data passed in by the user.

typedef void (*bt_gatt_indicate_func_t)(struct bt_conn *conn, struct bt_gatt_indicate_params *params, uint8_t err)

    Indication complete result callback.

    **Param conn**
    Connection object.

    **Param params**
    Indication params object.

    **Param err**
    ATT error code

typedef void (*bt_gatt_indicate_params_destroy_t)(struct bt_gatt_indicate_params *params)

**Enums**

enum [anonymous]

    **Values:**

    enumerator BT_GATT_ITER_STOP = 0

    enumerator BT_GATT_ITER_CONTINUE

**Functions**
void bt_gatt_cb_register(struct bt_gatt_cb *cb)
    Register GATT callbacks.

    Register callbacks to monitor the state of GATT.

    Parameters
    • cb – Callback struct.

int bt_gatt_service_register(struct bt_gatt_service *svc)
    Register GATT service.

    Register GATT service. Applications can make use of macros such as BT_GATT_PRIMARY_SERVICE, BT_GATT_CHARACTERISTIC, BT_GATT_DESCRIPTOR, etc.

    When using CONFIG_BT_SETTINGS then all services that should have bond configuration loaded, i.e. CCC values, must be registered before calling settings_load.

    When using CONFIG_BT_GATT_CACHING and CONFIG_BT_SETTINGS then all services that should be included in the GATT Database Hash calculation should be added before calling settings_load. All services registered after settings_load will trigger a new database hash calculation and a new hash stored.

    There are two situations where this function can be called: either before bt_init() has been called, or after settings_load() has been called. Registering a service in the middle is not supported and will return an error.

    Parameters
    • svc – Service containing the available attributes

    Returns
    0 in case of success or negative value in case of error.

Returns
    -EAGAIN if bt_init() has been called but settings_load() hasn't yet.

int bt_gatt_service_unregister(struct bt_gatt_service *svc)
    Unregister GATT service.

    Parameters
    • svc – Service to be unregistered.

    Returns
    0 in case of success or negative value in case of error.

bool bt_gatt_service_is_registered(const struct bt_gatt_service *svc)
    Check if GATT service is registered.

    Parameters
    • svc – Service to be checked.

    Returns
    true if registered or false if not register.

void bt_gatt_foreach_attr_type(uint16_t start_handle, uint16_t end_handle, const struct bt_uuid *uuid, const void *attr_data, uint16_t num_matches, bt_gatt_attr_func_t func, void *user_data)
    Attribute iterator by type.

    Iterate attributes in the given range matching given UUID and/or data.

    Parameters
    • start_handle – Start handle.
• end_handle – End handle.
• uuid – UUID to match, passing NULL skips UUID matching.
• attr_data – Attribute data to match, passing NULL skips data matching.
• num_matches – Number matches, passing 0 makes it unlimited.
• func – Callback function.
• user_data – Data to pass to the callback.

static inline void bt_gatt_foreach_attr(uint16_t start_handle, uint16_t end_handle,
  bt_gatt_attr_func_t func, void *user_data)

Attribute iterator.
Iterate attributes in the given range.

Parameters
• start_handle – Start handle.
• end_handle – End handle.
• func – Callback function.
• user_data – Data to pass to the callback.

struct bt_gatt_attr *bt_gatt_attr_next(const struct bt_gatt_attr *attr)

Iterate to the next attribute.
Iterate to the next attribute following a given attribute.

Parameters
• attr – Current Attribute.

Returns
The next attribute or NULL if it cannot be found.

struct bt_gatt_attr *bt_gatt_find_by_uuid(const struct bt_gatt_attr *attr, uint16_t attr_count,
  const struct bt_uuid *uuid)

Find Attribute by UUID.
Find the attribute with the matching UUID. To limit the search to a service set the attr to the
service attributes and the attr_count to the service attribute count.

Parameters
• attr – Pointer to an attribute that serves as the starting point for the search of
  a match for the UUID. Passing NULL will search the entire range.
• attr_count – The number of attributes from the starting point to search for a
  match for the UUID. Set to 0 to search until the end.
• uuid – UUID to match.

uint16_t bt_gatt_attr_get_handle(const struct bt_gatt_attr *attr)

Get Attribute handle.

Parameters
• attr – Attribute object.

Returns
Handle of the corresponding attribute or zero if the attribute could not be found.
uint16_t bt_gatt_attr_value_handle(const struct bt_gatt_attr *attr)
Get the handle of the characteristic value descriptor.

Note: The user_data of the attribute must of type bt_gatt_chrc.

Parameters
- attr – A Characteristic Attribute.

Returns
the handle of the corresponding Characteristic Value. The value will be zero (the invalid handle) if attr was not a characteristic attribute.

ssize_t bt_gatt_attr_read(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf,
uint16_t buf_len, uint16_t offset, const void *value, uint16_t value_len)
Generic Read Attribute value helper.
Read attribute value from local database storing the result into buffer.

Parameters
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value.
- buf_len – Buffer length.
- offset – Start offset.
- value – Attribute value.
- value_len – Length of the attribute value.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_service(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *
buf, uint16_t len, uint16_t offset)
Read Service Attribute helper.
Read service attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_uuid.

Parameters
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.
ssize_t bt_gatt_attr_read_included(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Include Attribute helper.
Read include service attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_include.

Parameters
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_chrc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Attribute helper.
Read characteristic attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_chrc.

Parameters
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Client Characteristic Configuration Attribute helper.
Read CCC attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a _bt_gatt_ccc.

Parameters
- conn – Connection object.
- attr – Attribute to read.
• buf – Buffer to store the value read.
• len – Buffer length.
• offset – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_write_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Write Client Characteristic Configuration Attribute helper.
Write value in the buffer into CCC attribute.

Note: Only use this with attributes which user_data is a _bt_gatt_ccc.

Parameters
• conn – Connection object.
• attr – Attribute to read.
• buf – Buffer to store the value read.
• len – Buffer length.
• offset – Start offset.
• flags – Write flags.

Returns
number of bytes written in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cep(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Extended Properties Attribute helper.
Read CEP attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_cep.

Parameters
• conn – Connection object
• attr – Attribute to read
• buf – Buffer to store the value read
• len – Buffer length
• offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cud(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic User Description Descriptor Attribute helper.
Read CUD attribute value from local database storing the result into buffer after encoding it.
Note: Only use this with attributes which user_data is a NULL-terminated C string.

### Parameters
- **conn** – Connection object
- **attr** – Attribute to read
- **buf** – Buffer to store the value read
- **len** – Buffer length
- **offset** – Start offset

### Returns
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_cpft(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Characteristic Presentation format Descriptor Attribute helper.

Read CPF attribute value from local database storing the result into buffer after encoding it.

---

Note: Only use this with attributes which user_data is a bt_gatt_pf.

### Parameters
- **conn** – Connection object
- **attr** – Attribute to read
- **buf** – Buffer to store the value read
- **len** – Buffer length
- **offset** – Start offset

### Returns
number of bytes read in case of success or negative values in case of error.

```c
int bt_gatt_notify_cb(struct bt_conn *conn, struct bt_gatt_notify_params *params)
```

Notify attribute value change.

This function works in the same way as `bt_gatt_notify`. With the addition that after sending the notification the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the `CONFIG_BT_CONN_TX_MAX` option.

Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

### Parameters
- **conn** – Connection object.
- **params** – Notification parameters.

### Returns
0 in case of success or negative value in case of error.
int bt_gatt_notify_multiple(struct bt_conn *conn, uint16_t num_params, struct bt_gatt_notify_params params[])

Send multiple notifications in a single PDU.
The GATT Server will send a single ATT_MULTIPLE_HANDLE_VALUE_NTF PDU containing all the notifications passed to this API.

All params must have the same func and user_data (due to implementation limitation). But func(user_data) will be invoked for each parameter.

As this API may block to wait for Bluetooth Host resources, it is not recommended to call it from a cooperative thread or a Bluetooth callback.

The peer's GATT Client must write to this device's Client Supported Features attribute and set the bit for Multiple Handle Value Notifications before this API can be used.

Only use this API to force the use of the ATT_MULTIPLE_HANDLE_VALUE_NTF PDU. For standard applications, bt_gatt_notify_cb is preferred, as it will use this PDU if supported and automatically fallback to ATT_HANDLE_VALUE_NTF when not supported by the peer.

This API has an additional limitation: it only accepts valid attribute references and not UUIDs like bt_gatt_notify and bt_gatt_notify_cb.

Parameters
• conn – Target client. Notifying all connected clients by passing NULL is not yet supported, please use bt_gatt_notify instead.
• num_params – Element count of params array. Has to be greater than 1.
• params – Array of notification parameters. It is okay to free this after calling this function.

Return values
• 0 – Success. The PDU is queued for sending.
• -EINVAL –
  – One of the attribute handles is invalid.
  – Only one parameter was passed. This API expects 2 or more.
  – Not all func were equal or not all user_data were equal.
  – One of the characteristics is not notifiable.
  – An UUID was passed in one of the parameters.
• -ERANGE –
  – The notifications cannot all fit in a single ATT_MULTIPLE_HANDLE_VALUE_NTF.
  – They exceed the MTU of all open ATT bearers.
• -EPERM – The connection has a lower security level than required by one of the attributes.
• -EOPNOTSUPP – The peer hasn't yet communicated that it supports this PDU type.

static inline int bt_gatt_notify(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *data, uint16_t len)

Notify attribute value change.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.
The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

Parameters

• conn – Connection object.
• attr – Characteristic or Characteristic Value attribute.
• data – Pointer to Attribute data.
• len – Attribute value length.

Returns

0 in case of success or negative value in case of error.

static inline int bt_gatt_notify_uuid(struct bt_conn *conn, const struct bt_uuid *uuid, const struct bt_gatt_attr *attr, const void *data, uint16_t len)

Notify attribute value change by UUID.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection.

The attribute object is the starting point for the search of the UUID.

Parameters

• conn – Connection object.
• uuid – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the attr given, is used.
• attr – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
• data – Pointer to Attribute data.
• len – Attribute value length.

Returns

0 in case of success or negative value in case of error.

int bt_gatt_indicate(struct bt_conn *conn, struct bt_gatt_indicate_params *params)

Indicate attribute value change.

Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Note: This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

Parameters

• conn – Connection object.
• params – Indicate parameters.
Returns
0 in case of success or negative value in case of error.

bool bt_gatt_is_subscribed(struct bt_conn *conn, const struct bt_gatt_attr *attr, uint16_t ccc_type)

Check if connection have subscribed to attribute.

Check if connection has subscribed to attribute value change.

The attribute object can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC, or the Client Characteristic Configuration Descriptor (CCCD) which is created by BT_GATT_CCC.

Parameters
• conn – Connection object.
• attr – Attribute object.
• ccc_type – The subscription type, BT_GATT_CCC_NOTIFY and/or BT_GATT_CCC_INDICATE.

Returns
true if the attribute object has been subscribed.

uint16_t bt_gatt_get_mtu(struct bt_conn *conn)

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

Parameters
• conn – Connection object.

Returns
MTU in bytes

struct bt_gatt_ccc_cfg

#include <gatt.h> GATT CCC configuration entry.

Public Members

uint8_t id
Local identity, BT_ID_DEFAULT in most cases.

bt_addr_le_t peer
Remote peer address.

bool link_encrypted
Separate storage for encrypted and unencrypted context.
This indicate that the link was encrypted when the CCC was written.

uint16_t value
Configuration value.
struct bt_gatt_notify_params
#include <gatt.h>

Public Members

const struct bt_uuid *uuid
    Notification Attribute UUID type.
    Optional, use to search for an attribute with matching UUID when the attribute object
    pointer is not known.

const struct bt_gatt_attr *attr
    Notification Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the
    attribute with the given UUID.

const void *data
    Notification Value data.

uint16_t len
    Notification Value length.

bt_gatt_complete_func_t func
    Notification Value callback.

void *user_data
    Notification Value callback user data.

struct bt_gatt_indicate_params
#include <gatt.h>  GATT Indicate Value parameters.

Public Members

const struct bt_uuid *uuid
    Indicate Attribute UUID type.
    Optional, use to search for an attribute with matching UUID when the attribute object
    pointer is not known.

const struct bt_gatt_attr *attr
    Indicate Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the
    attribute with the given UUID.

bt_gatt_indicate_func_t func
    Indicate Value callback.
### bt_gatt_indicate_params_destroy_t

**destroy**

Indicate operation complete callback.

**const void *data**

Indicate Value data.

**uint16_t len**

Indicate Value length.

---

**GATT Client**

*group* bt_gatt_client

---

#### Typedefs

```c
typedef uint8_t (*bt_gatt_discover_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, struct bt_gatt_discover_params *params)
```

Discover attribute callback function.

If discovery procedure has completed this callback will be called with attr set to NULL. This will not happen if procedure was stopped by returning BT_GATT_ITER_STOP.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:

- **uuid** UUID representing the type of attribute.
- **handle** Handle in the remote database.
- **user_data** The value of the attribute, if the discovery type maps to an ATT operation that provides this information. NULL otherwise. See below.

The effective type of attr->user_data is determined by params. Note that the fields params->type and params->uuid are left unchanged by the discovery procedure.

<table>
<thead>
<tr>
<th>params-&gt;type</th>
<th>params-&gt;uuid</th>
<th>Type of attr-&gt;user_data</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>BT_GATT_DISCOVER_PRIMARY</code></td>

<td>any</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Also consider if using read-by-type instead of discovery is more convenient. See `bt_gatt_read` with `bt_gatt_read_params::handle_count` set to 0.
param conn
Connection object.

param attr
Attribute found, or NULL if not found.

param params
Discovery parameters given.

return
BT_GATT_ITER_CONTINUE to continue discovery procedure.

return
BT_GATT_ITER_STOP to stop discovery procedure.

typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_read_params *params, const void *data, uint16_t length)

Read callback function.

When reading using by_uuid, params->start_handle is the attribute handle for this data item.

param conn
Connection object.

param err
ATT error code.

param params
Read parameters used.

param data
Attribute value data. NULL means read has completed.

param length
Attribute value length.

return
BT_GATT_ITER_CONTINUE if should continue to the next attribute.

return
BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_write_params *params)

Write callback function.

param conn
Connection object.

param err
ATT error code.

param params
Write parameters used.

typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)

Notification callback function.

In the case of an empty notification, the data pointer will be non-NULL while the length will be 0, which is due to the special case where a data NULL pointer means unsubscribed.

param conn
Connection object. May be NULL, indicating that the peer is being unpaired
**Param params**  
Subscription parameters.

**Param data**  
Attribute value data. If NULL then subscription was removed.

**Param length**  
Attribute value length.

**Return**  
BT_GATT_ITER_CONTINUE to continue receiving value notifications.  
BT_GATT_ITER_STOP to unsubscribe from value notifications.

typedef void (*bt_gatt_subscribe_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_subscribe_params *params)

Subscription callback function.

**Param conn**  
Connection object.

**Param err**  
ATT error code.

**Param params**  
Subscription parameters used.

** Enums**

```c
enum [anonymous]
    GATT Discover types.

Values:

enumerator BT_GATT_DISCOVER_PRIMARY
    Discover Primary Services.

enumerator BT_GATT_DISCOVER_SECONDARY
    Discover Secondary Services.

enumerator BT_GATT_DISCOVER_INCLUDE
    Discover Included Services.

enumerator BT_GATT_DISCOVER_CHARACTERISTIC
    Discover Characteristic Values.

    Discover Characteristic Value and its properties.

enumerator BT_GATT_DISCOVER_DESCRIPTOR
    Discover Descriptors.

    Discover Attributes which are not services or characteristics.

@note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in extra round trips.
```
enumerator BT_GATT_DISCOVER_ATTRIBUTE
Discover Attributes.

Discover Attributes of any type.

@note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in more round trips.

enumerator BT_GATT_DISCOVER_STD_CHAR_DESC
Discover standard characteristic descriptor values.

Discover standard characteristic descriptor values and their properties.
Supported descriptors:
- Characteristic Extended Properties
- Client Characteristic Configuration
- Server Characteristic Configuration
- Characteristic Presentation Format

enum [anonymous]
Subscription flags.

Values:

enumerator BT_GATT_SUBSCRIBE_FLAG_VOLATILE
Persistence flag.

If set, indicates that the subscription is not saved on the GATT server side. Therefore, upon disconnection, the subscription will be automatically removed from the client's subscriptions list and when the client reconnects, it will have to issue a new subscription.

enumerator BT_GATT_SUBSCRIBE_FLAG_NO_RESUB
No resubscribe flag.

By default when BT_GATT_SUBSCRIBE_FLAG_VOLATILE is unset, the subscription will be automatically renewed when the client reconnects, as a workaround for GATT servers that do not persist subscriptions.

This flag will disable the automatic resubscription. It is useful if the application layer knows that the GATT server remembers subscriptions from previous connections and wants to avoid renewing the subscriptions.

enumerator BT_GATT_SUBSCRIBE_FLAG_WRITE_PENDING
Write pending flag.

If set, indicates write operation is pending waiting remote end to respond.

(continues on next page)
enumerator BT_GATT_SUBSCRIBE_FLAG_SENT
Sent flag.

If set, indicates that a subscription request (CCC write) has already been sent in the active connection. Used to avoid sending subscription requests multiple times when the \htmlonly<code>CONFIG_BT_GATT_AUTO_RESUBSCRIBE</code>\endhtmlonly → \xmlonly<verbatim>embed:rst:inline :kconfig:option:`CONFIG_BT_GATT_AUTO_RESUBSCRIBE`\endxmlonly quirk is enabled.

enumerator BT_GATT_SUBSCRIBE_NUM_FLAGS

Functions

int bt_gatt_exchange_mtu(struct bt_conn *conn, struct bt_gatt_exchange_params *params)
Exchange MTU.

This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

The Response comes in callback params->func. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note: Shall only be used once per connection.

Parameters

• conn – Connection object.
• params – Exchange MTU parameters.

Return values

• 0 – Successfully queued request. Will call params->func on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.
• -EALREADY – The MTU exchange procedure has been already performed.

int bt_gatt_discover(struct bt_conn *conn, struct bt_gatt_discover_params *params)
GATT Discover function.

This procedure is used by a client to discover attributes on a server.
Primary Service Discovery: Procedure allows to discover primary services either by Discover All Primary Services or Discover Primary Services by Service UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

The Response comes in callback params->func. The callback is run from the BT RX thread. params must remain valid until start of callback where iter attr is NULL or callback will return BT_GATT_ITER_STOP.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters
- conn – Connection object.
- params – Discover parameters.

Return values
- 0 – Successfully queued request. Will call params->func on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_read(struct bt_conn *conn, struct bt_gatt_read_params *params)

Read Attribute Value by handle.

This procedure read the attribute value and return it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the start_handle being updated for each instance.

If an instance does contain a long value which cannot be read entirely the caller will need to read the remaining data separately using the handle and offset.

The Response comes in callback params->func. The callback is run from the context specified by ’config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters
- conn – Connection object.
- params – Read parameters.

Return values
- 0 – Successfully queued request. Will call params->func on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_write(struct bt_conn *conn, struct bt_gatt_write_params *params)

Write Attribute Value by handle.
The Response comes in callback params->func. The callback is run from the context specified by `config BT_RECV_CONTEXT`. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from Bluetooth event context. When called from Bluetooth context, this function will instead return -ENOMEM if it would block to avoid a deadlock.

**Parameters**

- **conn** – Connection object.
- **params** – Write parameters.

**Return values**

- **0** – Successfully queued request. Will call params->func on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside Bluetooth event context to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.

```c
int bt_gatt_write_without_response_cb(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign, bt_gatt_complete_func_t func, void *user_data)
```

Write Attribute Value by handle without response with callback.

This function works in the same way as `bt_gatt_write_without_response`. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the `CONFIG_BT_CONN_TX_MAX` option.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

**Parameters**

- **conn** – Connection object.
- **handle** – Attribute handle.
- **data** – Data to be written.
- **length** – Data length.
- **sign** – Whether to sign data.
- **func** – Transmission complete callback.
- **user_data** – User data to be passed back to callback.

**Return values**

- **0** – Successfully queued request.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.

1644 Chapter 6. Connectivity
static inline int bt_gatt_write_without_response(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign)

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- conn – Connection object.
- handle – Attribute handle.
- data – Data to be written.
- length – Data length.
- sign – Whether to sign data.

Return values

- 0 – Successfully queued request.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_subscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)

Subscribe Attribute Value Notification.

This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

The Response comes in callback params->subscribe. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. The Notification callback params->notify is also called from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note: Notifications are asynchronous therefore the params must remain valid while subscribed and cannot be reused for additional subscriptions whilst active.

Parameters

- conn – Connection object.
- params – Subscribe parameters.

Return values

- 0 – Successfully queued request. Will call params->write on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.
int bt_gatt_resubscribe(uint8_t id, const bt_addr_le_t *peer, struct bt_gatt_subscribe_params *params)

Resubscribe Attribute Value Notification subscription.

Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

**Note:** Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

**Parameters**
- id – Local identity (in most cases BT_ID_DEFAULT).
- peer – Remote address.
- params – Subscribe parameters.

**Returns**
0 in case of success or negative value in case of error.

int bt_gatt_unsubscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)

Unsubscribe Attribute Value Notification.

This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.

The Response comes in callback params->func. The callback is run from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Parameters**
- conn – Connection object.
- params – Subscribe parameters.

**Return values**
- 0 – Successfully queued request. Will call params->write on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

void bt_gatt_cancel(struct bt_conn *conn, void *params)

Try to cancel the first pending request identified by params.

This function does not release params for reuse. The usual callbacks for the request still apply. A successful cancel simulates a BT_ATT_ERR_UNLIKELY response from the server.

This function can cancel the following request functions:
- bt_gatt_exchange_mtu
- bt_gatt_discover
- bt_gatt_read
- bt_gatt_write
- bt_gatt_subscribe
• **bt_gatt_unsubscribe**

**Parameters**

- **conn** – The connection the request was issued on.
- **params** – The address params used in the request function call.

```c
#include <gatt.h>

struct bt_gatt_exchange_params
#include <gatt.h> GATT Exchange MTU parameters.

**Public Members**

type (*func)(struct bt_conn *conn, uint8_t err, struct bt_gatt_exchange_params *params)

Response callback.

```c
#include <gatt.h>

struct bt_gatt_discover_params
#include <gatt.h> GATT Discover Attributes parameters.

**Public Members**

const struct bt_uuid *uuid

Discover UUID type.

```c
bt_gatt_discover_func_t func

Discover attribute callback.

```c
uint16_t attr_handle

Include service attribute declaration handle.

```c
uint16_t start_handle

Included service start handle.

```c
Discover start handle.

```c
uint16_t end_handle

Included service end handle.

```c
Discover end handle.

```c
uint8_t type

Discover type.

```c
#include <gatt.h> GATT Read parameters.

**Public Members**

```c
bt_gatt_read_func_t func

Read attribute callback.

```c
6.1. Bluetooth
size_t handle_count
    If equals to 1 single.handle and single.offset are used.
    If greater than 1 multiple.handles are used. If equals to 0 by_uuid is used for Read Using Characteristic UUID.

uint16_t handle
    Attribute handle.

uint16_t offset
    Attribute data offset.

uint16_t *handles
    Attribute handles to read with Read Multiple Characteristic Values.

bool variable
    If true use Read Multiple Variable Length Characteristic Values procedure.
    The values of the set of attributes may be of variable or unknown length. If false use Read Multiple Characteristic Values procedure. The values of the set of attributes must be of a known fixed length, with the exception of the last value that can have a variable length.

uint16_t start_handle
    First requested handle number.

uint16_t end_handle
    Last requested handle number.

const struct bt_uuid *uuid
    2 or 16 octet UUID.

struct bt_gatt_write_params
    #include <gatt.h> GATT Write parameters.

Public Members

bt_gatt_write_func_t func
    Response callback.

uint16_t handle
    Attribute handle.

uint16_t offset
    Attribute data offset.

const void *data
    Data to be written.

uint16_t length
    Length of the data.
struct bt_gatt_subscribe_params
#include <gatt.h> GATT Subscribe parameters.

Public Members

bt_gatt_notify_func_t notify
   Notification value callback.

bt_gatt_subscribe_func_t subscribe
   Subscribe CCC write request response callback If given, called with the subscription pa-
   rameters given when subscribing.

bt_gatt_write_func_t write
   Deprecated:

   uint16_t value_handle
      Subscribe value handle.

   uint16_t ccc_handle
      Subscribe CCC handle.

   uint16_t value
      Subscribe value.

   bt_security_t min_security
      Minimum required security for received notification.
      Notifications and indications received over a connection with a lower security level are
      silently discarded.

   atomic_t flags[ATOMIC_BITMAP_SIZE(BT_GATT_SUBSCRIBE_NUM_FLAGS)]
      Subscription flags.

HCI Drivers

API Reference

group bt_hci_driver
   HCI drivers.

Defines

IS_BT_QUIRK_NO_AUTO_DLE(bt_dev)

BT_HCI_EVT_FLAG_RECV_PRIO

BT_HCI_EVT_FLAG_RECV

6.1. Bluetooth
**Enums**

enum [anonymous]

Values:

enumerator BT_QUIRK_NO_RESET = \textit{BIT}(0)

enumerator BT_QUIRK_NO_AUTO_DLE = \textit{BIT}(1)

enum bt_hci_driver_bus

Possible values for the 'bus' member of the \textit{bt_hci_driver} struct.

Values:

enumerator BT_HCI_DRIVER_BUS_VIRTUAL = 0

enumerator BT_HCI_DRIVER_BUS_USB = 1

enumerator BT_HCI_DRIVER_BUS_PCCARD = 2

enumerator BT_HCI_DRIVER_BUS_UART = 3

enumerator BT_HCI_DRIVER_BUS_RS232 = 4

enumerator BT_HCI_DRIVER_BUS_PCI = 5

enumerator BT_HCI_DRIVER_BUS_SDIO = 6

enumerator BT_HCI_DRIVER_BUS_SPI = 7

enumerator BT_HCI_DRIVER_BUS_I2C = 8

enumerator BT_HCI_DRIVER_BUS_IPM = 9

**Functions**

static inline uint8_t bt_hci_evt_get_flags(uint8_t evt)

Get HCI event flags.

Helper for the HCI driver to get HCI event flags that describes rules that must be followed.

When \texttt{CONFIG_BT_RECV_BLOCKING} is enabled the flags \texttt{BT_HCI_EVT_FLAG_RECV} and \texttt{BT_HCI_EVT_FLAG_RECV_PRIO} indicates if the event should be given to \texttt{bt_recv} or \texttt{bt_recv_prio}.

Parameters

- \texttt{evt} – HCI event code.

Returns

HCI event flags for the specified event.
int bt_recv(struct net_buf *buf)

Receive data from the controller/HCI driver.

This is the main function through which the HCI driver provides the host with data from the controller. The buffer needs to have its type set with the help of \texttt{bt_buf_set_type()} before calling this API.

When \texttt{CONFIG_BT_RECV_BLOCKING} is defined then this API should not be used for so-called high priority HCI events, which should instead be delivered to the host stack through \texttt{bt_recv_prio()}.

\textbf{Parameters}

- \texttt{buf} – Network buffer containing data from the controller.

\textbf{Returns}

0 on success or negative error number on failure.

int bt_recv_prio(struct net_buf *buf)

Receive high priority data from the controller/HCI driver.

This is the same as \texttt{bt_recv()}, except that it should be used for so-called high priority HCI events. There’s a separate \texttt{bt_hci_evt_get_flags()} helper that can be used to identify which events have the BT\_HCI\__EVT\_FLAG\_RECV\_PRIO flag set.

As with \texttt{bt_recv()}, the buffer needs to have its type set with the help of \texttt{bt_buf_set_type()} before calling this API. The only exception is so called high priority HCI events which should be delivered to the host stack through \texttt{bt_recv_prio()} instead.

\textbf{Parameters}

- \texttt{buf} – Network buffer containing data from the controller.

\textbf{Returns}

0 on success or negative error number on failure.

uint8_t bt_read_static_addr(struct bt_hci_vs_static_addr addrs[], uint8_t size)

Read static addresses from the controller.

\textbf{Parameters}

- \texttt{addrs} – Random static address and Identity Root (IR) array.
- \texttt{size} – Size of array.

\textbf{Returns}

Number of addresses read.

int bt_hci_driver_register(const struct bt_hci_driver *drv)

Register a new HCI driver to the Bluetooth stack.

This needs to be called before any application code runs. The \texttt{bt_enable()} API will fail if there is no driver registered.

\textbf{Parameters}

- \texttt{drv} – A \texttt{bt_hci_driver} struct representing the driver.

\textbf{Returns}

0 on success or negative error number on failure.

int bt_hci_transport_setup(const struct device *dev)

Setup the HCI transport, which usually means to reset the Bluetooth IC.

\textbf{Note}: A weak version of this function is included in the H4 driver, so defining it is optional per board.
Parameters
- dev – The device structure for the bus connecting to the IC

Returns
0 on success, negative error value on failure

```
struct net_buf *bt_hci_evt_create(uint8_t evt, uint8_t len)
```
Allocate an HCI event buffer.
This function allocates a new buffer for an HCI event. It is given the event code and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- len – Length of event parameters.

Returns
Newly allocated buffer.

```
struct net_buf *bt_hci_cmd_complete_create(uint16_t op, uint8_t plen)
```
Allocate an HCI Command Complete event buffer.
This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- plen – Length of command parameters.

Returns
Newly allocated buffer.

```
struct net_buf *bt_hci_cmd_status_create(uint16_t op, uint8_t status)
```
Allocate an HCI Command Status event buffer.
This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- status – Status code.

Returns
Newly allocated buffer.

```
struct bt_hci_driver
```
#include <hci_driver.h> Abstraction which represents the HCI transport to the controller.
This struct is used to represent the HCI transport to the Bluetooth controller.

Public Members

```
const char *name
```
Name of the driver.
enum bt_hci_driver_bus bus

Bus of the transport (BT_HCI_DRIVER_BUS_*)

uint32_t quirks

Specific controller quirks.

These are set by the HCI driver and acted upon by the host. They can either be statically
set at buildtime, or set at runtime before the HCI driver's open() callback returns.

int (*open)(void)

Open the HCI transport.

Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the send() handler.

If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to start that thread.

Return

0 on success or negative error number on failure.

int (*close)(void)

Close the HCI transport.

Closes the HCI transport. This function must not return until the transport is closed.

If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to abort that thread.

Return

0 on success or negative error number on failure.

int (*send)(struct net_buf *buf)

Send HCI buffer to controller.

Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of bt_buf_get_type().

Note: This function must only be called from a cooperative thread.

Param buf

Buffer containing data to be sent to the controller.

Return

0 on success or negative error number on failure.

int (*setup)(void)

HCI vendor-specific setup.

Executes vendor-specific commands sequence to initialize BT Controller before BT Host executes Reset sequence.

Note: CONFIG_BT_HCI_SETUP must be selected for this field to be available.

Return

0 on success or negative error number on failure.
HCI RAW channel

**Overview** HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

**API Reference**

```c
#define BT_HCI_RAW_MODE_PASSTHROUGH 0x00
        Passthrough mode.

#define BT_HCI_RAW_MODE_H4 0x01
        H:4 mode.
```

**Functions**

```c
int bt_send(struct net_buf *buf)
        Send packet to the Bluetooth controller.
```

Parameters

- `buf` – netbuf packet to be send
Returns
Zero on success or (negative) error code otherwise.

```c
int bt_hci_raw_set_mode(uint8_t mode)
```
Set Bluetooth RAW channel mode.
Set access mode of Bluetooth RAW channel.

**Parameters**
- `mode` – Access mode.

**Returns**
Zero on success or (negative) error code otherwise.

```c
uint8_t bt_hci_raw_get_mode(void)
```
Get Bluetooth RAW channel mode.
Get access mode of Bluetooth RAW channel.

**Returns**
Access mode.

```c
void bt_hci_raw_cmd_ext_register(struct bt_hci_raw_cmd_ext *cmds, size_t size)
```
Register Bluetooth RAW command extension table.
Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

**Parameters**
- `cmds` – Pointer to the command extension table.
- `size` – Size of the command extension table.

```c
int bt_enable_raw(struct k_fifo *rx_queue)
```
Enable Bluetooth RAW channel:
Enable Bluetooth RAW HCI channel.

**Parameters**
- `rx_queue` – netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

**Returns**
Zero on success or (negative) error code otherwise.

```c
struct bt_hci_raw_cmd_ext

#include <hci_raw.h>
```

**Public Members**

```c
uint16_t op
```
Opcode of the command.

```c
size_t min_len
```
Minimal length of the command.
**Hands Free Profile (HFP)**

**API Reference**

```c
uint8_t (*func)(struct net_buf *buf)
```

Handler function.

**Handler function to be called when a command is intercepted.**

**Param buf**

Buffer containing the command.

**Return**

HCI Status code or BT_HCI_ERR_EXT_HANDLED if command has been handled already and a response has been sent as oppose to BT_HCI_ERR_SUCCESS which just indicates that the command can be sent to the controller to be processed.

---

**Hands Free Profile (HFP)**

**Defines**

- `HFP_HF_CMD_OK`
- `HFP_HF_CMD_ERROR`
- `HFP_HF_CMD_CME_ERROR`
- `HFP_HF_CMD_UNKNOWN_ERROR`

** Enums**

```c
enum bt_hfp_hf_at_cmd
```

**Values:**

- enumerator `BT_HFP_HF_ATA`
- enumerator `BT_HFP_HF_AT_CHUP`

**Functions**

```c
int bt_hfp_hf_register(struct bt_hfp_hf_cb *cb)
```

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

**Parameters**

- `cb` – callback structure.
Returns
0 in case of success or negative value in case of error.

int bt_hfp_hf_send_cmd(struct bt_conn *conn, enum bt_hfp_hf_at_cmd cmd)
Handsfree client Send AT.
Send specific AT commands to handsfree client profile.

Parameters
• conn – Connection object.
• cmd – AT command to be sent.

Returns
0 in case of success or negative value in case of error.

struct bt_hfp_hf_cmd_complete
#include <hfp_hf.h> HFP HF Command completion field.

struct bt_hfp_hf_cb
#include <hfp_hf.h> HFP profile application callback.

Public Members

void (*connected)(struct bt_conn *conn)
HF connected callback to application.
If this callback is provided it will be called whenever the connection completes.
  Param conn
  Connection object.

void (*disconnected)(struct bt_conn *conn)
HF disconnected callback to application.
If this callback is provided it will be called whenever the connection gets disconnected,
including when a connection gets rejected or cancelled or any error in SLC establishment.
  Param conn
  Connection object.

void (*service)(struct bt_conn *conn, uint32_t value)
HF indicator Callback.
This callback provides service indicator value to the application
  Param conn
  Connection object.
  Param value
  service indicator value received from the AG.

void (*call)(struct bt_conn *conn, uint32_t value)
HF indicator Callback.
This callback provides call indicator value to the application
  Param conn
  Connection object.
  Param value
  call indicator value received from the AG.
void (*call_setup)(struct bt_conn *conn, uint32_t value)
   HF indicator Callback.
   This callback provides call setup indicator value to the application
   **Param conn**
   Connection object.
   **Param value**
   call setup indicator value received from the AG.

void (*call_held)(struct bt_conn *conn, uint32_t value)
   HF indicator Callback.
   This callback provides call held indicator value to the application
   **Param conn**
   Connection object.
   **Param value**
   call held indicator value received from the AG.

void (*signal)(struct bt_conn *conn, uint32_t value)
   HF indicator Callback.
   This callback provides signal indicator value to the application
   **Param conn**
   Connection object.
   **Param value**
   signal indicator value received from the AG.

void (*roam)(struct bt_conn *conn, uint32_t value)
   HF indicator Callback.
   This callback provides roaming indicator value to the application
   **Param conn**
   Connection object.
   **Param value**
   roaming indicator value received from the AG.

void (*battery)(struct bt_conn *conn, uint32_t value)
   HF indicator Callback.
   This callback battery service indicator value to the application
   **Param conn**
   Connection object.
   **Param value**
   battery indicator value received from the AG.

void (*ring_indication)(struct bt_conn *conn)
   HF incoming call Ring indication callback to application.
   If this callback is provided it will be called whenever there is an incoming call.
   **Param conn**
   Connection object.

void (*cmd_complete_cb)(struct bt_conn *conn, struct bt_hfp_hf_cmd_complete *cmd)
   HF notify command completed callback to application.
   The command sent from the application is notified about its status
   **Param conn**
   Connection object.
Param cmd
structure contains status of the command including cme.

Logical Link Control and Adaptation Protocol (L2CAP)

L2CAP layer enables connection-oriented channels which can be enable with the configuration option: CONFIG_BT_L2CAP_DYNAMIC_CHANNEL. This channels support segmentation and reassembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the bt_l2cap_chan struct which contains the callbacks in the bt_l2cap_chan_ops struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the recv callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using bt_l2cap_chan_recv_complete() API if processing is asynchronous.

Note: The recv callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

For sending data the bt_l2cap_chan_send() API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using bt_l2cap_server_register() API passing the bt_l2cap_server struct which informs what psm it should listen to, the required security level sec_level, and the callback accept which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of bt_l2cap_chan_connect() API and can be disconnected with the bt_l2cap_chan_disconnect() API. Note that the later can also disconnect channel instances created by servers.

API Reference

group bt_l2cap
L2CAP.

Defines

BT_L2CAP_HDR_SIZE
L2CAP PDU header size, used for buffer size calculations.

BT_L2CAP_TX_MTU
Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

BT_L2CAP_RX_MTU
Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

BT_L2CAP_BUF_SIZE(mtu)
Helper to calculate needed buffer size for L2CAP PDUs.

Useful for creating buffer pools.

Parameters

• mtu – Needed L2CAP PDU MTU.

Returns

Needed buffer size to match the requested L2CAP PDU MTU.
BT_L2CAP_SDU_HDR_SIZE
L2CAP SDU header size, used for buffer size calculations.

BT_L2CAP_SDU_TX_MTU
Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.
The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmenta-
tion, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.
The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application
buffer pool.

BT_L2CAP_SDU_RX_MTU
Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.
The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmenta-
tion, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.
The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application
buffer pool. The application will have to define an alloc_buf callback for the channel in order
to support receiving segmented L2CAP SDUs.

BT_L2CAP_SDU_BUF_SIZE(mtu)
Helper to calculate needed buffer size for L2CAP SDUs.
Useful for creating buffer pools.

Parameters
- mtu – Required BT_L2CAP_*_SDU.

Returns
Needed buffer size to match the requested L2CAP SDU MTU.

BT_L2CAP_LE_CHAN(_ch)
Helper macro getting container object of type bt_l2cap_le_chan address having the same con-
tainer chan member address as object in question.

Parameters
- _ch – Address of object of bt_l2cap_chan type

Returns
Address of in memory bt_l2cap_le_chan object type containing the address of in
question object.

BT_L2CAP_CHAN_SEND_RESERVE
Headroom needed for outgoing L2CAP PDUs.

BT_L2CAP_SDU_CHAN_SEND_RESERVE
Headroom needed for outgoing L2CAP SDUs.

Typedefs

typedef void (*bt_l2cap_chan_destroy_t)(struct bt_l2cap_chan *chan)
Channel destroy callback.

Param chan
Channel object.
typedef enum bt_l2cap_chan_state bt_l2cap_chan_state_t
    Life-span states of L2CAP CoC channel.
    Used only by internal APIs dealing with setting channel to proper state depending on operational context.
    A channel enters the BT_L2CAP_CONNECTING state upon `bt_l2cap_chan_connect`, `bt_l2cap_ecred_chan_connect` or upon returning from `bt_l2cap_server::accept`.
    When a channel leaves the BT_L2CAP_CONNECTING state, `bt_l2cap_chan_ops::connected` is called.

typedef enum bt_l2cap_chan_status bt_l2cap_chan_status_t
    Status of L2CAP channel.

Enums

enum bt_l2cap_chan_state
    Life-span states of L2CAP CoC channel.
    Used only by internal APIs dealing with setting channel to proper state depending on operational context.
    A channel enters the BT_L2CAP_CONNECTING state upon `bt_l2cap_chan_connect`, `bt_l2cap_ecred_chan_connect` or upon returning from `bt_l2cap_server::accept`.
    When a channel leaves the BT_L2CAP_CONNECTING state, `bt_l2cap_chan_ops::connected` is called.
    Values:

    enumerator BT_L2CAP_DISCONNECTED
        Channel disconnected.

    enumerator BT_L2CAP_CONNECTING
        Channel in connecting state.

    enumerator BT_L2CAP_CONFIG
        Channel in config state, BR/EDR specific.

    enumerator BT_L2CAP_CONNECTED
        Channel ready for upper layer traffic on it.

    enumerator BT_L2CAP_DISCONNECTING
        Channel in disconnecting state.

enum bt_l2cap_chan_status
    Status of L2CAP channel.
    Values:

    enumerator BT_L2CAP_STATUS_OUT
        Channel output status.
enumerator BT_L2CAP_STATUS_SHUTDOWN

Channel shutdown status.

Once this status is notified it means the channel will no longer be able to transmit or receive data.

enumerator BT_L2CAP_STATUS_ENCRYPT_PENDING

Channel encryption pending status.

enumerator BT_L2CAP_NUM_STATUS

Functions

int bt_l2cap_server_register(struct bt_l2cap_server *server)

Register L2CAP server.

Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

Parameters

• server – Server structure.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_br_server_register(struct bt_l2cap_server *server)

Register L2CAP server on BR/EDR oriented connection.

Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

Parameters

• server – Server structure.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan **chans, uint16_t psm)

Connect Enhanced Credit Based L2CAP channels.

Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters

• conn – Connection object.

• chans – Array of channel objects.
• psm – Channel PSM to connect to.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_reconfigure(struct bt_l2cap_chan **chans, uint16_t mtu)
Reconfigure Enhanced Credit Based L2CAP channels.

Reconfigure up to 5 L2CAP channels. Channels must be from the same bt_conn. Once reconfiguration is completed each channel reconfigured() callback will be called. MTU cannot be decreased on any of provided channels.

Parameters
• chans – Array of channel objects. Null-terminated. Elements after the first 5 are silently ignored.
• mtu – Channel MTU to reconfigure to.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan *chan, uint16_t psm)
Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead. Channel object passed (over an address of it) as second parameter shouldn't be instantiated in application as standalone. Instead of, application should create transport dedicated L2CAP objects, i.e. type of bt_l2cap_le_chan for LE and/or type of bt_l2cap_br_chan for BR/EDR. Then pass to this API the location (address) of bt_l2cap_chan type object which is a member of both transport dedicated objects.

Parameters
• conn – Connection object.
• chan – Channel object.
• psm – Channel PSM to connect to.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_chan_disconnect(struct bt_l2cap_chan *chan)
Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result the channel disconnected() callback is called. Regarding to input parameter, to get details see reference description to bt_l2cap_chan_connect() API above.

Parameters
• chan – Channel object.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_chan_send(struct bt_l2capChan *chan, struct net_buf *buf)
Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, buf will be queued and sent as and when credits are received from peer. Regarding to first input parameter, to get details see reference description to bt_l2cap_chan_connect() API above.

When sending L2CAP data over an BR/EDR connection the application is sending L2CAP PDUs. The application is required to have reserved BT_L2CAP_CHAN_SEND_RESERVE bytes
in the buffer before sending. The application should use the `BT_L2CAP_BUF_SIZE()` helper to correctly size the buffers for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs. The application can optionally reserve `BT_L2CAP_SDU_CHAN_SEND_RESERVE` bytes in the buffer before sending. By reserving bytes in the buffer the stack can use this buffer as a segment directly, otherwise it will have to allocate a new segment for the first segment. If the application is reserving the bytes it should use the `BT_L2CAP_BUF_SIZE()` helper to correctly size the buffers for the outgoing buffer pool. When segmenting an L2CAP SDU into L2CAP PDUs the stack will first attempt to allocate buffers from the original buffer pool of the L2CAP SDU before using the stacks own buffer pool.

**Note:** Buffer ownership is transferred to the stack in case of success, in case of an error the caller retains the ownership of the buffer.

**Returns**
Bytes sent in case of success or negative value in case of error.

```c
int bt_l2cap_chan_give_credits(struct bt_l2cap_chan *chan, uint16_t additional_credits)
```
Give credits to the remote.

Only available for channels using `bt_l2cap_chan_ops::seg_recv`. `CONFIG_BT_L2CAPSEG_RECV` must be enabled to make this function available.

Each credit given allows the peer to send one segment.

This function depends on a valid `chan` object. Make sure to default-initialize or memset `chan` when allocating or reusing it for new connections.

Adding zero credits is not allowed.

Credits can be given before entering the `BT_L2CAP_CONNECTING` state. Doing so will adjust the ‘initial credits’ sent in the connection PDU.

Must not be called while the channel is in `BT_L2CAP_CONNECTING` state.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_l2cap_chan_recv_complete(struct bt_l2cap_chan *chan, struct net_buf *buf)
```
Complete receiving L2CAP channel data.

Complete the reception of incoming data. This shall only be called if the channel recv callback has returned -EINPROGRESS to process some incoming data. The buffer shall contain the original user data as that is used for storing the credits/segments used by the packet.

**Parameters**
- `chan` – Channel object.
- `buf` – Buffer containing the data.

**Returns**
0 in case of success or negative value in case of error.

```c
struct bt_l2cap_chan
```

`#include <l2cap.h>` L2CAP Channel structure.

**Public Members**
struct bt_conn *conn
    Channel connection reference.

cost struct bt_l2cap_chan_ops *ops
    Channel operations reference.

struct bt_l2cap_le_endpoint
    #include <l2cap.h> LE L2CAP Endpoint structure.

Public Members

uint16_t cid
    Endpoint Channel Identifier (CID)

uint16_t mtu
    Endpoint Maximum Transmission Unit.

uint16_t mps
    Endpoint Maximum PDU payload Size.

uint16_t init_credits
    Endpoint initial credits.

atomic_t credits
    Endpoint credits.

struct bt_l2cap_le_chan
    #include <l2cap.h> LE L2CAP Channel structure.

Public Members

struct bt_l2cap_chan chan
    Common L2CAP channel reference object.

struct bt_l2cap_le_endpoint rx
    Channel Receiving Endpoint.

    If the application has set an alloc_buf channel callback for the channel to support receiving segmented L2CAP SDUs the application should initialize the MTU of the Receiving Endpoint. Otherwise the MTU of the receiving endpoint will be initialized to BT_L2CAP_SDU_RX_MTU by the stack.

    This is the source of the MTU, MPS and credit values when sending L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP and L2CAP_CONFIGURATION_REQ.

uint16_t pending_rx_mtu
    Pending RX MTU on ECFC reconfigure, used internally by stack.
struct `bt_l2cap_le_endpoint` \texttt{tx}

Channel Transmission Endpoint.

This is an image of the remote’s rx.

The MTU and MPS is controlled by the remote by L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP or L2CAP_CONFIGURATION_REQ.

struct `bt_l2cap_br_endpoint`

`#include <l2cap.h>` BREDR L2CAP Endpoint structure.

**Public Members**

`uint16_t cid`

Endpoint Channel Identifier (CID)

`uint16_t mtu`

Endpoint Maximum Transmission Unit.

struct `bt_l2cap_br_chan`

`#include <l2cap.h>` BREDR L2CAP Channel structure.

**Public Members**

struct `bt_l2cap_chan` \texttt{chan}

Common L2CAP channel reference object.

struct `bt_l2cap_br_endpoint` \texttt{rx}

Channel Receiving Endpoint.

struct `bt_l2cap_br_endpoint` \texttt{tx}

Channel Transmission Endpoint.

`uint16_t psm`

Remote PSM to be connected.

`uint8_t ident`

Helps match request context during CoC.

struct `bt_l2cap_chan_ops`

`#include <l2cap.h>` L2CAP Channel operations structure.

**Public Members**

void (*\texttt{connected})(struct `bt_l2cap_chan` *\texttt{chan})

Channel connected callback.

If this callback is provided it will be called whenever the connection completes.
Param chan
The channel that has been connected

void (*disconnected)(struct bt_l2cap_chan *chan)
Channel disconnected callback.
If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.

Param chan
The channel that has been disconnected

void (*encrypt_change)(struct bt_l2cap_chan *chan, uint8_t hci_status)
Channel encrypt_change callback.
If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host’s controller.

Param chan
The channel which has made encryption status changed.

Param status
HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

struct net_buf *(*alloc_seg)(struct bt_l2cap_chan *chan)
Channel alloc_seg callback.
If this callback is provided the channel will use it to allocate buffers to store segments. This avoids wasting big SDU buffers with potentially much smaller PDUs. If this callback is supplied, it must return a valid buffer.

Param chan
The channel requesting a buffer.
Return
Allocated buffer.

struct net_buf *(*alloc_buf)(struct bt_l2cap_chan *chan)
Channel alloc_buf callback.
If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that requires segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to BT_L2CAP_SDU_RX_MTU.

Param chan
The channel requesting a buffer.
Return
Allocated buffer.

int (*recv)(struct bt_l2cap_chan *chan, struct net_buf *buf)
Channel recv callback.

Param chan
The channel receiving data.

Param buf
Buffer containing incoming data.
Return
0 in case of success or negative value in case of error.

Return
-EINPROGRESS in case where user has to confirm once the data has been processed by calling bt_l2cap_chan_recv_complete passing back the buffer received
with its original user_data which contains the number of segments/credits used by the packet.

```c
void (*sent)(struct bt_l2cap_chan *chan)
Channel sent callback.
If this callback is provided it will be called whenever a SDU has been completely sent.
  Param chan
  The channel which has sent data.
```

```c
void (*status)(struct bt_l2cap_chan *chan, atomic_t *status)
Channel status callback.
If this callback is provided it will be called whenever the channel status changes.
  Param chan
  The channel which status changed
  Param status
  The channel status
```

```c
void (*reconfigured)(struct bt_l2cap_chan *chan)
Channel reconfigured callback.
If this callback is provided it will be called whenever peer or local device requested recon-
figuration. Application may check updated MTU and MPS values by inspecting chan->le
endpoints.
  Param chan
  The channel which was reconfigured
```

```c
void (*seg_recv)(struct bt_l2cap_chan *chan, size_t sdu_len, off_t seg_offset, struct
net_buf_simple *seg)
Handle L2CAP segments directly.
This is an alternative to bt_l2cap_chan_ops::recv. They cannot be used together.
This is called immediately for each received segment.
Unlike with bt_l2cap_chan_ops::recv, flow control is explicit. Each time this handler is
invoked, the remote has permanently used up one credit. Use bt_l2cap_chan_give_credits
to give credits.
The start of an SDU is marked by seg_offset == 0. The end of an SDU is marked by
seg_offset + seg->len == sdu_len.
The stack guarantees that:
  • The sender had the credit.
  • The SDU length does not exceed MTU.
  • The segment length does not exceed MPS.
Additionally, the L2CAP protocol is such that:
  • Segments come in order.
  • SDUs cannot be interleaved or aborted halfway.

Note: With this alternative API, the application is responsible for setting the RX MTU
and MPS. The MPS must not exceed BT_L2CAP_RX_MTU.
```
struct bt_l2cap_server
  
#include <l2cap.h> L2CAP Server structure.

Public Members

uint16_t psm
  Server PSM.
  Possible values: 0 A dynamic value will be auto-allocated when bt_l2cap_server_register() is called.
  0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.
  0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

bt_security_t sec_level
  Required minimum security level.

int (*accept)(struct bt_conn *conn, struct bt_l2cap_chan **chan)
  Server accept callback.
  This callback is called whenever a new incoming connection requires authorization.
    Param conn
      The connection that is requesting authorization
    Param chan
      Pointer to received the allocated channel
  Return
    0 in case of success or negative value in case of error.
  Return
    -ENOMEM if no available space for new channel.
  Return
    -EACCES if application did not authorize the connection.
  Return
    -EPERM if encryption key size is too short.

Media Proxy

group bt_media_proxy

Media proxy module.

The media proxy module is the connection point between media players and media controllers.
A media player has (access to) media content and knows how to navigate and play this content. A media controller reads or gets information from a player and controls the player by setting player parameters and giving the player commands.

The media proxy module allows media player implementations to make themselves available to media controllers. And it allows controllers to access, and get updates from, any player.

The media proxy module allows both local and remote control of local player instances: A media controller may be a local application, or it may be a Media Control Service relaying requests from a remote Media Control Client. There may be either local or remote control, or both, or even multiple instances of each.

[Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

Functions

int media_proxy_ctrl_register(struct media_proxy_ctrl_cbs *ctrl_cbs)
Register a controller with the media_proxy.

Parameters
• ctrl_cbs – Callbacks to the controller

Returns
0 if success, errno on failure

int media_proxy_ctrl_discover_player(struct bt_conn *conn)
Discover a remote media player.

Discover a remote media player instance. The remote player instance will be discovered, and
accessed, using Bluetooth, via the media control client and a remote media control service.
This call will start a GATT discovery of the Media Control Service on the peer, and setup
handles and subscriptions.

This shall be called once before any other actions can be executed for the remote player. The
remote player instance will be returned in the discover_player() callback.

Parameters
• conn – The connection to do discovery for

Returns
0 if success, errno on failure

int media_proxy_ctrl_get_player_name(struct media_player *player)
Read Media Player Name.

Parameters
• player – Media player instance pointer

6.1. Bluetooth
Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_id(struct media_player *player)
Read Icon Object ID.
Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_url(struct media_player *player)
Read Icon URL.
Get a URL to the media player's icon.

Parameters
• player – Media player instance pointer

int media_proxy_ctrl_get_track_title(struct media_player *player)
Read Track Title.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_duration(struct media_player *player)
Read Track Duration.
The duration of a track is measured in hundredths of a second.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_position(struct media_player *player)
Read Track Position.
The position of the player (the playing position) is measured in hundredths of a second from
the beginning of the track

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_track_position(struct media_player *player, int32_t position)
Set Track Position.
Set the playing position of the media player in the current track. The position is given in in
hundredths of a second, from the beginning of the track the track for positive values, and
(backwards) from the end of the track for negative values.
Parameters

- player – Media player instance pointer
- position – The track position to set

Returns

0 if success, errno on failure.

```
int media_proxy_ctrl_get_playback_speed(struct media_player *player)
```

Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual playback speed = $2^{\frac{\text{speed parameter}}{64}}$

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

```
int media_proxy_ctrl_set_playback_speed(struct media_player *player, int8_t speed)
```

Set Playback Speed.

See the `get_playback_speed()` function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Parameters

- player – Media player instance pointer
- speed – The playback speed parameter to set

Returns

0 if success, errno on failure.

```
int media_proxy_ctrl_get_seeking_speed(struct media_player *player)
```

Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” or “fast forward” commands.

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

```
int media_proxy_ctrl_get_track_segments_id(struct media_player *player)
```

Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service.
See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Requires Object Transfer Service

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_get_current_track_id(struct media_player *player)

Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_set_current_track_id(struct media_player *player, uint64_t id)

Set Current Track Object ID.

Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Requires Object Transfer Service

Parameters

- player – Media player instance pointer
- id – The ID of a track object

Returns

0 if success, errno on failure.

int media_proxy_ctrl_get_next_track_id(struct media_player *player)

Read Next Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

Requires Object Transfer Service

Parameters

- player – Media player instance pointer

Returns

0 if success, errno on failure.

int media_proxy_ctrl_set_next_track_id(struct media_player *player, uint64_t id)

Set Next Track Object ID.

Change the player's next track to the track given by the ID.

Requires Object Transfer Service

Parameters

- player – Media player instance pointer
id – The ID of a track object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_parent_group_id(struct media_player *player)
Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service
The parent group is the parent of the current group.
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_current_group_id(struct media_player *player)
Read Current Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_current_group_id(struct media_player *player, uint64_t id)
Set Current Group Object ID.
Change the player's current group to the group given by the ID, and the current track to the first track in that group.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• id – The ID of a group object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_order(struct media_player *player)
Read Playing Order.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_set_playing_order(struct media_player *player, uint8_t order)
Set Playing Order.
Set the media player's playing order

Parameters
• player – Media player instance pointer
• order – The playing order to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_orders_supported(struct media_player *player)
Read Playing Orders Supported.
Read a bitmap containing the media player's supported playing orders.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_media_state(struct media_player *player)
Read Media State.
Read the media player's state

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_command(struct media_player *player, const struct mpl_cmd *command)
Send Command.
Send a command to the media player. Commands may cause the media player to change its
state May result in two callbacks - one for the actual sending of the command to the player,
one for the result of the command from the player.

Parameters
• player – Media player instance pointer
• command – The command to send

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_commands_supported(struct media_player *player)
Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_send_search(struct media_player *player, const struct mpl_search *search)

Set Search.
Write a search to the media player. If the search is successful, the search results will be available as a group object in the Object Transfer Service (OTS).

May result in up to three callbacks
• one for the actual sending of the search to the player
• one for the result code for the search from the player
• if the search is successful, one for the the search results object ID in the OTs

Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• search – The search to write

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_search_results_id(struct media_player *player)

Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service.

The search results object is a group object. The search results object only exists if a successful search operation has been done.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

uint8_t media_proxy_ctrl_get_content_ctrl_id(struct media_player *player)

Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_pl_register(struct media_proxy_pl_calls *pl_calls)

Register a player with the media proxy.

Register a player with the media proxy module, for use by media controllers.

The media proxy may call any non-NULL function pointers in the supplied media_proxy_pl_calls structure.

Parameters
• pl_calls – Function pointers to the media player's calls

Returns
0 if success, errno on failure
int media_proxy_pl_init(void)

struct bt_ots *bt_mcs_get_ots(void)

void media_proxy_pl_name_cb(const char *name)
    Player name changed callback.
    To be called when the player's name is changed.

    Parameters
    • name – The name of the player

void media_proxy_pl_icon_url_cb(const char *url)
    Player icon URL changed callback.
    To be called when the player's icon URL is changed.

    Parameters
    • url – The URL of the player's icon

void media_proxy_pl_track_changed_cb(void)
    Track changed callback.
    To be called when the player's current track is changed

void media_proxy_pl_track_title_cb(char *title)
    Track title callback.
    To be called when the player's current track is changed

    Parameters
    • title – The title of the track

void media_proxy_pl_track_duration_cb(int32_t duration)
    Track duration callback.
    To be called when the current track's duration is changed (e.g. due to a track change)
    The track duration is given in hundredths of a second.

    Parameters
    • duration – The track duration

void media_proxy_pl_track_position_cb(int32_t position)
    Track position callback.
    To be called when the media player's position in the track is changed, or when the player is paused or similar.
    Exception: This callback should not be called when the position changes during regular playback, i.e. while the player is playing and playback happens at a constant speed.
    The track position is given in hundredths of a second from the start of the track.

    Parameters
    • position – The media player's position in the track

void media_proxy_pl_playback_speed_cb(int8_t speed)
    Playback speed callback.
    To be called when the playback speed is changed.

    Parameters
    • speed – The playback speed parameter
void media_proxy_pl SEEKING_SPEED_CB(int8_t speed)
    Seeking speed callback.
    To be called when the seeking speed is changed.

    Parameters
    • speed – The seeking speed factor

void media_proxy_pl CURRENT_TRACK_ID_CB(uint64_t id)
    Current track object ID callback.
    To be called when the ID of the current track is changed (e.g. due to a track change).

    Parameters
    • id – The ID of the current track object in the OTS

void media_proxy_pl NEXT_TRACK_ID_CB(uint64_t id)
    Next track object ID callback.
    To be called when the ID of the current track is changed

    Parameters
    • id – The ID of the next track object in the OTS

void media_proxy_pl PARENT_GROUP_ID_CB(uint64_t id)
    Parent group object ID callback.
    To be called when the ID of the parent group is changed

    Parameters
    • id – The ID of the parent group object in the OTS

void media_proxy_pl CURRENT_GROUP_ID_CB(uint64_t id)
    Current group object ID callback.
    To be called when the ID of the current group is changed

    Parameters
    • id – The ID of the current group object in the OTS

void media_proxy_pl PLAYING_ORDER_CB(uint8_t order)
    Playing order callback.
    To be called when the playing order is changed

    Parameters
    • order – The playing order

void media_proxy_pl MEDIA_STATE_CB(uint8_t state)
    Media state callback.
    To be called when the media state is changed

    Parameters
    • state – The media player's state

void media_proxy_pl COMMAND_CB(const struct mpl_cmd_ntf *cmd_ntf)
    Command callback.
    To be called when a command has been sent, to notify whether the command was successfully performed or not. See the MEDIA_PROXY_CMD_* result code defines.

    Parameters
    • cmd_ntf – The result of the command
void media_proxy_pl_commands_supported_cb(uint32_t opcodes)
Commands supported callback.
To be called when the set of commands supported is changed

Parameters
- opcodes – The supported commands opcodes

void media_proxy_pl_search_cb(uint8_t result_code)
Search callback.
To be called when a search has been set to notify whether the search was successfully performed or not. See the MEDIA_PROXY_SEARCH_* result code defines.
The actual results of the search, if successful, can be found in the search results object.

Parameters
- result_code – The result (success or failure) of the search

void media_proxy_pl_search_results_id_cb(uint64_t id)
Search Results object ID callback.
To be called when the ID of the search results is changed (typically as the result of a new successful search).

Parameters
- id – The ID of the search results object in the OTS

struct mpl_cmd
#include <media_proxy.h> Media player command.

struct mpl_cmd_ntf
#include <media_proxy.h> Media command notification.

struct mpl_sci
#include <media_proxy.h> Search control item.

Public Members

uint8_t len
Length of type and parameter.

uint8_t type
MEDIA_PROXY_SEARCH_TYPE_<…>

char param[62]
Search parameter.

struct mpl_search
#include <media_proxy.h> Search.

struct media_proxy_ctrl_cbs
#include <media_proxy.h> Callbacks to a controller, from the media proxy.
Given by a controller when registering
Public Members

void (*local_player_instance)(struct media_player *player, int err)

Media Player Instance callback.
Called when the local Media Player instance is registered or read (TODO). Also called if the local player instance is already registered when the controller is registered. Provides the controller with the pointer to the local player instance.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, or errno on negative value.

void (*player_name_recv)(struct media_player *player, int err, const char *name)

Media Player Name receive callback.
Called when the Media Player Name is read or changed See also media_proxy_ctrl_name_get()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param name**
The name of the media player

void (*icon_id_recv)(struct media_player *player, int err, uint64_t id)

Media Player Icon Object ID receive callback.
Called when the Media Player Icon Object ID is read See also media_proxy_ctrl_get_icon_id()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID of the Icon object in the Object Transfer Service (48 bits)

void (*icon_url_recv)(struct media_player *player, int err, const char *url)

Media Player Icon URL receive callback.
Called when the Media Player Icon URL is read See also media_proxy_ctrl_get_icon_url()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param url**
The URL of the icon

void (*track_changed_recv)(struct media_player *player, int err)

Track changed receive callback.
Called when the Current Track is changed

**Param player**
Media player instance pointer
**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*track_title_recv)(struct media_player *player, int err, const char *title)
Track Title receive callback.
Called when the Track Title is read or changed See also *media_proxy_ctrl_get_track_title()*

  **Param player**
  Media player instance pointer

  **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

  **Param title**
  The title of the current track

void (*track_duration_recv)(struct media_player *player, int err, int32_t duration)
Track Duration receive callback.
Called when the Track Duration is read or changed See also *media_proxy_ctrl_get_track_duration()*

  **Param player**
  Media player instance pointer

  **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

  **Param duration**
  The duration of the current track

void (*track_position_recv)(struct media_player *player, int err, int32_t position)
Track Position receive callback.
Called when the Track Position is read or changed See also *media_proxy_ctrl_get_track_position() and media_proxy_ctrl_set_track_position()**

  **Param player**
  Media player instance pointer

  **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

  **Param position**
  The player's position in the track

void (*track_position_write)(struct media_player *player, int err, int32_t position)
Track Position write callback.
Called when the Track Position is written See also *media_proxy_ctrl_set_track_position().*

  **Param player**
  Media player instance pointer

  **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

  **Param position**
  The position given attempted to write

void (*playback_speed_recv)(struct media_player *player, int err, int8_t speed)
Playback Speed receive callback.
Called when the Playback Speed is read or changed See also `media_proxy_ctrl_get_playback_speed()` and `media_proxy_ctrl_set_playback_speed()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The playback speed parameter

```c
void (*playback_speed_write)(struct media_player *player, int err, int8_t speed)
```

Playback Speed write callback.

Called when the Playback Speed is written See also `media_proxy_ctrl_set_playback_speed()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The playback speed parameter attempted to write

```c
void (*seeking_speed_recv)(struct media_player *player, int err, int8_t speed)
```

Seeking Speed receive callback.

Called when the Seeking Speed is read or changed See also `media_proxy_ctrl_get_seeking_speed()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The seeking speed factor

```c
void (*track_segments_id_recv)(struct media_player *player, int err, uint64_t id)
```

Track Segments Object ID receive callback.

Called when the Track Segments Object ID is read See also `media_proxy_ctrl_get_track_segments_id()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID of the track segments object in Object Transfer Service (48 bits)

```c
void (*current_track_id_recv)(struct media_player *player, int err, uint64_t id)
```

Current Track Object ID receive callback.

Called when the Current Track Object ID is read or changed See also `media_proxy_ctrl_get_current_track_id()` and `media_proxy_ctrl_set_current_track_id()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value
value.

**Param id**
The ID of the current track object in Object Transfer Service (48 bits)

```c
void (*current_track_id_write)(struct media_player *player, int err, uint64_t id)
```

Current Track Object ID write callback.

Called when the Current Track Object ID is written. See also `media_proxy_ctrl_set_current_track_id()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**
  - The ID (48 bits) attempted to write

```c
void (*next_track_id_recv)(struct media_player *player, int err, uint64_t id)
```

Next Track Object ID receive callback.

Called when the Next Track Object ID is read or changed. See also `media_proxy_ctrl_get_next_track_id()` and `media_proxy_ctrl_set_next_track_id()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**
  - The ID of the next track object in Object Transfer Service (48 bits)

```c
void (*next_track_id_write)(struct media_player *player, int err, uint64_t id)
```

Next Track Object ID write callback.

Called when the Next Track Object ID is written. See also `media_proxy_ctrl_set_next_track_id()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**
  - The ID (48 bits) attempted to write

```c
void (*parent_group_id_recv)(struct media_player *player, int err, uint64_t id)
```

Parent Group Object ID receive callback.

Called when the Parent Group Object ID is read or changed. See also `media_proxy_ctrl_get_parent_group_id()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**
  - The ID of the parent group object in Object Transfer Service (48 bits)

```c
void (*current_group_id_recv)(struct media_player *player, int err, uint64_t id)
```

Current Group Object ID receive callback.
Called when the Current Group Object ID is read or changed See also `media_proxy_ctrl_get_current_group_id()` and `media_proxy_ctrl_set_current_group_id()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID of the current group object in Object Transfer Service (48 bits)

```c
void (*current_group_id_write)(struct media_player *player, int err, uint64_t id)
```

Current Group Object ID write callback.

Called when the Current Group Object ID is written See also `media_proxy_ctrl_set_current_group_id()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID (48 bits) attempted to write

```c
void (*playing_order_recv)(struct media_player *player, int err, uint8_t order)
```

Playing Order receive callback.

Called when the Playing Order is read or changed See also `media_proxy_ctrl_get_playing_order()` and `media_proxy_ctrl_set_playing_order()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param order**
The playing order

```c
void (*playing_order_write)(struct media_player *player, int err, uint8_t order)
```

Playing Order write callback.

Called when the Playing Order is written See also `media_proxy_ctrl_set_playing_order()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param order**
The playing order attempted to write

```c
void (*playing_orders_supported_recv)(struct media_player *player, int err, uint16_t orders)
```

Playing Orders Supported receive callback.

Called when the Playing Orders Supported is read See also `media_proxy_ctrl_get_playing_orders_supported()`

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value
value.

**Param orders**

The playing orders supported

```c
void (*media_state_recv)(struct media_player *player, int err, uint8_t state)
```

Media State receive callback.

Called when the Media State is read or changed See also `media_proxy_ctrl_get_media_state()` and `media_proxy_ctrl_send_command()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param state**
  - The media player state

```c
void (*command_send)(struct media_player *player, int err, const struct mpl_cmd *cmd)
```

Command send callback.

Called when a command has been sent See also `media_proxy_ctrl_send_command()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param cmd**
  - The command sent

```c
void (*command_recv)(struct media_player *player, int err, const struct mpl_cmd_ntf *result)
```

Command result receive callback.

Called when a command result has been received See also `media_proxy_ctrl_send_command()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param result**
  - The result received

```c
void (*commands_supported_recv)(struct media_player *player, int err, uint32_t opcodes)
```

Commands supported receive callback.

Called when the Commands Supported is read or changed See also `media_proxy_ctrl_get_commands_supported()`

- **Param player**
  - Media player instance pointer
- **Param err**
  - Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param opcodes**
  - The supported command opcodes (bitmap)

```c
void (*search_send)(struct media_player *player, int err, const struct mpl_search *search)
```

Search send callback.
Called when a search has been sent See also \texttt{media_proxy_ctrl_send_search()}

\textbf{Param player}
Media player instance pointer

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or errno on negative value.

\textbf{Param search}
The search sent

\begin{verbatim}
void (*search_recv)(struct media_player *player, int err, uint8_t result_code)
\end{verbatim}

Search result code receive callback.

Called when a search result code has been received See also \texttt{media_proxy_ctrl_send_search()}

The search result code tells whether the search was successful or not. For a successful search, the actual results of the search (i.e. what was found as a result of the search) can be accessed using the Search Results Object ID. The Search Results Object ID has a separate callback - \texttt{search_results_id_recv()}.

\textbf{Param player}
Media player instance pointer

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or errno on negative value.

\textbf{Param result_code}
Search result code

\begin{verbatim}
void (*search_results_id_recv)(struct media_player *player, int err, uint64_t id)
\end{verbatim}

Search Results Object ID receive callback See also \texttt{media_proxy_ctrl_get_search_results_id()}

Called when the Search Results Object ID is read or changed

\textbf{Param player}
Media player instance pointer

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or errno on negative value.

\textbf{Param id}
The ID of the search results object in Object Transfer Service (48 bits)

\begin{verbatim}
void (*content_ctrl_id_recv)(struct media_player *player, int err, uint8_t ccid)
\end{verbatim}

Content Control ID receive callback.

Called when the Content Control ID is read See also \texttt{media_proxy_ctrl_get_content_ctrl_id()}

\textbf{Param player}
Media player instance pointer

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or errno on negative value.

\textbf{Param ccid}
The content control ID

\begin{verbatim}
struct media_proxy_pl_calls
#include <media_proxy.h> Available calls in a player, that the media proxy can call.
\end{verbatim}

Given by a player when registering.
Public Members

const char *(*get_player_name)(void)
    Read Media Player Name.
    
        Return
            The name of the media player

uint64_t (*get_icon_id)(void)
    Read Icon Object ID.
    Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service
    See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.
    
        Return
            The Icon Object ID

const char *(*get_icon_url)(void)
    Read Icon URL.
    Get a URL to the media player's icon.
    
        Return
            The URL of the Icon

const char *(*get_track_title)(void)
    Read Track Title.
    
        Return
            The title of the current track

int32_t (*get_track_duration)(void)
    Read Track Duration.
    The duration of a track is measured in hundredths of a second.
    
        Return
            The duration of the current track

int32_t (*get_track_position)(void)
    Read Track Position.
    The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track
    
        Return
            The position of the player in the current track

void (*set_track_position)(int32_t position)
    Set Track Position.
    Set the playing position of the media player in the current track. The position is given in hundredths of a second, from the beginning of the track for positive values, and (backwards) from the end of the track for negative values.
    
        Param position
            The player position to set

int8_t (*get_playback_speed)(void)
    Get Playback Speed.
The playback speed parameter is related to the actual playback speed as follows:
actual playback speed = 2 ^ (speed_parameter/64)

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Return
The playback speed parameter

void (*set_playback_speed)(int8_t speed)
Set Playback Speed.
See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Param speed
The playback speed parameter to set

int8_t (*get_seeking_speed)(void)
Get Seeking Speed.
The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.
The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.
Return
The seeking speed factor

uint64_t (*get_track_segments_id)(void)
Read Current Track Segments Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.
Return
Current The Track Segments Object ID

uint64_t (*get_current_track_id)(void)
Read Current Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.
Return
The Current Track Object ID

void (*set_current_track_id)(uint64_t id)
Set Current Track Object ID.
Change the player’s current track to the track given by the ID. (Behaves similarly to the goto track command.)

**Param id**
The ID of a track object

```c
uint64_t (*get_next_track_id)(void)
```

Read Next Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

**Return**
The Next Track Object ID

```c
void (*set_next_track_id)(uint64_t id)
```

Set Next Track Object ID.

Change the player’s next track to the track given by the ID.

**Param id**
The ID of a track object

```c
uint64_t (*get_parent_group_id)(void)
```

Read Parent Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service

The parent group is the parent of the current group.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

**Return**
The Current Group Object ID

```c
uint64_t (*get_current_group_id)(void)
```

Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

**Return**
The Current Group Object ID

```c
void (*set_current_group_id)(uint64_t id)
```

Set Current Group Object ID.

Change the player’s current group to the group given by the ID, and the current track to the first track in that group.

**Param id**
The ID of a group object

```c
uint8_t (*get_playing_order)(void)
```

Read Playing Order.

**Return**
The media player’s current playing order

```c
void (*set_playing_order)(uint8_t order)
```
Set Playing Order.

Set the media player’s playing order. See the MEDIA_PROXY_PLAYING_ORDER_* defines.

**Param order**
The playing order to set

```c
uint16_t (*get_playing_orders_supported)(void)
Read Playing Orders Supported.
Read a bitmap containing the media player’s supported playing orders. See the MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_* defines.

**Return**
The media player's supported playing orders
```

```c
uint8_t (*get_media_state)(void)
Read Media State.
Read the media player's state See the MEDIA_PROXY_MEDIA_STATE_* defines.

**Return**
The media player's state
```

```c
void (*send_command)(const struct mpl_cmd *command)
Send Command.
Send a command to the media player. For command opcodes (play, pause, ...) - see the MEDIA_PROXY_OP_* defines.

**Param command**
The command to send
```

```c
uint32_t (*get_commands_supported)(void)
Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes. See the MEDIA_PROXY_OP_SUP_* defines.

**Return**
The media player's supported command opcodes
```

```c
void (*send_search)(const struct mpl_search *search)
Set Search.
Write a search to the media player. (For the formatting of a search, see the Media Control Service spec and the mcs.h file.)

**Param search**
The search to write
```

```c
uint64_t (*get_search_results_id)(void)
Read Search Results Object ID.
Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service
The search results object is a group object. The search results object only exists if a successful search operation has been done.

**Return**
The Search Results Object ID
```
uint8_t (*get_content_ctrl_id)(void)
Read Content Control ID.
The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Return
The content control ID for the media player

Media Control Client

group bt_gatt_mcc
Bluetooth Media Control Client (MCC) interface.
Updated to the Media Control Profile specification revision 1.0

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Typedefs

typedef void (*bt_mcc_discover_mcs_cb)(struct bt_conn *conn, int err)
Callback function for bt_mcc_discover_mcs()
Called when a media control server is discovered

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_player_name_cb)(struct bt_conn *conn, int err, const char *name)
Callback function for bt_mcc_read_player_name()
Called when the player name is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param name
Player name

typedef void (*bt_mcc_read_icon_url_cb)(struct bt_conn *conn, int err, const char *icon_url)
Callback function for bt_mcc_read_icon_url()
Called when the icon URL is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param icon_url
The URL of the Icon
typedef void (*bt_mcc_track_changed_ntf_cb)(struct bt_conn *conn, int err)
Callback function for track changed notifications.
Called when a track change is notified.
The track changed characteristic is a special case. It can not be read or set, it can only be notified.

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_track_title_cb)(struct bt_conn *conn, int err, const char *title)
Callback function for `bt_mcc_read_track_title()`
Called when the track title is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param title**
The title of the track

typedef void (*bt_mcc_read_track_duration_cb)(struct bt_conn *conn, int err, int32_t dur)
Callback function for `bt_mcc_read_track_duration()`
Called when the track duration is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param dur**
The duration of the track

typedef void (*bt_mcc_read_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for `bt_mcc_read_track_position()`
Called when the track position is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param pos**
The Track Position

typedef void (*bt_mcc_set_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for `bt_mcc_set_track_position()`
Called when the track position is set

**Param conn**
The connection that was used to initialise the media control client

6.1. Bluetooth
**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param pos**
The Track Position set (or attempted to set)

typedef void (*bt_mcc_read_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for `bt_mcc_read_playback_speed()`
Called when the playback speed is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param speed**
The Playback Speed

typedef void (*bt_mcc_set_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for `bt_mcc_set_playback_speed()`
Called when the playback speed is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param speed**
The Playback Speed set (or attempted to set)

typedef void (*bt_mcc_read_seeking_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for `bt_mcc_read_seeking_speed()`
Called when the seeking speed is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param speed**
The Seeking Speed

typedef void (*bt_mcc_read_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)
Callback function for `bt_mcc_read_playing_order()`
Called when the playing order is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param order**
The playback order
typedef void (*bt_mcc_set_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)
Callback function for bt_mcc_set_playing_order()
Called when the playing order is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param order
The Playing Order set (or attempted to set)

typedef void (*bt_mcc_read_playing_orders_supported_cb)(struct bt_conn *conn, int err, uint16_t orders)
Callback function for bt_mcc_read_playing_orders_supported()
Called when the supported playing orders are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param orders
The playing orders supported (bitmap)

typedef void (*bt_mcc_read_media_state_cb)(struct bt_conn *conn, int err, uint8_t state)
Callback function for bt_mcc_read_media_state()
Called when the media state is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param state
The Media State

typedef void (*bt_mcc_send_cmd_cb)(struct bt_conn *conn, int err, const struct mpl_cmd *cmd)
Callback function for bt_mcc_send_cmd()
Called when a command is sent, i.e. when the media control point is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param cmd
The command sent

typedef void (*bt_mcc_cmd_ntf_cb)(struct bt_conn *conn, int err, const struct mpl_cmd_ntf *ntf)
Callback function for command notifications.
Called when the media control point is notified
Notifications for commands (i.e. for writes to the media control point) use a different parameter structure than what is used for sending commands (writing to the media control point)
Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ntf
The command notification

typedef void (*bt_mcc_read_opcodes_supported_cb)(struct bt_conn *conn, int err, uint32_t opcodes)
Callback function for bt_mcc_read_opcodes_supported()
Called when the supported opcodes (commands) are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param opcodes
The supported opcodes

typedef void (*bt_mcc_read_content_control_id_cb)(struct bt_conn *conn, int err, uint8_t ccid)
Callback function for bt_mcc_read_content_control_id()
Called when the content control ID is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ccid
The Content Control ID

Functions

int bt_mcc_init(struct bt_mcc_cb *cb)
Initialize Media Control Client.

Parameters
• cb – Callbacks to be used

Returns
0 if success, errno on failure.

int bt_mcc_discover_mcs(struct bt_conn *conn, bool subscribe)
Discover Media Control Service.
Discover Media Control Service (MCS) on the server given by the connection Optionally sub-
scribe to notifications.
Shall be called once, after media control client initialization and before using other media
control client functionality.

Parameters
• conn – Connection to the peer device
• subscribe – Whether to subscribe to notifications
Returns
0 if success, errno on failure.

int bt_mcc_read_player_name(struct bt_conn *conn)
Read Media Player Name.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_icon_url(struct bt_conn *conn)
Read Icon Object URL.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_title(struct bt_conn *conn)
Read Track Title.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_duration(struct bt_conn *conn)
Read Track Duration.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_position(struct bt_conn *conn)
Read Track Position.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_set_track_position(struct bt_conn *conn, int32_t pos)
Set Track position.

Parameters
• conn – Connection to the peer device
• pos – Track position

Returns
0 if success, errno on failure.

int bt_mcc_read_playback_speed(struct bt_conn *conn)
Read Playback speed.

Parameters

6.1. Bluetooth
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_set_playback_speed(struct bt_conn *conn, int8_t speed)
Set Playback Speed.

Parameters
• conn – Connection to the peer device
• speed – Playback speed

Returns
0 if success, errno on failure.

int bt_mcc_read_seeking_speed(struct bt_conn *conn)
Read Seeking speed.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_playing_order(struct bt_conn *conn)
Read Playing Order.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_set_playing_order(struct bt_conn *conn, uint8_t order)
Set Playing Order.

Parameters
• conn – Connection to the peer device
• order – Playing order

Returns
0 if success, errno on failure.

int bt_mcc_read_playing_orders_supported(struct bt_conn *conn)
Read Playing Orders Supported.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_media_state(struct bt_conn *conn)
Read Media State.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.
int bt_mcc_send_cmd(struct bt_conn *conn, const struct mpl_cmd *cmd)
    Send a command.
    Write a command (e.g. “play”, “pause”) to the server's media control point.

    Parameters
    • conn – Connection to the peer device
    • cmd – The command to send

    Returns
    0 if success, errno on failure.

int bt_mcc_read_opcodes_supported(struct bt_conn *conn)
    Read Opcodes Supported.

    Parameters
    • conn – Connection to the peer device

    Returns
    0 if success, errno on failure.

int bt_mcc_read_content_control_id(struct bt_conn *conn)
    Read Content Control ID.

    Parameters
    • conn – Connection to the peer device

    Returns
    0 if success, errno on failure.

struct bt_mcc_cb

#include <mcc.h>
Media control client callbacks.

Bluetooth Mesh Profile

The Bluetooth mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy.
This module implements the Bluetooth Mesh Profile Specification v1.0.1.
Read more about Bluetooth mesh on the Bluetooth SIG Website.

Core
The core provides functionality for managing the general Bluetooth mesh state.

Low Power Node
The Low Power Node (LPN) role allows battery powered devices to participate in a
mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which
is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio
turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages.
The radio control and polling is managed automatically by the mesh stack, but the LPN API allows
the application to trigger the polling at any time through bt_mesh_lpn_poll(). The LPN operation
parameters, including poll interval, poll event timing and Friend requirements is controlled through the
CONFIG_BT_MESH_LOW_POWER option and related configuration options.

When using the LPN feature with logging, it is strongly recommended to only use the
CONFIG_LOG_MODE_DEFERRED option. Log modes other than the deferred may cause unintended delays
during processing of log messages. This in turns will affect scheduling of the receive delay and receive
window. The same limitation applies for the CONFIG_BT_MESH_FRIEND option.

6.1. Bluetooth
Replay Protection List The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks.

To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, CONFIG_BT_MESH_RPL_STORE_TIMEOUT can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn’t completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss) by calling bt_mesh_rpl_pending_store(). This is up to the node to decide, which RPL entries are to be stored in this case.

Setting CONFIG_BT_MESH_RPL_STORE_TIMEOUT to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between CONFIG_BT_MESH_RPL_STORE_TIMEOUT and calling bt_mesh_rpl_pending_store() may reduce a risk of security vulnerability and flash wear out.

Persistent storage The mesh stack uses the Settings Subsystem for storing the device configuration persistently. When the stack configuration changes and the change needs to be stored persistently, the stack schedules a work item. The delay between scheduling the work item and submitting it to the workqueue is defined by the CONFIG_BT_MESH_STORE_TIMEOUT option. Once storing of data is scheduled, it can not be rescheduled until the work item is processed. Exceptions are made in certain cases as described below.

When IV index, Sequence Number or CDB configuration have to be stored, the work item is submitted to the workqueue without the delay. If the work item was previously scheduled, it will be rescheduled without the delay.

The Replay Protection List uses the same work item to store RPL entries. If storing of RPL entries is requested and no other configuration is pending to be stored, the delay is set to CONFIG_BT_MESH_RPL_STORE_TIMEOUT. If other stack configuration has to be stored, the delay defined by the CONFIG_BT_MESH_STORE_TIMEOUT option is less than CONFIG_BT_MESH_RPL_STORE_TIMEOUT, and the work item was scheduled by the Replay Protection List, the work item will be rescheduled.

When the work item is running, the stack will store all pending configuration, including the RPL entries.

Work item execution context The CONFIG_BT_MESH_SETTINGS_WORKQ option configures the context from which the work item is executed. This option is enabled by default, and results in stack using a dedicated cooperative thread to process the work item. This allows the stack to process other incoming and outgoing messages, as well as other work items submitted to the system workqueue, while the stack configuration is being stored.

When this option is disabled, the work item is submitted to the system workqueue. This means that the system workqueue is blocked for the time it takes to store the stack's configuration. It is not recommended to disable this option as this will make the device non-responsive for a noticeable amount of time.

Advertisement identity All mesh stack bearers advertise data with the BT_ID_DEFAULT local identity. The value is preset in the mesh stack implementation. When Bluetooth® Low Energy (LE) and Bluetooth mesh coexist on the same device, the application should allocate and configure another local identity for Bluetooth LE purposes before starting the communication.
API reference

group bt_mesh

Bluetooth mesh.

Defines

BT_MESH_NET_PRIMARY
Primary Network Key index.

BT_MESH_FEAT_RELAY
Relay feature.

BT_MESH_FEAT_PROXY
GATT Proxy feature.

BT_MESH_FEAT_FRIEND
Friend feature.

BT_MESH_FEAT_LOW_POWER
Low Power Node feature.

BT_MESH_FEAT_SUPPORTED
Supported heartbeat publication features.

BT_MESH_LPN_CB_DEFINE(_name)
Register a callback structure for Friendship events.

Parameters
• _name – Name of callback structure.

BT_MESH_FRIEND_CB_DEFINE(_name)
Register a callback structure for Friendship events.

Registers a callback structure that will be called whenever Friendship gets established or terminated.

Parameters
• _name – Name of callback structure.

Functions

int bt_mesh_init(const struct bt_mesh_prov *prov, const struct bt_mesh_comp *comp)
Initialize Mesh support.

After calling this API, the node will not automatically advertise as unprovisioned, rather the
bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or
more provisioning bearers.

Parameters
• prov – Node provisioning information.
• comp – Node Composition.
Returns
Zero on success or (negative) error code otherwise.

void bt_mesh_reset(void)
Reset the state of the local Mesh node.
Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.
After calling this API, the node will not automatically advertise as unprovisioned, rather the bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

int bt_mesh_suspend(void)
Suspend the Mesh network temporarily.
This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_resume(void)
Resume a suspended Mesh network.
This API resumes the local node, after it has been suspended using the bt_mesh_suspend() API.

Returns
0 on success, or (negative) error code on failure.

void bt_mesh_iv_update_test(bool enable)
Toggle the IV Update test mode.
This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

Parameters
• enable – true to enable IV Update test mode, false to disable it.

bool bt_mesh_iv_update(void)
Toggle the IV Update state.
This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

Returns
true if IV Update In Progress state was entered, false otherwise.

int bt_mesh_lpn_set(bool enable)
Toggle the Low Power feature of the local device.
Enables or disables the Low Power feature of the local device. This is exposed as a run-time feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

Parameters
• enable – true to enable LPN functionality, false to disable it.

Returns
Zero on success or (negative) error code otherwise.
int bt_mesh_lpn_poll(void)
   Send out a Friend Poll message.
   Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

   Returns
   Zero on success or (negative) error code otherwise.

int bt_mesh_friend_terminate(uint16_t lpn_addr)
   Terminate Friendship.
   Terminated Friendship for given LPN.

   Parameters
   • lpn_addr – Low Power Node address.

   Returns
   Zero on success or (negative) error code otherwise.

void bt_mesh_rpl_pending_store(uint16_t addr)
   Store pending RPL entry(ies) in the persistent storage.
   This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.

   Note: When flash is used as the persistent storage, calling this API too frequently may wear it out.

   Parameters
   • addr – Address of the node which RPL entry needs to be stored or BT_MESH_ADDR_ALL_NODES to store all pending RPL entries.

const uint8_t *bt_mesh_va_uuid_get(uint16_t addr, const uint8_t *uuid, uint16_t *retaddr)
   Iterate stored Label UUIDs.
   When addr is BT_MESH_ADDR_UNASSIGNED, this function iterates over all available addresses starting with uuid. In this case, use retaddr to get virtual address representation of the returned Label UUID. When addr is a virtual address, this function returns next Label UUID corresponding to the addr. When uuid is NULL, this function returns the first available UUID. If uuid is previously returned uuid, this function returns following uuid.

   Parameters
   • addr – Virtual address to search for, or BT_MESH_ADDR_UNASSIGNED.
   • uuid – Pointer to the previously returned Label UUID or NULL.
   • retaddr – Pointer to a memory where virtual address representation of the returning UUID is to be stored to.

   Returns
   Pointer to Label UUID, or NULL if no more entries found.

struct bt_mesh_lpn_cb
   #include <main.h> Low Power Node callback functions.

Public Members
void (*established)(uint16_t net_idx, uint16_t friend_addr, uint8_t queue_size, uint8_t recv_window)

Friendship established.

This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.
- **Param queue_size**
  Friend queue size.
- **Param recv_window**
  Low Power Node’s listens duration for Friend response.

void (*terminated)(uint16_t net_idx, uint16_t friend_addr)

Friendship terminated.

This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.

void (*polled)(uint16_t net_idx, uint16_t friend_addr, bool retry)

Local Poll Request.

This callback notifies the application that the local node has polled the friend node.

This callback will be called before `bt_mesh_lpn_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  Friend address.
- **Param retry**
  Retry or first poll request for each transaction.

```c
struct bt_mesh_friend_cb
```

```c
#include <main.h>
```

Friend Node callback functions.

**Public Members**

void (*established)(uint16_t net_idx, uint16_t lpn_addr, uint8_t recv_delay, uint32_t polltimeout)

Friendship established.

This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.
- **Param lpn_addr**
  Low Power Node address.
- **Param recv_delay**
  Receive Delay in units of 1 millisecond.
- **Param polltimeout**
  PollTimeout in units of 1 millisecond.
void (*terminated)(uint16_t net_idx, uint16_t lpn_addr)

Friendship terminated.
This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**
  Low Power Node address.

void (*polled)(uint16_t net_idx, uint16_t lpn_addr)

Friend Poll Request.
This callback notifies the application that the low power node has polled the friend node.
This callback will be called before `bt_mesh_friend_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**
  LPN address.

---

**Access layer**

The access layer is the application's interface to the Bluetooth mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

**Mesh models**

The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into *elements*. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to `bt_mesh_init()` during initialization. The Bluetooth SIG have defined a set of foundation models (see *Mesh models*) and a set of models for implementing common behavior in the Bluetooth Mesh Model Specification. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the *Configuration Server*:

**Opcode list**

The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special `BT_MESH_MODEL_OP_END` entry. This entry must always be present in the opcode list, unless the list is empty. In that case, `BT_MESH_MODEL_NO_OPS` should be used in place of a proper opcode list definition.

**AppKey list**

The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the `CONFIG_BT_MESH_MODEL_KEY_COUNT` configuration option. The contents of the AppKey list is managed by the *Configuration Server*.

---

6.1. Bluetooth
Subscription list  A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the `CONFIG_BT_MESH_MODEL_GROUP_COUNT` configuration option. The contents of the subscription list is managed by the Configuration Server.

Model publication  The models may send messages in two ways:

- By specifying a set of message parameters in a `bt_mesh_msg_ctx`, and calling `bt_mesh_model_send()`.
- By setting up a `bt_mesh_model_pub` structure and calling `bt_mesh_model_publish()`.

When publishing messages with `bt_mesh_model_publish()`, the model will use the publication parameters configured by the Configuration Server. This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to `bt_mesh_model_pub.msg`. The Config Server may also set up period publication for the publication message. To support this, the model must populate the `bt_mesh_model_pub.update` callback. The `bt_mesh_model_pub.update` callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

By setting `bt_mesh_model_pub.retr_update` to 1, the model can configure the `bt_mesh_model_pub.update` callback to be triggered on every retransmission. This can, for example, be used by models that make use of a Delay parameter, which can be adjusted for every retransmission. The `bt_mesh_model_pub_is_retransmission()` function can be used to differentiate a first publication and a retransmission. The `BT_MESH_PUB_MSG_TOTAL` and `BT_MESH_PUB_MSG_NUM` macros can be used to return total number of transmissions and the retransmission number within one publication interval.

Extended models  The Bluetooth mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an “extension tree”. All models in an extension tree share a single subscription list per element it spans.

Model extensions are done by calling `bt_mesh_model_extend()` during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.

The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with `CONFIG_BT_MESH_MODEL_EXTENSIONS` to have any effect.

Model data storage  Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling `bt_mesh_model_data_store()`. To be able to read out the data the next time the device reboots, the model's `bt_mesh_model_cb.settings_set` callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the `read_cb` passed as a parameter to the callback. See the Settings module documentation for details.

When model data changes frequently, storing it on every change may lead to increased wear of flash. To reduce the wear, the model can postpone storing of data by calling
bt_mesh_model_data_store_schedule(). The stack will schedule a work item with delay defined by the CONFIG_BT_MESH_STORE_TIMEOUT option. When the work item is running, the stack will call the bt_mesh_model_cb.pending_store callback for every model that has requested storing of data. The model can then call bt_mesh_model_data_store() to store the data.

If CONFIG_BT_MESH_SETTINGS_WORKQ is enabled, the bt_mesh_model_cb.pending_store callback is called from a dedicated thread. This allows the stack to process other incoming and outgoing messages while model data is being stored. It is recommended to use this option and the bt_mesh_model_data_store_schedule() function when large amount of data needs to be stored.

API reference

group bt_mesh_access
    Access layer.
    
    Group addresses
    
    BT_MESH_ADDR_UNASSIGNED
        unassigned

BT_MESH_MODEL_ID_DFD_CLI
Firmware Distribution Client.

Defines

BT_MESH_ADDR_IS_UNICAST(addr)
Check if a Bluetooth Mesh address is a unicast address.

BT_MESH_ADDR_IS_GROUP(addr)
Check if a Bluetooth Mesh address is a group address.

BT_MESH_ADDR_IS_FIXED_GROUP(addr)
Check if a Bluetooth Mesh address is a fixed group address.

BT_MESH_ADDR_IS_VIRTUAL(addr)
Check if a Bluetooth Mesh address is a virtual address.

BT_MESH_ADDR_IS_RFU(addr)
Check if a Bluetooth Mesh address is a RFU address.

BT_MESH_IS_DEV_KEY(key)
Check if a Bluetooth Mesh key is a device key.

BT_MESH_APP_SEG_SDU_MAX
Maximum size of an access message segment (in octets).

BT_MESH_APP_UNSEG_SDU_MAX
Maximum payload size of an unsegmented access message (in octets).

BT_MESH_RX_SEG_MAX
Maximum number of segments supported for incoming messages.

BT_MESH_TX_SEG_MAX
Maximum number of segments supported for outgoing messages.

BT_MESH_TX_SDU_MAX
Maximum possible payload size of an outgoing access message (in octets).

BT_MESH_RX_SDU_MAX
Maximum possible payload size of an incoming access message (in octets).
BT_MESH_ELEM(_loc, _mods, _vnd_mods)
Helper to define a mesh element within an array.
In case the element has no SIG or Vendor models the helper macro BT_MESH_MODEL_NONE can be given instead.

Parameters
- _loc – Location Descriptor.
- _mods – Array of models.
- _vnd_mods – Array of vendor models.

BT_MESH_MODEL_OP_1(b0)
BT_MESH_MODEL_OP_2(b0, b1)
BT_MESH_MODEL_OP_3(b0, cid)

BT_MESH_LEN_EXACT(len)
Macro for encoding exact message length for fixed-length messages.

BT_MESH_LEN_MIN(len)
Macro for encoding minimum message length for variable-length messages.

BT_MESH_MODEL_OP_END
End of the opcode list.
Must always be present.

BT_MESH_MODEL_NO_OPS
Helper to define an empty opcode list.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

BT_MESH_MODEL_NONE
Helper to define an empty model array.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

BT_MESH_MODEL_CNT_CB(_id, _op, _pub, _user_data, _keys, _grps, _cb)
Composition data SIG model entry with callback functions with specific number of keys & groups.
This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters
- _id – Model ID.
- _op – Array of model opcode handlers.
- _pub – Model publish parameters.
- _user_data – User data for the model.
- _keys – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
- _grps – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
• _cb – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CNT_VND_CB(_company, _id, _op, _pub, _user_data, _keys, _grps, _cb)
Composition data vendor model entry with callback functions with specific number of keys & groups.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters
• _company – Company ID.
• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.
• _keys – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
• _grps – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
• _cb – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CB(_id, _op, _pub, _user_data, _cb)
Composition data SIG model entry with callback functions.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters
• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.
• _cb – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_METADATA_CB(_id, _op, _pub, _user_data, _cb, _metadata)
Composition data SIG model entry with callback functions and metadata.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters
• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.
• _cb – Callback structure, or NULL to keep no callbacks.
• _metadata – Metadata structure.

BT_MESH_MODEL_VND_CB(_company, _id, _op, _pub, _user_data, _cb)
Composition data vendor model entry with callback functions.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.
Parameters

- \_company – Company ID.
- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.
- \_cb – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL_VND_METADATA_CB(_company, _id, _op, _pub, _user_data, _cb, _metadata)`

Composition data vendor model entry with callback functions and metadata.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- \_company – Company ID.
- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.
- \_cb – Callback structure, or NULL to keep no callbacks.
- \_metadata – Metadata structure.

`BT_MESH_MODEL(_id, _op, _pub, _user_data)`

Composition data SIG model entry.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.

`BT_MESH_MODEL_VND(_company, _id, _op, _pub, _user_data)`

Composition data vendor model entry.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- \_company – Company ID.
- \_id – Model ID.
- \_op – Array of model opcode handlers.
- \_pub – Model publish parameters.
- \_user\_data – User data for the model.
BT_MESH_TRANSMIT(count, int_ms)
Encode transmission count & interval steps.

Parameters
• count – Number of retransmissions (first transmission is excluded).
• int_ms – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_TRANSMIT_COUNT(transmit)
Decode transmit count from a transmit value.

Parameters
• transmit – Encoded transmit count & interval value.

Returns
Transmission count (actual transmissions is N + 1).

BT_MESH_TRANSMIT_INT(transmit)
Decode transmit interval from a transmit value.

Parameters
• transmit – Encoded transmit count & interval value.

Returns
Transmission interval in milliseconds.

BT_MESH_PUB_TRANSMIT(count, int_ms)
Encode Publish Retransmit count & interval steps.

Parameters
• count – Number of retransmissions (first transmission is excluded).
• int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_PUB_TRANSMIT_COUNT(transmit)
Decode Publish Retransmit count from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Retransmission count (actual transmissions is N + 1).

BT_MESH_PUB_TRANSMIT_INT(transmit)
Decode Publish Retransmit interval from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Transmission interval in milliseconds.
BT_MESH_PUB_MSG_TOTAL(pub)
Get total number of messages within one publication interval including initial publication.

Parameters
• pub – Model publication context.

Returns
total number of messages.

BT_MESH_PUB_MSG_NUM(pub)
Get message number within one publication interval.
Meant to be used inside bt_mesh_model_pub::update.

Parameters
• pub – Model publication context.

Returns
message number starting from 1.

BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)
Define a model publication context.

Parameters
• _name – Variable name given to the context.
• _update – Optional message update callback (may be NULL).
• _msg_len – Length of the publication message.

BT_MESH_MODELS_METADATA_ENTRY(_len, _id, _data)
Initialize a Models Metadata entry structure in a list.

Parameters
• _len – Length of the metadata entry.
• _id – ID of the Models Metadata entry.
• _data – Pointer to a contiguous memory that contains the metadata.

BT_MESH_MODELS_METADATA_NONE
Helper to define an empty Models metadata array.

BT_MESH_MODELS_METADATA_END
End of the Models Metadata list.
Must always be present.

BT_MESH_TTL_DEFAULT
Special TTL value to request using configured default TTL.

BT_MESH_TTL_MAX
Maximum allowed TTL value.

Functions
int bt_mesh_model_send(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct net_buf_simple *msg, const struct bt_mesh_send_cb *cb, void *cb_data)

Send an Access Layer message.

Parameters
• model – Mesh (client) Model that the message belongs to.
• ctx – Message context, includes keys, TTL, etc.
• msg – Access Layer payload (the actual message to be sent).
• cb – Optional “message sent” callback.
• cb_data – User data to be passed to the callback.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_model_publish(struct bt_mesh_model *model)

Send a model publication message.

Before calling this function, the user needs to ensure that the model publication message (bt_mesh_model_pub::msg) contains a valid message to be sent. Note that this API is only to be used for non-period publishing. For periodic publishing the app only needs to make sure that bt_mesh_model_pub::msg contains a valid message whenever the bt_mesh_model_pub::update callback is called.

Parameters
• model – Mesh (client) Model that’s publishing the message.

Returns
0 on success, or (negative) error code on failure.

static inline bool bt_mesh_model_pub_is_retransmission(const struct bt_mesh_model *model)

Check if a message is being retransmitted.

Meant to be used inside the bt_mesh_model_pub::update callback.

Parameters
• model – Mesh Model that supports publication.

Returns
true if this is a retransmission, false if this is a first publication.

struct bt_mesh_elem *bt_mesh_model_elem(struct bt_mesh_model *mod)

Get the element that a model belongs to.

Parameters
• mod – Mesh model.

Returns
Pointer to the element that the given model belongs to.

struct bt_mesh_model *bt_mesh_model_find(const struct bt_mesh_elem *elem, uint16_t id)

Find a SIG model.

Parameters
• elem – Element to search for the model in.
• id – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no SIG model with the given ID exists in the given element.
**struct bt_mesh_model** bt_mesh_model_find_vnd(const struct bt_mesh_elem *elem, uint16_t company, uint16_t id)

Find a vendor model.

**Parameters**

- **elem** – Element to search for the model in.
- **company** – Company ID of the model.
- **id** – Model ID of the model.

**Returns**

A pointer to the Mesh model matching the given parameters, or NULL if no vendor model with the given ID exists in the given element.

```c
static inline bool bt_mesh_model_in_primary(const struct bt_mesh_model *mod)
```

Get whether the model is in the primary element of the device.

**Parameters**

- **mod** – Mesh model.

**Returns**

true if the model is on the primary element, false otherwise.

```c
int bt_mesh_model_data_store(struct bt_mesh_model *mod, bool vnd, const char *name, const void *data, size_t data_len)
```

Immediately store the model’s user data in persistent storage.

**Parameters**

- **mod** – Mesh model.
- **vnd** – This is a vendor model.
- **name** – Name/key of the settings item. Only SETTINGS_MAX_DIR_DEPTH bytes will be used at most.
- **data** – Model data to store, or NULL to delete any model data.
- **data_len** – Length of the model data.

**Returns**

0 on success, or (negative) error code on failure.

```c
void bt_mesh_model_data_store_schedule(struct bt_mesh_model *mod)
```

Schedule the model’s user data store in persistent storage.

This function triggers the `bt_mesh_model_cb::pending_store` callback for the corresponding model after delay defined by `CONFIG_BT_MESH_STORE_TIMEOUT`.

The delay is global for all models. Once scheduled, the callback can not be re-scheduled until previous schedule completes.

**Parameters**

- **mod** – Mesh model.

```c
int bt_mesh_model_extend(struct bt_mesh_model *extending_mod, struct bt_mesh_model *base_mod)
```

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, ie a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.
All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

**Parameters**

- `extending_mod` – Mesh model that is extending the base model.
- `base_mod` – The model being extended.

**Return values**

- 0 – Successfully extended the `base_mod` model.

```c
int bt_mesh_model_correspond(struct bt_mesh_model *corresponding_mod, struct bt_mesh_model *base_mod)
```

Let a model correspond to another.

Mesh models may correspond to each other, which means that if one is present, other must be present too. A Mesh model may correspond to any number of models, in any element. All models connected together via correspondence form single Correspondence Group, which has its unique Correspondence ID. Information about Correspondence is used to construct Composition Data Page 1.

This function must be called on already initialized `base_mod`. Because this function is designed to be called in `corresponding_mod` initializer, this means that `base_mod` shall be initialized before `corresponding_mod` is.

**Parameters**

- `corresponding_mod` – Mesh model that is corresponding to the base model.
- `base_mod` – The model being corresponded to.

**Return values**

- 0 – Successfully saved correspondence to the `base_mod` model.
- -ENOMEM – There is no more space to save this relation.
- -ENOTSUP – Composition Data Page 1 is not supported.

```c
bool bt_mesh_model_is_extended(struct bt_mesh_model *model)
```

Check if model is extended by another model.

**Parameters**

- `model` – The model to check.

**Return values**

- true – If model is extended by another model, otherwise false

```c
int bt_mesh_comp_change_prepare(void)
```

Indicate that the composition data will change on next bootup.

Tell the config server that the composition data is expected to change on the next bootup, and the current composition data should be backed up.

**Returns**

- Zero on success or (negative) error code otherwise.

```c
int bt_mesh_models_metadata_change_prepare(void)
```

Indicate that the metadata will change on next bootup.

Tell the config server that the models metadata is expected to change on the next bootup, and the current models metadata should be backed up.

**Returns**

- Zero on success or (negative) error code otherwise.
struct bt_mesh_elem
#include <access.h> Abstraction that describes a Mesh Element.

Public Members

uint16_t addr
    Unicast Address.
    Set at runtime during provisioning.

const uint16_t loc
    Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t model_count
    The number of SIG models in this element.

const uint8_t vnd_model_count
    The number of vendor models in this element.

struct bt_mesh_model *const models
    The list of SIG models in this element.

struct bt_mesh_model *const vnd_models
    The list of vendor models in this element.

struct bt_mesh_model_op
#include <access.h> Model opcode handler.

Public Members

const uint32_t opcode
    OpCode encoded using the BT_MESH_MODEL_OP_* macros.

const ssize_t len
    Message length.
    If the message has variable length then this value indicates minimum message length and
    should be positive. Handler function should verify precise length based on the contents
    of the message. If the message has fixed length then this value should be negative. Use
    BT_MESH_LEN_* macros when defining this value.

int (*const func)(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct
    net_buf_simple *buf)
    Handler function for this opcode.
    
    Param model
        Model instance receiving the message.
    
    Param ctx
        Message context for the message.
    
    Param buf
        Message buffer containing the message payload, not including the opcode.
return
Zero on success or (negative) error code otherwise.

struct bt_mesh_model_pub
#include <access.h> Model publication context.
The context should primarily be created using the BT_MESH_MODEL_PUB_DEFINE macro.

Public Members

struct bt_mesh_model *mod
The model the context belongs to.
Initialized by the stack.

uint16_t addr
Publish Address.

const uint8_t *uuid
Label UUID if Publish Address is Virtual Address.

uint16_t key
Publish AppKey Index.

uint16_t cred
Friendship Credentials Flag.

uint16_t send_rel
Force reliable sending (segment acks)

uint16_t fast_period
Use FastPeriodDivisor.

uint16_t retr_update
Call update callback on every retransmission.

uint8_t ttl1
Publish Time to Live.

uint8_t retransmit
Retransmit Count & Interval Steps.

uint8_t period
Publish Period.

uint8_t period_div
Divisor for the Period.

uint8_t count
Transmissions left.
### Public Members

```c
int (*const settings_set)(struct bt_mesh_model *model, const char *name, size_t len_rd, settings_read_cb read_cb, void *cb_arg)
```

Set value handler of user data tied to the model.

**See also:**

- `settings_handler::h_set`

**Param model**
- Model to set the persistent data of.

**Param name**
- Name/key of the settings item.
**Param len_rd**
The size of the data found in the backend.

**Param read_cb**
Function provided to read the data from the backend.

**Param cb_arg**
Arguments for the read function provided by the backend.

**Return**
0 on success, error otherwise.

```c
int (*const start)(struct bt_mesh_model *model)
```
Callback called when the mesh is started.

This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.

When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.

**Param model**
Model this callback belongs to.

**Return**
0 on success, error otherwise.

```c
int (*const init)(struct bt_mesh_model *model)
```
Model init callback.

Called on every model instance during mesh initialization.

If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of `bt_mesh_init`.

**Param model**
Model to be initialized.

**Return**
0 on success, error otherwise.

```c
void (*const reset)(struct bt_mesh_model *model)
```
Model reset callback.

Called when the mesh node is reset. All model data is deleted on reset, and the model should clear its state.

**Note:** If the model stores any persistent data, this needs to be erased manually.

```c
void (*const pending_store)(struct bt_mesh_model *model)
```
Callback used to store pending model's user data.

Triggered by `bt_mesh_model_data_store_schedule`.

To store the user data, call `bt_mesh_model_data_store`.

**Param model**
Model this callback belongs to.

```c
struct bt_mesh_mod_id_vnd
```

`#include <access.h>` Vendor model ID.
Public Members

```c
uint16_t company
    Vendor's company ID.
```

```c
uint16_t id
    Model ID.
```

```c
struct bt_mesh_model
    #include <access.h> Abstraction that describes a Mesh Model instance.
```

Public Members

```c
const uint16_t id
    SIG model ID.
```

```c
const struct bt_mesh_mod_id_vnd vnd
    Vendor model ID.
```

```c
struct bt_mesh_model_pub *const pub
    Model Publication.
```

```c
uint16_t *const keys
    AppKey List.
```

```c
uint16_t *const groups
    Subscription List (group or virtual addresses)
```

```c
const struct bt_mesh_model_op *const op
    Opcode handler list.
```

```c
const struct bt_mesh_model_cb *const cb
    Model callback structure.
```

```c
void *user_data
    Model-specific user data.
```

```c
struct bt_mesh_send_cb
    #include <access.h> Callback structure for monitoring model message sending.
```

Public Members

```c
void (*start)(uint16_t duration, int err, void *cb_data)
    Handler called at the start of the transmission.
```

- **Param duration**
  - The duration of the full transmission.

- **Param err**
  - Error occurring during sending.
**Param cb_data**
Callback data, as passed to the send API.

```c
void (*end)(int err, void *cb_data)
```
Handler called at the end of the transmission.

**Param err**
Error occurring during sending.

**Param cb_data**
Callback data, as passed to the send API.

```c
#include <access.h>
```
Node Composition.

**Public Members**

```c
struct bt_mesh_comp
```

```
#include <access.h> Node Composition.
```

```c
struct bt_mesh_comp
```

- `uint16_t cid`
  Company ID.

- `uint16_t pid`
  Product ID.

- `uint16_t vid`
  Version ID.

- `size_t elem_count`
  The number of elements in this device.

```c
struct bt_mesh_elem *elem
```
List of elements.

**Mesh models**

**Foundation models** The Bluetooth mesh specification defines foundation models that can be used by network administrators to configure and diagnose mesh nodes.

**Configuration Server** The Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a Configuration Client to control it.

..note::
The bt_mesh_cfg_srv structure has been deprecated. The initial values of the Relay, Beacon, Friend, Network transmit and Relay retransmit should be set through Kconfig, and the Heartbeat feature should be controlled through the Heartbeat API.

The Configuration Server model is mandatory on all Bluetooth mesh nodes, and should be instantiated in the first element.

**API reference**

*group bt_mesh_cfg_srv*
Configuration Server Model.

### 6.1. Bluetooth 1735
Defines

`BT_MESH_MODEL_CFG_SRV`
Generic Configuration Server model composition data entry.

Configuration Client   The Configuration Client model is a foundation model defined by the Bluetooth mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a Configuration Server model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Configuration Client model is optional, but should be instantiated on the first element if it is present in the composition data.

API reference

group bt_mesh_cfg_cli
Configuration Client Model.

Defines

`BT_MESH_MODEL_CFG_CLI(cli_data)`
Generic Configuration Client model composition data entry.

Parameters

- `cli_data` – Pointer to a Configuration Client Model instance.

`BT_MESH_PUB_PERIOD_100MS(steps)`
Helper macro to encode model publication period in units of 100ms.

Parameters

- `steps` – Number of 100ms steps.

Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_SEC(steps)`
Helper macro to encode model publication period in units of 1 second.

Parameters

- `steps` – Number of 1 second steps.

Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10SEC(steps)`
Helper macro to encode model publication period in units of 10 seconds.

Parameters

- `steps` – Number of 10 second steps.
Returns
Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10MIN(steps)`
Helper macro to encode model publication period in units of 10 minutes.

Parameters
- `steps` – Number of 10 minute steps.

Returns
Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

Functions

```c
int bt_mesh_cfg_cli_node_reset(uint16_t net_idx, uint16_t addr, bool *status)
```
Reset the target node and remove it from the network.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp, struct net_buf_simple *comp)
```
Get the target node's composition data.

If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in `rsp`.

This method can be used asynchronously by setting `rsp` and `comp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `page` – Composition data page, or 0xff to request the first available page.
- `rsp` – Return parameter for the returned page number, or NULL.
- `comp` – Composition data buffer to fill.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```
Get the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
status – Status response parameter, returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)
```

Get the target node’s network key refresh phase state.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `status` – Status response parameter.
- `phase` – Pointer to the Key Refresh variable to fill.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t transition, uint8_t *status, uint8_t *phase)
```

Set the target node’s network key refresh phase parameters.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `transition` – Transition parameter.
- `status` – Status response parameter.
- `phase` – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node’s network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`. 
• **status** – Status response parameter. Returns one of **BT_MESH_BEACON_DISABLED** or **BT_MESH_BEACON_ENABLED** on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```
Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **ttl** – TTL response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```
Set the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New Time To Live value.
- **ttl** – TTL response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```
Get the target node's Friend feature status.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter. Returns one of **BT_MESH_FRIEND_DISABLED**, **BT_MESH_FRIEND_ENABLED** or **BT_MESH_FRIEND_NOT_SUPPORTED** on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```
Set the target node's Friend feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
• addr – Target node address.
• val – New Friend feature state. Should be one of
  \texttt{BT_MESH_FRIEND_DISABLED} or \texttt{BT_MESH_FRIEND_ENABLED}.
• status – Status response parameter. Returns one of
  \texttt{BT_MESH_FRIEND_DISABLED}, \texttt{BT_MESH_FRIEND_ENABLED} or
  \texttt{BT_MESH_FRIEND_NOT_SUPPORTED} on success.

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_cfg_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
\end{verbatim}

Get the target node’s Proxy feature state.

This method can be used asynchronously by setting \texttt{status} as NULL. This way the method
will not wait for response and will return immediately after sending the command.

\textbf{Parameters}

• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter. Returns one of
  \texttt{BT_MESH_GATT_PROXY_DISABLED}, \texttt{BT_MESH_GATT_PROXY_ENABLED} or
  \texttt{BT_MESH_GATT_PROXY_NOT_SUPPORTED} on success.

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_cfg_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
\end{verbatim}

Set the target node’s Proxy feature state.

This method can be used asynchronously by setting \texttt{status} as NULL. This way the method
will not wait for response and will return immediately after sending the command.

\textbf{Parameters}

• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Proxy feature state. Must be one of
  \texttt{BT_MESH_GATT_PROXY_DISABLED} or \texttt{BT_MESH_GATT_PROXY_ENABLED}.
• status – Status response parameter. Returns one of
  \texttt{BT_MESH_GATT_PROXY_DISABLED}, \texttt{BT_MESH_GATT_PROXY_ENABLED} or
  \texttt{BT_MESH_GATT_PROXY_NOT_SUPPORTED} on success.

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_cfg_cli_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
\end{verbatim}

Get the target node’s network transmit state.

This method can be used asynchronously by setting \texttt{transmit} as NULL. This way the method
will not wait for response and will return immediately after sending the command.

\textbf{Parameters}

• net_idx – Network index to encrypt with.
• addr – Target node address.
• transmit – Network transmit response parameter. Returns the en-
  coded network transmission parameters on success. Decoded with
  \texttt{BT_MESH_TRANSMIT_COUNT} and \texttt{BT_MESH_TRANSMIT_INT}.
Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_net_transmit_set(}\text{uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit})
\]

Set the target node’s network transmit parameters.
This method can be used asynchronously by setting `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
`BT_MESH_TRANSMIT`.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New encoded network transmit parameters.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_relay_get(}\text{uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit})
\]

Get the target node’s Relay feature state.
This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter. Returns one of `BT_MESH_RELAY_DISABLED`, `BT_MESH_RELAY_ENABLED` or `BT_MESH_RELAY_NOT_SUPPORTED` on success.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_relay_set(}\text{uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit})
\]

Set the target node’s Relay parameters.
This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
`BT_MESH_TRANSMIT`.

6.1. Bluetooth
### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_relay` – New relay state. Must be one of `BT_MESH_RELAY_DISABLED` or `BT_MESH_RELAY_ENABLED`.
- `new_transmit` – New encoded relay transmit parameters.
- `status` – Status response parameter. Returns one of `BT_MESH_RELAY_DISABLED`, `BT_MESH_RELAY_ENABLED` or `BT_MESH_RELAY_NOT_SUPPORTED` on success.

### Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)
```

Add a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

### Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_get(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)
```

Get a list of the target node's network key indexes.

This method can be used asynchronously by setting `keys` or `key_cnt` as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `keys` – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
- `key_cnt` – Net key index list length. Should be set to the capacity of the `keys` list when calling. Will return the number of returned network key indexes upon success.

### Returns

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)

Delete a network key from the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index.
- status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Add an application key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index the application key belongs to.
- key_app_idx – Application key index.
- app_key – Application key.
- status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)

Get a list of the target node’s application key indexes for a specific network key.

This method can be used asynchronously by setting status and (keys or key_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index to request the app key indexes of.
- status – Status response parameter.
- keys – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
- key_cnt – App key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned application key indexes upon success.
Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                uint16_t key_app_idx, uint8_t *status)
```

Delete an application key from the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Bind an application to a SIG model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to bind.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Unbind an application from a SIG model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to unbind.
- `mod_id` – Model ID.
- `status` – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Bind an application to a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to bind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Unbind an application from a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to unbind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)

Get a list of all applications bound to a SIG model on the target node.
This method can be used asynchronously by setting status and (apps or app_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **status** – Status response parameter.
• **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **app_cnt** – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t mod_id, uint16_t cid, uint8_t *status,
                                   uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.
This method can be used asynchronously by setting `status` and (apps or app_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.
• **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **app_cnt** – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
                                uint8_t *status)
```

Get publish parameters for a SIG model on the target node.
This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **pub** – Publication parameter return buffer.
• **status** – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)

Get publish parameters for a vendor model on the target node.
This method can be used asynchronously by setting status and pub as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
uint8_t *status)

Set publish parameters for a SIG model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.
pub shall not be NULL.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub,
uint8_t *status)

Set publish parameters for a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.
pub shall not be NULL.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                               uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Add a group address to a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                   uint8_t *status)
```

Add a group address to a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Delete a group address in a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.
Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                   uint8_t *status)
```

Delete a group address in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                     uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a SIG model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a vendor model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
 const uint8_t label[16], uint16_t mod_id, uint16_t
 *virt_addr, uint8_t *status)

Delete a virtual address in a SIG model’s subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address parameter to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
 const uint8_t label[16], uint16_t mod_id, uint16_t
 cid, uint16_t *virt_addr, uint8_t *status)

Delete a virtual address in a vendor model’s subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_mod_sub_va_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)

Get the subscription list of a SIG model on the target node.
This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *
                                    subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *
sub, uint8_t *status)
```

Set the target node’s Heartbeat subscription parameters.

This method can be used Heartbeat subscription parameters by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *
sub, uint8_t *status)
```
• net_idx – Network index to encrypt with.
• addr – Target node address.
• sub – New Heartbeat subscription parameters.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Get the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting status and sub as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• net_idx – Network index to encrypt with.
• addr – Target node address.
• sub – Heartbeat subscription parameter return buffer.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Set the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL;

**Note:** The target node must already have received the specified network key.

**Parameters**
• net_idx – Network index to encrypt with.
• addr – Target node address.
• pub – New Heartbeat publication parameters.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Get the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• net_idx – Network index to encrypt with.
• addr – Target node address.
• pub – Heartbeat publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                  uint16_t mod_id, uint8_t *status)
```

Delete all group addresses in a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del_all_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id,
                                       uint16_t cid, uint8_t *status)
```

Delete all group addresses in a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                   const uint8_t net_key[16], uint8_t *status)
```

Update a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• net_key – Network key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_app_key_update}(\text{uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,}
\text{ uint16_t key_app_idx, const uint8_t app_key[16],}
\text{ uint8_t *status)}
\]

Update an application key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• key_app_idx – Application key index.
• app_key – Application key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_node_identity_set}(\text{uint16_t net_idx, uint16_t addr, uint16_t}
\text{ key_net_idx, uint8_t new_identity , uint8_t *status,}
\text{ uint8_t *identity)}
\]

Set the Node Identity parameters.

This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• new_identity – New identity state. Must be one of \text{BT_MESH_NODE_IDENTITY_STOPPED} or \text{BT_MESH_NODE_IDENTITY_RUNNING}
• key_net_idx – Network key index the application key belongs to.
• status – Status response parameter.
• identity – Identity response parameter.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_cli_node_identity_get}(\text{uint16_t net_idx, uint16_t addr, uint16_t}
\text{ key_net_idx, uint8_t *status, uint8_t *identity)}
\]

Get the Node Identity parameters.

This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• status – Status response parameter.

• identity – Identity response parameter. Must be one of \texttt{BT_MESH_NODE_IDENTITY_STOPPED} or \texttt{BT_MESH_NODE_IDENTITY_RUNNING}

Returns
0 on success, or (negative) error code on failure.

\texttt{int bt\_mesh\_cfg\_cli\_lpn\_timeout\_get(uint16\_t net\_idx, uint16\_t addr, uint16\_t unicast\_addr, int32\_t *polltimeout)}

Get the Low Power Node Polltimeout parameters.
This method can be used asynchronously by setting \texttt{polltimeout} as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• \texttt{net\_idx} – Network index to encrypt with.
• \texttt{addr} – Target node address.
• \texttt{unicast\_addr} – LPN unicast address.
• \texttt{polltimeout} – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

\texttt{int32\_t bt\_mesh\_cfg\_cli\_timeout\_get(void)}

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

\texttt{void bt\_mesh\_cfg\_cli\_timeout\_set(int32\_t timeout)}

Set the transmission timeout value.

Parameters
• \texttt{timeout} – The new transmission timeout.

\texttt{int bt\_mesh\_comp\_p0\_get(struct bt\_mesh\_comp\_p0 *comp, struct net\_buf\_simple *buf)}

Create a composition data page 0 representation from a buffer.

The composition data page object will take ownership over the buffer, which should not be manipulated directly after this call.

This function can be used in combination with \texttt{bt\_mesh\_cfg\_cli\_comp\_data\_get} to read out composition data page 0 from other devices:

\begin{verbatim}
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;

err = bt_mesh_cfg_cli_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
    bt_mesh_comp_p0_get(&comp, &buf);
}
\end{verbatim}

Parameters
• \texttt{buf} – Network buffer containing composition data.
• \texttt{comp} – Composition data structure to fill.

Returns
0 on success, or (negative) error code on failure.
struct bt_mesh_comp_p0_elem *bt_mesh_comp_p0_elem_pull(const struct bt_mesh_comp_p0 *comp, struct bt_mesh_comp_p0_elem *elem)

Pull a composition data page 0 element from a composition data page 0 instance.
Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters
• comp – Composition data page
• elem – Element to fill.

Returns
A pointer to elem on success, or NULL if no more elements could be pulled.

uint16_t bt_mesh_comp_p0_elem_mod(struct bt_mesh_comp_p0_elem *elem, int idx)

Get a SIG model from the given composition data page 0 element.

Parameters
• elem – Element to read the model from.
• idx – Index of the SIG model to read.

Returns
The Model ID of the SIG model at the given index, or 0xffff if the index is out of bounds.

struct bt_mesh_mod_id_vnd bt_mesh_comp_p0_elem_mod_vnd(struct bt_mesh_comp_p0_elem *elem, int idx)

Get a vendor model from the given composition data page 0 element.

Parameters
• elem – Element to read the model from.
• idx – Index of the vendor model to read.

Returns
The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

struct bt_mesh_comp_p1_elem *bt_mesh_comp_p1_elem_pull(struct net_buf_simple *buf, struct bt_mesh_comp_p1_elem *elem)

Pull a Composition Data Page 1 Element from a composition data page 1 instance.
Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters
• buf – Composition data page 1 buffer
• elem – Element to fill.

Returns
A pointer to elem on success, or NULL if no more elements could be pulled.

struct bt_mesh_comp_p1_model_item *bt_mesh_comp_p1_item_pull(struct bt_mesh_comp_p1_elem *elem, struct bt_mesh_comp_p1_model_item *item)

Pull a Composition Data Page 1 Model Item from a Composition Data Page 1 Element.
Each call to this function will pull out a new item from the Composition Data Page 1 Element, until all items have been pulled.

**Parameters**
- `elem` – Composition data page 1 Element
- `item` – Model Item to fill.

**Returns**
A pointer to `item` on success, or NULL if no more elements could be pulled.

```c
struct bt_mesh_comp_p1_ext_item *bt_mesh_comp_p1_pull_ext_item(struct bt_mesh_comp_p1_model_item *item, struct bt_mesh_comp_p1_ext_item *ext_item)
```

Pull Extended Model Item contained in Model Item.
Each call to this function will pull out a new element from the Extended Model Item, until all elements have been pulled.

**Parameters**
- `item` – Model Item to pull Extended Model Items from
- `ext_item` – Extended Model Item to fill

**Returns**
A pointer to `ext_item` on success, or NULL if item could not be pulled

```c
int bt_mesh_key_idx_unpack_list(struct net_buf_simple *buf, uint16_t *dst_arr, size_t *dst_cnt)
```

Unpack a list of key index entries from a buffer.
On success, `dst_cnt` is set to the amount of unpacked key index entries.

**Parameters**
- `buf` – Message buffer containing encoded AppKey or NetKey Indexes.
- `dst_arr` – Destination array for the unpacked list.
- `dst_cnt` – Size of the destination array.

**Returns**
0 on success.

**Returns**
-EMSGSIZE if `dst_arr` size is to small to parse full message.

```c
struct bt_mesh_cfg_cli_cb
#include <cfg_cli.h> Mesh Configuration Client Status messages callback.
```

**Public Members**

```c
void (*comp_data)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t page, struct net_buf_simple *buf)
```
Optional callback for Composition data messages.
Handles received Composition data messages from a server.

**Note:** For decoding `buf`, please refer to `bt_mesh_comp_p0_get` and `bt_mesh_comp_p1_elem_pull`. 

6.1. Bluetooth
void (*mod_pub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub)

Optional callback for Model Pub status messages.

Handles received Model Pub status messages from a server.

void (*mod_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t sub_addr, uint32_t mod_id)

Optional callback for Model Sub Status messages.

Handles received Model Sub Status messages from a server.

void (*mod_sub_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct net_buf_simple *buf)

Optional callback for Model Sub list messages.

Handles received Model Sub list messages from a server.

Note: The buf parameter should be decoded using net_buf_simple_pull_le16 in iteration, as long as buf->len is greater than or equal to 2.
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status code for the message.

**Param elem_addr**
Address of the element.

**Param mod_id**
Model ID.

**Param cid**
Company ID.

**Param buf**
Message buffer containing subscription addresses.

```c
void (*node_reset_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr)
Optional callback for Node Reset Status messages.
Handles received Node Reset Status messages from a server.
**Param cli**
Client that received the status message.
**Param addr**
Address of the sender.
```

```c
void (*beacon_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Beacon Status messages.
Handles received Beacon Status messages from a server.
**Param cli**
Client that received the status message.
**Param addr**
Address of the sender.
**Param status**
Status Code for requesting message.
```

```c
void (*ttl_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Default TTL Status messages.
Handles received Default TTL Status messages from a server.
**Param cli**
Client that received the status message.
**Param addr**
Address of the sender.
**Param status**
Status Code for requesting message.
```

```c
void (*friend_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Friend Status messages.
Handles received Friend Status messages from a server.
**Param cli**
Client that received the status message.
**Param addr**
Address of the sender.
**Param status**
Status Code for requesting message.
```

```c
void (*gatt_proxy_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for GATT Proxy Status messages.
```
Handles received GATT Proxy Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

```c
void (*network_transmit_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status);
```
Optional callback for Network Transmit Status messages.

Handles received Network Transmit Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

```c
void (*relay_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint8_t transmit);
```
Optional callback for Relay Status messages.

Handles received Relay Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param transmit**
The relay retransmit count and interval steps.

```c
void (*net_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx);
```
Optional callback for NetKey Status messages.

Handles received NetKey Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param net_idx**
The index of the NetKey.

```c
void (*net_key_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, struct net_buf_simple *buf);
```
Optional callback for Netkey list messages.

Handles received Netkey list messages from a server.

**Note:** The `buf` parameter should be decoded using the `bt_mesh_key_idx_unpack_list` helper function.

**Param cli**
Client that received the status message.
Param addr
  Address of the sender.
Param buf
  Message buffer containing key indexes.

void (*app_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint16_t app_idx)

Optional callback for AppKey Status messages.
Handles received AppKey Status messages from a server.
  Param cli
    Client that received the status message.
  Param addr
    Address of the sender.
  Param status
    Status Code for requesting message.
  Param net_idx
    The index of the NetKey.
  Param app_idx
    The index of the AppKey.

void (*app_key_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, struct net_buf_simple *buf)

Optional callback for Appkey list messages.
Handles received Appkey list messages from a server.

Note: The buf parameter should be decoded using the bt_mesh_key_idx_unpack_list helper function.

Param cli
  Client that received the status message.
Param addr
  Address of the sender.
Param status
  Status code for the message.
Param net_idx
  The index of the NetKey.
Param buf
  Message buffer containing key indexes.

void (*mod_app_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t app_idx, uint32_t mod_id)

Optional callback for Model App Status messages.
Handles received Model App Status messages from a server.
  Param cli
    Client that received the status message.
  Param addr
    Address of the sender.
  Param status
    Status Code for requesting message.
  Param elem_addr
    The unicast address of the element.
  Param app_idx
    The sub address.
Param mod_id
The model ID within the element.

void (*)(mod_app_list)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct net_buf_simple *buf)
Optional callback for Model App list messages.
Handles received Model App list messages from a server.

Note: The buf parameter should be decoded using the bt_mesh_key_idx_unpack_list helper function.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.
Param elem_addr
Address of the element.
Param mod_id
Model ID.
Param cid
Company ID.
Param buf
Message buffer containing key indexes.

void (*)(node_identity_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t identity)
Optional callback for Node Identity Status messages.
Handles received Node Identity Status messages from a server.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param net_idx
The index of the NetKey.
Param identity
The node identity state.

void (*)(lpn_timeout_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint16_t elem_addr, uint32_t timeout)
Optional callback for LPN PollTimeout Status messages.
Handles received LPN PollTimeout Status messages from a server.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param elem_addr
The unicast address of the LPN.
Param timeout
Current value of PollTimeout timer of the LPN.
void (*krp_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t phase)

Optional callback for Key Refresh Phase status messages.
Handles received Key Refresh Phase status messages from a server.

\begin{itemize}
  \item \textbf{Param cli}
    Client that received the status message.
  \item \textbf{Param addr}
    Address of the sender.
  \item \textbf{Param status}
    Status code for the message.
  \item \textbf{Param net_idx}
    The index of the NetKey.
  \item \textbf{Param phase}
    Phase of the KRP.
\end{itemize}

void (*hb_pub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, struct bt_mesh_cfg_cli_hb_pub *pub)

Optional callback for Heartbeat pub status messages.
Handles received Heartbeat pub status messages from a server.

\begin{itemize}
  \item \textbf{Param cli}
    Client that received the status message.
  \item \textbf{Param addr}
    Address of the sender.
  \item \textbf{Param status}
    Status code for the message.
  \item \textbf{Param pub}
    HB publication configuration parameters.
\end{itemize}

void (*hb_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, struct bt_mesh_cfg_cli_hb_sub *sub)

Optional callback for Heartbeat Sub status messages.
Handles received Heartbeat Sub status messages from a server.

\begin{itemize}
  \item \textbf{Param cli}
    Client that received the status message.
  \item \textbf{Param addr}
    Address of the sender.
  \item \textbf{Param status}
    Status code for the message.
  \item \textbf{Param sub}
    HB subscription configuration parameters.
\end{itemize}

struct bt_mesh_cfg_cli

\texttt{#include <cfg_cli.h>} Mesh Configuration Client Model Context.

\subsection*{Public Members}

\begin{itemize}
  \item \texttt{struct bt_mesh_model *model}
    Composition data model entry pointer.
  \item \texttt{const struct bt_mesh_cfg_cli_cb *cb}
    Optional callback for Mesh Configuration Client Status messages.
\end{itemize}
struct bt_mesh_cfg_cli_mod_pub

#include <cfg_cli.h> Model publication configuration parameters.

Public Members

uint16_t addr
Publication destination address.

const uint8_t *uuid
Virtual address UUID, or NULL if this is not a virtual address.

uint16_t app_idx
Application index to publish with.

bool cred_flag
Friendship credential flag.

uint8_t ttl
Time To Live to publish with.

uint8_t period
Encoded publish period.

See also:
BT_MESH_PUB_PERIOD_100MS, BT_MESH_PUB_PERIOD_SEC,
BT_MESH_PUB_PERIOD_10SEC, BT_MESH_PUB_PERIOD_10MIN

uint8_t transmit
Encoded transmit parameters.

See also:
BT_MESH_TRANSMIT

struct bt_mesh_cfg_cli_hb_sub

#include <cfg_cli.h> Heartbeat subscription configuration parameters.

Public Members

uint16_t src
Source address to receive Heartbeat messages from.

uint16_t dst
Destination address to receive Heartbeat messages on.
uint8_t period

Logarithmic subscription period to keep listening for.

The decoded subscription period is \(1 << (\text{period} - 1)\) seconds, or 0 seconds if period is 0.

uint8_t count

Logarithmic Heartbeat subscription receive count.

The decoded Heartbeat count is \(1 << (\text{count} - 1)\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.

Ignored in Heartbeat subscription set.

uint8_t min

Minimum hops in received messages, i.e. the shortest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

uint8_t max

Maximum hops in received messages, i.e. the longest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

struct bt_mesh_cfg_cli_hb_pub

#include <cfg_cli.h> Heartbeat publication configuration parameters.

Public Members

uint16_t dst

Heartbeat destination address.

uint8_t count

Logarithmic Heartbeat count.

Decoded as \(1 << (\text{count} - 1)\) if count is between 1 and 0x11, 0 if count is 0, or "indefinitely" if count is 0xff.

When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.

When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

uint8_t period

Logarithmic Heartbeat publication transmit interval in seconds.

Decoded as \(1 << (\text{period} - 1)\) if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.
uint8_t ttl
Publication message Time To Live value.

uint16_t feat
Bitmap of features that trigger Heartbeat publications.
Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER

uint16_t net_idx
Network index to publish with.

struct bt_mesh_comp_p0
#include <cfg_cli.h> Parsed Composition data page 0 representation.
Should be pulled from the return buffer passed to bt_mesh_cfg_cli_comp_data_get using bt_mesh_comp_p0_get.

Public Members

uint16_t cid
Company ID.

uint16_t pid
Product ID.

uint16_t vid
Version ID.

uint16_t crpl
Replay protection list size.

uint16_t feat
Supported features, see BT_MESH_FEAT_SUPPORTED.

struct bt_mesh_comp_p0_elem
#include <cfg_cli.h> Composition data page 0 element representation.

Public Members

uint16_t loc
Element location.

size_t nsig
The number of SIG models in this element.

size_t nvendor
The number of vendor models in this element.
struct bt_mesh_comp_p1_elem
    #include <cfg_cli.h>

Public Members

size_t nsig
    The number of SIG models in this element.

size_t nvnd
    The number of vendor models in this element.

struct bt_mesh_comp_p1_model_item
    #include <cfg_cli.h> Composition data page 1 model item representation.

Public Members

bool cor_present
    Corresponding_Group_ID field indicator.

bool format
    Determines the format of Extended Model Item.

uint8_t ext_item_cnt
    Number of items in Extended Model Items.

uint8_t cor_id
    Buffer containing Extended Model Items.
    If cor_present is set to 1 it starts with Corresponding_Group_ID

struct bt_mesh_comp_p1_item_short
    #include <cfg_cli.h> Extended Model Item in short representation.

Public Members

uint8_t elem_offset
    Element address modifier.

uint8_t mod_item_idx
    Model Index.

struct bt_mesh_comp_p1_item_long
    #include <cfg_cli.h> Extended Model Item in long representation.
Public Members

uint8_t elem_offset
Element address modifier.

uint8_t mod_item_idx
Model Index.

struct bt_mesh_comp_p1_ext_item
#include <cfg_cli.h> Extended Model Item.

Public Members

struct bt_mesh_comp_p1_item_short short_item
Item in short representation.

struct bt_mesh_comp_p1_item_long long_item
Item in long representation.

Health Server  The Health Server model provides attention callbacks and node diagnostics for Health Client models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

Faults  The Health Server model may report a list of faults that have occurred in the device's lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node's design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values 0x01 to 0x7f are reserved for the Bluetooth mesh specification, and the full list of specification defined faults are available in Health faults. Fault values 0x80 to 0xff are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

Attention state  The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they're provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: bt_mesh_health_srv_cb.attn_on is called at the beginning of the attention period, bt_mesh_health_srv_cb.attn_off is called at the end.

The remaining time for the attention period may be queried through bt_mesh_health_srv.attn_timer.

API reference

group bt_mesh_health_srv
    Health Server Model.
Defines

\texttt{BT\_MESH\_HEALTH\_PUB\_DEFINE(_name, _max\_faults)}

A helper to define a health publication context.

\textbf{Parameters}

- \texttt{_name} – Name given to the publication context variable.
- \texttt{_max\_faults} – Maximum number of faults the element can have.

\texttt{BT\_MESH\_MODEL\_HEALTH\_SRV(srv, pub)}

Define a new health server model.

Note that this API needs to be repeated for each element that the application wants to have a health server model on. Each instance also needs a unique \texttt{bt\_mesh\_health\_srv} and \texttt{bt\_mesh\_model\_pub} context.

\textbf{Parameters}

- \texttt{srv} – Pointer to a unique struct \texttt{bt\_mesh\_health\_srv}.
- \texttt{pub} – Pointer to a unique struct \texttt{bt\_mesh\_model\_pub}.

\textbf{Returns}

New mesh model instance.

\texttt{BT\_MESH\_HEALTH\_TEST\_INFO\_METADATA\_ID}

Health Test Information Metadata ID.

\texttt{BT\_MESH\_HEALTH\_TEST\_INFO\_METADATA(tests)}

\texttt{BT\_MESH\_HEALTH\_TEST\_INFO(cid, tests...)}

Define a Health Test Info Metadata array.

\textbf{Parameters}

- \texttt{cid} – Company ID of the Health Test suite.
- \texttt{tests} – A comma separated list of tests.

\textbf{Returns}

A comma separated list of values that make Health Test Info Metadata

Functions

\texttt{int bt\_mesh\_health\_srv\_fault\_update(struct bt\_mesh\_elem *elem)}

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

\textbf{Parameters}

- \texttt{elem} – Element to update the fault state of.

\textbf{Returns}

0 on success, or (negative) error code otherwise.

\texttt{struct bt\_mesh\_health\_srv\_cb}

#include \texttt{health\_srv\_h} Callback function for the Health Server model.
Public Members

int (*fault_get_cur)(struct bt_mesh_model *model, uint8_t *test_id, uint16_t *company_id, uint8_t *faults, uint8_t *fault_count)

Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

All faults shall be associated with at least one Company ID, representing the device vendor or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated with one of them at the time. To report faults for multiple Company IDs, interleave which Company ID is reported for each call.

Param model
Health Server model instance to get faults of.

Param test_id
Test ID response buffer.

Param company_id
Company ID response buffer.

Param faults
Array to fill with current faults.

Param fault_count
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

Return
0 on success, or (negative) error code otherwise.

int (*fault_get_reg)(struct bt_mesh_model *model, uint16_t company_id, uint8_t *test_id, uint8_t *faults, uint8_t *fault_count)

Callback for fetching all registered faults.

Registered faults are all past and current faults since the last call to fault_clear. Only faults associated with the given Company ID should be reported.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

Param model
Health Server model instance to get faults of.

Param company_id
Company ID to get faults for.

Param test_id
Test ID response buffer.

Param faults
Array to fill with registered faults.

Param fault_count
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

Return
0 on success, or (negative) error code otherwise.

int (*fault_clear)(struct bt_mesh_model *model, uint16_t company_id)

Clear all registered faults associated with the given Company ID.
**Param model**
Health Server model instance to clear faults of.

**Param company_id**
Company ID to clear faults for.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_test)(struct bt_mesh_model *model, uint8_t test_id, uint16_t company_id)
```

Run a self-test.

The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

**Param model**
Health Server model instance to run test for.

**Param test_id**
Test ID to run.

**Param company_id**
Company ID to run test for.

**Return**
0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn't start.

```c
void (*attn_on)(struct bt_mesh_model *model)
```

Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the `attn_off` callback is called.

**Param model**
Health Server model to start the attention state of.

```c
void (*attn_off)(struct bt_mesh_model *model)
```

Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

**Param model**

```c
struct bt_mesh_health_srv
#include <health_srv.h> Mesh Health Server Model Context.
```

**Public Members**

```c
struct bt_mesh_model *model
Composition data model entry pointer.
```

```c
const struct bt_mesh_health_srv_cb *cb
Optional callback struct.
```

```c
struct k_work_delayable attn_timer
Attention Timer state.
```
Health faults  Fault values defined by the Bluetooth mesh specification.

group bt_mesh_health_faults
  List of specification defined Health fault values.

Defines

BT_MESH_HEALTH_FAULT_NO_FAULT
  No fault has occurred.

BT_MESH_HEALTH_FAULT_VENDOR_SPECIFIC_START
Start of the vendor specific fault values.
All values below this are reserved for the Bluetooth Specification.

**Health Client**  The Health Client model interacts with a Health Server model to read out diagnostics and control the node’s attention state.

All message passing functions in the Health Client API have `cli` as their first parameter. This is a pointer to the client model instance to be used in this function call. The second parameter is the `ctx` or message context. Message context contains netkey index, appkey index and unicast address that the target node uses.

The Health Client model is optional, and may be instantiated in any element. However, if a Health Client model is instantiated in an element other than the first, an instance must also be present in the first element.

*See Health faults* for a list of specification defined fault values.

**API reference**

*group* `bt_mesh_health_cli`

Health Client Model.

**Defines**

`BT_MESH_MODEL_HEALTH_CLI(cli_data)`
Generic Health Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a *Health Client Model* instance.
Functions

`int bt_mesh_health_cli_fault_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)`

Get the registered fault state for the given Company ID.

This method can be used asynchronously by setting `test_id` and (`faults` or `fault_count`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

See also:

Health faults

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to get the registered faults of.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

`int bt_mesh_health_cli_fault_clear(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)`

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting `test_id` and (`faults` or `fault_count`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

See also:

Health faults

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to clear the registered faults for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.
Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid)
```

Clear the registered faults for the given Company ID (unacked).

See also:
**Health faults**

Parameters
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to clear the registered faults for.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)
```

Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting `faults` or `fault_count` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

Parameters
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to invoke the test for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id)
```

Invoke a self-test procedure for the given Company ID (unacked).

Parameters
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to invoke the test for.
- `test_id` – Test ID response buffer.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_period_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *divisor)

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 << \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting \(\text{divisor}\) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \text{period_status} callback in \text{bt_mesh_health_cli} struct.

Parameters
- \(\text{cli}\) – Client model to send on.
- \(\text{ctx}\) – Message context, or NULL to use the configured publish parameters.
- \(\text{divisor}\) – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_period_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor, uint8_t *updated_divisor)

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 << \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting \(\text{updated_divisor}\) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \text{period_status} callback in \text{bt_mesh_health_cli} struct.

Parameters
- \(\text{cli}\) – Client model to send on.
- \(\text{ctx}\) – Message context, or NULL to use the configured publish parameters.
- \(\text{divisor}\) – New Health period divisor.
- \(\text{updated_divisor}\) – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_period_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor)

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

Parameters
- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **divisor** – New Health period divisor.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *attention)
```

Get the current attention timer value.

This method can be used asynchronously by setting `attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `attention_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – Attention timer response buffer, measured in seconds.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention, uint8_t *updated_attention)
```

Set the attention timer.

This method can be used asynchronously by setting `updated_attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `attention_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – New attention timer time, in seconds.
- **updated_attention** – Attention timer response buffer, measured in seconds.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention)
```

Set the attention timer (unacknowledged).

**Parameters**
- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – New attention timer time, in seconds.

**Returns**
0 on success, or (negative) error code on failure.
int32_t bt_mesh_health_cli_timeout_get(void)
    Get the current transmission timeout value.

    Returns
    The configured transmission timeout in milliseconds.

void bt_mesh_health_cli_timeout_set(int32_t timeout)
    Set the transmission timeout value.

    Parameters
    • timeout ~ The new transmission timeout.

struct bt_mesh_health_cli
    #include <health_cli.h> Health Client Model Context.

Public Members

struct bt_mesh_model *model
    Composition data model entry pointer.

struct bt_mesh_model_pub pub
    Publication structure instance.

struct net_buf_simple pub_buf
    Publication buffer.

uint8_t pub_data[BT_MESH_MODEL_BUF_LEN(BT_MESH_MODEL_OP_2(0x80, 0x32), 3)]
    Publication data.

void (*period_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t divisor)
    Optional callback for Health Period Status messages. Handles received Health Period Status messages from a Health server. The divisor param represents the period divisor value.
    Param cli
        Health client that received the status message.
    Param addr
        Address of the sender.
    Param divisor
        Health Period Divisor value.

void (*attention_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t attention)
    Optional callback for Health Attention Status messages. Handles received Health Attention Status messages from a Health server. The attention param represents the current attention value.
    Param cli
        Health client that received the status message.
    Param addr
        Address of the sender.
    Param attention
        Current attention value.
void (*fault_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)

Optional callback for Health Fault Status messages. Handles received Health Fault Status messages from a Health server. The faults array represents all faults that are currently present in the server’s element.

See also:
Health faults

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param test_id
Identifier of a most recently performed test.

Param cid
Company Identifier of the node.

Param faults
Array of faults.

Param fault_count
Number of faults in the fault array.

void (*current_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)

Optional callback for Health Current Status messages. Handles received Health Current Status messages from a Health server. The faults array represents all faults that are currently present in the server’s element.

See also:
Health faults

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param test_id
Identifier of a most recently performed test.

Param cid
Company Identifier of the node.

Param faults
Array of faults.

Param fault_count
Number of faults in the fault array.

Large Composition Data Client The Large Composition Data Client model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_LARGE_COMP_DATA_CLI option.

The Large Composition Data Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of reading pages of Composition Data that do not fit in a Config Composition Data Status message and reading the metadata of the model instances on a node that supports the Large Composition Data Server model.
The Large Composition Data Client model communicates with a Large Composition Data Server model using the device key of the node containing the target Large Composition Data Server model instance. If present, the Large Composition Data Client model must only be instantiated on the primary element.

**API reference**

group bt_mesh_large_comp_data_cli

**Defines**

\[
\text{BT_MESH_MODEL_LARGE_COMP_DATA_CLI}(\text{cli}_\text{data})
\]

Large Composition Data Client model Composition Data entry.

**Parameters**

- `cli_data` – Pointer to a Large Composition Data Client model instance.

**Functions**

```
int bt_mesh_large_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct bt_mesh_large_comp_data_rsp *rsp)
```

Send Large Composition Data Get message.

This API is used to read a portion of a Composition Data Page. This API can be used asynchronously by setting `rsp` as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When `rsp` is set, the user is responsible for providing a buffer for the Composition Data in `bt_mesh_large_comp_data_rsp::data`. If a buffer is not provided, the metadata won't be copied.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node element address.
- `page` – Composition Data Page to read.
- `offset` – Offset within the Composition Data Page.
- `rsp` – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

**Returns**

0 on success, or (negative) error code on failure.

```
int bt_mesh_models_metadata_get(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct bt_mesh_large_comp_data_rsp *rsp)
```

Send Models Metadata Get message.

This API is used to read a portion of a Models Metadata Page. This API can be used asynchronously by setting `rsp` as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When `rsp` is set, a user is responsible for providing a buffer for metadata in `bt_mesh_large_comp_data_rsp::data`. If a buffer is not provided, the metadata won't be copied.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node element address.
• page – Models Metadata Page to read.
• offset – Offset within the Models Metadata Page.
• rsp – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

Returns
0 on success, or (negative) error code on failure.

struct bt_mesh_large_comp_data_rsp
#include <large_comp_data_cli.h> Large Composition Data response.

Public Members

uint8_t page
Page number.

uint16_t offset
Offset within the page.

uint16_t total_size
Total size of the page.

struct net_buf_simple *data
Pointer to allocated buffer for storing received data.

struct bt_mesh_large_comp_data_cli_cb
#include <large_comp_data_cli.h> Large Composition Data Status messages callbacks.

Public Members

void (*large_comp_data_status)(struct bt_mesh_large_comp_data_cli *cli, uint16_t addr,
struct bt_mesh_large_comp_data_rsp *rsp)
Optional callback for Large Composition Data Status message.
Handles received Large Composition Data Status messages from a Large Composition Data Server.
If the content of rsp is needed after exiting this callback, a user should deep copy it.

Param cli
Large Composition Data Client context.

Param addr
Address of the sender.

Param rsp
Response received from the server.

void (*models_metadata_status)(struct bt_mesh_large_comp_data_cli *cli, uint16_t addr,
struct bt_mesh_large_comp_data_rsp *rsp)
Optional callback for Models Metadata Status message.
Handles received Models Metadata Status messages from a Large Composition Data Server.
If the content of rsp is needed after exiting this callback, a user should deep copy it.
Param `cli`

Large Composition Data Client context.

Param `addr`

Address of the sender.

Param `rsp`

Response received from the server.

```c
struct bt_mesh_large_comp_data_cli

#include <large_comp_data_cli.h> Large Composition Data Client model context.
```

### Public Members

```c
struct bt_mesh_model *model

Model entry pointer.
```

```c
struct bt_mesh_msg_ack_ctx ack_ctx

Internal parameters for tracking message responses.
```

```c
const struct bt_mesh_large_comp_data_cli_cb *cb

Optional callback for Large Composition Data Status messages.
```

---

**Large Composition Data Server**

The Large Composition Data Server model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled through the `CONFIG_BT_MESH_LARGE_COMP_DATA_SRV` option.

The Large Composition Data Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of exposing pages of Composition Data that do not fit in a Config Composition Data Status message and to expose metadata of the model instances.

The Large Composition Data Server does not have an API of its own and relies on a **Large Composition Data Client** to control it. The model only accepts messages encrypted with the node’s device key.

If present, the Large Composition Data Server model must only be instantiated on the primary element.

**Models metadata**

The Large Composition Data Server model allows each model to have a list of model’s specific metadata that can be read by the Large Composition Data Client model. The metadata list can be associated with the `bt_mesh_model` through the `bt_mesh_model.metadata` field. The metadata list consists of one or more entries defined by the `bt_mesh_models_metadata_entry` structure. Each entry contains the length and ID of the metadata, and a pointer to the raw data. Entries can be created using the `BT_MESH_MODELS_METADATA_ENTRY` macro. The `BT_MESH_MODELS_METADATA_END` macro marks the end of the metadata list and must always be present. If the model has no metadata, the helper macro `BT_MESH_MODELS_METADATA_NONE` can be used instead.

### API reference

#### group bt_mesh_large_comp_data_srv

**Defines**

```c
BT_MESH_MODEL_LARGE_COMP_DATA_SRV

Large Composition Data Server model composition data entry.
```
On-Demand Private Proxy Client  The On-Demand Private Proxy Client model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled with the CONFIG_BT_MESH_OD_PRIV_PROXY_CLI option.

The On-Demand Private Proxy Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to set and retrieve the On-Demand Private GATT Proxy state. The state defines how long a node will advertise Mesh Proxy Service with Private Network Identity type after it receives a Solicitation PDU.

The On-Demand Private Proxy Client model communicates with an On-Demand Private Proxy Server model using the device key of the node containing the target On-Demand Private Proxy Server model instance.

Configurations  The On-Demand Private Proxy Client model behavior can be configured with the transmission timeout option CONFIG_BT_MESH_OD_PRIV_PROXY_CLI_TIMEOUT. The CONFIG_BT_MESH_OD_PRIV_PROXY_CLI_TIMEOUT controls how long the Client waits for a state response message to arrive in milliseconds. This value can be changed at runtime using bt_mesh_od_priv_proxy_cli_timeout_set().

API reference

group bt_mesh_od_priv_proxy_cli

Defines

BT_MESH_MODEL_OD_PRIV_PROXY_CLI(cli_data)
On-Demand Private Proxy Client model composition data entry.

Functions

int bt_mesh_od_priv_proxy_cli_get(struct bt_mesh_msg_ctx *ctx, uint8_t *val_rsp)
Get the target's On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting val_rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the od_status callback in bt_mesh_od_priv_proxy_cli struct.

Parameters

• ctx – Message context for the message.
• val_rsp – Response buffer for On-Demand Private GATT Proxy value.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_od_priv_proxy_cli_set(struct bt_mesh_msg_ctx *ctx, uint8_t val, uint8_t *val_rsp)
Set the target’s On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting val_rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the od_status callback in bt_mesh_od_priv_proxy_cli struct.

Parameters

• ctx – Message context for the message.
void bt_mesh_od_priv_proxy_cli_timeout_set(int32_t timeout)
Set the transmission timeout value.

Parameters
• timeout – The new transmission timeout in milliseconds.

struct bt_mesh_od_priv_proxy_cli
#include <od_priv_proxy_cli.h> On-Demand Private Proxy Client Model Context.

Public Members

struct bt_mesh_model *model
Solicitation PDU RPL model entry pointer.

void (*od_status)(struct bt_mesh_od_priv_proxy_cli *cli, uint16_t addr, uint8_t state)
Optional callback for On-Demand Private Proxy Status messages.
Handles received On-Demand Private Proxy Status messages from a On-Demand Private
Proxy server. The state param represents state of On-Demand Private Proxy server.
  Param cli
   On-Demand Private Proxy client that received the status message.
  Param addr
   Address of the sender.
  Param state
   State value.

On-Demand Private Proxy Server  The On-Demand Private Proxy Server model is a foundation model
defined by the Bluetooth mesh specification. It is enabled with the CONFIG_BT_MESH_OD_PRIV_PROXY_SRV option.
The On-Demand Private Proxy Server model was introduced in the Bluetooth Mesh Protocol Specification
version 1.1, and supports the configuration of advertising with Private Network Identity type of a node
that is a recipient of Solicitation PDUs by managing its On-Demand Private GATT Proxy state.
When enabled, the Solicitation PDU RPL Configuration Server is also enabled. The On-Demand Private
Proxy Server is dependent on the Private Beacon Server to be present on the node.
The On-Demand Private Proxy Server does not have an API of its own, and relies on a On-Demand Private
Proxy Client to control it. The On-Demand Private Proxy Server model only accepts messages encrypted
with the node’s device key.
If present, the On-Demand Private Proxy Server model must be instantiated on the primary element.

group bt_mesh_od_priv_proxy_srv
Defines

BT_MESH_MODEL_OD_PRIV_PROXY_SRV
On-Demand Private Proxy Server model composition data entry.

Opcodes Aggregator Client  The Opcodes Aggregator Client model is a foundation model defined by the Bluetooth mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_OP_AGG_CLI option.

The Opcodes Aggregator Client model is introduced in the Bluetooth Mesh Profile Specification version 1.1, and is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the Opcodes Aggregator Server model.

The Opcodes Aggregator Client model communicates with an Opcodes Aggregator Server model using the device key of the target node or the application keys configured by the Configuration Client.

The Opcodes Aggregator Client model must only be instantiated on the primary element, and it is implicitly bound to the device key on initialization.

The Opcodes Aggregator Client model should be bound to the same application keys that the client models, used to produce the sequence of messages, are bound to.

To be able to aggregate a message from a client model, it should support an asynchronous API, for example through callbacks.

API reference

group bt_mesh_op_agg_cli

Defines

BT_MESH_MODEL_OP_AGG_CLI
Opcodes Aggregator Client model composition data entry.

Functions

int bt_mesh_op_agg_cli_seq_start(uint16_t net_idx, uint16_t app_idx, uint16_t dst, uint16_t elem_addr)
Configure Opcodes Aggregator context.

Parameters

• net_idx – NetKey index to encrypt with.
• app_idx – AppKey index to encrypt with.
• dst – Target Opcodes Aggregator Server address.
• elem_addr – Target node element address for the sequence message.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_op_agg_cli_seq_send(void)
Opcodes Aggregator message send.

Uses previously configured context and sends aggregated message to target node.
Returns
0 on success, or (negative) error code on failure.

`void bt_mesh_op_agg_cli_seq_abort(void)`
Abort Opcodes Aggregator context.

`bool bt_mesh_op_agg_cli_seq_is_started(void)`
Check if Opcodes Aggregator Sequence context is started.

Returns
ture if it is started, otherwise false.

`size_t bt_mesh_op_agg_cli_seq_tailroom(void)`
Get Opcodes Aggregator context tailroom.

Returns
Remaning tailroom of Opcodes Aggregator SDU.

`int32_t bt_mesh_op_agg_cli_timeout_get(void)`
Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

`void bt_mesh_op_agg_cli_timeout_set(int32_t timeout)`
Set the transmission timeout value.

Parameters
• timeout – The new transmission timeout.

Opcodes Aggregator Server The Opcodes Aggregator Server model is a foundation model defined by the Bluetooth mesh specification. It is an optional model, enabled with the `CONFIG_BT_MESH_OP_AGG_SRV` option.

The Opcodes Aggregator Server model is introduced in the Bluetooth Mesh Profile Specification version 1.1, and is used to support the functionality of processing a sequence of access layer messages.

The Opcodes Aggregator Server model accepts messages encrypted with the node's device key or the application keys.

The Opcodes Aggregator Server model can only be instantiated on the node's primary element.

The targeted server models should be bound to the same application key that is used to encrypt the sequence of access layer messages sent to the Opcodes Aggregator Server.

The Opcodes Aggregator Server handles aggregated messages and dispatches them to the respective models and their message handlers. Current implementation assumes that responses are sent from the same execution context as the received message and doesn't allow to send a postponed response, for example from a work queue.

API reference

Defines

`BT_MESH_MODEL_OP_AGG_SRV`
Opcodes Aggregator Server model composition data entry.
Note: The Opcodes Aggregator Server handles aggregated messages and dispatches them to the respective models and their message handlers. Current implementation assumes that responses are sent from the same execution context as the received message and doesn’t allow to send a postponed response, e.g. from workqueue.

Private Beacon Server  The Private Beacon Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with `CONFIG_BT_MESH_PRIV_BEACON_SRV` option.

The Private Beacon Server model is introduced in the Bluetooth Mesh Profile Specification version 1.1, and controls the mesh node’s Private Beacon state, Private GATT Proxy state and Private Node Identity state.

The Private Beacons feature adds privacy to the different Bluetooth mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network’s IV index, IV update and the Key Refresh state. The Private Beacon Server must be instantiated for the device to support sending of the private beacons, but the node will process received private beacons without it.

The Private Beacon Server does not have an API of its own, but relies on a Private Beacon Client to control it. The Private Beacon Server model only accepts messages encrypted with the node’s device key.

The application can configure the initial parameters of the Private Beacon Server model through the `bt_mesh_priv_beacon_srv` instance passed to `BT_MESH_MODEL_PRIV_BEACON_SRV`. Note that if the mesh node stored changes to this configuration in the settings subsystem, the initial values may be overwritten upon loading.

The Private Beacon Server model is optional, and can only be instantiated in the node’s primary element.

API reference

```
group bt_mesh_priv_beacon_srv

Defines

BT_MESH_MODEL_PRIV_BEACON_SRV

Private Beacon Server model composition data entry.
```

Private Beacon Client  The Private Beacon Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_PRIV_BEACON_CLI` option.

The Private Beacon Client model is introduced in the Bluetooth Mesh Profile Specification version 1.1, and provides functionality for configuring the Private Beacon Server models.

The Private Beacons feature adds privacy to the different Bluetooth mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network’s IV index, IV update and the Key Refresh state.

The Private Beacon Client model communicates with a Private Beacon Server model using the device key of the target node. The Private Beacon Client model may communicate with servers on other nodes or self-configure through the local Private Beacon Server model.

All configuration functions in the Private Beacon Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and the primary unicast address the target node was provisioned with.

The Private Beacon Client model is optional, and can be instantiated on any element.
API reference

group bt_mesh_priv_beacon_cli

Defines

BT_MESH_MODEL_PRIV_BEACON_CLI(cli_data)
Private Beacon Client model composition data entry.

Parameters

• cli_data – Pointer to a Bluetooth Mesh Private Beacon Client instance.

Functions

int bt_mesh_priv_beacon_cli_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_beacon *val)
Set the target's Private Beacon state.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Private Beacon value. Returns response status on success.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_priv_beacon_cli_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_beacon *val)
Get the target's Private Beacon state.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – Response buffer for Private Beacon value.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_priv_beacon_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t *val)
Set the target's Private GATT Proxy state.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Private GATT Proxy value. Returns response status on success.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_priv_beacon_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *val)
Get the target's Private GATT Proxy state.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – Response buffer for Private GATT Proxy value.

Returns
0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_node_id_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_priv_node_id *val)
```

Set the target's Private Node Identity state.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.

Returns
0 on success, or (negative) error code otherwise.

```c
int bt_mesh_priv_beacon_cli_node_id_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, struct bt_mesh_priv_node_id *val)
```

Get the target's Private Node Identity state.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network index to get the Private Node Identity state of.
• val – Response buffer for Private Node Identity value.

Returns
0 on success, or (negative) error code otherwise.

```c
struct bt_mesh_priv_beacon
#include "priv_beacon_cli.h" Private Beacon.
```

Public Members

6.1. Bluetooth
const struct bt_mesh_priv_beacon_cli_cb *cb

Optional callback for Private Beacon Client Status messages.

**Remote Provisioning Client**  The Remote Provisioning Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_RPR_CLI` option.

The Remote Provisioning Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1. This model provides functionality to remotely provision devices into a mesh network, and perform Node Provisioning Protocol Interface procedures by interacting with mesh nodes that support the **Remote Provisioning Server** model.

The Remote Provisioning Client model communicates with a Remote Provisioning Server model using the device key of the node containing the target Remote Provisioning Server model instance. If present, the Remote Provisioning Client model must be instantiated on the primary element.

**Scanning**  The scanning procedure is used to scan for unprovisioned devices located nearby the Remote Provisioning Server. The Remote Provisioning Client starts a scan procedure by using the `bt_mesh_rpr_scan_start()` call:

```c
static void rpr_scan_report(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const struct bt_mesh_rpr_unprov *unprov, struct net_buf_simple *adv_data)
{
}

struct bt_mesh_rpr_cli rpr_cli = {
    .scan_report = rpr_scan_report,
};

const struct bt_mesh_rpr_node srv = {
    .addr = 0x0004,
    .net_idx = 0,
    .ttl = BT_MESH_TTL_DEFAULT,
};

struct bt_mesh_rpr_scan_status status;
uint8_t *uuid = NULL;
uint8_t timeout = 10;
uint8_t max_devs = 3;

bt_mesh_rpr_scan_start(&rpr_cli, &srv, uuid, timeout, max_devs, &status);
```

The above example shows pseudo code for starting a scan procedure on the target Remote Provisioning Server node. This procedure will start a ten-second, multiple-device scanning where the generated scan report will contain a maximum of three unprovisioned devices. If the UUID argument was specified, the same procedure would only scan for the device with the corresponding UUID. After the procedure completes, the server sends the scan report that will be handled in the client's `bt_mesh_rpr_cli.scan_report` callback.

Additionally, the Remote Provisioning Client model also supports extended scanning with the `bt_mesh_rpr_scan_start_ext()` call. Extended scanning supplements regular scanning by allowing the Remote Provisioning Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device if it is supported by the unprovisioned device.

1794 Chapter 6. Connectivity
Provisioning  The Remote Provisioning Client starts a provisioning procedure by using the `bt_mesh_provision_remote()` call:

```c
struct bt_mesh_rpr_cli rpr_cli;

const struct bt_mesh_rpr_node srv = {
    .addr = 0x0004,
    .net_idx = 0,
    .ttl = BT_MESH_TTL_DEFAULT,
};

uint8_t uuid[16] = { 0xaa };
uint16_t addr = 0x0006;
uint16_t net_idx = 0;

bt_mesh_provision_remote(&rpr_cli, &srv, uuid, net_idx, addr);
```

The above example shows pseudo code for remotely provisioning a device through a Remote Provisioning Server node. This procedure will attempt to provision the device with the corresponding UUID, and assign the address 0x0006 to its primary element using the network key located at index zero.

**Note:** During the remote provisioning, the same `bt_mesh_prov` callbacks are triggered as for ordinary provisioning. See section Provisioning for further details.

Re-provisioning  In addition to scanning and provisioning functionality, the Remote Provisioning Client also provides means to reconfigure node addresses, device keys and Composition Data on devices that support the Remote Provisioning Server model. This is provided through the Node Provisioning Protocol Interface (NPPI) which supports the following three procedures:

- Device Key Refresh procedure: Used to change the device key of the Target node without a need to reconfigure the node.
- Node Address Refresh procedure: Used to change the node's device key and unicast address.
- Node Composition Refresh procedure: Used to change the device key of the node, and to add or delete models or features of the node.

The three NPPI procedures can be initiated with the `bt_mesh_reprovision_remote()` call:

```c
struct bt_mesh_rpr_cli rpr_cli;
struct bt_mesh_rpr_node srv = {
    .addr = 0x0006,
    .net_idx = 0,
    .ttl = BT_MESH_TTL_DEFAULT,
};

bool composition_changed = false;
uint16_t new_addr = 0x0009;

bt_mesh_reprovision_remote(&rpr_cli, &srv, new_addr, composition_changed);
```

The above example shows pseudo code for triggering a Node Address Refresh procedure on the Target node. The specific procedure is not chosen directly, but rather through the other parameters that are inputted. In the example we can see that the current unicast address of the Target is 0x0006, while the new address is set to 0x0009. If the two addresses were the same, and the `composition_changed` flag was set to true, this code would instead trigger a Node Composition Refresh procedure. If the two addresses were the same, and the `composition_changed` flag was set to false, this code would trigger a Device Key Refresh procedure.
**API reference**

*group bt_mesh_rpr_cli*

**Defines**

**BT_MESH_RPR_SCAN_MAX_DEVS_ANY**

Special value for the `max_devs` parameter of `bt_mesh_rpr_scan_start`. Tells the Remote Provisioning Server not to put restrictions on the max number of devices reported to the Client.

**BT_MESH_MODEL_RPR_CLI(_cli)**

Remote Provisioning Client model composition data entry.

**Parameters**

- `_cli` – Pointer to a *Remote Provisioning Client model* instance.

**Functions**

```plaintext
int bt_mesh_rpr_scan_caps_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_caps *caps)
```

Get scanning capabilities of Remote Provisioning Server.

**Parameters**

- `cli` – Remote Provisioning Client.
- `caps` – Capabilities response buffer.

**Returns**

0 on success, or (negative) error code otherwise.

```plaintext
int bt_mesh_rpr_scan_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_scan_status *status)
```

Get current scanning state of Remote Provisioning Server.

**Parameters**

- `cli` – Remote Provisioning Client.
- `status` – Scan status response buffer.

**Returns**

0 on success, or (negative) error code otherwise.

```plaintext
int bt_mesh_rpr_scan_start(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, uint8_t max_devs, struct bt_mesh_rpr_scan_status *status)
```

Start scanning for unprovisioned devices.

Tells the Remote Provisioning Server to start scanning for unprovisioned devices. The Server will report back the results through the `bt_mesh_rpr_cli::scan_report` callback.

Use the `uuid` parameter to scan for a specific device, or leave it as NULL to report all unprovisioned devices.

The Server will ignore duplicates, and report up to `max_devs` number of devices. Requesting a `max_devs` number that's higher than the Server's capability will result in an error.
Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **uuid** – Device UUID to scan for, or NULL to report all devices.
- **timeout** – Scan timeout in seconds. Must be at least 1 second.
- **max_devs** – Max number of devices to report, or 0 to report as many as possible.
- **status** – Scan status response buffer.

Returns

0 on success, or (negative) error code otherwise.

```c
int bt_mesh_rpr_scan_start_ext(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, const uint8_t *ad_types, size_t ad_count)
```

Start extended scanning for unprovisioned devices.

Extended scanning supplements regular unprovisioned scanning, by allowing the Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device, if supported. If no UUID is provided, the Server will report a scan on its own OOB information and advertising data.

Use the `ad_types` array to specify which AD types to include in the scan report. Some AD types invoke special behavior:

- **BT_DATA_NAME_COMPLETE** Will report both the complete and the shortened name.
- **BT_DATA_URI** If the unprovisioned beacon contains a URI hash, the Server will extend the scanning to include packets other than the scan response, to look for URIs matching the URI hash. Only matching URIs will be reported.

The following AD types should not be used:

- **BT_DATA_NAME_SHORTENED**
- **BT_DATA_UUID16_SOME**
- **BT_DATA_UUID32_SOME**
- **BT_DATA_UUID128_SOME**

Additionally, each AD type should only occur once.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **uuid** – Device UUID to start extended scanning for, or NULL to scan the remote server.
- **timeout** – Scan timeout in seconds. Valid values from `BT_MESH_RPR_EXT_SCAN_TIME_MIN` to `BT_MESH_RPR_EXT_SCAN_TIME_MAX`. Ignored if UUID is NULL.
- **ad_types** – List of AD types to include in the scan report. Must contain 1 to `CONFIG_BT_MESH_RPR_AD_TYPES_MAX` entries.
- **ad_count** – Number of AD types in `ad_types`.

Returns

0 on success, or (negative) error code otherwise.
int bt_mesh_rpr_scan_stop(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_scan_status *status)

Stop any ongoing scanning on the Remote Provisioning Server.

Parameters
• cli – Remote Provisioning Client.
• srv – Remote Provisioning Server.
• status – Scan status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_rpr_link_get(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)

Get the current link status of the Remote Provisioning Server.

Parameters
• cli – Remote Provisioning Client.
• srv – Remote Provisioning Server.
• rsp – Link status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_rpr_link_close(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)

Close any open link on the Remote Provisioning Server.

Parameters
• cli – Remote Provisioning Client.
• srv – Remote Provisioning Server.
• rsp – Link status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int32_t bt_mesh_rpr_cli_timeout_get(void)

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void bt_mesh_rpr_cli_timeout_set(int32_t timeout)

Set the transmission timeout value.

The transmission timeout controls the amount of time the Remote Provisioning Client models will wait for a response from the Server.

Parameters
• timeout – The new transmission timeout.

struct bt_mesh_rpr_scan_status

#include <rpr_cli.h> Scan status response.
Public Members

enum bt_mesh_rpr_status status  
Current scan status.

enum bt_mesh_rpr_scan scan  
Current scan state.

uint8_t max_devs  
Max number of devices to report in current scan.

uint8_t timeout  
Seconds remaining of the scan.

struct bt_mesh_rpr_caps  
#include <rpr_cli.h> Remote Provisioning Server scanning capabilities.

Public Members

uint8_t max_devs  
Max number of scannable devices.

bool active_scan  
Supports active scan.

struct bt_mesh_rpr_cli  
#include <rpr_cli.h> Remote Provisioning Client model instance.

Public Members

void (*scan_report)(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_unprov *unprov, struct net_buf_simple *adv_data)  
Scan report callback.

Param cli  
Remote Provisioning Client.

Param srv  
Remote Provisioning Server.

Param unprov  
Unprovisioned device.

Param adv_data  
Advertisement data for the unprovisioned device, or NULL if extended scanning hasn’t been enabled. An empty buffer indicates that the extended scanning finished without collecting additional information.

Remote Provisioning Server  The Remote Provisioning Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the CONFIG_BT_MESH_RPR_SRV option.

The Remote Provisioning Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of remotely provisioning devices into a mesh network.

6.1. Bluetooth
The Remote Provisioning Server does not have an API of its own, but relies on a Remote Provisioning Client to control it. The Remote Provisioning Server model only accepts messages encrypted with the node’s device key.

If present, the Remote Provisioning Server model must be instantiated on the primary element.

Note that after refreshing the device key, node address or Composition Data through a Node Provisioning Protocol Interface (NPPI) procedure, the \texttt{bt\_mesh\_prou\_reprovisioned} callback is triggered. See section Remote Provisioning Client for further details.

**API reference**

\texttt{group bt\_mesh\_rpr\_srv}

**Defines**

\texttt{BT\_MESH\_MODEL\_RPR\_SRV}

Remote Provisioning Server model composition data entry.

**Solicitation PDU RPL Configuration Client** The Solicitation PDU RPL Configuration Client model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled through the \texttt{CONFIG\_BT\_MESH\_SOL\_PDU\_RPL\_CLI} option.

The Solicitation PDU RPL Configuration Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of removing addresses from the solicitation replay protection list (SRPL) of a node that supports the Solicitation PDU RPL Configuration Server model.

The Solicitation PDU RPL Configuration Client model communicates with a Solicitation PDU RPL Configuration Server model using the application keys configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Client model must be instantiated on the primary element.

**Configurations** The Solicitation PDU RPL Configuration Client model behavior can be configured with the transmission timeout option \texttt{CONFIG\_BT\_MESH\_SOL\_PDU\_RPL\_CLI\_TIMEOUT}. The \texttt{CONFIG\_BT\_MESH\_SOL\_PDU\_RPL\_CLI\_TIMEOUT} controls how long the Solicitation PDU RPL Configuration Client waits for a response message to arrive in milliseconds. This value can be changed at runtime using \texttt{bt\_mesh\_sol\_pdu\_rpl\_cli\_timeout\_set()}.

**API reference**

\texttt{group bt\_mesh\_sol\_pdu\_rpl\_cli}

**Defines**

\texttt{BT\_MESH\_MODEL\_SOL\_PDU\_RPL\_CLI} (\texttt{cli\_data})

Solicitation PDU RPL Client model composition data entry.

**Functions**
int bt_mesh_sol_pdu_rpl_clear(struct bt_mesh_msg_ctx *ctx, uint16_t range_start, uint8_t range_len, uint16_t *start_rsp, uint8_t *len_rsp)

Remove entries from Solicitation PDU RPL of addresses in given range.

This method can be used asynchronously by setting start_rsp or len_rsp as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the srpl_status callback in bt_mesh_sol_pdu_rpl_cli struct.

Parameters

• ctx – Message context for the message.
• range_start – Start of Unicast address range.
• range_len – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.
• start_rsp – Range start response buffer.
• len_rsp – Range length response buffer.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_sol_pdu_rpl_clear_unack(struct bt_mesh_msg_ctx *ctx, uint16_t range_start, uint8_t range_len)

Remove entries from Solicitation PDU RPL of addresses in given range (unacked).

Parameters

• ctx – Message context for the message.
• range_start – Start of Unicast address range.
• range_len – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.

Returns

0 on success, or (negative) error code otherwise.

void bt_mesh_sol_pdu_rpl_cli_timeout_set(int32_t timeout)

Set the transmission timeout value.

Parameters

• timeout – The new transmission timeout in milliseconds.

struct bt_mesh_sol_pdu_rpl_cli

#include <sol_pdu_rpl_cli.h> Solicitation PDU RPL Client Model Context.

Public Members

struct bt_mesh_model *model

Solicitation PDU RPL model entry pointer.

void (*srpl_status)(struct bt_mesh_sol_pdu_rpl_cli *cli, uint16_t addr, uint16_t range_start, uint8_t range_length)

Optional callback for Solicitation PDU RPL Status messages.

Handles received Solicitation PDU RPL Status messages from a Solicitation PDU RPL server. The start param represents the start of range that server has cleared. The length param represents length of range cleared by server.
Param cli
Solicitation PDU RPL client that received the status message.

Param addr
Address of the sender.

Param range_start
Range start value.

Param range_length
Range length value.

Solicitation PDU RPL Configuration Server
The Solicitation PDU RPL Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The model is enabled if the node has the On-Demand Private Proxy Server enabled.

The Solicitation PDU RPL Configuration Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and manages the Solicitation Replay Protection List (SRPL) saved on the device. The SRPL is used to reject Solicitation PDUs that are already processed by a node. When a valid Solicitation PDU message is successfully processed by a node, the SSRC field and SSEQ field of the message are stored in the node’s SRPL.

The Solicitation PDU RPL Configuration Server does not have an API of its own, and relies on a Solicitation PDU RPL Configuration Client to control it. The model only accepts messages encrypted with an application key as configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Server model must be instantiated on the primary element.

Configurations
For the Solicitation PDU RPL Configuration Server model, the CONFIG_BT_MESH_PROXY_SRPL_SIZE option can be configured to set the size of the SRPL.

API reference

group bt_mesh_sol_pdu_rpl_srv

Defines

BT_MESH_MODEL_SOL_PDU_RPL_SRV
Solicitation PDU RPL Server model composition data entry.

Model specification models
In addition to the foundation models defined in the Bluetooth mesh specification, the Bluetooth Mesh Model Specification defines several models, some of which are implemented in Zephyr:

BLOB Transfer models
The Binary Large Object (BLOB) Transfer models provide functionality for sending large binary objects from a single source to many Target nodes over the Bluetooth mesh network. It is the underlying transport method for the Device Firmware Update (DFU), but may be used for other object transfer purposes.

The BLOB Transfer models support transfers of continuous binary objects of up to 4 GB (2^{32} bytes). The BLOB transfer protocol has built-in recovery procedures for packet losses, and sets up checkpoints to ensure that all targets have received all the data before moving on. Data transfer order is not guaranteed.

BLOB transfers are constrained by the transfer speed and reliability of the underlying mesh network. Under ideal conditions, the BLOBs can be transferred at a rate of up to 1 kbps, allowing a 100 kB BLOB to be transferred in 10-15 minutes. However, network conditions, transfer capabilities and other limiting factors can easily degrade the data rate by several orders of magnitude. Tuning the parameters of the
transfer according to the application and network configuration, as well as scheduling it to periods with low network traffic, will offer significant improvements on the speed and reliability of the protocol. However, achieving transfer rates close to the ideal rate is unlikely in actual deployments.

There are two BLOB Transfer models:

**BLOB Transfer Server** The Binary Large Object (BLOB) Transfer Server model implements reliable receiving of large binary objects. It serves as the backend of the Firmware Update Server, but can also be used for receiving other binary images.

**BLOBs** As described in *BLOB Transfer models*, the binary objects transferred by the BLOB Transfer models are divided into blocks, which are divided into chunks. As the transfer is controlled by the BLOB Transfer Client model, the BLOB Transfer Server must allow blocks to come in any order. The chunks within a block may also come in any order, but all chunks in a block must be received before the next block is started.

The BLOB Transfer Server keeps track of the received blocks and chunks, and will process each block and chunk only once. The BLOB Transfer Server also ensures that any missing chunks are resent by the BLOB Transfer Client.

**Usage** The BLOB Transfer Server is instantiated on an element with a set of event handler callbacks:

```c
static const struct bt_mesh_blob_srv_cb blob_cb = {
    /* Callbacks */
};
static struct bt_mesh_blob_srv blob_srv = {
    .cb = &blob_cb,
};
static struct bt_mesh_model models[] = {
    BT_MESH_MODEL_BLOB_SRV(&blob_srv),
};
```

A BLOB Transfer Server is capable of receiving a single BLOB transfer at a time. Before the BLOB Transfer Server can receive a transfer, it must be prepared by the user. The transfer ID must be passed to the BLOB Transfer Server through the `bt_mesh_blob_srv_recv()` function before the transfer is started by the BLOB Transfer Client. The ID must be shared between the BLOB Transfer Client and the BLOB Transfer Server through some higher level procedure, like a vendor specific transfer management model.

Once the transfer has been set up on the BLOB Transfer Server, it’s ready for receiving the BLOB. The application is notified of the transfer progress through the event handler callbacks, and the BLOB data is sent to the BLOB stream.

The interaction between the BLOB Transfer Server, BLOB stream and application is shown below:

**Transfer suspension** The BLOB Transfer Server keeps a running timer during the transfer, that is reset on every received message. If the BLOB Transfer Client does not send a message before the transfer timer expires, the transfer is suspended by the BLOB Transfer Server.

The BLOB Transfer Server notifies the user of the suspension by calling the `suspended` callback. If the BLOB Transfer Server is in the middle of receiving a block, this block is discarded.

The BLOB Transfer Client may resume a suspended transfer by starting a new block transfer. The BLOB Transfer Server notifies the user by calling the `resume` callback.
Fig. 8: BLOB Transfer Server model interaction
**Transfer recovery**  The state of the BLOB transfer is stored persistently. If a reboot occurs, the BLOB Transfer Server will attempt to recover the transfer. When the Bluetooth mesh subsystem is started (for instance by calling `bt_mesh_init()`, the BLOB Transfer Server will check for aborted transfers, and call the `recover` callback if there is any. In the recover callback, the user must provide a BLOB stream to use for the rest of the transfer. If the recover callback doesn’t return successfully or does not provide a BLOB stream, the transfer is abandoned. If no recover callback is implemented, transfers are always abandoned after a reboot.

After a transfer is successfully recovered, the BLOB Transfer Server enters the suspended state. It will stay suspended until the BLOB Transfer Client resumes the transfer, or the user cancels it.

**Note:** The BLOB Transfer Client sending the transfer must support transfer recovery for the transfer to complete. If the BLOB Transfer Client has already given up the transfer, the BLOB Transfer Server will stay suspended until the application calls `bt_mesh_blob_srv_cancel()`.

---

**API reference**

**group bt_mesh_blob_srv**

**Defines**

- `BT_MESH_BLOB_BLOCKS_MAX`  
  Max number of blocks in a single transfer.

- `BT_MESH_MODEL_BLOB_SRV(_srv)`  
  BLOB Transfer Server model composition data entry.

**Parameters**

- `_srv` – Pointer to a Bluetooth Mesh BLOB Transfer Server model API instance.

**Functions**

```c
int bt_mesh_blob_srv_recv(struct bt_mesh_blob_srv *srv, uint64_t id, const struct bt_mesh_blob_io *io, uint8_t ttl, uint16_t timeout_base)
```

Prepare BLOB Transfer Server for an incoming transfer.

Before a BLOB Transfer Server can receive a transfer, the transfer must be prepared through some application level mechanism. The BLOB Transfer Server will only accept incoming transfers with a matching BLOB ID.

**Parameters**

- `srv` – BLOB Transfer Server instance.
- `id` – BLOB ID to accept.
- `io` – BLOB stream to write the incoming BLOB to.
- `ttl` – Time to live value to use in responses to the BLOB Transfer Client.
- `timeout_base` – Extra time for the Client to respond in addition to the base 10 seconds, in 10-second increments.

**Returns**

0 on success, or (negative) error code on failure.
int bt_mesh_blob_srv_cancel(struct bt_mesh_blob_srv *srv)
   Cancel the current BLOB transfer.

   Tells the BLOB Transfer Client to drop this device from the list of Targets for the current
   transfer. Note that the client may continue sending the transfer to other Targets.

Parameters
   • srv – BLOB Transfer Server instance.

Returns
   0 on success, or (negative) error code on failure.

bool bt_mesh_blob_srv_is_busy(const struct bt_mesh_blob_srv *srv)
   Get the current state of the BLOB Transfer Server.

Parameters
   • srv – BLOB Transfer Server instance.

Returns
   true if the BLOB Transfer Server is currently participating in a transfer, false oth-
   erwise.

uint8_t bt_mesh_blob_srv_progress(const struct bt_mesh_blob_srv *srv)
   Get the current progress of the active transfer in percent.

Parameters
   • srv – BLOB Transfer Server instance.

Returns
   The current transfer progress, or 0 if no transfer is active.

struct bt_mesh_blob_srv_cb
   #include <blob_srv.h> BLOB Transfer Server model event handlers.

   All callbacks are optional.

Public Members

int (*start)(struct bt_mesh_blob_srv *srv, struct bt_mesh_msg_ctx *ctx, struct
            bt_mesh_blob_xfer *xfer)
   Transfer start callback.

   Called when the transfer has started with the prepared BLOB ID.

   Param srv
      BLOB Transfer Server instance.

   Param ctx
      Message context for the incoming start message. The entire transfer will be
      sent from the same source address.

   Param xfer
      Transfer parameters.

   Return
      0 on success, or (negative) error code to reject the transfer.

void (*end)(struct bt_mesh_blob_srv *srv, uint64_t id, bool success)
   Transfer end callback.

   Called when the transfer ends, either because it was cancelled, or because it finished
   successfully. A new transfer may be prepared.
**Note:** The transfer may end before it’s started if the start parameters are invalid.

**Param srv**
BLOB Transfer Server instance.

**Param id**
BLOB ID of the cancelled transfer.

**Param success**
Whether the transfer was successful.

```c
void (*suspended)(struct bt_mesh_blob_srv *srv)
```
Transfer suspended callback.

Called if the Server timed out while waiting for a transfer packet. A suspended transfer may resume later from the start of the current block. Any received chunks in the current block should be discarded, they will be received again if the transfer resumes.

The transfer will call `resumed` again when resuming.

**Note:** The BLOB Transfer Server does not run a timer in the suspended state, and it’s up to the application to determine whether the transfer should be permanently cancelled. Without interaction, the transfer will be suspended indefinitely, and the BLOB Transfer Server will not accept any new transfers.

**Param srv**
BLOB Transfer Server instance.

```c
void (*resume)(struct bt_mesh_blob_srv *srv)
```
Transfer resume callback.

Called if the transfer is resumed after being suspended.

**Param srv**
BLOB Transfer Server instance.

```c
int (*recover)(struct bt_mesh_blob_srv *srv, struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_io **io)
```
Transfer recovery callback.

Called when the Bluetooth mesh subsystem is started if the device is rebooted in the middle of a transfer.

Transfers will not be resumed after a reboot if this callback is not defined.

**Param srv**
BLOB Transfer Server instance.

**Param xfer**
Transfer to resume.

**Param io**
BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**
0 on success, or (negative) error code to abandon the transfer.

```c
#define bt_mesh_blob_srv
#include <blob_srv.h>
```
BLOB Transfer Server instance.
Public Members

```c
const struct bt_mesh_blob_srv_cb *cb
    Event handler callbacks.
```

```c
struct bt_mesh_blob_srv_state
    #include <blob_srv.h>
```

BLOB Transfer Client The Binary Large Object (BLOB) Transfer Client is the sender of the BLOB transfer. It supports sending BLOBs of any size to any number of Target nodes, in both Push BLOB Transfer Mode and Pull BLOB Transfer Mode.

Usage

Initialization The BLOB Transfer Client is instantiated on an element with a set of event handler callbacks:

```c
static const struct bt_mesh_blob_cli_cb blob_cb = {
    /* Callbacks */
};
static struct bt_mesh_blob_cli blob_cli = {
    .cb = &blob_cb,
};
static struct bt_mesh_model models[] = {
    BT_MESH_MODEL_BLOB_CLI(&blob_cli),
};
```

Transfer context Both the transfer capabilities retrieval procedure and the BLOB transfer uses an instance of a `bt_mesh_blob_cli_inputs` to determine how to perform the transfer. The BLOB Transfer Client Inputs structure must at least be initialized with a list of targets, an application key and a time to live (TTL) value before it is used in a procedure:

```c
static struct bt_mesh_blob_target targets[3] = {
    {.addr = 0x0001 },
    {.addr = 0x0002 },
    {.addr = 0x0003 },
};
static struct bt_mesh_blob_cli_inputs inputs = {
    .app_idx = MY_APP_IDX,
    .ttl = BT_MESH_TTL_DEFAULT,
};
sys_slist_init(&inputs.targets);
sys_slist_append(&inputs.targets, &targets[0].n);
sys_slist_append(&inputs.targets, &targets[1].n);
sys_slist_append(&inputs.targets, &targets[2].n);
```

Note that all BLOB Transfer Servers in the transfer must be bound to the chosen application key.
**Group address**  The application may additionally specify a group address in the context structure. If the group is not `BT_MESH_ADDR_UNASSIGNED`, the messages in the transfer will be sent to the group address, instead of being sent individually to each Target node. Mesh Manager must ensure that all Target nodes having the BLOB Transfer Server model subscribe to this group address.

Using group addresses for transferring the BLOBs can generally increase the transfer speed, as the BLOB Transfer Client sends each message to all Target nodes at the same time. However, sending large, segmented messages to group addresses in Bluetooth mesh is generally less reliable than sending them to unicast addresses, as there is no transport layer acknowledgment mechanism for groups. This can lead to longer recovery periods at the end of each block, and increases the risk of losing Target nodes. Using group addresses for BLOB transfers will generally only pay off if the list of Target nodes is extensive, and the effectiveness of each addressing strategy will vary heavily between different deployments and the size of the chunks.

**Transfer timeout**  If a Target node fails to respond to an acknowledged message within the BLOB Transfer Client's time limit, the Target node is dropped from the transfer. The application can reduce the chances of this by giving the BLOB Transfer Client extra time through the context structure. The extra time may be set in 10-second increments, up to 182 hours, in addition to the base time of 20 seconds. The wait time scales automatically with the transfer TTL.

Note that the BLOB Transfer Client only moves forward with the transfer in following cases:

- All Target nodes have responded.
- A node has been removed from the list of Target nodes.
- The BLOB Transfer Client times out.

Increasing the wait time will increase this delay.

**BLOB transfer capabilities retrieval**  It is generally recommended to retrieve BLOB transfer capabilities before starting a transfer. The procedure populates the transfer capabilities from all Target nodes with the most liberal set of parameters that allows all Target nodes to participate in the transfer. Any Target nodes that fail to respond, or respond with incompatible transfer parameters, will be dropped.

Target nodes are prioritized according to their order in the list of Target nodes. If a Target node is found to be incompatible with any of the previous Target nodes, for instance by reporting a non-overlapping block size range, it will be dropped. Lost Target nodes will be reported through the `lost_target` callback.

The end of the procedure is signalled through the `caps` callback, and the resulting capabilities can be used to determine the block and chunk sizes required for the BLOB transfer.

**BLOB transfer**  The BLOB transfer is started by calling `bt_mesh_blob_cli_send()` function, which (in addition to the aforementioned transfer inputs) requires a set of transfer parameters and a BLOB stream instance. The transfer parameters include the 64-bit BLOB ID, the BLOB size, the transfer mode, the block size in logarithmic representation and the chunk size. The BLOB ID is application defined, but must match the BLOB ID the BLOB Transfer Servers have been started with.

The transfer runs until it either completes successfully for at least one Target node, or it is cancelled. The end of the transfer is communicated to the application through the `end` callback. Lost Target nodes will be reported through the `lost_target` callback.

**API reference**

```c
bt_mesh_blob_cli
```

6.1. Bluetooth
Defines

BT_MESH_MODEL_BLOB_CLI(_cli)
BLOB Transfer Client model Composition Data entry.

Parameters

• _cli – Pointer to a Bluetooth Mesh BLOB Transfer Client model API instance.

Enums

enum bt_mesh_blob_cli_state
BLOB Transfer Client state.
Values:

enumerator BT_MESH_BLOB_CLI_STATE_NONE
No transfer is active.

enumerator BT_MESH_BLOB_CLI_STATE_CAPS_GET
Retrieving transfer capabilities.

enumerator BT_MESH_BLOB_CLI_STATE_START
Sending transfer start.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_START
Sending block start.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_SEND
Sending block chunks.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_CHECK
Checking block status.

enumerator BT_MESH_BLOB_CLI_STATE_XFER_CHECK
Checking transfer status.

enumerator BT_MESH_BLOB_CLI_STATE_CANCEL
Cancelling transfer.

enumerator BT_MESH_BLOB_CLI_STATE_SUSPENDED
Transfer is suspended.

enumerator BT_MESH_BLOB_CLI_STATE_XFER_PROGRESS_GET
Checking transfer progress.

Functions
int bt_mesh_blob_cli_caps_get(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs)

Retrieve transfer capabilities for a list of Target nodes.

Queries the availability and capabilities of all Target nodes, producing a cumulative set of transfer capabilities for the Target nodes, and returning it through the \texttt{bt\_mesh\_blob\_cli\_cb::caps} callback.

Retrieving the capabilities may take several seconds, depending on the number of Target nodes and mesh network performance. The end of the procedure is indicated through the \texttt{bt\_mesh\_blob\_cli\_cb::caps} callback.

This procedure is not required, but strongly recommended as a preparation for a transfer to maximize performance and the chances of success.

\textbf{Parameters}

- \texttt{cli} – BLOB Transfer Client instance.
- \texttt{inputs} – Statically allocated BLOB Transfer Client transfer inputs.

\textbf{Returns}

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_send(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_io *io)

Perform a BLOB transfer.

Starts sending the transfer to the Target nodes. Only Target nodes with a status of \texttt{BT\_MESH\_BLOB\_SUCCESS} will be considered.

The transfer will keep going either until all Target nodes have been dropped, or the full BLOB has been sent.

The BLOB transfer may take several minutes, depending on the number of Target nodes, size of the BLOB and mesh network performance. The end of the transfer is indicated through the \texttt{bt\_mesh\_blob\_cli\_cb::end} callback.

A Client only supports one transfer at the time.

\textbf{Parameters}

- \texttt{cli} – BLOB Transfer Client instance.
- \texttt{inputs} – Statically allocated BLOB Transfer Client transfer inputs.
- \texttt{xfer} – Statically allocated transfer parameters.
- \texttt{io} – BLOB stream to read the transfer from.

\textbf{Returns}

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_suspend(struct bt_mesh_blob_cli *cli)

Suspend the active transfer.

\textbf{Parameters}

- \texttt{cli} – BLOB Transfer Client instance.

\textbf{Returns}

0 on success, or (negative) error code otherwise.

int bt_mesh_blob_cli_resume(struct bt_mesh_blob_cli *cli)

Resume the suspended transfer.

\textbf{Parameters}
• cli – BLOB Transfer Client instance.

Returns
0 on success, or (negative) error code otherwise.

void bt_mesh_blob_cli_cancel(struct bt_mesh_blob_cli *cli)
Cancel an ongoing transfer.

Parameters
• cli – BLOB Transfer Client instance.

int bt_mesh_blob_cli_xfer_progress_get(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs)
Get the progress of BLOB transfer.

This function can only be used if the BLOB Transfer Client is currently not performing a BLOB transfer. To get progress of the active BLOB transfer, use the bt_mesh_blob_cli_xfer_progress_active_get function.

Parameters
• cli – BLOB Transfer Client instance.
• inputs – Statically allocated BLOB Transfer Client transfer inputs.

Returns
0 on success, or (negative) error code otherwise.

uint8_t bt_mesh_blob_cli_xfer_progress_active_get(struct bt_mesh_blob_cli *cli)
Get the current progress of the active transfer in percent.

Parameters
• cli – BLOB Transfer Client instance.

Returns
The current transfer progress, or 0 if no transfer is active.

bool bt_mesh_blob_cli_is_busy(struct bt_mesh_blob_cli *cli)
Get the current state of the BLOB Transfer Client.

Parameters
• cli – BLOB Transfer Client instance.

Returns
true if the BLOB Transfer Client is currently participating in a transfer or retrieving the capabilities and false otherwise.

#include <blob_cli.h> Target node's Pull mode (Pull BLOB Transfer Mode) context used while sending chunks to the Target node.

Public Members

int64_t block_report_timestamp
Timestamp when the Block Report Timeout Timer expires for this Target node.

uint8_t missing[DIV_ROUND_UP(CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX, 8)]
Missing chunks reported by this Target node.
struct bt_mesh_blob_target
    #include <blob_cli.h> BLOB Transfer Client Target node.

Public Members

sys_snnode_t n
    Linked list node.

uint16_t addr
    Target node address.

struct bt_mesh_blob_target_pull *pull
    Target node's Pull mode context.
    Needs to be initialized when sending a BLOB in Pull mode.

uint8_t status
    BLOB transfer status, see bt_mesh_blob_status.

struct bt_mesh_blob_xfer_info
    #include <blob_cli.h> BLOB transfer information.

If phase is BT_MESH_BLOB_XFER_PHASE_INACTIVE, the fields below phase are not initialized. If phase is BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START, the fields below id are not initialized.

Public Members

enum bt_mesh_blob_status status
    BLOB transfer status.

enum bt_mesh_blob_xfer_mode mode
    BLOB transfer mode.

enum bt_mesh_blob_xfer_phase phase
    BLOB transfer phase.

uint64_t id
    BLOB ID.

uint32_t size
    BLOB size in octets.

uint8_t block_size_log
    Logarithmic representation of the block size.

uint16_t mtu_size
    MTU size in octets.
const uint8_t *missing_blocks
    Bit field indicating blocks that were not received.

struct bt_mesh_blob_cli_inputs
    #include <blob_cli.h> BLOB Transfer Client transfer inputs.
    Public Members

    sys_slist_t targets
        Linked list of Target nodes.
        Each node should point to bt_mesh_blob_target::n.

    uint16_t app_idx
        AppKey index to send with.

    uint16_t group
        Group address destination for the BLOB transfer, or BT_MESH_ADDR_UNASSIGNED to send every message to each Target node individually.

    uint8_t ttl
        Time to live value of BLOB transfer messages.

    uint16_t timeout_base
        Additional response time for the Target nodes, in 10-second increments.
        The extra time can be used to give the Target nodes more time to respond to messages from the Client. The actual timeout will be calculated according to the following formula:

        \[
        \text{timeout} = 20 \text{ seconds} + (10 \text{ seconds} \times \text{timeout_base}) + (100 \text{ ms} \times \text{TTL})
        \]

        If a Target node fails to respond to a message from the Client within the configured transfer timeout, the Target node is dropped.

struct bt_mesh_blob_cli_caps
    #include <blob_cli.h> Transfer capabilities of a Target node.
    Public Members

    size_t max_size
        Max BLOB size.

    uint8_t min_block_size_log
        Logarithmic representation of the minimum block size.

    uint8_t max_block_size_log
        Logarithmic representation of the maximum block size.
uint16_t max_chunks
    Max number of chunks per block.

uint16_t max_chunk_size
    Max chunk size.

uint16_t mtu_size
    Max MTU size.

class bt_mesh_blob_xfer_mode
    Supported transfer modes.

#include <blob_cli.h> Event handler callbacks for the BLOB Transfer Client model.

All handlers are optional.

Public Members

void (*)(caps)(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_cli_caps *caps)
    Capabilities retrieval completion callback.
    Called when the capabilities retrieval procedure completes, indicating that a common set
    of acceptable transfer parameters have been established for the given list of Target nodes.
    All compatible Target nodes have status code BT_MESH_BLOB_SUCCESS.
    Param cli
        BLOB Transfer Client instance.
    Param caps
        Safe transfer capabilities if the transfer capabilities of at least one Target node
        has satisfied the Client, or NULL otherwise.

void (*)(lost_target)(struct bt_mesh_blob_cli *cli, struct bt_mesh_blob_target *target, enum bt_mesh_blob_status reason)
    Target node loss callback.
    Called whenever a Target node has been lost due to some error in the transfer. Losing a
    Target node is not considered a fatal error for the Client until all Target nodes have been
    lost.
    Param cli
        BLOB Transfer Client instance.
    Param target
        Target node that was lost.
    Param reason
        Reason for the Target node loss.

void (*)(suspended)(struct bt_mesh_blob_cli *cli)
    Transfer is suspended.
    Called when the transfer is suspended due to response timeout from all Target nodes.
    Param cli
        BLOB Transfer Client instance.

void (*)(end)(struct bt_mesh_blob_cli *cli, const struct bt_mesh_blob_xfer *xfer, bool success)
Transfer end callback.
Called when the transfer ends.

**Param cli**
BLOB Transfer Client instance.

**Param xfer**
Completed transfer.

**Param success**
Status of the transfer. Is true if at least one Target node received the whole transfer.

```c
void (*xfer_progress)(struct bt_mesh_blob_cli *cli, struct bt_mesh_blob_target *target, const struct bt_mesh_blob_xfer_info *info)
```
Transfer progress callback.
The content of info is invalidated upon exit from the callback. Therefore it needs to be copied if it is planned to be used later.

**Param cli**
BLOB Transfer Client instance.

**Param target**
Target node that responded to the request.

**Param info**
BLOB transfer information.

```c
void (*xfer_progress_complete)(struct bt_mesh_blob_cli *cli)
```
End of Get Transfer Progress procedure.
Called when all Target nodes have responded or the procedure timed-out.

**Param cli**
BLOB Transfer Client instance.

```c
struct bt_mesh_blob_cli
#include <blob_cli.h> BLOB Transfer Client model instance.
```

**Public Members**

```c
const struct bt_mesh_blob_cli_cb *cb
```
Event handler callbacks.
The BLOB Transfer Client is instantiated on the sender node, and the BLOB Transfer Server is instantiated on the receiver nodes.

**Concepts** The BLOB transfer protocol introduces several new concepts to implement the BLOB transfer.

**BLOBs** BLOBs are binary objects up to 4 GB in size, that can contain any data the application would like to transfer through the mesh network. The BLOBs are continuous data objects, divided into blocks and chunks to make the transfers reliable and easy to process. No limitations are put on the contents or structure of the BLOB, and applications are free to define any encoding or compression they’d like on the data itself.

The BLOB transfer protocol does not provide any built-in integrity checks, encryption or authentication of the BLOB data. However, the underlying encryption of the Bluetooth mesh protocol provides data integrity checks and protects the contents of the BLOB from third parties using network and application level encryption.
Blocks  The binary objects are divided into blocks, typically from a few hundred to several thousand bytes in size. Each block is transmitted separately, and the BLOB Transfer Client ensures that all BLOB Transfer Servers have received the full block before moving on to the next. The block size is determined by the transfer’s `block_size_log` parameter, and is the same for all blocks in the transfer except the last, which may be smaller. For a BLOB stored in flash memory, the block size is typically a multiple of the flash page size of the Target devices.

Chunks  Each block is divided into chunks. A chunk is the smallest data unit in the BLOB transfer, and must fit inside a single Bluetooth mesh access message excluding the opcode (379 bytes or less). The mechanism for transferring chunks depends on the transfer mode.

When operating in Push BLOB Transfer Mode, the chunks are sent as unacknowledged packets from the BLOB Transfer Client to all targeted BLOB Transfer Servers. Once all chunks in a block have been sent, the BLOB Transfer Client asks each BLOB Transfer Server if they’re missing any chunks, and resend them. This is repeated until all BLOB Transfer Servers have received all chunks, or the BLOB Transfer Client gives up.

When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request a small number of chunks from the BLOB Transfer Client at a time, and wait for the BLOB Transfer Client to send them before requesting more chunks. This repeats until all chunks have been transferred, or the BLOB Transfer Server gives up.

Read more about the transfer modes in the Transfer modes section.

BLOB streams  In the BLOB Transfer models’ APIs, the BLOB data handling is separated from the high-level transfer handling. This split allows reuse of different BLOB storage and transfer strategies for different applications. While the high level transfer is controlled directly by the application, the BLOB data itself is accessed through a BLOB stream.

The BLOB stream is comparable to a standard library file stream. Through opening, closing, reading and writing, the BLOB Transfer model gets full access to the BLOB data, whether it’s kept in flash, RAM, or on a peripheral. The BLOB stream is opened with an access mode (read or write) before it’s used, and the BLOB Transfer models will move around inside the BLOB’s data in blocks and chunks, using the BLOB stream as an interface.

Interaction  Before the BLOB is read or written, the stream is opened by calling its `open` callback. When used with a BLOB Transfer Server, the BLOB stream is always opened in write mode, and when used with a BLOB Transfer Client, it’s always opened in read mode.

For each block in the BLOB, the BLOB Transfer model starts by calling `block_start`. Then, depending on the access mode, the BLOB stream’s `wr` or `rd` callback is called repeatedly to move data to or from the BLOB. When the model is done processing the block, it calls `block_end`. When the transfer is complete, the BLOB stream is closed by calling `close`.

Implementations  The application may implement their own BLOB stream, or use the implementations provided by Zephyr:

BLOB Flash  The BLOB Flash Readers and Writers implement BLOB reading to and writing from flash partitions defined in the `flash map`.

BLOB Flash Reader  The BLOB Flash Reader interacts with the BLOB Transfer Client to read BLOB data directly from flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Client. Each BLOB Flash Reader only supports one transfer at the time.
BLOB Flash Writer  The BLOB Flash Writer interacts with the BLOB Transfer Server to write BLOB data directly to flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Server. Each BLOB Flash Writer only supports one transfer at the time, and requires a block size that is a multiple of the flash page size. If a transfer is started with a block size lower than the flash page size, the transfer will be rejected.

The BLOB Flash Writer copies chunk data into a buffer to accommodate chunks that are unaligned with the flash write block size. The buffer data is padded with `0xff` if either the start or length of the chunk is unaligned.

API Reference

group bt_mesh_blob_io_flash

Functions

```c
int bt_mesh_blob/io_flash_init(struct bt_mesh_blob/io_flash *flash, uint8_t area_id, off_t offset);
```

Initialize a flash stream.

Parameters

- `flash` – Flash stream.
- `area_id` – Flash partition identifier. See `flash_area_open`.
- `offset` – Offset into the flash area, in bytes.

Returns

0 on success or (negative) error code otherwise.

```c
struct bt_mesh_blob/io_flash
```

`<blob_io_flash.h>` BLOB flash stream.

Public Members

- `uint8_t area_id`
  
  Flash area ID to write the BLOB to.

- `enum bt_mesh_blob/io_mode mode`
  
  Active stream mode.

- `off_t offset`
  
  Offset into the flash area to place the BLOB at (in bytes).

Transfer capabilities  Each BLOB Transfer Server may have different transfer capabilities. The transfer capabilities of each device are controlled through the following configuration options:

- `CONFIG_BT_MESH_BLOB_SIZE_MAX`
- `CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MIN`
- `CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MAX`
- `CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX`
The `CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX` option is also used by the BLOB Transfer Client and affects memory consumption by the BLOB Transfer Client model structure.

To ensure that the transfer can be received by as many servers as possible, the BLOB Transfer Client can retrieve the capabilities of each BLOB Transfer Server before starting the transfer. The client will transfer the BLOB with the highest possible block and chunk size.

**Transfer modes** BLOBs can be transferred using two transfer modes, Push BLOB Transfer Mode and Pull BLOB Transfer Mode. In most cases, the transfer should be conducted in Push BLOB Transfer Mode.

In Push BLOB Transfer Mode, the send rate is controlled by the BLOB Transfer Client, which will push all the chunks of each block without any high level flow control. Push BLOB Transfer Mode supports any number of Target nodes, and should be the default transfer mode.

In Pull BLOB Transfer Mode, the BLOB Transfer Server will “pull” the chunks from the BLOB Transfer Client at its own rate. Pull BLOB Transfer Mode can be conducted with multiple Target nodes, and is intended for transferring BLOBs to Target nodes acting as *Low Power Node*. When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request chunks from the BLOB Transfer Client in small batches, and wait for them all to arrive before requesting more chunks. This process is repeated until the BLOB Transfer Server has received all chunks in a block. Then, the BLOB Transfer Client starts the next block, and the BLOB Transfer Server requests all chunks of that block.

**Transfer timeout** The timeout of the BLOB transfer is based on a Timeout Base value. Both client and server use the same Timeout Base value, but they calculate timeout differently.

The BLOB Transfer Server uses the following formula to calculate the BLOB transfer timeout:

\[ 10 \times (\text{Timeout Base} + 1) \text{ seconds} \]

For the BLOB Transfer Client, the following formula is used:

\[ (10000 \times (\text{Timeout Base} + 2)) + (100 \times \text{TTL}) \text{ milliseconds} \]

where TTL is time to live value set in the transfer.

**API reference** This section contains types and defines common to the BLOB Transfer models.

*group bt_mesh_blob*

**Defines**

`CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX`

**Enums**

*enum bt_mesh_blob_xfer_mode*

BLOB transfer mode.

*Values:*

- `BT_MESH_BLOB_XFER_MODE_NONE`: No valid transfer mode.
enumerator BT_MESH_BLOB_XFER_MODE_PUSH
   Push mode (Push BLOB Transfer Mode).

denumerator BT_MESH_BLOB_XFER_MODE_PULL
   Pull mode (Pull BLOB Transfer Mode).

denumerator BT_MESH_BLOB_XFER_MODE_ALL
   Both modes are valid.

denum bt_mesh_blob_xfer_phase
   Transfer phase.
   
   Values:

   enumerator BT_MESH_BLOB_XFER_PHASE_INACTIVE
      The BLOB Transfer Server is awaiting configuration.

   enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START
      The BLOB Transfer Server is ready to receive a BLOB transfer.

   enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_BLOCK
      The BLOB Transfer Server is waiting for the next block of data.

   enumerator BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_CHUNK
      The BLOB Transfer Server is waiting for the next chunk of data.

   enumerator BT_MESH_BLOB_XFER_PHASE_COMPLETE
      The BLOB was transferred successfully.

   enumerator BT_MESH_BLOB_XFER_PHASE_SUSPENDED
      The BLOB transfer is paused.

denum bt_mesh_blob_status
   BLOB model status codes.
   
   Values:

   enumerator BT_MESH_BLOB_SUCCESS
      The message was processed successfully.

   enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_NUM
      The Block Number field value is not within the range of blocks being transferred.

   enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_SIZE
      The block size is smaller than the size indicated by the Min Block Size Log state or is larger than the size indicated by the Max Block Size Log state.

   enumerator BT_MESH_BLOB_ERR_INVALID_CHUNK_SIZE
      The chunk size exceeds the size indicated by the Max Chunk Size state, or the number of chunks exceeds the number specified by the Max Total Chunks state.
enumerator BT_MESH_BLOB_ERR_WRONG_PHASE
   The operation cannot be performed while the server is in the current phase.

enumerator BT_MESH_BLOB_ERR_INVALID_PARAM
   A parameter value in the message cannot be accepted.

enumerator BT_MESH_BLOB_ERR_WRONG_BLOB_ID
   The message contains a BLOB ID value that is not expected.

enumerator BT_MESH_BLOB_ERR_BLOB_TOO_LARGE
   There is not enough space available in memory to receive the BLOB.

enumerator BT_MESH_BLOB_ERR_UNSUPPORTED_MODE
   The transfer mode is not supported by the BLOB Transfer Server model.

enumerator BT_MESH_BLOB_ERR_INTERNAL
   An internal error occurred on the node.

enumerator BT_MESH_BLOB_ERR_INFO_UNAVAILABLE
   The requested information cannot be provided while the server is in the current phase.

enum bt_mesh_blob_io_mode
   BLOB stream interaction mode.

Values:

enumerator BT_MESH_BLOB_READ
   Read data from the stream.

enumerator BT_MESH_BLOB_WRITE
   Write data to the stream.

struct bt_mesh_blob_block
   #include <blob.h> BLOB transfer data block.

Public Members

size_t size
   Block size in bytes.

off_t offset
   Offset in bytes from the start of the BLOB.

uint16_t number
   Block number.

uint16_t chunk_count
   Number of chunks in block.
Bitmap of missing chunks.

```c
uint8_t missing[DIV_ROUND_UP(0, 8)]
```

```c
struct bt_mesh_blob_chunk
#include <blob.h> // BLOB data chunk.
```

**Public Members**

```c
off_t offset
```
Offset of the chunk data from the start of the block.

```c
size_t size
```
Chunk data size.

```c
uint8_t *data
```
Chunk data.

```c
struct bt_mesh_blob_xfer
#include <blob.h> // BLOB transfer.
```

**Public Members**

```c
uint64_t id
```
BLOB ID.

```c
size_t size
```
Total BLOB size in bytes.

```c
enum bt_mesh_blob_xfer_mode mode
```
BLOB transfer mode.

```c
uint16_t chunk_size
```
Base chunk size. May be smaller for the last chunk.

```c
struct bt_mesh_blob_io
#include <blob.h> // BLOB stream.
```

**Public Members**

```c
int (*open)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, enum bt_mesh_blob_io_mode mode)
```
Open callback. Called when the reader is opened for reading.

**Param io**
BLOB stream.
**Param xfer**  
BLOB transfer.

**Param mode**  
Direction of the stream (read/write).

**Return**  
0 on success, or (negative) error code otherwise.

```c
void (*close)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer)
```

Close callback.

Called when the reader is closed.

**Param io**  
BLOB stream.

**Param xfer**  
BLOB transfer.

```c
int (*block_start)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block)
```

Block start callback.

Called when a new block is opened for sending. Each block is only sent once, and are always sent in increasing order. The data chunks inside a single block may be requested out of order and multiple times.

**Param io**  
BLOB stream.

**Param xfer**  
BLOB transfer.

**Param block**  
Block that was started.

```c
void (*block_end)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block)
```

Block end callback.

Called when the current block has been transmitted in full. No data from this block will be requested again, and the application data associated with this block may be discarded.

**Param io**  
BLOB stream.

**Param xfer**  
BLOB transfer.

**Param block**  
Block that finished sending.

```c
int (*wr)(const struct bt_mesh_blob_io *io, const struct bt_mesh_blob_xfer *xfer, const struct bt_mesh_blob_block *block, const struct bt_mesh_blob_chunk *chunk)
```

Chunk data write callback.

Used by the BLOB Transfer Server on incoming data.

Each block is divided into chunks of data. This callback is called when a new chunk of data is received. Chunks may be received in any order within their block.

If the callback returns successfully, this chunk will be marked as received, and will not be received again unless the block is restarted due to a transfer suspension. If the callback returns a non-zero value, the chunk remains unreceived, and the BLOB Transfer Client will attempt to resend it later.

Note that the Client will only perform a limited number of attempts at delivering a chunk before dropping a Target node from the transfer. The number of retries performed by the Client is implementation specific.
### Chunk data read callback

Chunk data read callback.

Used by the BLOB Transfer Client to fetch outgoing data.

The Client calls the chunk data request callback to populate a chunk message going out to the Target nodes. The data request callback may be called out of order and multiple times for each offset, and cannot be used as an indication of progress.

Returning a non-zero status code on the chunk data request callback results in termination of the transfer.

**Param io**
- BLOB stream.

**Param xfer**
- BLOB transfer.

**Param block**
- Block the chunk is part of.

**Param chunk**
- Received chunk.

**Return**
- 0 on success, or (negative) error code otherwise.

---

**Device Firmware Update (DFU)**  
Bluetooth mesh supports the distribution of firmware images across a mesh network. The Bluetooth mesh DFU subsystem implements the Firmware update section of the Bluetooth Mesh Model Specification v1.1.

Bluetooth mesh DFU implements a distribution mechanism for firmware images, and does not put any restrictions on the size, format or usage of the images. The primary design goal of the subsystem is to provide the qualifiable parts of the Bluetooth mesh DFU specification, and leave the usage, firmware validation and deployment to the application.

The DFU specification is implemented in the Zephyr Bluetooth mesh DFU subsystem as three separate models:

**Firmware Update Server**  
The Firmware Update Server model implements the Target node functionality of the Device Firmware Update (DFU) subsystem. It extends the BLOB Transfer Server, which it uses to receive the firmware image binary from the Distributor node.

Together with the extended BLOB Transfer Server model, the Firmware Update Server model implements all the required functionality for receiving firmware updates over the mesh network, but does not provide any functionality for storing, applying or verifying the images.

**Firmware images**  
The Firmware Update Server holds a list of all the updatable firmware images on the device. The full list shall be passed to the server through the _imgs parameter in BT_MESH_DFU_SRV_INIT, and must be populated before the Bluetooth mesh subsystem is started. Each
firmware image in the image list must be independently updatable, and should have its own firmware ID.

For instance, a device with an upgradable bootloader, an application and a peripheral chip with firmware update capabilities could have three entries in the firmware image list, each with their own separate firmware ID.

**Receiving transfers**  The Firmware Update Server model uses a BLOB Transfer Server model on the same element to transfer the binary image. The interaction between the Firmware Update Server, BLOB Transfer Server and application is described below:

---

**Fig. 9:** Bluetooth mesh Firmware Update Server transfer

---

6.1. Bluetooth
Transfer check  The transfer check is an optional pre-transfer check the application can perform on incoming firmware image metadata. The Firmware Update Server performs the transfer check by calling the `check` callback.

The result of the transfer check is a pass/fail status return and the expected `bt_mesh_dfu_effect`. The DFU effect return parameter will be communicated back to the Distributor, and should indicate what effect the firmware update will have on the mesh state of the device. If the transfer will cause the device to change its Composition Data or become unprovisioned, this should be communicated through the effect parameter of the metadata check.

Start  The Start procedure prepares the application for the incoming transfer. It'll contain information about which image is being updated, as well as the update metadata.

The Firmware Update Server `start` callback must return a pointer to the BLOB Writer the BLOB Transfer Server will send the BLOB to.

BLOB transfer  After the setup stage, the Firmware Update Server prepares the BLOB Transfer Server for the incoming transfer. The entire firmware image is transferred to the BLOB Transfer Server, which passes the image to its assigned BLOB Writer.

At the end of the BLOB transfer, the Firmware Update Server calls its `end` callback.

Image verification  After the BLOB transfer has finished, the application should verify the image in any way it can to ensure that it is ready for being applied. Once the image has been verified, the application calls `bt_mesh_dfu_srv_verified()`.

If the image can't be verified, the application calls `bt_mesh_dfu_srv_rejected()`.

Applying the image  Finally, if the image was verified, the Distributor may instruct the Firmware Update Server to apply the transfer. This is communicated to the application through the `apply` callback. The application should swap the image and start running with the new firmware. The firmware image table should be updated to reflect the new firmware ID of the updated image.

When the transfer applies to the mesh application itself, the device might have to reboot as part of the swap. This restart can be performed from inside the apply callback, or done asynchronously. After booting up with the new firmware, the firmware image table should be updated before the Bluetooth mesh subsystem is started.

The Distributor will read out the firmware image table to confirm that the transfer was successfully applied. If the metadata check indicated that the device would become unprovisioned, the Target node is not required to respond to this check.

API reference

`bt_mesh_dfu_srv`  API for the Bluetooth mesh Firmware Update Server model.

Defines

`BT_MESH_DFU_SRV_INIT(_handlers, _imgs, _img_count)`

Initialization parameters for Firmware Update Server model.

Parameters

- `_handlers` – DFU handler function structure.
- `_imgs` – List of `bt_mesh_dfu_img` managed by this Server.
• _img_count – Number of DFU images managed by this Server.

BT_MESH_MODEL_DFU_SRV(_srv)

Firmware Update Server model entry.

Parameters
• _srv – Pointer to a Firmware Update Server model instance.

Functions

void bt_mesh_dfu_srv_verified(struct bt_mesh_dfu_srv *srv)

Accept the received DFU transfer.

Should be called at the end of a successful DFU transfer.

If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if the image is ready to be applied.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_rejected(struct bt_mesh_dfu_srv *srv)

Reject the received DFU transfer.

Should be called at the end of a successful DFU transfer.

If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if one of the checks fail.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_cancel(struct bt_mesh_dfu_srv *srv)

Cancel the ongoing DFU transfer.

Parameters
• srv – Firmware Update Server instance.

void bt_mesh_dfu_srv_applied(struct bt_mesh_dfu_srv *srv)

Confirm that the received DFU transfer was applied.

Should be called as a result of the bt_mesh_dfu_srv_cb::apply callback.

Parameters
• srv – Firmware Update Server instance.

bool bt_mesh_dfu_srv_is_busy(const struct bt_mesh_dfu_srv *srv)

Check if the Firmware Update Server is busy processing a transfer.

Parameters
• srv – Firmware Update Server instance.

Returns
true if a DFU procedure is in progress, false otherwise.

uint8_t bt_mesh_dfu_srv_progress(const struct bt_mesh_dfu_srv *srv)

Get the progress of the current DFU procedure, in percent.

Parameters
• srv – Firmware Update Server instance.
Returns

The current transfer progress in percent.

struct bt_mesh_dfu_srv_cb
#include <dfu_srv.h> Firmware Update Server event callbacks.

Public Members

int (*check)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, struct net_buf_simple *metadata, enum bt_mesh_dfu_effect *effect)

Transfer check callback.

The transfer check can be used to validate the incoming transfer before it starts. The contents of the metadata is implementation specific, and should contain all the information the application needs to determine whether this image should be accepted, and what the effect of the transfer would be.

If applying the image will have an effect on the provisioning state of the mesh stack, this can be communicated through the effect return parameter.

The metadata check can be performed both as part of starting a new transfer and as a separate procedure.

This handler is optional.

Param srv
Firmware Update Server instance.

Param img
DFU image the metadata check is performed on.

Param metadata
Image metadata.

Param effect
Return parameter for the image effect on the provisioning state of the mesh stack.

Return
0 on success, or (negative) error code otherwise.

int (*start)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, struct net_buf_simple *metadata, const struct bt_mesh_blob_io **io)

Transfer start callback.

Called when the Firmware Update Server is ready to start a new DFU transfer. The application must provide an initialized BLOB stream to be used during the DFU transfer.

The following error codes are treated specially, and should be used to communicate these issues:

• -ENOMEM: The device cannot fit this image.
• -EBUSY: The application is temporarily unable to accept the transfer.
• -EALREADY: The device has already received and verified this image, and there's no need to transfer it again. The Firmware Update model will skip the transfer phase, and mark the image as verified.

This handler is mandatory.

Param srv
Firmware Update Server instance.

Param img
DFU image being updated.

Param metadata
Image metadata.
**Param Io**

BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**

0 on success, or (negative) error code otherwise. Return codes -ENOMEM, -EBUSY
-EALREADY will be passed to the updater, other error codes are reported as internal errors.

```c
void (*end)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, bool success)
```

Transfer end callback.

This handler is optional.

If the transfer is successful, the application should verify the firmware image, and call either `bt_mesh_dfu_srv_verified` or `bt_mesh_dfu_srv_rejected` depending on the outcome.

If the transfer fails, the Firmware Update Server will be available for new transfers immediately after this function returns.

- **Param srv**
  Firmware Update Server instance.

- **Param img**
  DFU image that failed the update.

- **Param success**
  Whether the DFU transfer was successful.

```c
int (*recover)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img, const struct bt_mesh_blob_io **io)
```

Transfer recovery callback.

If the device reboots in the middle of a transfer, the Firmware Update Server calls this function when the Bluetooth mesh subsystem is started.

This callback is optional, but transfers will not be recovered after a reboot without it.

- **Param srv**
  Firmware Update Server instance.

- **Param img**
  DFU image being updated.

- **Param io**
  BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.

**Return**

0 on success, or (negative) error code to abandon the transfer.

```c
int (*apply)(struct bt_mesh_dfu_srv *srv, const struct bt_mesh_dfu_img *img)
```

Transfer apply callback.

Called after a transfer has been validated, and the updater sends an apply message to the Target nodes.

This handler is optional.

- **Param srv**
  Firmware Update Server instance.

- **Param img**
  DFU image that should be applied.

**Return**

0 on success, or (negative) error code otherwise.

```c
struct bt_mesh_dfu_srv
#include <dfu_srv.h> Firmware Update Server instance.
```
Should be initialized with `BT_MESH_DFU_SRV_INIT`.

**Public Members**

```c
struct bt_mesh_blob_srv blob
    Underlying BLOB Transfer Server.

const struct bt_mesh_dfu_srv_cb *cb
    Callback structure.

const struct bt_mesh_dfu_img *imgs
    List of updatable images.

size_t img_count
    Number of updatable images.
```

**Firmware Update Client** The Firmware Update Client is responsible for distributing firmware updates through the mesh network. The Firmware Update Client uses the `BLOB Transfer Client` as a transport for its transfers.

**API reference**

```c
group bt_mesh_dfu_cli
    API for the Bluetooth mesh Firmware Update Client model.

Defines

`BT_MESH_DFU_CLI_INIT(_handlers)`
    Initialization parameters for the Firmware Uppdate Client model.

See also:

`bt_mesh_dfu_cli_cb`.

**Parameters**

- `_handlers` – Handler callback structure.

`BT_MESH_MODEL_DFU_CLI(_cli)`
    Firmware Update Client model Composition Data entry.

**Parameters**

- `_cli` – Pointer to a Firmware Uppdate Client model instance.

**Typedefs**
typedef enum bt_mesh_dfu_iter (*bt_mesh_dfu_img_cb_t)(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t idx, uint8_t total, const struct bt_mesh_dfu_img *img, void *cb_data)

DFU image callback.

The image callback is called for every DFU image on the Target node when calling `bt_mesh_dfu_cli_imgs_get`.

- **Param cli**
  Firmware Update Client model instance.

- **Param ctx**
  Message context of the received message.

- **Param idx**
  Image index.

- **Param total**
  Total number of images on the Target node.

- **Param img**
  Image information for the given image index.

- **Param cb_data**
  Callback data.

**Retval BT_MESH_DFU_ITER_STOP**
Stop iterating through the image list and return from `bt_mesh_dfu_cli_imgs_get`.

**Retval BT_MESH_DFU_ITER_CONTINUE**
Continue iterating through the image list if any images remain.

**Functions**

```c
int bt_mesh_dfu_cli_send(struct bt_mesh_dfu_cli *cli, const struct bt_mesh_blob_cli_inputs *inputs, const struct bt_mesh_blob_io *io, const struct bt_mesh_dfu_cli_xfer *xfer)
```

Start distributing a DFU.

Starts distribution of the firmware in the given slot to the list of DFU Target nodes in ctx. The transfer runs in the background, and its end is signalled through the `bt_mesh_dfu_cli_cb::ended` callback.

**Note:** The BLOB Transfer Client transfer inputs targets list must point to a list of `bt_mesh_dfu_target` nodes.

**Parameters**

- `cli` – Firmware Update Client model instance.
- `inputs` – BLOB Transfer Client transfer inputs.
- `io` – BLOB stream to read BLOB from.
- `xfer` – Firmware Update Client transfer parameters.

**Returns**

0 on success, or (negative) error code otherwise.
int bt_mesh_dfu_cli_suspend(struct bt_mesh_dfu_cli *cli)
Suspend a DFU transfer.

Parameters
• cli – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_resume(struct bt_mesh_dfu_cli *cli)
Resume the suspended transfer.

Parameters
• cli – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_cancel(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx)
Cancel a DFU transfer.

Will cancel the ongoing DFU transfer, or the transfer on a specific Target node if ctx is valid.

Parameters
• cli – Firmware Update Client model instance.
• ctx – Message context, or NULL to cancel the ongoing DFU transfer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_apply(struct bt_mesh_dfu_cli *cli)
Apply the completed DFU transfer.

A transfer can only be applied after it has ended successfully. The Firmware Update Client's applied callback is called at the end of the apply procedure.

Parameters
• cli – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_confirm(struct bt_mesh_dfu_cli *cli)
Confirm that the active transfer has been applied on the Target nodes.

A transfer can only be confirmed after it has been applied. The Firmware Update Client's confirmed callback is called at the end of the confirm procedure.

Target nodes that have reported the effect as BT_MESH_DFU_EFFECT_UNPROV are expected to not respond to the query, and will fail if they do.

Parameters
• cli – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

uint8_t bt_mesh_dfu_cli_progress(struct bt_mesh_dfu_cli *cli)
Get progress as a percentage of completion.

Parameters
• cli – Firmware Update Client model instance.
Returns
The progress of the current transfer in percent, or 0 if no transfer is active.

bool bt_mesh_dfu_cli_is_busy(struct bt_mesh_dfu_cli *cli)
Check whether a DFU transfer is in progress.

Parameters
• cli – Firmware Update Client model instance.

Returns
ture if the BLOB Transfer Client is currently participating in a transfer, false otherwise.

int bt_mesh_dfu_cli_imgs_get(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx,
                           bt_mesh_dfu_img_cb_t cb, void *cb_data, uint8_t max_count)
Perform a DFU image list request.
Requests the full list of DFU images on a Target node, and iterates through them, calling the cb for every image.
The DFU image list request can be used to determine which image index the Target node holds its different firmwares in.
Waits for a response until the procedure timeout expires.

Parameters
• cli – Firmware Update Client model instance.
• ctx – Message context.
• cb – Callback to call for each image index.
• cb_data – Callback data to pass to cb.
• max_count – Max number of images to return.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_metadata_check(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx,
                                   uint8_t img_idx, const struct bt_mesh_dfu_slot *slot,
                                   struct bt_mesh_dfu_metadata_status *rsp)
Perform a metadata check for the given DFU image slot.
The metadata check procedure allows the Firmware Update Client to check if a Target node will accept a transfer of this DFU image slot, and what the effect would be.
Waits for a response until the procedure timeout expires.

Parameters
• cli – Firmware Update Client model instance.
• ctx – Message context.
• img_idx – Target node’s image index to check.
• slot – DFU image slot to check for.
• rsp – Metadata status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_cli_status_get(struct bt_mesh_dfu_cli *cli, struct bt_mesh_msg_ctx *ctx, struct bt_mesh_dfu_target_status *rsp)
Get the status of a Target node.
Parameters

- cli – Firmware Update Client model instance.
- ctx – Message context.
- rsp – Response data buffer.

Returns

0 on success, or (negative) error code otherwise.

int32_t bt_mesh_dfu_cli_timeout_get(void)
Get the current procedure timeout value.

Returns

The configured procedure timeout.

void bt_mesh_dfu_cli_timeout_set(int32_t timeout)
Set the procedure timeout value.

Parameters

- timeout – The new procedure timeout.

struct bt_mesh_dfu_target
#include <dfu_cli.h> DFU Target node.

Public Members

struct bt_mesh_blob_target blob
BLOB Target node.

uint8_t img_idx
Image index on the Target node.

uint8_t effect
Expected DFU effect, see bt_mesh_dfu_effect.

uint8_t status
Current DFU status, see bt_mesh_dfu_status.

uint8_t phase
Current DFU phase, see bt_mesh_dfu_phase.

struct bt_mesh_dfu_metadata_status
#include <dfu_cli.h> Metadata status response.

Public Members

uint8_t idx
Image index.

defined bt_mesh_dfu_status status
Status code.
enum \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore effect} \texttt{effect}  
Effect of transfer.

\begin{verbatim}
struct \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore target\textunderscore status}
#include <dfu\textunderscore cli.h> \texttt{DFU Target node status parameters.}

\textbf{Public Members}

enum \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore status} \texttt{status}  
Status of the previous operation.

enum \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore phase} \texttt{phase}  
Phase of the current DFU transfer.

enum \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore effect} \texttt{effect}  
The effect the update will have on the Target device's state.

uint64_t \texttt{blob_id}  
BLOB ID used in the transfer.

uint8_t \texttt{img\textunderscore idx}  
Image index to transfer.

uint8_t \texttt{ttl}  
TTL used in the transfer.

uint16_t \texttt{timeout\_base}  
Additional response time for the Target nodes, in 10-second increments.
\end{verbatim}

The extra time can be used to give the Target nodes more time to respond to messages from the Client. The actual timeout will be calculated according to the following formula:

\begin{verbatim}
* timeout = 20 \text{ seconds} + (10 \text{ seconds} \times \texttt{timeout\_base}) + (100 \text{ ms} \times \texttt{TTL})
\end{verbatim}

If a Target node fails to respond to a message from the Client within the configured transfer timeout, the Target node is dropped.

\begin{verbatim}
struct \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore cli\textunderscore cb}
#include <dfu\textunderscore cli.h> \texttt{Firmware Update Client event callbacks.}

\textbf{Public Members}

void (*\texttt{suspended})(struct \texttt{bt\textunderscore mesh\textunderscore dfu\textunderscore cli} *\texttt{cli})  
BLOB transfer is suspended.

Called when the BLOB transfer is suspended due to response timeout from all Target nodes.

\textbf{Param cli}  
Firmware Update Client model instance.
\end{verbatim}
void (*ended)(struct bt_mesh_dfu_cli *cli, enum bt_mesh_dfu_status reason)
DFU ended.
Called when the DFU transfer ends, either because all Target nodes were lost or because
the transfer was completed successfully.

  **Param cli**
  Firmware Update Client model instance.

  **Param reason**
  Reason for ending.

void (*applied)(struct bt_mesh_dfu_cli *cli)
DFU transfer applied on all active Target nodes.
Called at the end of the apply procedure started by `bt_mesh_dfu_cli_apply`.

  **Param cli**
  Firmware Update Client model instance.

void (*confirmed)(struct bt_mesh_dfu_cli *cli)
DFU transfer confirmed on all active Target nodes.
Called at the end of the apply procedure started by `bt_mesh_dfu_cli_confirm`.

  **Param cli**
  Firmware Update Client model instance.

void (*lost_target)(struct bt_mesh_dfu_cli *cli, struct bt_mesh_dfu_target *target)
DFU Target node was lost.
A DFU Target node was dropped from the receivers list. The Target node’s status is set
to reflect the reason for the failure.

  **Param cli**
  Firmware Update Client model instance.

  **Param target**
  DFU Target node that was lost.

struct bt_mesh_dfu_cli
#include <dfu_cli.h> Firmware Update Client model instance.
Should be initialized with `BT_MESH_DFU_CLI_INIT`.

**Public Members**

const struct bt_mesh_dfu_cli_cb *cb
Callback structure.

struct bt_mesh_blob_cli blob
Underlying BLOB Transfer Client.

struct bt_mesh_dfu_cli_xfer_blob_params
#include <dfu_cli.h> BLOB parameters for Firmware Update Client transfer:

**Public Members**

```c
uint16_t chunk_size
    Base chunk size.
    May be smaller for the last chunk.
```

```c
struct bt_mesh_dfu_cli_xfer
    #include <dfu_cli.h> Firmware Update Client transfer parameters:
```

### Public Members

```c
uint64_t blob_id
    BLOB ID to use for this transfer, or 0 to set it randomly.
```

```c
const struct bt_mesh_dfu_slot *slot
    DFU image slot to transfer.
```

```c
enum bt_mesh_blob_xfer_mode mode
    Transfer mode (Push (Push BLOB Transfer Mode) or Pull (Pull BLOB Transfer Mode))
```

```c
const struct bt_mesh_dfu_cli_xfer_blob_params *blob_params
    BLOB parameters to be used for the transfer, or NULL to retrieve Target nodes' capabilities before sending a firmware.
```

**Firmware Distribution Server** The Firmware Distribution Server model implements the Distributor role for the Device Firmware Update (DFU) subsystem. It extends the BLOB Transfer Server, which it uses to receive the firmware image binary from the Initiator node. It also instantiates a Firmware Update Client, which it uses to distribute firmware updates throughout the mesh network.

**Note:** Currently, the Firmware Distribution Server supports out-of-band (OOB) retrieval of firmware images over SMP service only.

The Firmware Distribution Server does not have an API of its own, but relies on a Firmware Distribution Client model on a different device to give it information and trigger image distribution and upload.

**Firmware slots** The Firmware Distribution Server is capable of storing multiple firmware images for distribution. Each slot contains a separate firmware image with metadata, and can be distributed to other mesh nodes in the network in any order. The contents, format and size of the firmware images are vendor specific, and may contain data from other vendors. The application should never attempt to execute or modify them.

The slots are managed remotely by a Firmware Distribution Client, which can both upload new slots and delete old ones. The application is notified of changes to the slots through the Firmware Distribution Server's callbacks (bt_mesh_fd_srv_cb). While the metadata for each firmware slot is stored internally, the application must provide a BLOB streams for reading and writing the firmware image.

**API reference**

```
group bt_mesh_dfd_srv
    API for the Firmware Distribution Server model.
```
Defines

CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX

BT_MESH_DFD_SRV_INIT(_cb)
   Initialization parameters for the Firmware Distribution Server model.

BT_MESH_MODEL_DFD_SRV(_srv)
   Firmware Distribution Server model Composition Data entry.

   Parameters
   • _srv – Pointer to a Firmware Distribution Server model instance.

struct bt_mesh_dfd_srv_cb
   #include <dfd_srv.h> Firmware Distribution Server callbacks:

   Public Members

   int (*recv)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot, const struct bt_mesh_blob_io **io)
      Slot receive callback.
      Called at the start of an upload procedure. The callback must fill io with a pointer to a writable BLOB stream for the Firmware Distribution Server to write the firmware image to.
      Param srv
         Firmware Distribution Server model instance.
      Param slot
         DFU image slot being received.
      Param io
         BLOB stream response pointer.
      Return
         0 on success, or (negative) error code otherwise.

   void (*del)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot)
      Slot delete callback.
      Called when the Firmware Distribution Server is about to delete a DFU image slot. All allocated data associated with the firmware slot should be deleted.
      Param srv
         Firmware Update Server instance.
      Param slot
         DFU image slot being deleted.

   int (*send)(struct bt_mesh_dfd_srv *srv, const struct bt_mesh_dfu_slot *slot, const struct bt_mesh_blob_io **io)
      Slot send callback.
      Called at the start of a distribution procedure. The callback must fill io with a pointer to a readable BLOB stream for the Firmware Distribution Server to read the firmware image from.
      Param srv
         Firmware Distribution Server model instance.
      Param slot
         DFU image slot being sent.
**Param io**
- BLOB stream response pointer.

**Return**
- 0 on success, or (negative) error code otherwise.

```c
void (*phase)(struct bt_mesh_dfd_srv *srv, enum bt_mesh_dfd_phase phase)
```

Phase change callback (Optional).

Called whenever the phase of the Firmware Distribution Server changes.

**Param srv**
- Firmware Distribution Server model instance.

**Param phase**
- New Firmware Distribution phase.

```c
#include <dfd_srv.h>
```

Overview

**DFU roles** The Bluetooth mesh DFU subsystem defines three different roles the mesh nodes have to assume in the distribution of firmware images:

**Target node**
- Target node is the receiver and user of the transferred firmware images. All its functionality is implemented by the Firmware Update Server model. A transfer may be targeting any number of Target nodes, and they will all be updated concurrently.

**Distributor**
- The Distributor role serves two purposes in the DFU process. First, it's acting as the Target node in the Upload Firmware procedure, then it distributes the uploaded image to other Target nodes as the Distributor. The Distributor does not select the parameters of the transfer, but relies on an Initiator to give it a list of Target nodes and transfer parameters. The Distributor functionality is implemented in two models, Firmware Distribution Server and Firmware Update Client. The Firmware Distribution Server is responsible for communicating with the Initiator, and the Firmware Update Client is responsible for distributing the image to the Target nodes.

**Initiator**
- The Initiator role is typically implemented by the same device that implements the Bluetooth mesh Provisioner and Configurator roles. The Initiator needs a full overview of the potential Target nodes and their firmware, and will control (and initiate) all firmware updates. The Initiator role is not implemented in the Zephyr Bluetooth mesh DFU subsystem.

Bluetooth mesh applications may combine the DFU roles in any way they’d like, and even take on multiple instances of the same role by instantiating the models on separate elements. For instance, the Distributor and Initiator role can be combined by instantiating the Firmware Update Client on the Initiator node and calling its API directly.

It’s also possible to combine the Initiator and Distributor devices into a single device, and replace the Firmware Distribution Server model with a proprietary mechanism that will access the Firmware Update Client model directly, e.g. over a serial protocol.

**Note:** All DFU models instantiate one or more BLOB Transfer models, and may need to be spread over multiple elements for certain role combinations.

**Stages** The Bluetooth mesh DFU process is designed to act in three stages:

---

6.1. Bluetooth 1839
Upload stage
First, the image is uploaded to a Distributor in a mesh network by an external entity, such as a phone or gateway (the Initiator). During the Upload stage, the Initiator transfers the firmware image and all its metadata to the Distributor node inside the mesh network. The Distributor stores the firmware image and its metadata persistently, and awaits further instructions from the Initiator. The time required to complete the upload process depends on the size of the image. After the upload completes, the Initiator can disconnect from the network during the much more time-consuming Distribution stage. Once the firmware has been uploaded to the Distributor, the Initiator may trigger the Distribution stage at any time.

Firmware Capability Check stage (optional)
Before starting the Distribution stage, the Initiator may optionally check if Target nodes can accept the new firmware. Nodes that do not respond, or respond that they can’t receive the new firmware, are excluded from the firmware distribution process.

Distribution stage
Before the firmware image can be distributed, the Initiator transfers the list of Target nodes and their designated firmware image index to the Distributor. Next, it tells the Distributor to start the firmware distribution process, which runs in the background while the Initiator and the mesh network perform other duties. Once the firmware image has been transferred to the Target nodes, the Distributor may ask them to apply the firmware image immediately and report back with their status and new firmware IDs.

Firmware images
All updatable parts of a mesh node's firmware should be represented as a firmware image. Each Target node holds a list of firmware images, each of which should be independently updatable and identifiable.

Firmware images are represented as a BLOB (the firmware itself) with the following additional information attached to it:

Firmware ID
The firmware ID is used to identify a firmware image. The Initiator node may ask the Target nodes for a list of its current firmware IDs to determine whether a newer version of the firmware is available. The format of the firmware ID is vendor specific, but generally, it should include enough information for an Initiator node with knowledge of the format to determine the type of image as well as its version. The firmware ID is optional, and its max length is determined by `CONFIG_BT_MESH_DFU_FWID_MAXLEN`.

**Firmware metadata**

The firmware metadata is used by the Target node to determine whether it should accept an incoming firmware update, and what the effect of the update would be. The metadata format is vendor specific, and should contain all information the Target node needs to verify the image, as well as any preparation the Target node has to make before the image is applied. Typical metadata information can be image signatures, changes to the node's Composition Data and the format of the BLOB. The Target node may perform a metadata check before accepting incoming transfers to determine whether the transfer should be started. The firmware metadata can be discarded by the Target node after the metadata check, as other nodes will never request the metadata from the Target node. The firmware metadata is optional, and its maximum length is determined by `CONFIG_BT_MESH_DFU_METADATA_MAXLEN`.

The Bluetooth mesh DFU subsystem in Zephyr provides its own metadata format (`bt_mesh_dfu_metadata`) together with a set of related functions that can be used by an end product. The support for it is enabled using the `CONFIG_BT_MESH_DFU_METADATA` option. The format of the metadata is presented in the table below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Size (Bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New firmware version</td>
<td>8 B</td>
<td>1 B: Major version 1 B: Minor version 2 B: Revision 4 B: Build number</td>
</tr>

<td>for new firmware</td>
<td>(Optional)</td>
<td></td>
</tr>
</tbody>
</table>

**Firmware URI**

The firmware URI gives the Initiator information about where firmware updates for the image can be found. The URI points to an online resource the Initiator can interact with to get new versions of the firmware. This allows Initiators to perform updates for any node in the mesh network by interacting with the web server pointed to in the URI. The URI must point to a resource using the `http` or `https` schemes, and the targeted web server must behave according to the Firmware Check Over HTTPS procedure defined by the specification. The firmware URI is optional, and its max length is determined by `CONFIG_BT_MESH_DFU_URI_MAXLEN`.

**Note:** The out-of-band distribution mechanism is not supported.

**Firmware effect**

A new image may have the Composition Data Page 0 different from the one allocated on a Target node. This may have an effect on the provisioning data of the node and how the Distributor finalizes the DFU. Depending on the availability of the Remote Provisioning Server model on the old and
new image, the device may either boot up unprovisioned after applying the new firmware or require to be re-provisioned. The complete list of available options is defined in `bt_mesh_dfu_effect`:

**BT_MESH_DFU_EFFECT_NONE**
The device stays provisioned after the new firmware is programmed. This effect is chosen if the composition data of the new firmware doesn’t change.

**BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR**
This effect is chosen when the composition data changes and the device doesn’t support the remote provisioning. The new composition data takes place only after re-provisioning.

**BT_MESH_DFU_EFFECT_COMP_CHANGE**
This effect is chosen when the composition data changes and the device supports the remote provisioning. In this case, the device stays provisioned and the new composition data takes place after re-provisioning using the Remote Provisioning models.

**BT_MESH_DFU_EFFECT_UNPROV**
This effect is chosen if the composition data in the new firmware changes, the device doesn’t support the remote provisioning, and the new composition data takes effect after applying the firmware.

When the Target node receives the Firmware Update Firmware Metadata Check message, the Firmware Update Server model calls the `bt_mesh_dfu_srv_cb.check` callback, the application can then process the metadata and provide the effect value.

**DFU procedures**
The DFU protocol is implemented as a set of procedures that must be performed in a certain order.

The Initiator controls the Upload stage of the DFU protocol, and all Distributor side handling of the upload subprocedures is implemented in the Firmware Distribution Server.

The Distribution stage is controlled by the Distributor, as implemented by the Firmware Update Client. The Target node implements all handling of these procedures in the Firmware Update Server, and notifies the application through a set of callbacks.

**Uploading the firmware**
The Upload Firmware procedure uses the BLOB Transfer models to transfer the firmware image from the Initiator to the Distributor. The Upload Firmware procedure works in two steps:

1. The Initiator generates a BLOB ID, and sends it to the Distributor’s Firmware Distribution Server along with the firmware information and other input parameters of the BLOB transfer. The Firmware Distribution Server stores the information, and prepares its BLOB Transfer Server for the incoming transfer before it responds with a status message to the Initiator.

2. The Initiator’s BLOB Transfer Client model transfers the firmware image to the Distributor’s BLOB Transfer Server, which stores the image in a predetermined flash partition.

When the BLOB transfer finishes, the firmware image is ready for distribution. The Initiator may upload several firmware images to the Distributor, and ask it to distribute them in any order or at any time. Additional procedures are available for querying and deleting firmware images from the Distributor.

The following Distributor’s capabilities related to firmware images can be configured using the configuration options:

- **CONFIG_BT_MESH_DFU_SLOT_CNT**: Amount of image slots available on the device.
- **CONFIG_BT_MESH_DFD_SRV_SLOT_MAX_SIZE**: Maximum allowed size for each image.
- **CONFIG_BT_MESH_DFD_SRV_SLOT_SPACE**: Available space for all images.
Fig. 11: DFU stages and procedures as seen from the Distributor
Populating the Distributor’s receivers list  Before the Distributor can start distributing the firmware image, it needs a list of Target nodes to send the image to. The Initiator gets the full list of Target nodes either by querying the potential targets directly, or through some external authority. The Initiator uses this information to populate the Distributor’s receivers list with the address and relevant firmware image index of each Target node. The Initiator may send one or more Firmware Distribution Receivers Add messages to build the Distributor’s receivers list, and a Firmware Distribution Receivers Delete All message to clear it.

The maximum number of receivers that can be added to the Distributor is configured through the `CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX` configuration option.

Initiating the distribution  Once the Distributor has stored a firmware image and received a list of Target nodes, the Initiator may initiate the distribution procedure. The BLOB transfer parameters for the distribution are passed to the Distributor along with an update policy. The update policy decides whether the Distributor should request that the firmware is applied on the Target nodes or not. The Distributor stores the transfer parameters and starts distributing the firmware image to its list of Target nodes.

Firmware distribution  The Distributor’s Firmware Update Client model uses its BLOB Transfer Client model’s broadcast subsystem to communicate with all Target nodes. The firmware distribution is performed with the following steps:

1. The Distributor’s Firmware Update Client model generates a BLOB ID and sends it to each Target node’s Firmware Update Server model, along with the other BLOB transfer parameters, the Target node firmware image index and the firmware image metadata. Each Target node performs a metadata check and prepares their BLOB Transfer Server model for the transfer, before sending a status response to the Firmware Update Client, indicating if the firmware update will have any effect on the Bluetooth mesh state of the node.

2. The Distributor’s BLOB Transfer Client model transfers the firmware image to all Target nodes.

3. Once the BLOB transfer has been received, the Target nodes’ applications verify that the firmware is valid by performing checks such as signature verification or image checksums against the image metadata.

4. The Distributor’s Firmware Update Client model queries all Target nodes to ensure that they’ve all verified the firmware image.

If the distribution procedure completed with at least one Target node reporting that the image has been received and verified, the distribution procedure is considered successful.

Note: The firmware distribution procedure only fails if all Target nodes are lost. It is up to the Initiator to request a list of failed Target nodes from the Distributor and initiate additional attempts to update the lost Target nodes after the current attempt is finished.

Suspending the distribution  The Initiator can also request the Distributor to suspend the firmware distribution. In this case, the Distributor will stop sending any messages to Target nodes. When the firmware distribution is resumed, the Distributor will continue sending the firmware from the last successfully transferred block.

Applying the firmware image  If the Initiator requested it, the Distributor can initiate the Apply Firmware on Target Node procedure on all Target nodes that successfully received and verified the firmware image. The Apply Firmware on Target Node procedure takes no parameters, and to avoid ambiguity, it should be performed before a new transfer is initiated. The Apply Firmware on Target Node procedure consists of the following steps:
1. The Distributor's Firmware Update Client model instructs all Target nodes that have verified the firmware image to apply it. The Target nodes' Firmware Update Server models respond with a status message before calling their application's apply callback.

2. The Target node's application performs any preparations needed before applying the transfer, such as storing a snapshot of the Composition Data or clearing its configuration.

3. The Target node's application swaps the current firmware with the new image and updates its firmware image list with the new firmware ID.

4. The Distributor's Firmware Update Client model requests the full list of firmware images from each Target node, and scans through the list to make sure that the new firmware ID has replaced the old.

**Note:** During the metadata check in the distribution procedure, the Target node may have reported that it will become unprovisioned after the firmware image is applied. In this case, the Distributor's Firmware Update Client model will send a request for the full firmware image list, and expect no response.

**Cancelling the distribution** The firmware distribution can be cancelled at any time by the Initiator. In this case, the Distributor starts the cancelling procedure by sending a cancelling message to all Target nodes. The Distributor waits for the response from all Target nodes. Once all Target nodes have replied, or the request has timed out, the distribution procedure is cancelled. After this the distribution procedure can be started again from the Firmware distribution section.

**API reference** This section lists the types common to the Device Firmware Update mesh models.

```plaintext
group bt_mesh_dfu

Defines

CONFIG_BT_MESH_DFU_FWID_MAXLEN
CONFIG_BT_MESH_DFU_METADATA_MAXLEN
CONFIG_BT_MESH_DFU_URI_MAXLEN

Enums

enum bt_mesh_dfu_phase
  DFU transfer phase.
  Values:

  enumerator BT_MESH_DFU_PHASE_IDLE
    Ready to start a Receive Firmware procedure.

  enumerator BT_MESH_DFU_PHASE_TRANSFER_ERR
    The Transfer BLOB procedure failed.
```

6.1. Bluetooth
enumerator BT_MESH_DFU_PHASE_TRANSFER_ACTIVE
   The Receive Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY
   The Verify Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY_OK
   The Verify Firmware procedure completed successfully.

enumerator BT_MESH_DFU_PHASE_VERIFY_FAIL
   The Verify Firmware procedure failed.

enumerator BT_MESH_DFU_PHASE_APPLYING
   The Apply New Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_TRANSFER_CANCELED
   Firmware transfer has been canceled.

enumerator BT_MESH_DFU_PHASE_APPLY_SUCCESS
   Firmware applying succeeded.

enumerator BT_MESH_DFU_PHASE_APPLY_FAIL
   Firmware applying failed.

enumerator BT_MESH_DFU_PHASE_UNKNOWN
   Phase of a node was not yet retrieved.

enum bt_mesh_dfu_status
   DFU status.
   Values:

enumerator BT_MESH_DFU_SUCCESS
   The message was processed successfully.

enumerator BT_MESH_DFU_ERR_RESOURCES
   Insufficient resources on the node.

enumerator BT_MESH_DFU_ERR_WRONG_PHASE
   The operation cannot be performed while the Server is in the current phase.

enumerator BT_MESH_DFU_ERR_INTERNAL
   An internal error occurred on the node.

enumerator BT_MESH_DFU_ERR_FW_IDX
   The message contains a firmware index value that is not expected.

enumerator BT_MESH_DFU_ERR_METADATA
   The metadata check failed.
enumerator BT_MESH_DFU_ERR_TEMPORARILY_UNAVAILABLE
   The Server cannot start a firmware update.

enumerator BT_MESH_DFU_ERR_BLOB_XFER_BUSY
   Another BLOB transfer is in progress.

enum bt_mesh_dfu_effect
   Expected effect of a DFU transfer.
   Values:

   enumerator BT_MESH_DFU_EFFECT_NONE
      No changes to node Composition Data.

   enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR
      Node Composition Data changed and the node does not support remote provisioning.

   enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE
      Node Composition Data changed, and remote provisioning is supported.
      The node supports remote provisioning and Composition Data Page 0x80. Page 0x80 contains different Composition Data than Page 0x0.

   enumerator BT_MESH_DFU_EFFECT_UNPROV
      Node will be unprovisioned after the update.

enum bt_mesh_dfu_iter
   Action for DFU iteration callbacks.
   Values:

   enumerator BT_MESH_DFU_ITER_STOP
      Stop iterating.

   enumerator BT_MESH_DFU_ITER_CONTINUE
      Continue iterating.

struct bt_mesh_dfu_img
   #include <dfu.h> DFU image instance.
   Each DFU image represents a single updatable firmware image.

   Public Members

   const void *fwid
      Firmware ID.

   size_t fwid_len
      Length of the firmware ID.
const char *uri
    Update URI, or NULL.
    Must use one of the http: or https: schemes.

struct bt_mesh_dfu_slot
    #include <dfu.h> DFU image slot for DFU distribution.

Public Members

size_t size
    Size of the firmware in bytes.

size_t fwid_len
    Length of the firmware ID.

size_t metadata_len
    Length of the metadata.

size_t uri_len
    Length of the image URI.

uint8_t fwid[0]
    Firmware ID.

uint8_t metadata[0]
    Metadata.

char uri[0]
    Image URI.

group bt_mesh_dfu_metadata
    Common types and functions for the Bluetooth mesh DFU metadata.

Enums

eenum bt_mesh_dfu_metadata_fw_core_type
    Firmware core type.
    Values:

    enumerator BT_MESH_DFU_FW_CORE_TYPE_APP = BIT(0)
        Application core.

    enumerator BT_MESH_DFU_FW_CORE_TYPE_NETWORK = BIT(1)
        Network core.

    enumerator BT_MESH_DFU_FW_CORE_TYPE_APP_SPECIFIC_BLOB = BIT(2)
        Application-specific BLOB.
Functions

int bt_mesh_dfu_metadata_decode(struct net_buf_simple *buf, struct bt_mesh_dfu_metadata *metadata)

Decode a firmware metadata from a network buffer.

Parameters
• buf – Buffer containing a raw metadata to be decoded.
• metadata – Pointer to a metadata structure to be filled.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_metadata_encode(const struct bt_mesh_dfu_metadata *metadata, struct net_buf_simple *buf)

Encode a firmware metadata into a network buffer.

Parameters
• metadata – Firmware metadata to be encoded.
• buf – Buffer to store the encoded metadata.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_metadata_comp_hash_get(struct net_buf_simple *buf, uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data state.

The format of the Composition Data is defined in MshPRFv1.0.1, section 4.2.1.1.

Parameters
• buf – Pointer to buffer holding Composition Data.
• key – 128-bit key to be used in the hash computation.
• hash – Pointer to a memory location to which the hash will be stored.

Returns
0 on success, or (negative) error code otherwise.

int bt_mesh_dfu_metadata_comp_hash_local_get(uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data Page 0 of this device.

Parameters
• key – 128-bit key to be used in the hash computation.
• hash – Pointer to a memory location to which the hash will be stored.

Returns
0 on success, or (negative) error code otherwise.

#include <dfu_metadata.h> Firmware version.

Public Members

uint8_t major
Firmware major version.
uint8_t minor
Firmware minor version.

uint16_t revision
Firmware revision.

uint32_t build_num
Firmware build number.

struct bt_mesh_dfu_metadata
#include <dfu_metadata.h> Firmware metadata.

Public Members

struct bt_mesh_dfu_metadata_fw_ver fw_ver
New firmware version.

uint32_t fw_size
New firmware size.

enum bt_mesh_dfu_metadata_fw_core_type fw_core_type
New firmware core type.

uint32_t comp_hash
Hash of incoming Composition Data.

uint16_t elems
New number of node elements.

uint8_t *user_data
Application-specific data for new firmware.
This field is optional.

uint32_t user_data_len
Length of the application-specific field.

Message The Bluetooth mesh message provides set of structures, macros and functions used for preparing message buffers, managing message and acknowledged message contexts.

API reference
group bt_mesh_msg
Message.
defines

\textbf{BT\_MESH\_MIC\_SHORT}
Length of a short Mesh MIC.

\textbf{BT\_MESH\_MIC\_LONG}
Length of a long Mesh MIC.

\textbf{BT\_MESH\_MODEL\_OP\_LEN(_op)}
Helper to determine the length of an opcode.

\textbf{Parameters}

- _op – Opcode.

\textbf{BT\_MESH\_MODEL\_BUF\_LEN(_op, _payload\_len)}
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

\textbf{Parameters}

- _op – Opcode of the message.
- _payload\_len – Length of the model payload.

\textbf{BT\_MESH\_MODEL\_BUF\_LEN\_LONG\_MIC(_op, _payload\_len)}
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

\textbf{Parameters}

- _op – Opcode of the message.
- _payload\_len – Length of the model payload.

\textbf{BT\_MESH\_MODEL\_BUF\_DEFINE(_buf, _op, _payload\_len)}
Define a Mesh model message buffer using \textit{NET\_BUF\_SIMPLE\_DEFINE}.

\textbf{Parameters}

- _buf – Buffer name.
- _op – Opcode of the message.
- _payload\_len – Length of the model message payload.

\textbf{BT\_MESH\_MSG\_CTX\_INIT(net\_key\_idx, app\_key\_idx, dst, ttl)}
Helper for \textit{bt\_mesh\_msg\_ctx} structure initialization.

\textbf{Note:} If dst is a Virtual Address, Label UUID shall be initialized separately.

\textbf{Parameters}

- net\_key\_idx – NetKey Index of the subnet to send the message on. Only used if app\_key\_idx points to devkey.
- app\_key\_idx – AppKey Index to encrypt the message with.
- dst – Remote addr.
- ttl – Time To Live.
BT_MESH_MSG_CTX_INIT_APP(app_key_idx, dst)

Helper for bt_mesh_msg_ctx structure initialization secured with Application Key.

**Parameters**

- app_key_idx – AppKey Index to encrypt the message with.
- dst – Remote addr.

BT_MESH_MSG_CTX_INIT_DEV(net_key_idx, dst)

Helper for bt_mesh_msg_ctx structure initialization secured with Device Key of a remote device.

**Parameters**

- net_key_idx – NetKey Index of the subnet to send the message on.
- dst – Remote addr.

BT_MESH_MSG_CTX_INIT_PUB(pub)

Helper for bt_mesh_msg_ctx structure initialization using Model Publication context.

**Parameters**

- pub – Pointer to a model publication context.

**Functions**

void bt_mesh_model_msg_init(struct net_buf_simple *msg, uint32_t opcode)

Initialize a model message.

Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

**Parameters**

- msg – Message buffer.
- opcode – Opcode to encode.

static inline void bt_mesh_msg_ack_ctx_init(struct bt_mesh_msg_ack_ctx *ack)

Initialize an acknowledged message context.

Initializes semaphore used for synchronization between bt_mesh_msg_ack_ctx_wait and bt_mesh_msg_ack_ctx_rx calls. Call this function before using bt_mesh_msg_ack_ctx.

**Parameters**

- ack – Acknowledged message context to initialize.

static inline void bt_mesh_msg_ack_ctx_reset(struct bt_mesh_msg_ack_ctx *ack)

Reset the synchronization semaphore in an acknowledged message context.

This function aborts call to bt_mesh_msg_ack_ctx_wait.

**Parameters**

- ack – Acknowledged message context to be reset.

void bt_mesh_msg_ack_ctx_clear(struct bt_mesh_msg_ack_ctx *ack)

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by bt_mesh_msg_ack_ctx_prepare.

**Parameters**

- ack – Acknowledged message context to be cleared.
int bt_mesh_msg_ack_ctx_prepare(struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t dst, void *user_data)

Prepare an acknowledged message context for the incoming message to wait.
This function sets the opcode, remote address of the incoming message and stores the user data. Use this function before calling bt_mesh_msg_ack_ctx_wait.

Parameters
• ack – Acknowledged message context to prepare.
• dst – Destination address of the message.
• user_data – User data for the acknowledged message context.

Returns
0 on success, or (negative) error code on failure.

static inline bool bt_mesh_msg_ack_ctx_busy(struct bt_mesh_msg_ack_ctx *ack)

Check if the acknowledged message context is initialized with an opcode.

Parameters
• ack – Acknowledged message context.

Returns
true if the acknowledged message context is initialized with an opcode, false otherwise.

int bt_mesh_msg_ack_ctx_wait(struct bt_mesh_msg_ack_ctx *ack, k_timeout_t timeout)

Wait for a message acknowledge.
This function blocks execution until bt_mesh_msg_ack_ctx_rx is called or by timeout.

Parameters
• ack – Acknowledged message context of the message to wait for.
• timeout – Wait timeout.

Returns
0 on success, or (negative) error code on failure.

static inline void bt_mesh_msg_ack_ctx_rx(struct bt_mesh_msg_ack_ctx *ack)

Mark a message as acknowledged.
This function unblocks call to bt_mesh_msg_ack_ctx_wait.

Parameters
• ack – Context of a message to be acknowledged.

bool bt_mesh_msg_ack_ctx_match(const struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t addr, void **user_data)

Check if an opcode and address of a message matches the expected one.

Parameters
• ack – Acknowledged message context to be checked.
• addr – Source address of the incoming message.
• user_data – If not NULL, returns a user data stored in the acknowledged message context by bt_mesh_msg_ack_ctx_prepare.

Returns
true if the incoming message matches the expected one, false otherwise.
struct bt_mesh_msg_ctx
   
   #include <msg.h> Message sending context.

Public Members

uint16_t net_idx
   
   NetKey Index of the subnet to send the message on.

uint16_t app_idx
   
   AppKey Index to encrypt the message with.

uint16_t addr
   
   Remote address.

uint16_t recv_dst
   
   Destination address of a received message.
   
   Not used for sending.

const uint8_t *uuid
   
   Label UUID if Remote address is Virtual address, or NULL otherwise.

int8_t recv_rssi
   
   RSSI of received packet.
   
   Not used for sending.

uint8_t recv_ttl
   
   Received TTL value.
   
   Not used for sending.

bool send_rel
   
   Force sending reliably by using segment acknowledgment.

uint8_t send_ttl
   
   TTL, or BT_MESH_TTL_DEFAULT for default TTL.

struct bt_mesh_msg_ack_ctx
   
   #include <msg.h> Acknowledged message context for tracking the status of model messages pending a response.

Public Members

struct k_sem sem
   
   Sync semaphore.

uint32_t op
   
   Opcode we're waiting for.
uint16_t dst
   Address of the node that should respond.

void *user_data
   User specific parameter.

**Provisioning**  Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The *provisioner* represents the network owner, and is responsible for adding new nodes to the mesh network.
- The *provisionee* is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an *unprovisioned device*.

The Provisioning module in the Zephyr Bluetooth mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

**The Provisioning process**  All Bluetooth mesh nodes must be provisioned before they can participate in a Bluetooth mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconing
- Invitation
- Public key exchange
- Authentication
- Provisioning data transfer

**Beaconing**  To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call `bt_mesh_prov_enable()`. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the OOB information field, as specified in the `prov` parameter passed to `bt_mesh_init()`. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

**Uniform Resource Identifier**  The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special `none` scheme, encoded as 0x01. The available schemes are listed on the Bluetooth website.

Examples of encoded URIs:

<table>
<thead>
<tr>
<th>URI</th>
<th>Encoded</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://example.com">http://example.com</a></td>
<td>\x16/example.com</td>
</tr>
<tr>
<td><a href="https://www.zephyrproject.org/">https://www.zephyrproject.org/</a></td>
<td>\x17/www.zephyrproject.org/</td>
</tr>
<tr>
<td>just a string</td>
<td>\x01just a string</td>
</tr>
</tbody>
</table>
Provisioning invitation  The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server Attention state, if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods and algorithms.

Public key exchange  Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.

If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can’t retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to bt_mesh_prov.public_key_be and bt_mesh_prov.private_key_be. The keys needs to be provided in big-endian bytes order.

To provide the device’s public key obtained via OOB, call bt_mesh_prov_remote_pub_key_set() on the provisioner side.

Authentication  After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB**: An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.

- **Input OOB**: The user inputs the authentication value. The available input actions are listed in bt_mesh_input_action_t.

- **Output OOB**: Show the user the authentication value. The available output actions are listed in bt_mesh_output_action_t.

The application must provide callbacks for the supported authentication methods in bt_mesh_prov, as well as enabling the supported actions in bt_mesh_prov.output_actions and bt_mesh_prov.input_actions.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the bt_mesh_prov.input_complete or bt_mesh_prov.complete callback is called. If the action is blink, beep or vibrate, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the bt_mesh_prov.input callback. The user response should be fed back to the Provisioning API through bt_mesh_input_string() or bt_mesh_input_number(). If no user response is recorded within 60 seconds, the Provisioning process is aborted.

If Provisionee wants to mandate OOB authentication, it is mandatory to use the BT_MESH_ECDH_P256_HMAC_SHA256_AES_CCM algorithm.
Data transfer  After the device has been successfully authenticated, the provisioner transfers the Provisioning data:

- Unicast address
- A network key
- IV index
- Network flags
  - Key refresh
  - IV update

Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning `bt_mesh_prov.complete` callback gets called.

Provisioning security  Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI disclosed a set of vulnerabilities in the Bluetooth mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Mesh Profile specification erratum 16350, as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

API reference

`group bt_mesh_prov`  
Provisioning.

**Enums**

enum [anonymous]  
Available authentication algorithms.  
*Values:*

enumerator BT_MESH_PROV_AUTH_CMAC_AES128_AES_CCM

enumerator BT_MESH_PROV_AUTH_HMAC_SHA256_AES_CCM

enum [anonymous]  
OOB Type field values.  
*Values:*

enumerator BT_MESH_STATIC_OOBAVAILABLE = BIT(0)  
Static OOB information available.

enumerator BT_MESH_OOB_AUTH_REQUIRED = BIT(1)  
OOB authentication required.
enum bt_mesh_output_action_t  
Available Provisioning output authentication actions.

Values:

enumerator BT_MESH_NO_OUTPUT = 0

enumerator BT_MESH_BLINK = BIT(0)  
Blink.

enumerator BT_MESH_BEEP = BIT(1)  
Beep.

enumerator BT_MESH_VIBRATE = BIT(2)  
Vibrate.

enumerator BT_MESH_DISPLAY_NUMBER = BIT(3)  
Output numeric.

enumerator BT_MESH_DISPLAY_STRING = BIT(4)  
Output alphanumeric.

enum bt_mesh_input_action_t  
Available Provisioning input authentication actions.

Values:

enumerator BT_MESH_NO_INPUT = 0

enumerator BT_MESH_PUSH = BIT(0)  
Push.

enumerator BT_MESH_TWIST = BIT(1)  
Twist.

enumerator BT_MESH_ENTER_NUMBER = BIT(2)  
Input number.

enumerator BT_MESH_ENTER_STRING = BIT(3)  
Input alphanumeric.

enum bt_mesh_prov_bearer_t  
Available Provisioning bearers.

Values:

enumerator BT_MESH_PROV_ADV = BIT(0)  
PB-ADV bearer.

enumerator BT_MESH_PROV_GATT = BIT(1)  
PB-GATT bearer.
enum bt_mesh_prov_oob_info_t
    Out of Band information location.

Values:

enumerator BT_MESH_PROV_OOB_OTHER = BIT(0)
    Other.

enumerator BT_MESH_PROV_OOB_URI = BIT(1)
    Electronic / URI.

enumerator BT_MESH_PROV_OOB_2D_CODE = BIT(2)
    2D machine-readable code

enumerator BT_MESH_PROV_OOB_BAR_CODE = BIT(3)
    Bar Code.

enumerator BT_MESH_PROV_OOB_NFC = BIT(4)
    Near Field Communication (NFC)

enumerator BT_MESH_PROV_OOB_NUMBER = BIT(5)
    Number.

enumerator BT_MESH_PROV_OOB_STRING = BIT(6)
    String.

enumerator BT_MESH_PROV_OOB_CERTIFICATE = BIT(7)
    Support for certificate-based provisioning.

enumerator BT_MESH_PROV_OOB_RECORDS = BIT(8)
    Support for provisioning records.

enumerator BT_MESH_PROV_OOB_ON_BOX = BIT(11)
    On box.

enumerator BT_MESH_PROV_OOB_IN_BOX = BIT(12)
    Inside box.

enumerator BT_MESH_PROV_OOB_ON_PAPER = BIT(13)
    On piece of paper.

enumerator BT_MESH_PROV_OOB_IN_MANUAL = BIT(14)
    Inside manual.

enumerator BT_MESH_PROV_OOB_ON_DEV = BIT(15)
    On device.
Functions

int bt_mesh_input_string(const char *str)
Provide provisioning input OOB string.
This is intended to be called after the bt_mesh_prov input callback has been called with BT_MESH_ENTER_STRING as the action.

Parameters
• str – String.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_input_number(uint32_t num)
Provide provisioning input OOB number.
This is intended to be called after the bt_mesh_prov input callback has been called with BT_MESH_ENTER_NUMBER as the action.

Parameters
• num – Number.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_prov_remote_pub_key_set(const uint8_t public_key[64])
Provide Device public key.

Parameters
• public_key – Device public key in big-endian.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_input(bt_mesh_input_action_t action, uint8_t size)
Use Input OOB authentication.
Provisioner only.
Instruct the unprovisioned device to use the specified Input OOB authentication action. When using BT_MESH_PUSH, BT_MESH_TWIST or BT_MESH_ENTER_NUMBER, the bt_mesh_prov::output_number callback is called with a random number that has to be entered on the unprovisioned device.
When using BT_MESH_ENTER_STRING, the bt_mesh_prov::output_string callback is called with a random string that has to be entered on the unprovisioned device.

Parameters
• action – Authentication action used by the unprovisioned device.
• size – Authentication size.

Returns
Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_output(bt_mesh_output_action_t action, uint8_t size)
Use Output OOB authentication.
Provisioner only.
Instruct the unprovisioned device to use the specified Output OOB authentication action. The bt_mesh_prov::input callback will be called.
When using `BT_MESH_BLINK`, `BT_MESH_BEEP`, `BT_MESH_VIBRATE` or `BT_MESH_DISPLAY_NUMBER`, and the application has to call `bt_mesh_input_number` with the random number indicated by the unprovisioned device.

When using `BT_MESH_DISPLAY_STRING`, the application has to call `bt_mesh_input_string` with the random string displayed by the unprovisioned device.

**Parameters**

- `action` – Authentication action used by the unprovisioned device.
- `size` – Authentication size.

**Returns**

Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_static(const uint8_t *static_val, uint8_t size)
```

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

**Parameters**

- `static_val` – Static OOB value.
- `size` – Static OOB value size.

**Returns**

Zero on success or (negative) error code otherwise.

```
int bt_mesh_auth_method_set_none(void)
```

Don’t use OOB authentication.

Provisioner only.

Don’t use any authentication when provisioning new devices. This is the default behavior.

**Warning:** Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

**Returns**

Zero on success or (negative) error code otherwise.

```
int bt_mesh_prov_enable(bt_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.

**Returns**

Zero on success or (negative) error code otherwise.

```
int bt_mesh_prov_disable(bt_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.
Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t iv_index, uint16_t addr, const uint8_t dev_key[16])
```

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

Parameters
- `net_key` – Network Key
- `net_idx` – Network Key Index
- `flags` – Provisioning Flags
- `iv_index` – IV Index
- `addr` – Primary element address
- `dev_key` – Device Key

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_adv(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-ADV.

Parameters
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_gatt(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-GATT.

Parameters
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_remote(struct bt_mesh_rpr_cli *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint16_t net_idx, uint16_t addr)
```

Provision a Mesh Node using PB-Remote.

Parameters
- `cli` – Remote Provisioning Client Model to provision with.
• **srv** – Remote Provisioning Server that should be used to tunnel the provisioning.

• **uuid** – UUID of the unprovisioned node

• **net_idx** – Network Key Index to give to the unprovisioned node.

• **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_reprovision_remote(struct bt_mesh_rpr_cli *cli, struct bt_mesh_rpr_node *srv, uint16_t addr, bool comp_change)
```

Reprovision a Mesh Node using PB-Remote.

Reprovisioning can be used to change the device key, unicast address and composition data of another device. The reprovisioning procedure uses the same protocol as normal provisioning, with the same level of security.

There are three tiers of reprovisioning:

a. Refreshing the device key

b. Refreshing the device key and node address. Composition data may change, including the number of elements.

c. Refreshing the device key and composition data, in case the composition data of the target node changed due to a firmware update or a similar procedure.

The target node indicates that its composition data changed by instantiating its composition data page 128. If the number of elements have changed, it may be necessary to move the unicast address of the target node as well, to avoid overlapping addresses.

**Note:** Changing the unicast addresses of the target node requires changes to all nodes that publish directly to any of the target node’s models.

**Parameters**

• **cli** – Remote Provisioning Client Model to provision on

• **srv** – Remote Provisioning Server to reprovision

• **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.

• **comp_change** – The target node has indicated that its composition data has changed. Note that the target node will reject the update if this isn’t true.

**Returns**
Zero on success or (negative) error code otherwise.

```c
bool bt_mesh_is_provisioned(void)
```

Check if the local node has been provisioned.

This API can be used to check if the local node has been provisioned or not. It can e.g. be helpful to determine if there was a stored network in flash, i.e. if the network was restored after calling `settings_load()`.

**Returns**
True if the node is provisioned. False otherwise.

```c
struct bt_mesh_dev_capabilities
```

```
#include <main.h> Device Capabilities.
```
Public Members

uint8_t elem_count
   Number of elements supported by the device.

uint16_t algorithms
   Supported algorithms and other capabilities.

uint8_t pub_key_type
   Supported public key types.

uint8_t oob_type
   Supported OOB Types.

bt_mesh_output_action_t output_actions
   Supported Output OOB Actions.

bt_mesh_input_action_t input_actions
   Supported Input OOB Actions.

uint8_t output_size
   Maximum size of Output OOB supported.

uint8_t input_size
   Maximum size in octets of Input OOB supported.

struct bt_mesh_prov
   #include <main.h> Provisioning properties & capabilities.

Public Members

const uint8_t * uuid
   The UUID that's used when advertising as unprovisioned.

const char * uri
   Optional URI.
   This will be advertised separately from the unprovisioned beacon, however the unprovisioned beacon will contain a hash of it so the two can be associated by the provisioner.

bt_mesh_prov_oob_info_t oob_info
   Out of Band information field.

const uint8_t * public_key_be
   Pointer to Public Key in big-endian for OOB public key type support.
   Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.
   Must be used together with bt_mesh_prov::private_key_be.
const uint8_t *private_key_be

Pointer to Private Key in big-endian for OOB public key type support.

Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.

Must be used together with bt_mesh_prov::public_key_be.

const uint8_t *static_val

Static OOB value.

uint8_t static_val_len

Static OOB value length.

uint8_t output_size

Maximum size of Output OOB supported.

uint16_t output_actions

Supported Output OOB Actions.

uint8_t input_size

Maximum size of Input OOB supported.

uint16_t input_actions

Supported Input OOB Actions.

void (*capabilities)(const struct bt_mesh_dev_capabilities *cap)

Provisioning Capabilities.

This callback notifies the application that the provisioning capabilities of the unprovisioned device has been received.

The application can consequently call bt_mesh_auth_method_set_<*> to select suitable provisioning oob authentication method.

When this callback returns, the provisioner will start authentication with the chosen method.

Param cap
capabilities supported by device.

int (*output_number)(bt_mesh_output_action_t act, uint32_t num)

Output of a number is requested.

This callback notifies the application that it should output the given number using the given action.

Param act
Action for outputting the number.

Param num
Number to be outputted.

Return
Zero on success or negative error code otherwise

int (*output_string)(const char *str)

Output of a string is requested.

This callback notifies the application that it should display the given string to the user.
Param `str`  
String to be displayed.

Return  
Zero on success or negative error code otherwise

```c
int (*input)(bt_mesh_input_action_t act, uint8_t size)
```

Input is requested.

This callback notifies the application that it should request input from the user using the given action. The requested input will either be a string or a number, and the application needs to consequently call the `bt_mesh_input_string()` or `bt_mesh_input_number()` functions once the data has been acquired from the user.

Param `act`  
Action for inputting data.

Param `num`  
Maximum size of the inputted data.

Return  
Zero on success or negative error code otherwise

```c
void (*input_complete)(void)
```

The other device finished their OOB input.

This callback notifies the application that it should stop displaying its output OOB value, as the other party finished their OOB input.

```c
void (*unprovisioned_beacon)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info, uint32_t *uri_hash)
```

Unprovisioned beacon has been received.

This callback notifies the application that an unprovisioned beacon has been received.

Param `uuid`  
UUID

Param `oob_info`  
OOB Information

Param `uri_hash`  
Pointer to URI Hash value. NULL if no hash was present in the beacon.

```c
void (*unprovisioned_beacon_gatt)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info)
```

PB-GATT Unprovisioned Advertising has been received.

This callback notifies the application that an PB-GATT unprovisioned Advertising has been received.

Param `uuid`  
UUID

Param `oob_info`  
OOB Information

```c
void (*link_open)(bt_mesh_prov_bearer_t bearer)
```

Provisioning link has been opened.

This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

Param `bearer`  
Provisioning bearer.

```c
void (*link_close)(bt_mesh_prov_bearer_t bearer)
```

Provisioning link has been closed.
This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

**Param bearer**
Provisioning bearer.

```c
void (*complete)(uint16_t net_idx, uint16_t addr)
```
Provisioning is complete.

This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param addr**
Primary element address.

```c
void (*reprovisioned)(uint16_t addr)
```
Local node has been reprovisioned.

This callback notifies the application that reprovisioning has been successfully completed.

**Param addr**
New primary element address.

```c
void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)
```
A new node has been added to the provisioning database.

This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param uuid**
UUID of the added node

**Param addr**
Primary element address.

**Param num_elem**
Number of elements that this node has.

```c
void (*reset)(void)
```
Node has been reset.

This callback notifies the application that the local node has been reset and needs to be provisioned again. The node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

**Proxy** The Proxy feature allows legacy devices like phones to access the Bluetooth mesh network through GATT. The Proxy feature is only compiled in if the `CONFIG_BT_MESH_GATT_PROXY` option is set. The Proxy feature state is controlled by the `Configuration Server`, and the initial value can be set with `bt_mesh_cfg_srv.gatt_proxy`.

Nodes with the Proxy feature enabled can advertise with Network Identity and Node Identity, which is controlled by the `Configuration Client`.

The GATT Proxy state indicates if the Proxy feature is supported.
Private Proxy  A node supporting the Proxy feature and the Private Beacon Server model can advertise with Private Network Identity and Private Node Identity types, which is controlled by the Private Beacon Client. By advertising with this set of identification types, the node allows the legacy device to connect to the network over GATT while maintaining the privacy of the network.

The Private GATT Proxy state indicates whether the Private Proxy functionality is supported.

Proxy Solicitation  In the case where both GATT Proxy and Private GATT Proxy states are disabled on a node, a legacy device cannot connect to it. A node supporting the On-Demand Private Proxy Server may however be solicited to advertise connectable advertising events without enabling the Private GATT Proxy state. To solicit the node, the legacy device can send a Solicitation PDU by calling the bt_mesh_proxy_solicit() function. To enable this feature, the client must to be compiled with the CONFIG_BT_MESH_PROXY_SOLICITATION option set.

Solicitation PDUs are non-mesh, non-connectable, undirected advertising messages containing Proxy Solicitation UUID, encrypted with the network key of the subnet that the legacy device wants to connect to. The PDU contains the source address of the legacy device and a sequence number. The sequence number is maintained by the legacy device and is incremented for every new Solicitation PDU sent.

Each node supporting the Solicitation PDU reception holds its own Solicitation Replay Protection List (SRPL). The SRPL protects the solicitation mechanism from replay attacks by storing solicitation sequence number (SSEQ) and solicitation source (SSRC) pairs of valid Solicitation PDUs processed by the node. The delay between updating the SRPL and storing the change to the persistent storage is defined by CONFIG_BT_MESH_RPL_STORE_TIMEOUT.

The Solicitation PDU RPL Configuration models, Solicitation PDU RPL Configuration Client and Solicitation PDU RPL Configuration Server, provide the functionality of saving and clearing SRPL entries. A node that supports the Solicitation PDU RPL Configuration Client model can clear a section of the SRPL on the target by calling the bt_mesh_sol_pdu_rpl_clear() function. Communication between the Solicitation PDU RPL Configuration Client and Server is encrypted using the application key, therefore, the Solicitation PDU RPL Configuration Client can be instantiated on any device in the network.

When the node receives the Solicitation PDU and successfully authenticates it, it will start advertising connectable advertisements with the Private Network Identity type. The duration of the advertisement can be configured by the On-Demand Private Proxy Client model.

API reference

**group** bt_mesh_proxy

Proxy.

**Defines**

BT_MESH_PROXY_CB_DEFINE(_name)

Register a callback structure for Proxy events.

Registers a structure with callback functions that gets called on various Proxy events.

**Parameters**

- _name – Name of callback structure.

**Functions**

int bt_mesh_proxy_identity_enable(void)

Enable advertising with Node Identity.

This API requires that GATT Proxy support has been enabled. Once called each subnet will start advertising using Node Identity for the next 60 seconds.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_proxy_private_identity_enable(void)
Enable advertising with Private Node Identity.
This API requires that GATT Proxy support has been enabled. Once called each subnet will
start advertising using Private Node Identity for the next 60 seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_proxy_connect(uint16_t net_idx)
Allow Proxy Client to auto connect to a network.
This API allows a proxy client to auto-connect a given network.

Parameters
• net_idx – Network Key Index

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_proxy_disconnect(uint16_t net_idx)
Disallow Proxy Client to auto connect to a network.
This API disallows a proxy client to connect a given network.

Parameters
• net_idx – Network Key Index

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_proxy_solicit(uint16_t net_idx)
Schedule advertising of Solicitation PDUs on Proxy Client.
Once called Proxy Client will schedule advertising Solicitation PDUs for the amount of time
defined by adv_int * (CONFIG_BT_MESH_SOL_ADV_XMIT + 1), where adv_int is 20ms for
Bluetooth v5.0 or higher, or 100ms otherwise.
If the number of advertised Solicitation PDUs reached 0xFFFFFFFF, the advertisements will no
longer be started until the node is reprovisioned.

Parameters
• net_idx – Network Key Index

Returns
0 on success, or (negative) error code on failure.

struct bt_mesh_proxy_cb
#include <proxy.h> Callbacks for the Proxy feature.
Should be instantiated with BT_MESH_PROXY_CB_DEFINE.

Public Members

void (*identity_enabled)(uint16_t net_idx)
Started sending Node Identity beacons on the given subnet.

Param net.idx
Network index the Node Identity beacons are running on.
void (*identity_disabled)(uint16_t net_idx)
    Stopped sending Node Identity beacons on the given subnet.

**Param net_idx**
Network index the Node Identity beacons were running on.

**Heartbeat**  The Heartbeat feature provides functionality for monitoring Bluetooth mesh nodes and determining the distance between nodes.

The Heartbeat feature is configured through the *Configuration Server* model.

**Heartbeat messages**  Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.

Available Heartbeat feature flags:

- **BT_MESH_FEAT_RELAY**
- **BT_MESH_FEAT_PROXY**
- **BT_MESH_FEAT_FRIEND**
- **BT_MESH_FEAT_LOW_POWER**

**Heartbeat publication**  Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:

**Periodic publication**
The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

**Triggered publication**
The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.

The two publication types can be combined.

**Heartbeat subscription**  A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the `bt_mesh_hb_cb::recv` event handler.

When the Heartbeat subscription period ends, the `bt_mesh_hb_cb::sub_end` callback gets called.

**API reference**

`group bt_mesh_heartbeat`
Heartbeat.
Defines

\texttt{BT\_MESH\_HB\_CB\_DEFINE(_name)}

Register a callback structure for Heartbeat events.

Register a callback structure that will be called whenever Heartbeat events occur

\textbf{Parameters}

\begin{itemize}
  \item \texttt{_name} – Name of callback structure.
\end{itemize}

Functions

\texttt{void bt\_mesh\_hb\_pub\_get(struct bt\_mesh\_hb\_pub *get)}

Get the current Heartbeat publication parameters.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{get} – Heartbeat publication parameters return buffer.
\end{itemize}

\texttt{void bt\_mesh\_hb\_sub\_get(struct bt\_mesh\_hb\_sub *get)}

Get the current Heartbeat subscription parameters.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{get} – Heartbeat subscription parameters return buffer.
\end{itemize}

\texttt{struct bt\_mesh\_hb\_pub}

\texttt{#include \textless heartbeat.h\textgreater} Heartbeat Publication parameters.

\textbf{Public Members}

\begin{itemize}
  \item \texttt{uint16\_t dst}
      Destination address.
  \item \texttt{uint16\_t count}
      Remaining publish count.
  \item \texttt{uint8\_t ttl}
      Time To Live value.
  \item \texttt{uint16\_t feat}
      Bitmap of features that trigger a Heartbeat publication if they change.
      Legal values are \texttt{BT\_MESH\_FEAT\_RELAY}, \texttt{BT\_MESH\_FEAT\_PROXY}, \texttt{BT\_MESH\_FEAT\_FRIEND}, and \texttt{BT\_MESH\_FEAT\_LOW\_POWER}.
  \item \texttt{uint16\_t net\_idx}
      Network index used for publishing.
  \item \texttt{uint32\_t period}
      Publication period in seconds.
\end{itemize}

\texttt{struct bt\_mesh\_hb\_sub}

\texttt{#include \textless heartbeat.h\textgreater} Heartbeat Subscription parameters.
Public Members

uint32_t period
   Subscription period in seconds.

uint32_t remaining
   Remaining subscription time in seconds.

uint16_t src
   Source address to receive Heartbeats from.

uint16_t dst
   Destination address to received Heartbeats on.

uint16_t count
   The number of received Heartbeat messages so far.

uint8_t min_hops
   Minimum hops in received messages, ie the shortest registered path from the publishing
   node to the subscribing node.
   A Heartbeat received from an immediate neighbor has hop count = 1.

uint8_t max_hops
   Maximum hops in received messages, ie the longest registered path from the publishing
   node to the subscribing node.
   A Heartbeat received from an immediate neighbor has hop count = 1.

struct bt_mesh_hb_cb
   #include <heartbeat.h> Heartbeat callback structure.

Public Members

void (*recv)(const struct bt_mesh_hb_sub *sub, uint8_t hops, uint16_t feat)
   Receive callback for heartbeats.
   Gets called on every received Heartbeat that matches the current Heartbeat subscription
   parameters.
   **Param sub**
      Current Heartbeat subscription parameters.
   **Param hops**
      The number of hops the Heartbeat was received with.
   **Param feat**
      The feature set of the publishing node. The value is a bitmap
      of **BT_MESH_FEAT_RELAY**, **BT_MESH_FEAT_PROXY**, **BT_MESH_FEAT_FRIEND**
      and **BT_MESH_FEAT_LOW_POWER**.

void (*sub_end)(const struct bt_mesh_hb_sub *sub)
   Subscription end callback for heartbeats.
   Gets called when the subscription period ends, providing a summary of the received heart-
**Param sub**
Current Heartbeat subscription parameters.

```c
void (*pub_sent)(const struct bt_mesh_hb_pub *pub)
```
Publication sent callback for heartbeats.

Gets called when the heartbeat is successfully published.

**Param pub**
Current Heartbeat publication parameters.

### Runtime Configuration
The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth mesh nodes should generally be configured by a central network configurator device with a `Configuration Client` model. Each mesh node instantiates a `Configuration Server` model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can't rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

**Note:** Runtime configuration changes before the node is provisioned will not be stored in the persistent storage.

### API reference

```plaintext

Enums

enum bt_mesh_feat_state
    Bluetooth mesh feature states.
    
    Values:
    
    enumerator BT_MESH_FEATURE_DISABLED
        Feature is supported, but disabled.
    
    enumerator BT_MESH_FEATURE_ENABLED
        Feature is supported and enabled.
    
    enumerator BT_MESH_FEATURE_NOT_SUPPORTED
        Feature is not supported, and cannot be enabled.

Functions
void bt_mesh_beacon_set(bool beacon)
    Enable or disable sending of the Secure Network Beacon.

    Parameters
    • beacon – New Secure Network Beacon state.

bool bt_mesh_beacon_enabled(void)
    Get the current Secure Network Beacon state.

    Returns
    Whether the Secure Network Beacon feature is enabled.

int bt_mesh_priv_beacon_set(enum bt_mesh_feat_state priv_beacon)
    Enable or disable sending of the Mesh Private beacon.

    Support for the Private beacon state must be enabled with CONFIG_BT_MESH_PRIV_BEACONS.

    Parameters
    • priv_beacon – New Mesh Private beacon state. Must be one of BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.

    Return values
    • 0 – Successfully changed the Mesh Private beacon feature state.
    • -ENOTSUP – The Mesh Private beacon feature is not supported.
    • -EINVAL – Invalid parameter.
    • -EALREADY – Already in the given state.

desbt_mesh_priv_beacon_get(void)
    Get the current Mesh Private beacon state.

    Returns
    The Mesh Private beacon feature state.

void bt_mesh_priv_beacon_update_interval_set(uint8_t interval)
    Set the current Mesh Private beacon update interval.

    The Mesh Private beacon’s randomization value is updated regularly to maintain the node’s privacy. The update interval controls how often the beacon is updated, in 10 second increments.

    Parameters
    • interval – Private beacon update interval in 10 second steps, or 0 to update on every beacon transmission.

uint8_t bt_mesh_priv_beacon_update_interval_get(void)
    Get the current Mesh Private beacon update interval.

    The Mesh Private beacon’s randomization value is updated regularly to maintain the node’s privacy. The update interval controls how often the beacon is updated, in 10 second increments.

    Returns
    The Private beacon update interval in 10 second steps, or 0 if the beacon is updated every time it’s transmitted.

int bt_mesh_default_ttl_set(uint8_t default_ttl)
    Set the default TTL value.

    The default TTL value is used when no explicit TTL value is set. Models will use the default TTL value when bt_mesh_msg_ctx::send_ttl is BT_MESH_TTL_DEFAULT.

    Parameters
default_ttl – The new default TTL value. Valid values are 0x00 and 0x02 to BT_MESH_TTL_MAX.

Return values
- 0 – Successfully set the default TTL value.
- -EINVAL – Invalid TTL value.

uint8_t bt_mesh_default_ttl_get(void)
Get the current default TTL value.

Returns
The current default TTL value.

int bt_mesh_od_priv_proxy_get(void)
Get the current Mesh On-Demand Private Proxy state.

Return values
- 0 – or positive value represents On-Demand Private Proxy feature state
- -ENOTSUP – The On-Demand Private Proxy feature is not supported.

int bt_mesh_od_priv_proxy_set(uint8_t on_demand_proxy)
Set state of Mesh On-Demand Private Proxy.

Support for the On-Demand Private Proxy state must be enabled with BT_MESH_OD_PRIV_PROXY_SRV.

Parameters
- on_demand_proxy – New Mesh On-Demand Private Proxy state. Value of 0x00 means that advertising with Private Network Identity cannot be enabled on demand. Values in range 0x01 - 0xFF set interval of this advertising after valid Solicitation PDU is received or client disconnects.

Return values
- 0 – Successfully changed the Mesh On-Demand Private Proxy feature state.
- -ENOTSUP – The On-Demand Private Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

void bt_mesh_net_transmit_set(uint8_t xmit)
Set the Network Transmit parameters.

The Network Transmit parameters determine the parameters local messages are transmitted with.

See also:
BT_MESH_TRANSMIT

Parameters
- xmit – New Network Transmit parameters. Use BT_MESH_TRANSMIT for encoding.

uint8_t bt_mesh_net_transmit_get(void)
Get the current Network Transmit parameters.

The BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT macros can be used to decode the Network Transmit parameters.
Returns
The current Network Transmit parameters.

int bt_mesh_relay_set(enum bt_mesh_feat_state relay, uint8_t xmit)
Configure the Relay feature.
Enable or disable the Relay feature, and configure the parameters to transmit relayed messages with.
Support for the Relay feature must be enabled through the CONFIG_BT_MESH_RELAY configuration option.

See also:
BT_MESH_TRANSMIT

Parameters
• relay – New Relay feature state. Must be one of BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.
• xmit – New Relay retransmit parameters. Use BT_MESH_TRANSMIT for encoding.

Return values
• 0 – Successfully changed the Relay configuration.
• -ENOTSUP – The Relay feature is not supported.
• -EINVAL – Invalid parameter.
• -EALREADY – Already using the given parameters.

enum bt_mesh_feat_state bt_mesh_relay_get(void)
Get the current Relay feature state.

Returns
The Relay feature state.

uint8_t bt_mesh_relay_retransmit_get(void)
Get the current Relay Retransmit parameters.
The BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT macros can be used to decode the Relay Retransmit parameters.

Returns
The current Relay Retransmit parameters, or 0 if relay is not supported.

int bt_mesh_gatt_proxy_set(enum bt_mesh_feat_state gatt_proxy)
Enable or disable the GATT Proxy feature.
Support for the GATT Proxy feature must be enabled through the CONFIG_BT_MESH_GATT_PROXY configuration option.

Note: The GATT Proxy feature only controls a Proxy node's ability to relay messages to the mesh network. A node that supports GATT Proxy will still advertise Connectable Proxy beacons, even if the feature is disabled. The Proxy feature can only be fully disabled through compile time configuration.

Parameters
• gatt_proxy – New GATT Proxy state. Must be one of BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.
Return values

- 0 – Successfully changed the GATT Proxy feature state.
- -ENOTSUP – The GATT Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_gatt_proxy_get(void)
Get the current GATT Proxy state.

Returns
The GATT Proxy feature state.

int bt_mesh_priv_gatt_proxy_set(enum bt_mesh_feat_state priv_gatt_proxy)
Enable or disable the Private GATT Proxy feature.

Support for the Private GATT Proxy feature must be enabled through the
CONFIG_BT_MESH_PRIV_BEACONS and CONFIG_BT_MESH_GATT_PROXY configuration options.

Parameters

- priv_gatt_proxy – New Private GATT Proxy state. Must be one of
  BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.

Return values

- 0 – Successfully changed the Private GATT Proxy feature state.
- -ENOTSUP – The Private GATT Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_priv_gatt_proxy_get(void)
Get the current Private GATT Proxy state.

Returns
The Private GATT Proxy feature state.

int bt_mesh_friend_set(enum bt_mesh_feat_state friendship)
Enable or disable the Friend feature.

Any active friendships will be terminated immediately if the Friend feature is disabled.
Support for the Friend feature must be enabled through the CONFIG_BT_MESH_FRIEND config-
uration option.

Parameters

- friendship – New Friend feature state. Must be one of
  BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.

Return values

- 0 – Successfully changed the Friend feature state.
- -ENOTSUP – The Friend feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_friend_get(void)
Get the current Friend state.

Returns
The Friend feature state.
Frame statistic  The frame statistic API allows monitoring the number of received frames over different interfaces, and the number of planned and succeeded transmission and relaying attempts.

The API helps the user to estimate the efficiency of the advertiser configuration parameters and the scanning ability of the device. The number of the monitored parameters can be easily extended by customer values.

An application can read out and clean up statistics at any time.

API reference

group bt_mesh_stat

Statistic.

Functions

void bt_mesh_stat_get(struct bt_mesh_statistic *st)
  Get mesh frame handling statistic.

  Parameters
  • st – BLE mesh statistic.

void bt_mesh_stat_reset(void)
  Reset mesh frame handling statistic.

struct bt_mesh_statistic
  #include <statistic.h> The structure that keeps statistics of mesh frames handling.

Public Members

uint32_t rx_adv
  All received frames passed basic validation and decryption.
  Received frames over advertiser.

uint32_t rx_loopback
  Received frames over loopback.

uint32_t rx_proxy
  Received frames over proxy.

uint32_t rx_unknown
  Received over unknown interface.

uint32_t tx_adv_relay_planned
  Counter of frames that were initiated to relay over advertiser bearer.

uint32_t tx_adv_relay_succeeded
  Counter of frames that succeeded relaying over advertiser bearer.

uint32_t tx_local_planned
  Counter of frames that were initiated to send over advertiser bearer locally.
uint32_t tx_local_succeeded
   Counter of frames that succeeded to send over advertiser bearer locally.

uint32_t tx_friend_planned
   Counter of frames that were initiated to send over friend bearer.

uint32_t tx_friend_succeeded
   Counter of frames that succeeded to send over friend bearer.

**Bluetooth Mesh Shell**  The Bluetooth mesh shell subsystem provides a set of Bluetooth mesh shell commands for the *Shell* module. It allows for testing and exploring the Bluetooth mesh API through an interactive interface, without having to write an application.

The Bluetooth mesh shell interface provides access to most Bluetooth mesh features, including provisioning, configuration, and message sending.

**Prerequisites**  The Bluetooth mesh shell subsystem depends on the application to create the composition data and do the mesh initialization.

**Application**  The Bluetooth mesh shell subsystem is most easily used through the Bluetooth mesh shell application under `tests/bluetooth/mesh_shell`. See *Shell* for information on how to connect and interact with the Bluetooth mesh shell application.

**Basic usage**  The Bluetooth mesh shell subsystem adds a single *mesh* command, which holds a set of sub-commands. Every time the device boots up, make sure to call `mesh init` before any of the other Bluetooth mesh shell commands can be called:

```
uart:~$ mesh init
```

This is done to ensure that all available log will be printed to the shell output.

**Provisioning**  The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To do this the user must provision the device with the default network key and address 0x0001, execute:

```
uart:~$ mesh prov local 0 0x0001
```

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they're assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with `mesh prov pb-adv on` or `mesh prov pb-gatt on`. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call `mesh target dst <Addr>`.
- To set the network key index, call `mesh target net <NetKeyIdx>`.
- To set the application key index, call `mesh target app <AppKeyIdx>`.

By default, the transmission parameters are set to send messages to the provisioned address and network key.
Configuration  By setting the destination address to the local unicast address (0x0001 in the `mesh local` command above), we can perform self-configuration through any of the `Models` commands.

A good first step is to read out the node's own composition data:

```
uart:~$ mesh models cfg get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it's a good idea to add one:

```
uart:~$ mesh models cfg appkey add 0 0
```

Message sending  With an application key added (see above), the mesh node's transition parameters are all valid, and the Bluetooth mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:

```
uart:~$ mesh test net-send 82020100
```

Note:  All multibyte fields model messages are in little endian, except the opcode.

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

```
uart:~$ mesh target dst 0xffff
```

With the destination address set to 0xffff, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

Note:  To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in `subsys/bluetooth/mesh/shell.c`, and print the incoming message to the shell in the handler callback.

Parameter formats  The Bluetooth mesh shell commands are parsed with a variety of formats:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integers</td>
<td>The default format unless something else is specified. Can be either decimal or hexadecimal.</td>
<td>1234, 0xabcd01234</td>
</tr>
<tr>
<td>Hexstrings</td>
<td>For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.</td>
<td>deadbeef01234</td>
</tr>
<tr>
<td>Booleans</td>
<td>Boolean values are denoted in the API documentation as <code>&lt;val(off, on)&gt;</code>.</td>
<td>on, off, enabled, disabled, i, 0</td>
</tr>
</tbody>
</table>
Commands The Bluetooth mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, `mesh lpn set <value: off, on>`. Mandatory parameters are marked with angle brackets (e.g. `<NetKeyIdx>`), and optional parameters are marked with square brackets (e.g. `[DstAddr]`).

The Bluetooth mesh shell commands are divided into the following groups:

- General configuration
- Target
- Low Power Node
- Testing
- Provisioning
- Proxy
- Models
- Configuration database
- Frame statistic

Note: Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling `mesh` without any arguments.

General configuration

`mesh init`

Initialize the mesh shell. This command must be run before any other mesh command.

`mesh reset-local`

Reset the local mesh node to its initial unprovisioned state. This command will also clear the Configuration Database (CDB) if present.

Target The target commands enables the user to monitor and set the target destination address, network index and application index for the shell. These parameters are used by several commands, like provisioning, Configuration Client, etc.

`mesh target dst [DstAddr]`

Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell's control.

- **DstAddr**: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

`mesh target net [NetKeyIdx]`

Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The network key must already be added to the device, either through provisioning or by a Configuration Client.
• **NetKeyIdx**: If present, sets the new network index. If omitted, the current network index is printed.

```
mesh target app [AppKeyIdx]
```
Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.

• **AppKeyIdx**: If present, sets the new application index. If omitted, the current application index is printed.

**Low Power Node**

```
mesh lpn set <Val(off, on)>
```
Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes.

• **Val**: Sets whether Low Power operation is enabled.

```
mesh lpn poll
```
Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

**Testing**

```
mesh test net-send <HexString>
```
Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.

• **HexString**: Raw hexadecimal representation of the message to send.

```
mesh test iv-update
```
Force an IV update.

```
mesh test iv-update-test <Val(off, on)>
```
Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.

• **Val**: Enable or disable the IV update test mode.

```
mesh test rpl-clear
```
Clear the replay protection list, forcing the node to forget all received messages.

**Warning**: Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

**Health Server Test**

6.1. Bluetooth
mesh test health-srv add-fault <FaultID>

Register a new Health Server Fault for the Linux Foundation Company ID.
  • FaultID: ID of the fault to register (0x0001 to 0xFFFF)

mesh test health-srv del-fault [FaultID]

Remove registered Health Server faults for the Linux Foundation Company ID.
  • FaultID: If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

Provisioning To allow a device to broadcast connectable unprovisioned beacons, the CONFIG_BT_MESH_PROV_DEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_GATT option.

mesh prov pb-gatt <Val(off, on)>

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.
  • Val: Enable or disable provisioning with GATT

To allow a device to broadcast unprovisioned beacons, the CONFIG_BT_MESH_PROV_DEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_ADV option.

mesh prov pb-adv <Val(off, on)>

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.
  • Val: Enable or disable provisioning with advertiser

To allow a device to provision devices, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_ADV configuration options must be enabled.

mesh prov remote-adv <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.
  • UUID: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
  • NetKeyIdx: Index of the network key to pass to the device.
  • Addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
  • AttDur: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

To allow a device to provision devices over GATT, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_GATT_CLIENT configuration options must be enabled.
**mesh prov remote-gatt <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>**

Provision a nearby device into the mesh. The mesh node starts scanning for connectable advertising for PB-GATT with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.

- **UUID**: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **NetKeyIdx**: Index of the network key to pass to the device.
- **Addr**: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- **AttDur**: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

**mesh prov uuid [UUID(1-16 hex)]**

Get or set the mesh node’s UUID, used in the unprovisioned beacons.

- **UUID**: If present, new 128-bit UUID value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the current UUID will be printed. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

**mesh prov input-num <Number>**

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

- **Number**: Decimal authentication number.

**mesh prov input-str <String>**

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

- **String**: Unquoted alphanumeric authentication string.

**mesh prov static-oob [Val(1-16 hex)]**

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

- **Val**: If present, indicates the new hexadecimal value of the static OOB. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the static OOB value is cleared.

**mesh prov local <NetKeyIdx> <Addr> [IVI]**

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

- **NetKeyIdx**: Index of the network key to provision.
• **Addr**: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.

• **IVI**: Indicates the current network IV index. Defaults to 0 if omitted.

mesh prov beacon-listen <Val(off, on)>

Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner device to detect nearby unprovisioned devices and provision them. To enable this command, the `BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

• **Val**: Whether to enable the unprovisioned beacon printing.

mesh prov remote-pub-key <PubKey>

Provide Device public key.

• **PubKey**: Device public key in big-endian.

mesh prov auth-method input <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Input OOB authentication action.

• **Action**: Input action. Allowed values:
  - 0: No input action.
  - 1: Push action set.
  - 2: Twist action set.
  - 4: Enter number action set.
  - 8: Enter String action set.

• **Size**: Authentication size.

mesh prov auth-method output <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Output OOB authentication action.

• **Action**: Output action. Allowed values:
  - 0: No output action.
  - 1: Blink action set.
  - 2: Vibrate action set.
  - 4: Display number action set.
  - 8: Display String action set.

• **Size**: Authentication size.

mesh prov auth-method static <Val(1-16 hex)>

From the provisioner device, instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

• **Val**: Static OOB value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
mesh prov auth-method none

From the provisioner device, don't use any authentication when provisioning new devices. This is the default behavior.

Proxy  The Proxy Server module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_GATT_PROXY configuration option.

mesh proxy identity-enable

Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.

The Proxy Client module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_PROXY_CLIENT configuration option.

mesh proxy connect <NetKeyIdx>

Auto-Connect a nearby proxy server into the mesh.

- NetKeyIdx: Index of the network key to connect.

mesh proxy disconnect <NetKeyIdx>

Disconnect the existing proxy connection.

- NetKeyIdx: Index of the network key to disconnect.

mesh proxy solicit <NetKeyIdx>

Begin Proxy Solicitation of a subnet. Support of this feature can be enabled through the CONFIG_BT_MESH_PROXY_SOLICITATION configuration option.

- NetKeyIdx: Index of the network key to send Solicitation PDUs to.

Models

Configuration Client  The Configuration Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_CFG_CLI configuration option. This is implemented as a separate module (mesh models cfg) inside the mesh models subcommand list. This module will work on any instance of the Configuration Client model if the mentioned shell configuration options is enabled, and as long as the Configuration Client model is present in the model composition of the application. This shell module can be used for configuring itself and other nodes in the mesh network.

The Configuration Client uses general message parameters set by mesh target dst and mesh target net to target specific nodes. When the Bluetooth mesh shell node is provisioned, given that the BT_MESH_SHELL_PROV_CTX_INSTANCE option is enabled with the shell provisioning context initialized, the Configuration Client model targets itself by default. Similarly, when another node has been provisioned by the Bluetooth mesh shell, the Configuration Client model targets the new node. In most common use-cases, the Configuration Client is depending on the provisioning features and the Configuration database to be fully functional. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and the mesh nodes it provisioned. The following steps are an example of how you can set up a device to start using the Configuration Client commands:

- Initialize the client node (mesh init).
- Create the CDB (mesh cdb create).
• Provision the local device (`mesh prov local`).
• The shell module should now target itself.
• Monitor the composition data of the local node (`mesh models cfg get-comp`).
• Configure the local node as desired with the Configuration Client commands.
• Provision other devices (`mesh prov beacon-listen`) (`mesh prov remote-adv`) (`mesh prov remote-gatt`).
• The shell module should now target the newly added node.
• Monitor the newly provisioned nodes and their addresses (`mesh cdb show`).
• Monitor the composition data of the target device (`mesh models cfg get-comp`).
• Configure the node as desired with the Configuration Client commands.

`mesh models cfg target get`
Get the target Configuration server for the Configuration Client model.

`mesh models cfg help`
Print information for the Configuration Client shell module.

`mesh models cfg reset`
Reset the target device.

`mesh models cfg timeout [Timeout(s)]`
Get and set the Config Client model timeout used during message sending.
• `Timeout`: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

`mesh models cfg get-comp [Page]`
Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.
• `Page`: The composition data page to request. Defaults to 0 if omitted.

`mesh models cfg beacon [Val(off, on)]`
Get or set the network beacon transmission.
• `Val`: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

`mesh models cfg ttl [TTL]`
Get or set the default TTL value.
• `TTL`: If present, sets the new default TTL value. Legal TTL values are 0x00 and 0x02-0x7f. If omitted, the current default TTL value is printed.
mesh models cfg friend [Val(off, on)]

Get or set the Friend feature.

- **Val**: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
  - **0x00**: The feature is supported, but disabled.
  - **0x01**: The feature is enabled.
  - **0x02**: The feature is not supported.

mesh models cfg gatt-proxy [Val(off, on)]

Get or set the GATT Proxy feature.

- **Val**: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
  - **0x00**: The feature is supported, but disabled.
  - **0x01**: The feature is enabled.
  - **0x02**: The feature is not supported.

mesh models cfg relay [Val(off, on)] [Count] [Int(ms)]

Get or set the Relay feature and its parameters.

- **Val**: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
  - **0x00**: The feature is supported, but disabled.
  - **0x01**: The feature is enabled.
  - **0x02**: The feature is not supported.
- **Count**: Sets the new relay retransmit count if **val** is on. Ignored if **val** is off. Legal retransmit count is 0-7. Defaults to 2 if omitted.
- **Int**: Sets the new relay retransmit interval in milliseconds if **val** is on. Legal interval range is 10-320 milliseconds. Ignored if **val** is off. Defaults to 20 if omitted.

mesh models cfg node-id <NetKeyIdx> [Identity]

Get or set of current Node Identity state of a subnet.

- **NetKeyIdx**: The network key index to Get/Set.
- **Identity**: If present, sets the identity of Node Identity state.

mesh models cfg polltimeout-get <LPNAddr>

Get current value of the PollTimeout timer of the LPN within a Friend node.

- **LPNAddr**: Address of Low Power node.

mesh models cfg net-transmit-param [Count] [Int(ms)]

Get or set the network transmit parameters.

- **Count**: Sets the number of additional network transmits for every sent message. Legal retransmit count is 0-7.
• Int: Sets the new network retransmit interval in milliseconds. Legal interval range is 10-320 milliseconds.

```
mesh models cfg netkey add <NetKeyIdx> [Key(1-16 hex)]
```

Add a network key to the target node. Adds the key to the Configuration Database if enabled.
- **NetKeyIdx**: The network key index to add.
- **Key**: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

```
mesh models cfg netkey upd <NetKeyIdx> [Key(1-16 hex)]
```

Update a network key to the target node.
- **NetKeyIdx**: The network key index to updated.
- **Key**: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.

```
mesh models cfg netkey get
```

Get a list of known network key indexes.

```
mesh models cfg netkey del <NetKeyIdx>
```

Delete a network key from the target node.
- **NetKeyIdx**: The network key index to delete.

```
mesh models cfg appkey add <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]
```

Add an application key to the target node. Adds the key to the Configuration Database if enabled.
- **NetKeyIdx**: The network key index the application key is bound to.
- **AppKeyIdx**: The application key index to add.
- **Key**: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

```
mesh models cfg appkey upd <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]
```

Update an application key to the target node.
- **NetKeyIdx**: The network key index the application key is bound to.
- **AppKeyIdx**: The application key index to update.
- **Key**: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.
mesh models cfg appkey get <NetKeyIdx>

Get a list of known application key indexes bound to the given network key index.

- **NetKeyIdx**: Network key indexes to get a list of application key indexes from.

mesh models cfg appkey del <NetKeyIdx> <AppKeyIdx>

Delete an application key from the target node.

- **NetKeyIdx**: The network key index the application key is bound to.
- **AppKeyIdx**: The application key index to delete.

mesh models cfg model app-bind <Addr> <AppKeyIdx> <MID> [CID]

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- **Addr**: Address of the element the model is on.
- **AppKeyIdx**: The application key to bind to the model.
- **MID**: The model ID of the model to bind the key to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-unbind <Addr> <AppKeyIdx> <MID> [CID]

Unbind an application key from a model.

- **Addr**: Address of the element the model is on.
- **AppKeyIdx**: The application key to unbind from the model.
- **MID**: The model ID of the model to unbind the key from.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-get <ElemAddr> <MID> [CID]

Get a list of application keys bound to a model.

- **ElemAddr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the bound keys of.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model pub <Addr> <MID> [CID] [<PubAddr> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)>]

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- **Addr**: Address of the element the model is on.
- **MID**: The model ID of the model to get the bound keys of.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.
Publication parameters:

- PubAddr: The destination address to publish to.
- AppKeyIdx: The application key index to publish with.
- Cred: Whether to publish with Friendship credentials when acting as a Low Power Node.
- TTL: TTL value to publish with (0x00 to 0x07f).
- PerRes: Resolution of the publication period steps:
  - 0x00: The Step Resolution is 100 milliseconds
  - 0x01: The Step Resolution is 1 second
  - 0x02: The Step Resolution is 10 seconds
  - 0x03: The Step Resolution is 10 minutes
- PerSteps: Number of publication period steps, or 0 to disable periodic publication.
- Count: Number of retransmission for each published message (0 to 7).
- Int: The interval between each retransmission, in milliseconds. Must be a multiple of 50.

```
mesh models cfg model pub-va <Addr> <UUID(1-16 hex)> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)> <MID> [CID]
```

Set the publication parameters of a model.

- Addr: Address of the element the model is on.
- MID: The model ID of the model to get the bound keys of.
- CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- UUID: The destination virtual address to publish to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- AppKeyIdx: The application key index to publish with.
- Cred: Whether to publish with Friendship credentials when acting as a Low Power Node.
- TTL: TTL value to publish with (0x00 to 0x07f).
- PerRes: Resolution of the publication period steps:
  - 0x00: The Step Resolution is 100 milliseconds
  - 0x01: The Step Resolution is 1 second
  - 0x02: The Step Resolution is 10 seconds
  - 0x03: The Step Resolution is 10 minutes
- PerSteps: Number of publication period steps, or 0 to disable periodic publication.
- Count: Number of retransmission for each published message (0 to 7).
- Int: The interval between each retransmission, in milliseconds. Must be a multiple of 50.
mesh models cfg model sub-add <ElemAddr> <SubAddr> <MID> [CID]

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **ElemAddr**: Address of the element the model is on.
- **SubAddr**: 16-bit group address the model should subscribe to (0xc000 to 0xFEFF).
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del <ElemAddr> <SubAddr> <MID> [CID]

Unsubscribe a model from a group address.

- **ElemAddr**: Address of the element the model is on.
- **SubAddr**: 16-bit group address the model should remove from its subscription list (0xc000 to 0xFEFF).
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-add-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **ElemAddr**: Address of the element the model is on.
- **LabelUUID**: 128-bit label UUID of the virtual address to subscribe to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]

Unsubscribe a model from a virtual address.

- **ElemAddr**: Address of the element the model is on.
- **LabelUUID**: 128-bit label UUID of the virtual address to remove the subscription of. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **MID**: The model ID of the model to add the subscription to.
- **CID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.
mesh models cfg model sub-ow <ElemAddr> <SubAddr> <MID> [CID]

Overwrite all model subscriptions with a single new group address.

- ElemAddr: Address of the element the model is on.
- SubAddr: 16-bit group address the model should added to the subscription list (0xc000 to 0xFEFF).
- MID: The model ID of the model to add the subscription to.
- CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-ow-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]

Overwrite all model subscriptions with a single new virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- ElemAddr: Address of the element the model is on.
- LabelUUID: 128-bit label UUID of the virtual address as the new Address to be added to the subscription list. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- MID: The model ID of the model to add the subscription to.
- CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del-all <ElemAddr> <MID> [CID]

Remove all group and virtual address subscriptions from of a model.

- ElemAddr: Address of the element the model is on.
- MID: The model ID of the model to Unsubscribe all.
- CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-get <ElemAddr> <MID> [CID]

Get a list of addresses the model subscribes to.

- ElemAddr: Address of the element the model is on.
- MID: The model ID of the model to get the subscription list of.
- CID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg krp <NetKeyIdx> [Phase]

Get or set the key refresh phase of a subnet.

- NetKeyIdx: The identified network key used to Get/Set the current Key Refresh Phase state.
- Phase: New Key Refresh Phase. Valid phases are:
  - 0x00: Normal operation; Key Refresh procedure is not active
  - 0x01: First phase of Key Refresh procedure
  - 0x02: Second phase of Key Refresh procedure
```markdown
mesh models cfg hb-sub [<Src> <Dst> <Per>]

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- **Src**: Unicast source address to receive Heartbeat messages from.
- **Dst**: Destination address to receive Heartbeat messages on.
- **Per**: Logarithmic representation of the Heartbeat subscription period:
  - 0: Heartbeat subscription will be disabled.
  - 1 to 17: The node will subscribe to Heartbeat messages for \(2^{(period - 1)}\) seconds.

```markdown
mesh models cfg hb-pub [<Dst> <Count> <Per> <TTL> <Features> <NetKeyIdx>]

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- **Dst**: Destination address to publish Heartbeat messages to.
- **Count**: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will periodically publish \(2^{(count - 1)}\) Heartbeat messages.
  - 255: Heartbeat messages will be published periodically indefinitely.
- **Per**: Logarithmic representation of the Heartbeat publication period:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will publish Heartbeat messages every \(2^{(period - 1)}\) seconds.
- **TTL**: The TTL value to publish Heartbeat messages with (0x00 to 0x7f).
- **Features**: Bitfield of features that should trigger a Heartbeat publication when changed:
  - Bit 0: Relay feature.
  - Bit 1: Proxy feature.
  - Bit 2: Friend feature.
  - Bit 3: Low Power feature.
- **NetKeyIdx**: Index of the network key to publish Heartbeat messages with.

### Health Client

The Health Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_HEALTH_CLI` configuration option. This is implemented as a separate module (mesh models health) inside the mesh models subcommand list. This module will work on any instance of the Health Client model if the mentioned shell configuration options is enabled, and as long as one or more Health Client model(s) is present in the model composition of the application. This shell module can be used to trigger interaction between Health Clients and Servers on devices in a Mesh network.

By default, the module will choose the first Health Client instance in the model composition when using the Health Client commands. To choose a specific Health Client instance the user can utilize the commands `mesh models health instance set` and `mesh models health instance get-all`.

The Health Client may use the general messages parameters set by `mesh target dst`, `mesh target net` and `mesh target app` to target specific nodes. If the shell target destination address is set to zero, the targeted Health Client will attempt to publish messages using its configured publication parameters.
mesh models health instance set <ElemIdx>

Set the Health Client model instance to use.

- **ElemIdx**: Element index of Health Client model.

mesh models health instance get-all

Prints all available Health Client model instances on the device.

mesh models health fault-get <CID>

Get a list of registered faults for a Company ID.

- **CID**: Company ID to get faults for.

mesh models health fault-clear <CID>

Clear the list of faults for a Company ID.

- **CID**: Company ID to clear the faults for.

mesh models health fault-clear-unack <CID>

Clear the list of faults for a Company ID without requesting a response.

- **CID**: Company ID to clear the faults for.

mesh models health fault-test <CID> <TestID>

Invoke a self-test procedure, and show a list of triggered faults.

- **CID**: Company ID to perform self-tests for.
- **TestID**: Test to perform.

mesh models health fault-test-unack <CID> <TestID>

Invoke a self-test procedure without requesting a response.

- **CID**: Company ID to perform self-tests for.
- **TestID**: Test to perform.

mesh models health period-get

Get the current Health Server publish period divisor.

mesh models health period-set <Divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{Divisor}}$.

- **Divisor**: The new Health Server publish period divisor.
mesh models health period-set-unack <Divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / 2^{Divisor}.

- Divisor: The new Health Server publish period divisor.

mesh models health attention-get

Get the current Health Server attention state.

mesh models health attention-set <Time(s)>

Enable the Health Server attention state for some time.

- Time: Duration of the attention state, in seconds (0 to 255)

mesh models health attention-set-unack <Time(s)>

Enable the Health Server attention state for some time without requesting a response.

- Time: Duration of the attention state, in seconds (0 to 255)

**Binary Large Object (BLOB) Transfer Client model** The BLOB Transfer Client can be added to the mesh shell by enabling the `CONFIG_BT_MESH_BLOB_CLI` option, and disabling the `CONFIG_BT_MESH_DFU_CLI` option.

mesh models blob cli target <Addr>

Add a Target node for the next BLOB transfer.

- Addr: Unicast address of the Target node's BLOB Transfer Server model.

mesh models blob cli bounds [<Group>]

Get the total boundary parameters of all Target nodes.

- Group: Optional group address to use when communicating with Target nodes. If omitted, the BLOB Transfer Client will address each Target node individually.

mesh models blob cli tx <Id> <Size> <BlockSizeLog> <ChunkSize> [Group> [Mode(push, pull)>]]

Perform a BLOB transfer to Target nodes. The BLOB Transfer Client will send a dummy BLOB to all Target nodes, then post a message when the transfer is completed. Note that all Target nodes must first be configured to receive the transfer using the `mesh models blob srv rx` command.

- Id: 64-bit BLOB transfer ID.
- Size: Size of the BLOB in bytes.
- BlockSizeLog: Logarithmic representation of the BLOB's block size. The final block size will be 1 << block size log bytes.
- ChunkSize: Chunk size in bytes.
- Group: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.
• **Mode**: BLOB transfer mode to use. Must be either `push` (Push BLOB Transfer Mode) or `pull` (Pull BLOB Transfer Mode). If omitted, `push` will be used by default.

```plaintext
mesh models blob cli tx-cancel
Cancel an ongoing BLOB transfer.
```

```plaintext
mesh models blob cli tx-get [Group]
Determine the progress of a previously running BLOB transfer. Can be used when not performing a BLOB transfer.

- **Group**: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.
```

```plaintext
mesh models blob cli tx-suspend
Suspend the ongoing BLOB transfer.
```

```plaintext
mesh models blob cli tx-resume
Resume the suspended BLOB transfer.
```

```plaintext
mesh models blob cli instance-set <ElemIdx>
Use the BLOB Transfer Client model instance on the specified element when using the other BLOB Transfer Client model commands.

- **ElemIdx**: The element on which to find the BLOB Transfer Client model instance to use.
```

```plaintext
mesh models blob cli instance-get-all
Get a list of all BLOB Transfer Client model instances on the node.
```

**BLOB Transfer Server model** The **BLOB Transfer Server** can be added to the mesh shell by enabling the `CONFIG_BT_MESH_BLOB_SRV` option. The BLOB Transfer Server model is capable of receiving any BLOB data, but the implementation in the mesh shell will discard the incoming data.

```plaintext
mesh models blob srv rx <ID> [<TimeoutBase(10s steps)>]
Prepare to receive a BLOB transfer.

- **ID**: 64-bit BLOB transfer ID to receive.
- **TimeoutBase**: Optional additional time to wait for client messages, in 10-second increments.
```

```plaintext
mesh models blob srv rx-cancel
Cancel an ongoing BLOB transfer.
```

```plaintext
mesh models blob srv instance-set <ElemIdx>
Use the BLOB Transfer Server model instance on the specified element when using the other BLOB Transfer Server model commands.

- **ElemIdx**: The element on which to find the BLOB Transfer Server model instance to use.
```
mesh models blob srv instance-get-all

Get a list of all BLOB Transfer Server model instances on the node.

**Firmware Update Client model**  The Firmware Update Client model can be added to the mesh shell by enabling configuration options `CONFIG_BT_MESH_BLOB_CLI` and `CONFIG_BT_MESH_DFU_CLI`. The Firmware Update Client demonstrates the firmware update Distributor role by transferring a dummy firmware update to a set of Target nodes.

```
mesh models dfu slot add <Size> [FwID] [Metadata] [URI]
```

Add a virtual DFU image slot that can be transferred as a DFU image. The image slot will be assigned an image slot index, which is printed as a response, and can be used to reference the slot in other commands. To update the image slot, remove it using the `mesh models dfu slot del` shell command and then add it again.

- **Size**: DFU image slot size in bytes.
- **FwID**: Optional firmware ID, formatted as a hexstring.
- **Metadata**: Optional firmware metadata, formatted as a hexstring.
- **URI**: Optional URI for the firmware.

```
mesh models dfu slot del <SlotIdx>
```

Delete the DFU image slot at the given index.

- **SlotIdx**: Index of the slot to delete.

```
mesh models dfu slot get <SlotIdx>
```

Get all available information about a DFU image slot.

- **SlotIdx**: Index of the slot to get.

```
mesh models dfu cli target <Addr> <ImgIdx>
```

Add a Target node.

- **Addr**: Unicast address of the Target node.
- **ImgIdx**: Image index to address on the Target node.

```
mesh models dfu cli target-state
```

Check the DFU Target state of the device at the configured destination address.

```
mesh models dfu cli target-imgs [<MaxCount>]
```

Get a list of DFU images on the device at the configured destination address.

- **MaxCount**: Optional maximum number of images to return. If omitted, there’s no limit on the number of returned images.
mesh models dfu cli target-check <SlotIdx> <TargetImgIdx>

Check whether the device at the configured destination address will accept a DFU transfer from the given DFU image slot to the Target node's DFU image at the given index, and what the effect would be.

- SlotIdx: Index of the local DFU image slot to check.
- TargetImgIdx: Index of the Target node's DFU image to check.

mesh models dfu cli send <SlotIdx> [ <Group> ]

Start a DFU transfer to all added Target nodes.

- SlotIdx: Index of the local DFU image slot to send.
- Group: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Update Client will address each Target node individually.

mesh models dfu cli cancel [ <Addr> ]

Cancel the DFU procedure at any state on a specific Target node or on all Target nodes. When a Target node address is provided, the Firmware Update Client model will try to cancel the DFU procedure on the provided Target node. Otherwise, the Firmware Update Client model will try to cancel the ongoing DFU procedure on all Target nodes.

- Addr: Optional unicast address of a Target node on which to cancel the DFU procedure.

mesh models dfu cli apply

Apply the most recent DFU transfer on all Target nodes. Can only be called after a DFU transfer is completed.

mesh models dfu cli confirm

Confirm that the most recent DFU transfer was successfully applied on all Target nodes. Can only be called after a DFU transfer is completed and applied.

mesh models dfu cli suspend

Suspend the ongoing DFU transfer.

mesh models dfu cli resume

Resume the suspended DFU transfer.

mesh models dfu cli progress

Check the progress of the current transfer.

mesh models dfu cli instance-set <ElemIdx>

Use the Firmware Update Client model instance on the specified element when using the other Firmware Update Client model commands.

- ElemIdx: The element on which to find the Firmware Update Client model instance to use.
mesh models dfu cli instance-get-all

Get a list of all Firmware Update Client model instances on the node.

Firmware Update Server model The Firmware Update Server model can be added to the mesh shell by enabling configuration options CONFIG_BT_MESH_BLOB_SRV and CONFIG_BT_MESH_DFU_SRV. The Firmware Update Server demonstrates the firmware update Target role by accepting any firmware update. The mesh shell Firmware Update Server will discard the incoming firmware data, but otherwise behave as a proper firmware update Target node.

mesh models dfu srv applied

Mark the most recent DFU transfer as applied. Can only be called after a DFU transfer is completed, and the Distributor has requested that the transfer is applied.

As the mesh shell Firmware Update Server doesn't actually apply the incoming firmware image, this command can be used to emulate an applied status, to notify the Distributor that the transfer was successful.

mesh models dfu srv progress

Check the progress of the current transfer.

mesh models dfu srv rx-cancel

Cancel incoming DFU transfer.

mesh models dfu srv instance-set <ElemIdx>

Use the Firmware Update Server model instance on the specified element when using the other Firmware Update Server model commands.

• ElemIdx: The element on which to find the Firmware Update Server model instance to use.

mesh models dfu srv instance-get-all

Get a list of all Firmware Update Server model instances on the node.

Firmware Distribution Server model The Firmware Distribution Server model commands can be added to the mesh shell by enabling the CONFIG_BT_MESH_DFD_SRV configuration option. The shell commands for this model mirror the messages sent to the server by a Firmware Distribution Client model. To use these commands, a Firmware Distribution Server must be instantiated by the application.

mesh models dfd receivers-add <Addr>,<FwIdx>[:<Addr>,<FwIdx>]

Add receivers to the Firmware Distribution Server. Supply receivers as a list of comma-separated addr,fw_idx pairs, separated by semicolons, for example, 0x0001,0;0x0002,0;0x0004,1. Do not use spaces in the receiver list. Repeated calls to this command will continue populating the receivers list until mesh models dfd receivers-delete-all is called.

• Addr: Address of the receiving node(s).
• FwIdx: Index of the firmware slot to send to Addr.
mesh models dfd receivers-delete-all

Delete all receivers from the server.

mesh models dfd receivers-get <First> <Count>

Get a list of info about firmware receivers.

- **First**: Index of the first receiver to get from the receiver list.
- **Count**: The number of receivers for which to get info.

mesh models dfd capabilities-get

Get the capabilities of the server.

mesh models dfd get

Get information about the current distribution state, phase and the transfer parameters.

mesh models dfd start <AppKeyIdx> <SlotIdx> [<Group> [<PolicyApply> [<TTL> [<TimeoutBase> [<XferMode>]]]]]]

Start the firmware distribution.

- **AppKeyIdx**: Application index to use for sending. The common application key should be bound to the Firmware Update and BLOB Transfer models on the Distributor and Target nodes.
- **SlotIdx**: Index of the local image slot to send.
- **Group**: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Distribution Server will address each Target node individually. To keep addressing each Target node individually while changing other arguments, set this argument value to 0.
- **PolicyApply**: Optional field that corresponds to the update policy. Setting this to true will make the Firmware Distribution Server apply the image immediately after the transfer is completed.
- **TTL**: Optional. TTL value to use when sending. Defaults to configured default TTL.
- **TimeoutBase**: Optional additional value used to calculate timeout values in the firmware distribution process, in 10-second increments. See Transfer timeout for information about how timeout_base is used to calculate the transfer timeout. Defaults to 0.
- **XferMode**: Optional BLOB transfer mode. 1 = Push mode (Push BLOB Transfer Mode), 2 = Pull mode (Pull BLOB Transfer Mode). Defaults to Push mode.

mesh models dfd suspend

Suspend the ongoing distribution.

mesh models dfd cancel

Cancel the ongoing distribution.

mesh models dfd apply

Apply the distributed firmware.
mesh models dfd fw-get <FwID>
Get information about the firmware image uploaded to the server.
  • FwID: Firmware ID of the image to get.

mesh models dfd fw-get-by-idx <Idx>
Get information about the firmware image uploaded to the server in a specific slot.
  • Idx: Index of the slot to get the image from.

mesh models dfd fw-delete <FwID>
Delete a firmware image from the server.
  • FwID: Firmware ID of the image to delete.

mesh models dfd fw-delete-all
Delete all firmware images from the server.

mesh models dfd instance-set <ElemIdx>
Use the Firmware Distribution Server model instance on the specified element when using
the other Firmware Distribution Server model commands.
  • ElemIdx: The element on which to find the Firmware Distribution Server model instance
to use.

mesh models dfd instance-get-all
Get a list of all Firmware Distribution Server model instances on the node.

**DFU metadata** The DFU metadata commands allow generating metadata that can be used by a
Target node to check the firmware before accepting it. The commands are enabled through the
CONFIG_BT_MESH_DFU_METADATA configuration option.

mesh models dfu metadata comp-clear
Clear the stored composition data to be used for the Target node.

mesh models dfu metadata comp-add <CID> <ProductID> <VendorID> <Crpl> <Features>
Create a header of the Composition Data Page 0.
  • CID: Company identifier assigned by Bluetooth SIG.
  • ProductID: Vendor-assigned product identifier.
  • VendorID: Vendor-assigned version identifier.
  • Crpl: The size of the replay protection list.
  • Features: Features supported by the node in bit field format:
    – 0: Relay.
    – 1: Proxy.
    – 2: Friend.
    – 3: Low Power.
Add element description of the Target node.

- **Loc**: Element location.
- **NumS**: Number of SIG models instantiated on the element.
- **NumV**: Number of vendor models instantiated on the element.
- **SigMID**: SIG Model ID.
- **VndCID**: Vendor model company identifier.
- **VndMID**: Vendor model identifier.

Generate a hash of the stored Composition Data to be used in metadata.

- **Key**: Optional 128-bit key to be used to generate the hash. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.

Encode metadata for the DFU.

- **Major**: Major version of the firmware.
- **Minor**: Minor version of the firmware.
- **Rev**: Revision number of the firmware.
- **BuildNum**: Build number.
- **Size**: Size of the signed bin file.
- **CoreType**: New firmware core type in bit field format:
  - 0: Application core.
  - 1: Network core.
  - 2: Applications specific BLOB.
- **Hash**: Hash of the composition data generated using `mesh models dfu metadata comp-hash-get` command.
- **Elems**: Number of elements on the new firmware.
- **UserData**: User data supplied with the metadata.

**Segmentation and Reassembly (SAR) Configuration Client**  The SAR Configuration client is an optional mesh model that can be enabled through the `CONFIG_BT_MESH_SAR_CFG_CLI` configuration option. The SAR Configuration Client model is used to support the functionality of configuring the behavior of the lower transport layer of a node that supports the SAR Configuration Server model.

Send SAR Configuration Transmitter Get message.
Send SAR Configuration Transmitter Set message.
- **SegIntStep**: SAR Segment Interval Step state.
- **UniRetransCnt**: SAR Unicast Retransmissions Count state.
- **UniRetransWithoutProgCnt**: SAR Unicast Retransmissions Without Progress Count state.
- **UniRetransIntStep**: SAR Unicast Retransmissions Interval Step state.
- **UniRetransIntInc**: SAR Unicast Retransmissions Interval Increment state.
- **MultiRetransCnt**: SAR Multicast Retransmissions Count state.
- **MultiRetransInt**: SAR Multicast Retransmissions Interval state.

Send SAR Configuration Receiver Get message.

Send SAR Configuration Receiver Set message.
- **SegThresh**: SAR Segments Threshold state.
- **AckDelayInc**: SAR Acknowledgment Delay Increment state.
- **DiscardTimeout**: SAR Discard Timeout state.
- **RxSegIntStep**: SAR Receiver Segment Interval Step state.
- **AckRetransCount**: SAR Acknowledgment Retransmissions Count state.

**Private Beacon Client**  The Private Beacon Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_PRIV_BEACON_CLI` configuration option.

Get the target's Private Beacon state. Possible values:
- 0x00: The node doesn't broadcast Private beacons.
- 0x01: The node broadcasts Private beacons.

Set the target's Private Beacon state.
- **Val**: Control Private Beacon state.
- **RandInt**: Random refresh interval (in 10-second steps), or 0 to keep current value.
mesh models prb priv-gatt-proxy-get

Get the target's Private GATT Proxy state. Possible values:

- 0x00: The Private Proxy functionality is supported, but disabled.
- 0x01: The Private Proxy functionality is enabled.
- 0x02: The Private Proxy functionality is not supported.

mesh models prb priv-gatt-proxy-set <Val(off, on)>

Set the target's Private GATT Proxy state.

- Val: New Private GATT Proxy value:
  - 0x00: Disable the Private Proxy functionality.
  - 0x01: Enable the Private Proxy functionality.

mesh models prb priv-node-id-get <NetKeyIdx>

Get the target's Private Node Identity state. Possible values:

- 0x00: The node does not advertise with the Private Node Identity.
- 0x01: The node advertises with the Private Node Identity.
- 0x02: The node doesn't support advertising with the Private Node Identity.

- NetKeyIdx: Network index to get the Private Node Identity state of.

mesh models prb priv-node-id-set <NetKeyIdx> <State>

Set the target's Private Node Identity state.

- NetKeyIdx: Network index to set the Private Node Identity state of.
- State: New Private Node Identity value:
  - 0x00: Stop advertising with the Private Node Identity.
  - 0x01: Start advertising with the Private Node Identity.

**Opcodes Aggregator Client**  The Opcodes Aggregator client is an optional Bluetooth mesh model that can be enabled through the `CONFIG_BT_MESH_OP_AGG_CLI` configuration option. The Opcodes Aggregator Client model is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the Opcodes Aggregator Server model.

mesh models opagg seq-start <ElemAddr>

Start the Opcodes Aggregator Sequence message. This command initiates the context for aggregating messages and sets the destination address for next shell commands to `elem_addr`.

- ElemAddr: Element address that will process the aggregated opcodes.

mesh models opagg seq-send

Send the Opcodes Aggregator Sequence message. This command completes the procedure, sends the aggregated sequence message to the target node and clears the context.
mesh models opagg seq-abort

Abort the Opcodes Aggregator Sequence message. This command clears the Opcodes Aggregator Client context.

Remote Provisioning Client  The Remote Provisioning Client is an optional Bluetooth mesh model enabled through the CONFIG_BT_MESH_RPR_CLI configuration option. The Remote Provisioning Client model provides support for remote provisioning of devices into a mesh network by using the Remote Provisioning Server model.

This shell module can be used to trigger interaction between Remote Provisioning Clients and Remote Provisioning Servers on devices in a mesh network.

mesh models rpr scan <Timeout(s)> [UUID(1-16 hex)]

Start scanning for unprovisioned devices.

- **Timeout**: Scan timeout in seconds. Must be at least 1 second.
- **UUID**: Device UUID to scan for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, all devices will be reported.

mesh models rpr scan-ext <Timeout(s)> <UUID(1-16 hex)> [<ADType> ...]

Start the extended scanning for unprovisioned devices.

- **Timeout**: Scan timeout in seconds. Valid values from BT_MESH_RPR_EXT_SCAN_TIME_MIN to BT_MESH_RPR_EXT_SCAN_TIME_MAX.
- **UUID**: Device UUID to start extended scanning for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **ADType**: List of AD types to include in the scan report. Must contain 1 to CONFIG_BT_MESH_RPR_AD_TYPES_MAX entries.

mesh models rpr scan-srv [<ADType> ...]

Start the extended scanning for the Remote Provisioning Server.

- **ADType**: List of AD types to include in the scan report. Must contain 1 to CONFIG_BT_MESH_RPR_AD_TYPES_MAX entries.

mesh models rpr scan-caps

Get the scanning capabilities of the Remote Provisioning Server.

mesh models rpr scan-get

Get the current scanning state of the Remote Provisioning Server.

mesh models rpr scan-stop

Stop any ongoing scanning on the Remote Provisioning Server.

mesh models rpr link-get

Get the current link status of the Remote Provisioning Server.
**mesh models rpr link-close**

Close any open links on the Remote Provisioning Server.

**mesh models rpr provision-remote <UUID(1-16 hex)> <NetKeyIdx> <Addr>**

Provision a mesh node using the PB-Remote provisioning bearer.

- **UUID**: UUID of the unprovisioned node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **NetKeyIdx**: Network Key Index to give to the unprovisioned node.
- **Addr**: Address to assign to remote device. If addr is 0, the lowest available address will be chosen.

**mesh models rpr reprovision-remote <Addr> [CompChanged(false, true)]**

Reprovision a mesh node using the PB-Remote provisioning bearer.

- **Addr**: Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **CompChanged**: The Target node has indicated that its Composition Data has changed. Defaults to false.

**mesh models rpr instance-set <ElemIdx>**

Use the Remote Provisioning Client model instance on the specified element when using the other Remote Provisioning Client model commands.

- **ElemIdx**: The element on which to find the Remote Provisioning Client model instance to use.

**mesh models rpr instance-get-all**

Get a list of all Remote Provisioning Client model instances on the node.

**Configuration database**  
The Configuration database is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_CDB` configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

**mesh cdb create [NetKey(1-16 hex)]**

Create a Configuration database.

- **NetKey**: Optional network key value of the primary network key (NetKeyIndex=0). Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Defaults to the default key value if omitted.

**mesh cdb clear**

Clear all data from the Configuration database.
**mesh cdb show**

Show all data in the Configuration database.

**mesh cdb node-add <UUID(1-16 hex)> <Addr> <ElemCnt> <NetKeyIdx> [DevKey(1-16 hex)]**

Manually add a mesh node to the configuration database. Note that devices provisioned with `mesh provision` and `mesh provision-adv` will be added automatically if the Configuration Database is enabled and created.

- **UUID**: 128-bit hexadecimal UUID of the node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- **Addr**: Unicast address of the node, or 0 to automatically choose the lowest available address.
- **ElemCnt**: Number of elements on the node.
- **NetKeyIdx**: The network key the node was provisioned with.
- **DevKey**: Optional 128-bit device key value for the device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

**mesh cdb node-del <Addr>**

Delete a mesh node from the Configuration database. If possible, the node should be reset with `mesh reset` before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- **Addr**: Address of the node to delete.

**mesh cdb subnet-add <NetKeyIdx> [NetKey(1-16 hex)]**

Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known network keys.

- **NetKeyIdx**: Key index of the network key to add.
- **NetKey**: Optional 128-bit network key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

**mesh cdb subnet-del <NetKeyIdx>**

Delete a network key from the Configuration database.

- **NetKeyIdx**: Key index of the network key to delete.

**mesh cdb app-key-add <NetKeyIdx> <AppKeyIdx> [AppKey(1-16 hex)]**

Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known application keys.

- **NetKeyIdx**: Network key index the application key is bound to.
- **AppKeyIdx**: Key index of the application key to add.
- **AppKey**: Optional 128-bit application key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.
mesh cdb app-key-del <AppKeyIdx>

Delete an application key from the Configuration database.

- **AppKeyIdx**: Key index of the application key to delete.

**On-Demand Private GATT Proxy Client**  The On-Demand Private GATT Proxy Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_OD_PRIV_PROXY_CLI` configuration option.

mesh models od_priv_proxy od-priv-gatt-proxy [Dur(s)]

Set the On-Demand Private GATT Proxy state on active target, or fetch the value of this state from it.

- **Dur**: If given, set the state of On-Demand Private GATT Proxy to this value in seconds. Fetch this value otherwise.

**Solicitation PDU RPL Client**  The Solicitation PDU RPL Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_SOL_PDU_RPL_CLI` configuration option.

mesh models sol_pdu_rpl sol-pdu-rpl-clear <RngStart> <Ackd> [RngLen]

Clear active target's solicitation replay protection list (SRPL) in given range of solicitation source (SSRC) addresses.

- **RngStart**: Start address of the SSRC range.
- **Ackd**: This argument decides on whether an acknowledged or unacknowledged message will be sent.
- **RngLen**: Range length for the SSRC addresses to be cleared from the solicitation RPL list. This parameter is optional; if absent, only a single SSRC address will be cleared.

**Frame statistic**

mesh stat get

Get the frame statistic. The command prints numbers of received frames, as well as numbers of planned and succeeded transmission attempts.

mesh stat clear

Clear all statistics collected before.

**Bluetooth Microphone Control**

**API Reference**

*group* bt_gatt_micp

Microphone Control Profile (MICP)

[Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

`BT_MICP_MIC_DEV_AICS_CNT`

`BT_MICP_ERR_MUTE_DISABLED`
Application error codes.

`BT_MICP_MUTE_UNMUTED`
Microphone Control Profile mute states.

`BT_MICP_MUTE_MUTED`

`BT_MICP_MUTE_DISABLED`

Functions

```c
int bt_micp_mic_dev_register(struct bt_micp_mic_dev_register_param *param)
```

Initialize the Microphone Control Profile Microphone Device.
This will enable the Microphone Control Service instance and make it discoverable by Microphone Controllers.

**Parameters**

- `param` – Pointer to an initialization structure.

**Returns**

0 if success, errno on failure.

```c
int bt_micp_mic_dev_included_get(const struct bt_micp_included *included)
```

Get Microphone Device included services.
Returns a pointer to a struct that contains information about the Microphone Device included Audio Input Control Service instances.
Requires that `CONFIG_BT_MICP_MIC_DEV_AICS` is enabled.

**Parameters**

- `included` – Pointer to store the result in.

**Returns**

0 if success, errno on failure.

```c
int bt_micp_mic_dev_unmute(void)
```

Unmute the Microphone Device.

**Returns**

0 on success, GATT error value on fail.

```c
int bt_micp_mic_dev_mute(void)
```

Mute the Microphone Device.

**Returns**

0 on success, GATT error value on fail.

```c
int bt_micp_mic_dev_mute_disable(void)
```

Disable the mute functionality on the Microphone Device.
Can be reenabled by called `bt_micp_mic_dev_mute` or `bt_micp_mic_dev_unmute`. 
Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_get(void)
Read the mute state on the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_included_get(struct bt_micp_mic_ctlr *mic_ctlr, struct bt_micp_included *included)
Get Microphone Control Profile included services.
Returns a pointer to a struct that contains information about the Microphone Control Profile included services instances, such as pointers to the Audio Input Control Service instances.
Requires that CONFIG_BT_MICP_MIC_CTLR_AICS is enabled.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• included – [out] Pointer to store the result in.

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_conn_get(const struct bt_micp_mic_ctlr *mic_ctlr, struct bt_conn **conn)
Get the connection pointer of a Microphone Controller instance.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• conn – Connection pointer.

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_discover(struct bt_conn *conn, struct bt_micp_mic_ctlr **mic_ctlr)
Discover Microphone Control Service.

This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the bt_micp_mic_ctlr_cb::discover callback will notify when it is possible to start remote operations.

Parameters
• conn – The connection to initialize the profile for.
• mic_ctlr – [out] Valid remote instance object on success.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_unmute(struct bt_micp_mic_ctlr *mic_ctlr)
Unmute a remote Microphone Device.

Parameters
• mic_ctlr – Microphone Controller instance pointer.

Returns
0 on success, GATT error value on fail.
int bt_micp_mic_ctlr_mute(struct bt_micp_mic_ctlr *mic_ctlr)
    Mute a remote Microphone Device.

    **Parameters**
    - **mic_ctlr** – Microphone Controller instance pointer.

    **Returns**
    0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_mute_get(struct bt_micp_mic_ctlr *mic_ctlr)
    Read the mute state of a remote Microphone Device.

    **Parameters**
    - **mic_ctlr** – Microphone Controller instance pointer.

    **Returns**
    0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_cb_register(struct bt_micp_mic_ctlr_cb *cb)
    Registers the callbacks used by Microphone Controller.
    This can only be done as the client.

    **Parameters**
    - **cb** – The callback structure.

    **Returns**
    0 if success, errno on failure.

struct bt_micp_mic_dev_register_param
    #include <micp.h> Register parameters structure for Microphone Control Service.

    **Public Members**

    struct bt_micp_mic_dev_cb *cb
        Microphone Control Profile callback structure.

struct bt_micp_included
    #include <micp.h> Microphone Control Profile included services.
    Used for to represent the Microphone Control Profile included service instances, for either a Microphone Controller or a Microphone Device. The instance pointers either represent local service instances, or remote service instances.

    **Public Members**

    uint8_t aics_cnt
        Number of Audio Input Control Service instances.

    struct bt_aics **aics
        Array of pointers to Audio Input Control Service instances.
Public Members

void (*mute)(uint8_t mute)
   Callback function for Microphone Device mute.
   Called when the value is read with \texttt{bt_micp\_mic\_dev\_mute()}, or if the value is changed
   by either the Microphone Device or a Microphone Controller.
   \textbf{Param mute}
   The mute setting of the Microphone Control Service.

```c
struct bt_micp_mic_ctlr\_cb
#include <micp.h>
```

Public Members

void (*mute)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t mute)
   Callback function for Microphone Control Profile mute.
   Called when the value is read, or if the value is changed by either the Microphone Device
   or a Microphone Controller.
   \textbf{Param mic_ctlr}
   Microphone Controller instance pointer.
   \textbf{Param err}
   Error value. 0 on success, GATT error or errno on fail. For notifications, this
   will always be 0.
   \textbf{Param mute}
   The mute setting of the Microphone Control Service.

void (*discover)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t aics_count)
   Callback function for \texttt{bt_micp\_mic\_ctlr\_discover()}.  
   \textbf{Param mic_ctlr}
   Microphone Controller instance pointer.
   \textbf{Param err}
   Error value. 0 on success, GATT error or errno on fail.
   \textbf{Param aics\_count}
   Number of Audio Input Control Service instances on peer device.

void (*mute\_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
   Callback function for Microphone Control Profile mute/unmute.
   \textbf{Param mic_ctlr}
   Microphone Controller instance pointer.
   \textbf{Param err}
   Error value. 0 on success, GATT error or errno on fail.

void (*unmute\_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
   Callback function for Microphone Control Profile mute/unmute.
   \textbf{Param mic_ctlr}
   Microphone Controller instance pointer.
   \textbf{Param err}
   Error value. 0 on success, GATT error or errno on fail.

Serial Port Emulation (RFCOMM)

API Reference

group bt_rfcomm

RFCOMM.

**Typedefs**

typedef enum \texttt{bt\_rfcomm\_role} \texttt{bt\_rfcomm\_role\_t}

Role of RFCOMM session and dlc.

Used only by internal APIs

**Enums**

enum [anonymous]

\textit{Values}:

- enumerator \texttt{BT\_RFCOMM\_CHAN\_HFP\_HF} = 1
- enumerator \texttt{BT\_RFCOMM\_CHAN\_HFP\_AG}
- enumerator \texttt{BT\_RFCOMM\_CHAN\_HSP\_AG}
- enumerator \texttt{BT\_RFCOMM\_CHAN\_HSP\_HS}
- enumerator \texttt{BT\_RFCOMM\_CHAN\_SPP}

enum \texttt{bt\_rfcomm\_role}

Role of RFCOMM session and dlc.

Used only by internal APIs

\textit{Values}:

- enumerator \texttt{BT\_RFCOMM\_ROLE\_ACCEPTOR}
- enumerator \texttt{BT\_RFCOMM\_ROLE\_INITIATOR}

**Functions**

int \texttt{bt\_rfcomm\_server\_register} (struct \texttt{bt\_rfcomm\_server} *server)

Register RFCOMM server.

Register RFCOMM server for a channel, each new connection is authorized using the \texttt{accept()} callback which in case of success shall allocate the dlc structure to be used by the new connection.

\textbf{Parameters}

- \texttt{server} – Server structure.

\textbf{Returns}

0 in case of success or negative value in case of error.
int bt_rfcomm_dlc_connect(struct bt_conn *conn, struct bt_rfcomm_dlc *dlc, uint8_t channel)
    Connect RFCOMM channel.
    Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

    Parameters
    • conn – Connection object.
    • dlc – Dlc object.
    • channel – Server channel to connect to.

    Returns
    0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_send(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
    Send data to RFCOMM.
    Send data from buffer to the dlc. Length should be less than or equal to mtu.

    Parameters
    • dlc – Dlc object.
    • buf – Data buffer.

    Returns
    Bytes sent in case of success or negative value in case of error.

int bt_rfcomm_dlc_disconnect(struct bt_rfcomm_dlc *dlc)
    Disconnect RFCOMM dlc.
    Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result the dlc disconnected() callback is called.

    Parameters
    • dlc – Dlc object.

    Returns
    0 in case of success or negative value in case of error.

struct net_buf *bt_rfcomm_create_pdu(struct net_buf_pool *pool)
    Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

    Parameters
    • pool – Which pool to take the buffer from.

    Returns
    New buffer.

struct bt_rfcomm_dlc_ops
    #include <rfcomm.h> RFCOMM DLC operations structure.

Public Members

void (*connected)(struct bt_rfcomm_dlc *dlc)
    DLC connected callback.
    If this callback is provided it will be called whenever the connection completes.

    Param dlc
    The dlc that has been connected
void (*disconnected)(struct bt_rfcomm_dlc *dlc)
DLC disconnected callback.
If this callback is provided it will be called whenever the dlc is disconnected, including
when a connection gets rejected or cancelled (both incoming and outgoing)
  Param dlc
  The dlc that has been Disconnected

void (*recv)(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
DLC recv callback.
  Param dlc
  The dlc receiving data.
  Param buf
  Buffer containing incoming data.

struct bt_rfcomm_dlc
#include <rfcomm.h> RFCOMM DLC structure.

struct bt_rfcomm_server
#include <rfcomm.h>

Public Members

uint8_t channel
Server Channel.

int (*accept)(struct bt_conn *conn, struct bt_rfcomm_dlc **dlc)
Server accept callback.
This callback is called whenever a new incoming connection requires authorization.
  Param conn
  The connection that is requesting authorization
  Param dlc
  Pointer to received the allocated dlc
Return
  0 in case of success or negative value in case of error.

Bluetooth standard services

Battery Service

group bt_bas
  Battery Service (BAS)
  [Experimental] Users should note that the APIs can change as a part of ongoing development.

Functions

uint8_t bt_bas_get_battery_level(void)
  Read battery level value.
  Read the characteristic value of the battery level
Returns

The battery level in percent.

```c
int bt_bas_set_battery_level(uint8_t level)
```

Update battery level value.

Update the characteristic value of the battery level. This will send a GATT notification to all current subscribers.

**Parameters**

- `level` – The battery level in percent.

**Returns**

Zero in case of success and error code in case of error.

---

**Heart Rate Service**

*group bt_hrs*

Heart Rate Service (HRS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

```c
int bt_hrs_notify(uint16_t heartrate)
```

Notify heart rate measurement.

This will send a GATT notification to all current subscribers.

**Parameters**

- `heartrate` – The heartrate measurement in beats per minute.

**Returns**

Zero in case of success and error code in case of error.

---

**Immediate Alert Service**

*group bt_ias*

Immediate Alert Service (IAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

```c
BT_IAS_CB_DEFINE(_name)
```

Register a callback structure for immediate alert events.

**Parameters**

- `_name` – Name of callback structure.

** Enums**

```c
enum bt_ias_alert_lvl
```

`Values:`
enumerator BT_IAS_ALERT_LVL_NO_ALERT
   No alerting should be done on device.

enumerator BT_IAS_ALERT_LVL_MILD_ALERT
   Device shall alert.

enumerator BT_IAS_ALERT_LVL_HIGH_ALERT
   Device should alert in strongest possible way.

Functions

int bt_iias_local_alert_stop(void)
   Method for stopping alert locally.
   
   Returns
   Zero in case of success and error code in case of error.

int bt_iias_client_alert_write(struct bt_conn *conn, enum bt_iias_alert_lvl)
   Set alert level.
   
   Parameters
   • conn – Bluetooth connection object
   • bt_iias_alert_lvl – Level of alert to write
   
   Returns
   Zero in case of success and error code in case of error.

int bt_iias_discover(struct bt_conn *conn)
   Discover Immediate Alert Service.
   
   Parameters
   • conn – Bluetooth connection object
   
   Returns
   Zero in case of success and error code in case of error.

int bt_iias_client_cb_register(const struct bt_iias_client_cb *cb)
   Register Immediate Alert Client callbacks.
   
   Parameters
   • cb – The callback structure
   
   Returns
   Zero in case of success and error code in case of error.

struct bt_iias_cb
   #include <ias.h> Immediate Alert Service callback structure.

Public Members

void (*no_alert)(void)
   Callback function to stop alert.
   This callback is called when peer commands to disable alert.
void (*mild_alert)(void)
    Callback function for alert level value.
    This callback is called when peer commands to alert.

void (*high_alert)(void)
    Callback function for alert level value.
    This callback is called when peer commands to alert in the strongest possible way.

struct bt_ias_client_cb
    #include <ias.h>

Public Members

void (*discover)(struct bt_conn *conn, int err)
    Callback function for bt_ias_discover.
    This callback is called when discovery procedure is complete.
    Param conn
        Bluetooth connection object.
    Param err
        0 on success, ATT error or negative errno otherwise

Object Transfer Service

group bt_ots
    Object Transfer Service (OTS)
    [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_OTS_OBJ_ID_SIZE
    Size of OTS object ID (in bytes).

BT_OTS_OBJ_ID_MIN
    Minimum allowed value for object ID (except ID for directory listing)

BT_OTS_OBJ_ID_MAX
    Maximum allowed value for object ID (except ID for directory listing)

OTS_OBJ_ID_DIR_LIST
    ID of the Directory Listing Object.

BT_OTS_OBJ_ID_MASK
    Mask for OTS object IDs, preserving the 48 bits.

BT_OTS_OBJ_ID_STR_LEN
    Length of OTS object ID string (in bytes).
BT_OTS_OBJ_SET_PROP_DELETE(prop)
Set BT_OTS_OBJ_PROP_DELETE property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_EXECUTE(prop)
Set BT_OTS_OBJ_PROP_EXECUTE property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_READ(prop)
Set BT_OTS_OBJ_PROP_READ property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_WRITE(prop)
Set BT_OTS_OBJ_PROP_WRITE property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_APPEND(prop)
Set BT_OTS_OBJ_PROP_APPEND property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_TRUNCATE(prop)
Set BT_OTS_OBJ_PROP_TRUNCATE property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_PATCH(prop)
Set BT_OTS_OBJ_PROP_PATCH property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_SET_PROP_MARKED(prop)
Set BT_OTS_OBJ_SET_PROP_MARKED property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_GET_PROP_DELETE(prop)
Get BT_OTS_OBJ_PROP_DELETE property.

Parameters
• prop – Object properties.

BT_OTS_OBJ_GET_PROP_EXECUTE(prop)
Get BT_OTS_OBJ_PROP_EXECUTE property.

Parameters
• prop – Object properties.

6.1. Bluetooth
BT_OTS_OBJ_GET_PROP_READ(prop)
  Get BT_OTS_OBJ_PROP_READ property.

Parameters
  • prop – Object properties.

BT_OTS_OBJ_GET_PROP_WRITE(prop)
  Get BT_OTS_OBJ_PROP_WRITE property.

Parameters
  • prop – Object properties.

BT_OTS_OBJ_GET_PROP_APPEND(prop)
  Get BT_OTS_OBJ_PROP_APPEND property.

Parameters
  • prop – Object properties.

BT_OTS_OBJ_GET_PROP_TRUNCATE(prop)
  Get BT_OTS_OBJ_PROP_TRUNCATE property.

Parameters
  • prop – Object properties.

BT_OTS_OBJ_GET_PROP_PATCH(prop)
  Get BT_OTS_OBJ_PROP_PATCH property.

Parameters
  • prop – Object properties.

BT_OTS_OBJ_GET_PROP_MARKED(prop)
  Get BT_OTS_OBJ_PROP_MARKED property.

Parameters
  • prop – Object properties.

BT_OTS_OACP_SET_FEAT_CREATE(feat)
  Set BT_OTS_OACP_SET_FEAT_CREATE feature.

Parameters
  • feat – OTS features.

BT_OTS_OACP_SET_FEAT_DELETE(feat)
  Set BT_OTS_OACP_FEAT_DELETE feature.

Parameters
  • feat – OTS features.

BT_OTS_OACP_SET_FEAT_CHECKSUM(feat)
  Set BT_OTS_OACP_FEAT_CHECKSUM feature.

Parameters
  • feat – OTS features.

BT_OTS_OACP_SET_FEAT_EXECUTE(feat)
  Set BT_OTS_OACP_FEAT_EXECUTE feature.

Parameters
  • feat – OTS features.
BT_OTS_OACP_SET_FEAT_READ(feat)
Set **BT_OTS_OACP_FEAT_READ** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_SET_FEAT_WRITE(feat)
Set **BT_OTS_OACP_FEAT_WRITE** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_SET_FEAT_APPEND(feat)
Set **BT_OTS_OACP_FEAT_APPEND** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_SET_FEAT_TRUNCATE(feat)
Set **BT_OTS_OACP_FEAT_TRUNCATE** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_SET_FEAT_PATCH(feat)
Set **BT_OTS_OACP_FEAT_PATCH** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_SET_FEAT_ABORT(feat)
Set **BT_OTS_OACP_FEAT_ABORT** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_GET_FEAT_CREATE(feat)
Get **BT_OTS_OACP_FEAT_CREATE** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_GET_FEAT_DELETE(feat)
Get **BT_OTS_OACP_FEAT_DELETE** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_GET_FEAT_CHECKSUM(feat)
Get **BT_OTS_OACP_FEAT_CHECKSUM** feature.

**Parameters**
- feat – OTS features.

BT_OTS_OACP_GET_FEAT_EXECUTE(feat)
Get **BT_OTS_OACP_FEAT_EXECUTE** feature.

**Parameters**
- feat – OTS features.
Get \texttt{BT\_OTS\_OACP\_FEAT\_READ} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Get \texttt{BT\_OTS\_OACP\_FEAT\_WRITE} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Get \texttt{BT\_OTS\_OACP\_FEAT\_APPEND} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Get \texttt{BT\_OTS\_OACP\_FEAT\_TRUNCATE} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Get \texttt{BT\_OTS\_OACP\_FEAT\_PATCH} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Get \texttt{BT\_OTS\_OACP\_FEAT\_ABORT} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Set \texttt{BT\_OTS\_OLCP\_FEAT\_GO\_TO} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Set \texttt{BT\_OTS\_OLCP\_FEAT\_ORDER} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Set \texttt{BT\_OTS\_OLCP\_FEAT\_NUM\_REQ} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}

Set \texttt{BT\_OTS\_OLCP\_FEAT\_CLEAR} feature.

\textbf{Parameters}

\begin{itemize}
\item \texttt{feat} – OTS features.
\end{itemize}
BT_OTS_OLCP_GET_FEAT_GO_TO(feat)
   Get BT_OTS_OLCP_GET_FEAT_GO_TO feature.
   Parameters
      • feat – OTS features.

BT_OTS_OLCP_GET_FEAT_ORDER(feat)
   Get BT_OTS_OLCP_GET_FEAT_ORDER feature.
   Parameters
      • feat – OTS features.

BT_OTS_OLCP_GET_FEAT_NUM_REQ(feat)
   Get BT_OTS_OLCP_GET_FEAT_NUM_REQ feature.
   Parameters
      • feat – OTS features.

BT_OTS_OLCP_GET_FEAT_CLEAR(feat)
   Get BT_OTS_OLCP_GET_FEAT_CLEAR feature.
   Parameters
      • feat – OTS features.

BT_OTS_DATE_TIME_FIELD_SIZE

BT_OTS_STOP

BT_OTS_CONTINUE

typedef int (*bt_ots_client_dirlisting_cb)(struct bt_ots_obj_metadata *meta)
   Directory listing object metadata callback.

   If a directory listing is decoded using bt_ots_client_decode_dirlisting(), this callback will be
called for each object in the directory listing.

   Param meta
      The metadata of the decoded object

   Return
      int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop
      the decoding.

Enums

enum [anonymous]
   Properties of an OTS object.
   Values:

   enumerator BT_OTS_OBJ_PROP_DELETE = 0
      Bit 0 Deletion of this object is permitted.
enumerator BT_OTS_OBJ_PROP_EXECUTE = 1
   Bit 1 Execution of this object is permitted.

enumerator BT_OTS_OBJ_PROP_READ = 2
   Bit 2 Reading this object is permitted.

enumerator BT_OTS_OBJ_PROP_WRITE = 3
   Bit 3 Writing data to this object is permitted.

enumerator BT_OTS_OBJ_PROP_APPEND = 4
   Bit 4 Appending data to this object is permitted.
   
   Appending data increases its Allocated Size.

enumerator BT_OTS_OBJ_PROP_TRUNCATE = 5
   Bit 5 Truncation of this object is permitted.

enumerator BT_OTS_OBJ_PROP_PATCH = 6
   Bit 6 Patching this object is permitted.
   
   Patching this object overwrites some of the object's existing contents.

enumerator BT_OTS_OBJ_PROP_MARKED = 7
   Bit 7 This object is a marked object.

enum [anonymous]
   Object Action Control Point Feature bits.
   Values:

enumerator BT_OTS_OACP_FEAT_CREATE = 0
   Bit 0 OACP Create Op Code Supported.

enumerator BT_OTS_OACP_FEAT_DELETE = 1
   Bit 1 OACP Delete Op Code Supported

enumerator BT_OTS_OACP_FEAT_CHECKSUM = 2
   Bit 2 OACP Calculate Checksum Op Code Supported.

enumerator BT_OTS_OACP_FEAT_EXECUTE = 3
   Bit 3 OACP Execute Op Code Supported.

enumerator BT_OTS_OACP_FEAT_READ = 4
   Bit 4 OACP Read Op Code Supported.

enumerator BT_OTS_OACP_FEAT_WRITE = 5
   Bit 5 OACP Write Op Code Supported.
enumerator BT_OTS_OACP_FEAT_APPEND = 6
    Bit 6 Appending Additional Data to Objects Supported

enumerator BT_OTS_OACP_FEAT_TRUNCATE = 7
    Bit 7 Truncation of Objects Supported.

counter BY_OTS_OACP_FEAT_PATCH = 8
    Bit 8 Patching of Objects Supported

counter BT_OTS_OACP_FEAT_ABORT = 9
    Bit 9 OACP Abort Op Code Supported.

counter [anonymous]
   Object List Control Point Feature bits.
   Values:

        enumerator BT_OTS_OLCP_FEAT_GO_TO = 0
            Bit 0 OLCP Go To Op Code Supported.

        enumerator BT_OTS_OLCP_FEAT_ORDER = 1
            Bit 1 OLCP Order Op Code Supported.

        enumerator BT_OTS_OLCP_FEAT_NUM_REQ = 2
            Bit 2 OLCP Request Number of Objects Op Code Supported.

        enumerator BT_OTS_OLCP_FEAT_CLEAR = 3
            Bit 3 OLCP Clear Marking Op Code Supported.

        enumerator BT_OTS_METADATA_REQ_NAME = BIT(0)
            Request object name.

        enumerator BT_OTS_METADATA_REQ_TYPE = BIT(1)
            Request object type.

        enumerator BT_OTS_METADATA_REQ_SIZE = BIT(2)
            Request object size.
enumerator BT_OTS_METADATA_REQ_CREATED = BIT(3)
    Request object first created time.

enumerator BT_OTS_METADATA_REQ_MODIFIED = BIT(4)
    Request object last modified time.

enumerator BT_OTS_METADATA_REQ_ID = BIT(5)
    Request object ID.

enumerator BT_OTS_METADATA_REQ_PROPS = BIT(6)
    Request object properties.

enumerator BT_OTS_METADATA_REQ_ALL = 0x7F
    Request all object metadata.

Functions

int bt_ots_obj_add(struct bt_ots *ots, const struct bt_ots_obj_add_param *param)
    Add an object to the OTS instance.
    This function adds an object to the OTS database. When the object is being added, a callback
    obj_created() is called to notify the user about a new object ID.

    Parameters
    • ots – OTS instance.
    • param – Object addition parameters.

    Returns
    ID of created object in case of success.
    negative value in case of error.

int bt_ots_obj_delete(struct bt_ots *ots, uint64_t id)
    Delete an object from the OTS instance.
    This function deletes an object from the OTS database. When the object is deleted a callback
    obj_deleted() is called to notify the user about this event. At this point, it is possible to free
    allocated buffer for object data.

    Parameters
    • ots – OTS instance.
    • id – ID of the object to be deleted (uint48).

    Returns
    0 in case of success or negative value in case of error.

void *bt_ots_svc_decl_get(struct bt_ots *ots)
    Get the service declaration attribute.
    This function is enabled for CONFIG_BT_OTS_SECONDARY_SVC configuration. The first ser-
    vice attribute can be included in any other GATT service.

    Parameters
    • ots – OTS instance.
Returns
The first OTS attribute instance.

int bt_ots_init(struct bt_ots *ots, struct bt_ots_init_param *ots_init)

Initialize the OTS instance.

Parameters
• ots – OTS instance.
• ots_init – OTS initialization descriptor.

Returns
0 in case of success or negative value in case of error.

struct bt_ots *bt_ots_free_instance_get(void)

Get a free instance of OTS from the pool.

Returns
OTS instance in case of success or NULL in case of error.

int bt_ots_client_register(struct bt_ots_client *ots_inst)

Register an Object Transfer Service Instance.

Register an Object Transfer Service instance discovered on the peer. Call this function when an OTS instance is discovered (discovery is to be handled by the higher layer).

Parameters

Returns
int 0 if success, ERRNO on failure.

uint8_t bt_ots_client_indicate_handler(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)

OTS Indicate Handler function.

Set this function as callback for indicate handler when discovering OTS.

Parameters
• conn – Connection object. May be NULL, indicating that the peer is being unpaired.
• params – Subscription parameters.
• data – Attribute value data. If NULL then subscription was removed.
• length – Attribute value length.

int bt_ots_client_read_feature(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Read the OTS feature characteristic.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_id(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint64_t obj_id)

Select an object by its Object ID.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• obj_id – Object's ID.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_first(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the first object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_last(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the last object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_next(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the next object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_prev(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the previous object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_metadata(struct bt_ots_client *otc_inst, struct bt_conn *conn,
uint8_t metadata)

Read the metadata of the current object.
The metadata are returned in the obj_metadata_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• metadata – Bitfield (BT_OTS_METADATA_REQ_*) of the metadata to read.
Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Read the data of the current selected object.
This will trigger an OACP read operation for the current size of the object with a 0 offset and then expect receiving the content via the L2CAP CoC.
The data of the object are returned in the obj_data_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_write_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn,
const void *buf, size_t len, off_t offset, enum
bt_ots_oacp_write_op_mode mode)
Write the data of the current selected object.
This will trigger an OACP write operation for the current object with a specified offset and then expect transferring the content via the L2CAP CoC.
The length of the data written to object is returned in the obj_data_written() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• buf – Pointer to the data buffer to be written.
• len – Size of data.
• offset – Offset to write, usually 0.
• mode – Mode Parameter for OACP Write Op Code. See
  bt_ots_oacp_write_op_mode.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_get_object_checksum(struct bt_ots_client *otc_inst, struct bt_conn *conn,
off_t offset, size_t len)
Get the checksum of the current selected object.
This will trigger an OACP calculate checksum operation for the current object with a specified offset and length.
The checksum goes to OACP IND and obj_checksum_calculated() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• offset – Offset to calculate, usually 0.
• len – Len of data to calculate checksum for. May be less than the current object's size, but shall not be larger.

Returns
int 0 if success, ERRNO on failure.
int bt_ots_client_decode_dirlisting(uint8_t *data, uint16_t length, 
                                   bt_ots_client_dirlisting_cb cb)

Decode Directory Listing object into object metadata.
If the Directory Listing object contains multiple objects, then the callback will be called for
each of them.

Parameters
• data – The data received for the directory listing object.
• length – Length of the data.
• cb – The callback that will be called for each object.

static inline int bt_ots_obj_id_to_str(uint64_t obj_id, char *str, size_t len)
Converts binary OTS Object ID to string.

Parameters
• obj_id – Object ID.
• str – Address of user buffer with enough room to store formatted string contain-
ing binary Object ID.
• len – Length of data to be copied to user string buffer. Refer to
  BT_OTS_OBJ_ID_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary ID.

void bt_ots_metadata_display(struct bt_ots_obj_metadata *metadata, uint16_t count)
Displays one or more object metadata as text with LOG_INF.

Parameters
• metadata – Pointer to the first (or only) metadata in an array.
• count – Number of metadata objects to display information of.

struct bt_ots_obj_type
#include <ots.h> Type of an OTS object.

struct bt_ots_obj_size
#include <ots.h> Descriptor for OTS Object Size parameter.

Public Members

uint32_t cur
Current Size.

uint32_t alloc
Allocated Size.

struct bt_ots_feat
#include <ots.h> Features of the OTS.

struct bt_ots_date_time
#include <ots.h> Date and Time structure.
struct bt_ots_obj_metadata
   
   #include <ots.h> Metadata of an OTS object.

   Used by the server as a descriptor for OTS object initialization. Used by the client to present
   object metadata to the application.

Public Members

struct bt_ots_obj_type type
   
   Object Type.

struct bt_ots_obj_size size
   
   Object Size.

uint32_t props
   
   Object Properties.

struct bt_ots_obj_add_param
   
   #include <ots.h> Descriptor for OTS object addition.

   Public Members

   uint32_t size
       
       Object size to allocate.

   struct bt_ots_obj_type type
       
       Object type.

struct bt_ots_obj_created_desc
   
   #include <ots.h> Descriptor for OTS created object.

   Descriptor for OTS object created by the application. This descriptor is returned by
   bt_ots_cb::obj_created callback which contains further documentation on distinguishing be-
   tween server and client object creation.

   Public Members

   char *name
       
       Object name.

       The object name as a NULL terminated string.

       When the server creates a new object the name shall be > 0 and <=
       BT_OTS_OBJ_MAX_NAME_LEN When the client creates a new object the name shall be
       an empty string

   struct bt_ots_obj_size size
       
       Object size.

       bt_ots_obj_size::alloc shall be >= bt_ots_obj_add_param::size

6.1. Bluetooth
When the server creates a new object, `bt_ots_obj_size::cur` shall be \( \leq \) `bt_ots_obj_add_param::size`. When the client creates a new object, `bt_ots_obj_size::cur` shall be 0.

```c
uint32_t props
    Object properties.

struct bt_ots_cb
    #include <ots.h> OTS callback structure.
```

### Public Members

```c
int (*obj_created)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const struct bt_ots_obj_add_param *add_param, struct bt_ots_obj_created_desc *created_desc)
    Object created callback.
```

This callback is called whenever a new object is created. Application can reject this request by returning an error when it does not have necessary resources to hold this new object. This callback is also triggered when the server creates a new object with `bt_ots_obj_add()` API.

- **Param** `ots`
  OTS instance.
- **Param** `conn`
  The connection that is requesting object creation or NULL if object is created by `bt_ots_obj_add()`.
- **Param** `id`
  Object ID.
- **Param** `add_param`
  Object creation requested parameters.
- **Param** `created_desc`
  Created object descriptor that shall be filled by the receiver of this callback.

**Return**
- 0 in case of success or negative value in case of error.

```c
int (*obj_deleted)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)
    Object deleted callback.
```

This callback is called whenever an object is deleted. It is also triggered when the server deletes an object with `bt_ots_obj_delete()` API.

- **Param** `ots`
  OTS instance.
- **Param** `conn`
  The connection that deleted the object or NULL if this request came from the server.
- **Param** `id`
  Object ID.
Retval When
an error is indicated by using a negative value, the object delete procedure is
aborted and a corresponding failed status is returned to the client.

Return
0 in case of success.

Return
-EBUSY if the object is locked. This is generally not expected to be returned by
the application as the OTS layer tracks object accesses. An object locked status
is returned to the client.

Return
Other negative values in case of error. A generic operation failed status is re-
turned to the client.

void (*obj_selected)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)
Object selected callback.
This callback is called on successful object selection.

Param ots
OTS instance.

Param conn
The connection that selected new object.

Param id
Object ID.

ssize_t (*obj_read)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, void **data, size_t len, off_t offset)
Object read callback.
This callback is called multiple times during the Object read operation. OTS module will
keep requesting successive Object fragments from the application until the read operation
is completed. The end of read operation is indicated by NULL data parameter.

Param ots
OTS instance.

Param conn
The connection that read object.

Param id
Object ID.

Param data
In: NULL once the read operations is completed. Out: Next chunk of data to be
sent.

Param len
Remaining length requested by the client.

Param offset
Object data offset.

Return
Data length to be sent via data parameter. This value shall be smaller or equal
to the len parameter.

Return
Negative value in case of an error.

ssize_t (*obj_write)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const void *data, size_t len, off_t offset, size_t rem)
Object write callback.
This callback is called multiple times during the Object write operation. OTS module will
keep providing successive Object fragments to the application until the write operation is
completed. The offset and length of each write fragment is validated by the OTS module
to be within the allocated size of the object. The remaining length indicates data length

6.1. Bluetooth
remaining to be written and will decrease each write iteration until it reaches 0 in the last write fragment.

**Param ots**
OTS instance.

**Param conn**
The connection that wrote object.

**Param id**
Object ID.

**Param data**
Next chunk of data to be written.

**Param len**
Length of the current chunk of data in the buffer.

**Param offset**
Object data offset.

**Param rem**
Remaining length in the write operation.

**Return**
Number of bytes written in case of success, if the number of bytes written does not match len, -EIO is returned to the L2CAP layer.

**Return**
A negative value in case of an error.

**Return**
-EINPROGRESS has a special meaning and is unsupported at the moment. It should not be returned.

```c
void (*obj_name_written)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const char *cur_name, const char *new_name)
```

Object name written callback.

This callback is called when the object name is written. This is a notification to the application that the object name will be updated by the OTS service implementation.

**Param ots**
OTS instance.

**Param conn**
The connection that wrote object name.

**Param id**
Object ID.

**Param cur_name**
Current object name.

**Param new_name**
New object name.

```c
int (*obj_cal_checksum)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, off_t offset, size_t len, void **data)
```

Object Calculate checksum callback.

This callback is called when the OACP Calculate Checksum procedure is performed. Because object data is opaque to OTS, the application is the only one who knows where data is and should return pointer of actual object data.

**Param ots**
[in] OTS instance.

**Param conn**
[in] The connection that wrote object.

**Param id**
[in] Object ID.

**Param offset**
[in] The first octet of the object contents need to be calculated.

**Param len**
[in] The length number of octets object name.

**Param data**
[ out] Pointer of actual object data.

**Return**
0 to accept, or any negative value to reject.

```c
struct bt_ots_init_param
#include <ots.h> Descriptor for OTS initialization.
```

```c
struct bt_ots_client
#include <ots.h> OTS client instance.
```

```c
struct bt_ots_client_cb
#include <ots.h> OTS client callback structure.
```

**Public Members**

```c
void (*obj_selected)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err)
Callback function when a new object is selected.
Called when the a new object is selected and the current object has changed. The
cur_object in ots_inst will have been reset, and metadata should be read again with
bt_ots_client_read_object_metadata().
```

```c
Param ots_inst
Pointer to the OTC instance.
```

```c
Param conn
The connection to the peer device.
```

```c
Param err
Error code (bt_ots_olcp_res_code).
```

```c
int (*obj_data_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, uint32_t offset,
uint32_t len, uint8_t *data_p, bool is_complete)
Callback function for the data of the selected object.
Called when the data of the selected object are read using
bt_ots_client_read_object_data().
```

```c
Param ots_inst
Pointer to the OTC instance.
```

```c
Param conn
The connection to the peer device.
```

```c
Param offset
Offset of the received data.
```

```c
Param len
Length of the received data.
```

```c
Param data_p
Pointer to the received data.
```

```c
Param is_complete
Indicate if the whole object has been received.
```

**Return**
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop reading.

```c
void (*obj_metadata_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err,
uint8_t *metadata_read)
Callback function for metadata of the selected object.
```
Called when metadata of the selected object are read using `bt_ots_client_read_object_metadata()`. Not all of the metadata may have been initialized.

**Param ots_inst**
Pointer to the OTC instance.

**Param conn**
The connection to the peer device.

**Param err**
Error value. 0 on success, GATT error or ERRNO on fail.

**Param metadata_read**
Bitfield of the metadata that was successfully read.

```c
void (*obj_data_written)(struct bt_ots_client *ots_inst, struct bt_conn *conn, size_t len)
```

Callback function for the data of the write object.

Called when the data of the selected object is written using `bt_ots_client_write_object_data()`.

**Param ots_inst**
Pointer to the OTC instance.

**Param conn**
The connection to the peer device.

**Param len**
Length of the written data.

```c
void (*obj_checksum_calculated)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err, uint32_t checksum)
```

Callback function when checksum indication is received.

Called when the oacp_ind_handler received response of OP BT_GATT_OTS_OACP_PROC_CHECKSUM_CALC.

**Param ots_inst**
Pointer to the OTC instance.

**Param conn**
The connection to the peer device.

**Param err**
Error code (bt_gatt_ots_oacp_res_code).

**Param checksum**
Checksum if error code is BT_GATT_OTS_OACP_RES_SUCCESS, otherwise 0.

### Service Discovery Protocol (SDP)

BT_SDP_ATTR_SVCDB_STATE
Service Database State.

BT_SDP_ATTR_MPSD_SCENARIOS
MPSD Scenarios.

BT_SDP_ATTR_MPMD_SCENARIOS
MPMD Scenarios.

BT_SDP_ATTR_MPS_DEPENDENCIES
Supported Profiles & Protocols.

BT_SDP_ATTR_SERVICE_VERSION
Service Version.

BT_SDP_ATTR_EXTERNAL_NETWORK
External Network.

BT_SDP_ATTR_SUPPORTED_DATA_STORES_LIST
Supported Data Stores List.

BT_SDP_ATTR_DATA_EXCHANGE_SPEC
Data Exchange Specification.

BT_SDP_ATTR_NETWORK
Network.

BT_SDP_ATTR_FAX_CLASS1_SUPPORT
Fax Class 1 Support.

BT_SDP_ATTR_REMOTE_AUDIO_VOLUME_CONTROL
Remote Audio Volume Control.

BT_SDP_ATTR_MCAP_SUPPORTED_PROCEDURES
MCAP Supported Procedures.

BT_SDP_ATTR_FAX_CLASS20_SUPPORT
Fax Class 2.0 Support.

BT_SDP_ATTR_SUPPORTED_FORMATS_LIST
Supported Formats List.

BT_SDP_ATTR_FAX_CLASS2_SUPPORT
Fax Class 2 Support (vendor-specific)

BT_SDP_ATTR_AUDIO_FEEDBACK_SUPPORT
Audio Feedback Support.
BT_SDP_ATTR_NETWORK_ADDRESS
Network Address.

BT_SDP_ATTR_WAP_GATEWAY
WAP Gateway.

BT_SDP_ATTR_HOMEPAGE_URL
Homepage URL.

BT_SDP_ATTR_WAP_STACK_TYPE
WAP Stack Type.

BT_SDP_ATTR_SECURITY_DESC
Security Description.

BT_SDP_ATTR_NET_ACCESS_TYPE
Net Access Type.

BT_SDP_ATTR_MAX_NET_ACCESSRATE
Max Net Access Rate.

BT_SDP_ATTR_IP4_SUBNET
IPv4 Subnet.

BT_SDP_ATTR_IP6_SUBNET
IPv6 Subnet.

BT_SDP_ATTR_SUPPORTED_CAPABILITIES
BIP Supported Capabilities.

BT_SDP_ATTR_SUPPORTED_FEATURES
BIP Supported Features.

BT_SDP_ATTR_SUPPORTED_FUNCTIONS
BIP Supported Functions.

BT_SDP_ATTR_TOTAL_IMAGING_DATA_CAPACITY
BIP Total Imaging Data Capacity.

BT_SDP_ATTR_SUPPORTED_REPOSITORIES
Supported Repositories.

BT_SDP_ATTR_mas_instance_id
MAS Instance ID.

BT_SDP_ATTR_SUPPORTED_MESSAGE_TYPES
Supported Message Types.
6.1. Bluetooth 1947

BT_SDP_ATTR_PBAP_SUPPORTED_FEATURES
PBAP Supported Features.

BT_SDP_ATTR_MAP_SUPPORTED_FEATURES
MAP Supported Features.

BT_SDP_ATTR_SPECIFICATION_ID
Specification ID.

BT_SDP_ATTR_VENDOR_ID
Vendor ID.

BT_SDP_ATTR_PRODUCT_ID
Product ID.

BT_SDP_ATTR_VERSION
Version.

BT_SDP_ATTR_PRIMARY_RECORD
Primary Record.

BT_SDP_ATTR_VENDOR_ID_SOURCE
Vendor ID Source.

BT_SDP_ATTR_HID_DEVICE_RELEASE_NUMBER
HID Device Release Number.

BT_SDP_ATTR_HID_PARSER_VERSION
HID Parser Version.

BT_SDP_ATTR_HID_DEVICE_SUBCLASS
HID Device Subclass.

BT_SDP_ATTR_HID_COUNTRY_CODE
HID Country Code.

BT_SDP_ATTR_HID_VIRTUAL_CABLE
HID Virtual Cable.

BT_SDP_ATTR_HID_RECONNECT_INITIATE
HID Reconnect Initiate.

BT_SDP_ATTR_HID_DESCRIPTOR_LIST
HID Descriptor List.

BT_SDP_ATTR_HID_LANG_ID_BASE_LIST
HID Language ID Base List.
BT_SDP_ATTR_HID_SD_P_DISABLE
  HID SDP Disable.

BT_SDP_ATTR_HID_BATTERY_POWER
  HID Battery Power.

BT_SDP_ATTR_HID_REMOTE_WAKEUP
  HID Remote Wakeup.

BT_SDP_ATTR_HID_PROFILE_VERSION
  HID Profile Version.

BT_SDP_ATTR_HID_SUPERVISION_TIMEOUT
  HID Supervision Timeout.

BT_SDP_ATTR_HID_NORMALLY_CONNECTABLE
  HID Normally Connectable.

BT_SDP_ATTR_HID_BOOT_DEVICE
  HID Boot Device.

The Data representation in SDP PDUs (pps 339, 340 of BT SDP Spec)

These are the exact data type+size descriptor values that go into the PDU buffer.
The datatype (leading 5bits) + size descriptor (last 3 bits) is 8 bits. The size descriptor is critical
to extract the right number of bytes for the data value from the PDU.

For most basic types, the datatype+size descriptor is straightforward. However for constructed
types and strings, the size of the data is in the next “n” bytes following the 8 bits (datatype+size)
descriptor. Exactly what the “n” is specified in the 3 bits of the data size descriptor.

TextString and URLString can be of size $2^{8, 16, 32}$ bytes DataSequence and DataSequenceAlternates can be of size $2^{8, 16, 32}$ The size are computed post-facto in the API and are not known apriori.

BT_SDP_DATA_NIL
  Nil, the null type.

BT_SDP_UINT8
  Unsigned 8-bit integer.

BT_SDP_UINT16
  Unsigned 16-bit integer.

BT_SDP_UINT32
  Unsigned 32-bit integer.

BT_SDP_UINT64
  Unsigned 64-bit integer.
BT_SDP_UINT128
   Unsigned 128-bit integer.

BT_SDP_INT8
   Signed 8-bit integer.

BT_SDP_INT16
   Signed 16-bit integer.

BT_SDP_INT32
   Signed 32-bit integer.

BT_SDP_INT64
   Signed 64-bit integer.

BT_SDP_INT128
   Signed 128-bit integer.

BT_SDP_UUID_UNSPEC
   UUID, unspecified size.

BT_SDP_UUID16
   UUID, 16-bit.

BT_SDP_UUID32
   UUID, 32-bit.

BT_SDP_UUID128
   UUID, 128-bit.

BT_SDP_TEXT_STR_UNSPEC
   Text string, unspecified size.

BT_SDP_TEXT_STR8
   Text string, 8-bit length.

BT_SDP_TEXT_STR16
   Text string, 16-bit length.

BT_SDP_TEXT_STR32
   Text string, 32-bit length.

BT_SDP_BOOL
   Boolean.

BT_SDP_SEQ_UNSPEC
   Data element sequence, unspecified size.
BT_SDP_SEQ8
   Data element sequence, 8-bit length.

BT_SDP_SEQ16
   Data element sequence, 16-bit length.

BT_SDP_SEQ32
   Data element sequence, 32-bit length.

BT_SDP_ALT_UNSPEC
   Data element alternative, unspecified size.

BT_SDP_ALT8
   Data element alternative, 8-bit length.

BT_SDP_ALT16
   Data element alternative, 16-bit length.

BT_SDP_ALT32
   Data element alternative, 32-bit length.

BT_SDP_URL_STR_UNSPEC
   URL string, unspecified size.

BT_SDP_URL_STR8
   URL string, 8-bit length.

BT_SDP_URL_STR16
   URL string, 16-bit length.

BT_SDP_URL_STR32
   URL string, 32-bit length.

Defines

BT_SDP_SERVER_RECORD_HANDLE

BT_SDP_PRIMARY_LANG_BASE

BT_SDP_ATTR_SVCNAME_PRIMARY

BT_SDP_ATTR_SVCDESC_PRIMARY

BT_SDP_ATTR_PROVNAME_PRIMARY

BT_SDP_TYPE_DESC_MASK
BT_SDP_SIZE_DESC_MASK

BT_SDP_SIZE_INDEX_OFFSET

BT_SDP_ARRAY_8(...) 
Declare an array of 8-bit elements in an attribute.

BT_SDP_ARRAY_16(...) 
Declare an array of 16-bit elements in an attribute.

BT_SDP_ARRAY_32(...) 
Declare an array of 32-bit elements in an attribute.

BT_SDP_TYPE_SIZE(_type) 
Declare a fixed-size data element header.

Parameters

• _type – Data element header containing type and size descriptors.

BT_SDP_TYPE_SIZE_VAR(_type, _size) 
Declare a variable-size data element header.

Parameters

• _type – Data element header containing type and size descriptors.
• _size – The actual size of the data.

BT_SDP_DATA_ELEM_LIST(...) 
Declare a list of data elements.

BT_SDP_NEW_SERVICE 
SDP New Service Record Declaration Macro.

Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

BT_SDP_LIST(_att_id, _type_size, _data_elem_seq) 
Generic SDP List Attribute Declaration Macro.

Helper macro to declare a list attribute.

Parameters

• _att_id – List Attribute ID.
• _data_elem_seq – Data element sequence for the list.
• _type_size – SDP type and size descriptor.

BT_SDP_SERVICE_ID(_uuid) 
SDP Service ID Attribute Declaration Macro.

Helper macro to declare a service ID attribute.

Parameters

• _uuid – Service ID 16bit UUID.

BT_SDP_SERVICE_NAME(_name) 
SDP Name Attribute Declaration Macro.

Helper macro to declare a service name attribute.

Parameters
• `_name` – Service name as a string (up to 256 chars).

`BT_SDP_SUPPORTED_FEATURES(_features)`
SDP Supported Features Attribute Declaration Macro.
Helper macro to declare supported features of a profile/protocol.

**Parameters**

• `_features` – Feature mask as 16bit unsigned integer.

`BT_SDP_RECORD(_attrs)`
SDP Service Declaration Macro.
Helper macro to declare a service.

**Parameters**

• `_attrs` – List of attributes for the service record.

**Typedefs**

typedef uint8_t (*`bt_sdp_discover_func_t`)(struct bt_conn *conn, struct `bt_sdp_client_result` *result)

Callback type reporting to user that there is a resolved result on remote for given UUID and the result record buffer can be used by user for further inspection.

A function of this type is given by the user to the `bt_sdp_discover_params` object. It’ll be called on each valid record discovery completion for given UUID. When UUID resolution gives back no records then NULL is passed to the user. Otherwise user can get valid record(s) and then the internal hint ‘next record’ is set to false saying the UUID resolution is complete or the hint can be set by caller to true meaning that next record is available for given UUID. The returned function value allows the user to control retrieving follow-up resolved records if any. If the user doesn’t want to read more resolved records for given UUID since current record data fulfills its requirements then should return `BT_SDP_DISCOVER_UUID_STOP`. Otherwise returned value means more subcall iterations are allowable.

**Param conn**
Connection object identifying connection to queried remote.

**Param result**
Object pointing to logical unparsed SDP record collected on base of response driven by given UUID.

**Return**
`BT_SDP_DISCOVER_UUID_STOP` in case of no more need to read next record data and continue discovery for given UUID. By returning `BT_SDP_DISCOVER_UUID_CONTINUE` user allows this discovery continuation.

** Enums**

c enum [anonymous]

Helper enum to be used as return value of `bt_sdp_discover_func_t`.
The value informs the caller to perform further pending actions or stop them.

**Values:**

enumerator `BT_SDP_DISCOVER_UUID_STOP` = 0
enumerator BT_SDP_DISCOVER_UUID_CONTINUE

enum bt_sdp_proto

  Protocols to be asked about specific parameters.

  Values:

  enumerator BT_SDP_PROTO_RFCOMM = 0x0003

  enumerator BT_SDP_PROTO_L2CAP = 0x0100

Functions

int bt_sdp_register_service(struct bt_sdp_record *service)

Register a Service Record.

  Applications can make use of macros such as BT_SDP_DECLARE_SERVICE, BT_SDP_LIST, BT_SDP_SERVICE_ID, BT_SDP_SERVICE_NAME, etc. A service declaration must start with BT_SDP_NEW_SERVICE.

Parameters

  • service – Service record declared using BT_SDP_DECLARE_SERVICE.

Returns

  0 in case of success or negative value in case of error.

int bt_sdp_discover(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Allows user to start SDP discovery session.

  The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

Parameters

  • conn – Object identifying connection to remote.
  • params – SDP discovery parameters.

Returns

  0 in case of success or negative value in case of error.

int bt_sdp_discover_cancel(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Release waiting SDP discovery request.

  It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

Parameters

  • conn – Object identifying connection to remote.
  • params – SDP discovery parameters.

Returns

  0 in case of success or negative value in case of error.
int bt_sdp_get_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint16_t *param)

Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

**Parameters**

- `buf` – Original buffered raw record data.
- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param` – On success populated by found parameter value.

**Returns**

0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.

int bt_sdp_get_addl_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint8_t param_index, uint16_t *param)

Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

**Parameters**

- `buf` – Original buffered raw record data.
- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param_index` – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It's value is from 0, 0 means the first matched result, 1 means the second matched result.
- `param` – **[out]** On success populated by found parameter value.

**Returns**

0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

int bt_sdp_get_profile_version(const struct net_buf *buf, uint16_t profile, uint16_t *version)

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

**Parameters**

- `buf` – Original buffered raw record data.
- `profile` – Profile family identifier the profile belongs.
- `version` – On success populated by found version number.

**Returns**

0 on success, negative value if error occurred during processing.

int bt_sdp_get_features(const struct net_buf *buf, uint16_t *features)

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

**Parameters**

- `buf` – Buffer holding original raw record data from remote.
• features – On success object to be populated with SupportedFeature mask.

Returns
0 on success if feature found and valid, negative in case any error

struct bt_sdp_data_elem
#include <sdp.h> SDP Generic Data Element Value.

Public Members

uint8_t type
Type of the data element.

uint32_t data_size
Size of the data element.

uint32_t total_size
Total size of the data element.

struct bt_sdp_attribute
#include <sdp.h> SDP Attribute Value.

Public Members

uint16_t id
Attribute ID.

struct bt_sdp_data_elem *val
Attribute data.

struct bt_sdp_record
#include <sdp.h> SDP Service Record Value.

Public Members

uint32_t handle
Redundant, for quick ref.

struct bt_sdp_attribute *attrs
Base addr of attr array.

size_t attr_count
Number of attributes.

uint8_t index
Index of the record in LL.
struct bt_sdp_record *next
    Next service record.

struct bt_sdp_client_result
    #include <sdp.h> Generic SDP Client Query Result data holder.

Public Members

struct net_buf *resp_buf
    buffer containing unparsed SDP record result for given UUID

bool next_record_hint
    flag pointing that there are more result chunks for given UUID

const struct bt_uuid *uuid
    Reference to UUID object on behalf one discovery was started.

struct bt_sdp_discover_params
    #include <sdp.h> Main user structure used in SDP discovery of remote.

Public Members

const struct bt_uuid *uuid
    UUID (service) to be discovered on remote SDP entity.

bt_sdp_discover_func_t func
    Discover callback to be called on resolved SDP record.

struct net_buf_pool *pool
    Memory buffer enabled by user for SDP query results

Bluetooth Audio Volume Control

API Reference

group bt_gatt_vcp
    Volume Control Profile (VCP)
        [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_VCP_VOL_REND_VOCS_CNT

BT_VCP_VOL_REND_AICS_CNT
BT_VCP_ERR_INVALID_COUNTER
    Volume Control Service Error codes.

BT_VCP_ERR_OP_NOT_SUPPORTED

BT_VCP_STATE_UNMUTED
    Volume Control Service Mute Values.

BT_VCP_STATE_MUTED

Functions

int bt_vcp_vol_rend_included_get(struct bt_vcp_included *included)
    Get Volume Control Service included services.
    Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

    Parameters
    • included – [out] Pointer to store the result in.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_register(struct bt_vcp_vol_rend_register_param *param)
    Register the Volume Control Service.
    This will register and enable the service and make it discoverable by clients.

    Parameters
    • param – Volume Control Service register parameters.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_set_step(uint8_t volume_step)
    Set the Volume Control Service volume step size.
    Set the value that the volume changes, when changed relatively with e.g. bt_vcp_vol_rend_vol_down or bt_vcp_vol_rend_vol_up.
    This can only be done as the server.

    Parameters
    • volume_step – The volume step size (1-255).

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_get_state(void)
    Get the Volume Control Service volume state.

    Returns
    0 if success, errno on failure.
int bt_vcp_vol_rend_get_flags(void)
    Get the Volume Control Service flags.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_vol_down(void)
    Turn the volume down by one step on the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_vol_up(void)
    Turn the volume up by one step on the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_down(void)
    Turn the volume down and unmute the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_up(void)
    Turn the volume up and unmute the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_set_vol(uint8_t volume)
    Set the volume on the server.

    Parameters
    • volume – The absolute volume to set.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_unmute(void)
    Unmute the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_rend_mute(void)
    Mute the server.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_ctlr_cb_register(struct bt_vcp_vol_ctlr_cb *cb)
    Registers the callbacks used by the Volume Controller.

    Parameters
    • cb – The callback structure.

    Returns
    0 if success, errno on failure.

int bt_vcp_vol_ctlr_discover(struct bt_conn *conn, struct bt_vcp_vol_ctlr **vol_ctlr)
    Discover Volume Control Service and included services.

    This will start a GATT discovery and setup handles and subscriptions. This shall be
    called once before any other actions can be executed for the peer device, and the
    bt_vcp_vol_ctlr_cb::discover callback will notify when it is possible to start remote operations.
This shall only be done as the client,

**Parameters**

- `conn` – The connection to discover Volume Control Service for.

**Returns**

0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_conn_get(const struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_conn **conn)
```

Get the connection pointer of a client instance.

**Parameters**

- `vol_ctlr` – Volume Controller instance pointer.
- `conn` – [out] Connection pointer.

**Returns**

0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_included_get(struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_vcp_included *included)
```

Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

**Parameters**

- `vol_ctlr` – Volume Controller instance pointer.
- `included` – [out] Pointer to store the result in.

**Returns**

0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_state(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume state of a remote Volume Renderer.

**Parameters**

- `vol_ctlr` – Volume Controller instance pointer.

**Returns**

0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_flags(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume flags of a remote Volume Renderer.

**Parameters**

- `vol_ctlr` – Volume Controller instance pointer.

**Returns**

0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume down one step on a remote Volume Renderer.

**Parameters**

- `vol_ctlr` – Volume Controller instance pointer.

**Returns**

0 if success, errno on failure.
int bt_vcp_vol_ctlr_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume up one step on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume down one step and unmute on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume up one step and unmute on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_set_vol(struct bt_vcp_vol_ctlr *vol_ctlr, uint8_t volume)
Set the absolute volume on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.
• volume – The absolute volume to set.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute(struct bt_vcp_vol_ctlr *vol_ctlr)
Unmute a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_mute(struct bt_vcp_vol_ctlr *vol_ctlr)
Mute a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

struct bt_vcp_vol_rend_register_param
#include <vcp.h> Register structure for Volume Control Service.
Public Members

uint8_t step
   Initial step size (1-255)

uint8_t mute
   Initial mute state (0-1)

uint8_t volume
   Initial volume level (0-255)

struct bt_vocs_register_param *vocs_param[0]
   Register parameters for Volume Offset Control Services.

struct bt_aics_register_param *aics_param[0]
   Register parameters for Audio Input Control Services.

struct bt_vcp_vol_rend_cb *cb
   Volume Control Service callback structure.

struct bt_vcp_included
   
#include <vcp.h> Volume Control Service included services.

   Used for to represent the Volume Control Service included service instances, for either a client
   or a server. The instance pointers either represent local server instances, or remote service
   instances.

Public Members

uint8_t vocs_cnt
   Number of Volume Offset Control Service instances.

struct bt_vocs **vocs
   Array of pointers to Volume Offset Control Service instances.

uint8_t aics_cnt
   Number of Audio Input Control Service instances.

struct bt_aics **aics
   Array of pointers to Audio Input Control Service instances.

struct bt_vcp_vol_rend_cb
   
#include <vcp.h>

Public Members

6.1. Bluetooth
void (*state)(int err, uint8_t volume, uint8_t mute)
Callback function for Volume Control Service volume state.
Called when the value is locally read with \texttt{bt_vcp_vol_rend_get_state()}, or if the state is changed by either the Volume Renderer or a remote Volume Controller.

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.

\textbf{Param volume}
The volume of the Volume Control Service server.

\textbf{Param mute}
The mute setting of the Volume Control Service server.

void (*flags)(int err, uint8_t flags)
Callback function for Volume Control Service flags.
Called when the value is locally read as the server. Called when the value is remotely read as the client. Called if the value is changed by either the server or client.

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.

\textbf{Param flags}
The flags of the Volume Control Service server.

\begin{verbatim}
struct bt_vcp_vol_ctlr_cb
#include <vcp.h>
\end{verbatim}

\textbf{Public Members}

void (*state)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t volume, uint8_t mute)
Callback function for Volume Control Profile volume state.
Called when the value is remotely read as the Volume Controller. Called if the value is changed by either the Volume Renderer or Volume Controller, and notified to the Volume Controller.

\textbf{Param vol_ctlr}
Volume Controller instance pointer.

\textbf{Param err}
Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.

\textbf{Param volume}
The volume of the Volume Renderer.

\textbf{Param mute}
The mute setting of the Volume Renderer.

void (*flags)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t flags)
Callback function for Volume Control Profile volume flags.
Called when the value is remotely read as the Volume Controller. Called if the value is changed by the Volume Renderer.

A non-zero value indicates the the volume has been changed on the Volume Renderer since it was booted.

\textbf{Param vol_ctlr}
Volume Controller instance pointer.
**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param flags**

The flags of the Volume Renderer.

google (*discover*) (struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t vocs_count, uint8_t t aics_count)

Callback function for `bt_vcp_vol_ctlr_discover()`.

This callback is called once the discovery procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param vocs_count**

Number of Volume Offset Control Service instances on the remote Volume Renderer.

**Param aics_count**

Number of Audio Input Control Service instances the remote Volume Renderer.

void (*vol_down*) (struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for `bt_vcp_vol_ctlr_vol_down()`.

Called when the volume down procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_up*) (struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for `bt_vcp_vol_ctlr_vol_up()`.

Called when the volume up procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*mute*) (struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for `bt_vcp_vol_ctlr_mute()`.

Called when the mute procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*unmute*) (struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for `bt_vcp_vol_ctlr_unmute()`.

Called when the unmute procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.
Param err
   Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_down_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
   Callback function for bt_vcp_vol_ctlr_vol_down_unmute().
   Called when the volume down and unmute procedure is completed.
   Param vol_ctlr
      Volume Controller instance pointer.
   Param err
      Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_up_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
   Callback function for bt_vcp_vol_ctlr_vol_up_unmute().
   Called when the volume up and unmute procedure is completed.
   Param vol_ctlr
      Volume Controller instance pointer.
   Param err
      Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_set)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
   Callback function for bt_vcp_vol_ctlr_vol_set().
   Called when the set absolute volume procedure is completed.
   Param vol_ctlr
      Volume Controller instance pointer.
   Param err
      Error value. 0 on success, GATT error on positive value or errno on negative value.

Universal Unique Identifiers (UUIDs)

API Reference

group bt_uuid
   UUIDs.

Defines

BT_UUID_SIZE_16
   Size in octets of a 16-bit UUID.

BT_UUID_SIZE_32
   Size in octets of a 32-bit UUID.

BT_UUID_SIZE_128
   Size in octets of a 128-bit UUID.

BT_UUID_INIT_16(value)
   Initialize a 16-bit UUID.
Parameters
• value – 16-bit UUID value in host endianness.

BT_UUID_INIT_32(value)
Initialize a 32-bit UUID.

Parameters
• value – 32-bit UUID value in host endianness.

BT_UUID_INIT_128(value...)
Initialize a 128-bit UUID.

Parameters
• value – 128-bit UUID array values in little-endian format. Can be combined with BT_UUID_128_ENCODE to initialize a UUID from the readable form of UUIDs.

BT_UUID_DECLARE_16(value)
Helper to declare a 16-bit UUID inline.

Parameters
• value – 16-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_32(value)
Helper to declare a 32-bit UUID inline.

Parameters
• value – 32-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_128(value...)
Helper to declare a 128-bit UUID inline.

Parameters
• value – 128-bit UUID array values in little-endian format. Can be combined with BT_UUID_128_ENCODE to declare a UUID from the readable form of UUIDs.

Returns
Pointer to a generic UUID.

BT_UUID_16(__u)
Helper macro to access the 16-bit UUID from a generic UUID.

BT_UUID_32(__u)
Helper macro to access the 32-bit UUID from a generic UUID.

BT_UUID_128(__u)
Helper macro to access the 128-bit UUID from a generic UUID.

BT_UUID_128_ENCODE(w32, w1, w2, w3, w48)
Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data. Can be combined with BT_UUID_DECLARE_128 to declare a 128-bit UUID.

Example of how to declare the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E

6.1. Bluetooth
Example of how to encode the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E into advertising data.

Just replace the hyphen by the comma and add 0x prefixes.

**Parameters**

- \( w32 \) – First part of the UUID (32 bits)
- \( w1 \) – Second part of the UUID (16 bits)
- \( w2 \) – Third part of the UUID (16 bits)
- \( w3 \) – Fourth part of the UUID (16 bits)
- \( w48 \) – Fifth part of the UUID (48 bits)

**Returns**

The comma separated values for UUID 128 initializer that may be used directly as an argument for `BT_UUID_INIT_128` or `BT_UUID_DECLARE_128`.

`BT_UUID_16_ENCODE(w16)`

Encode 16-bit UUID into array values in little-endian format.

Helper macro to encode 16-bit UUID values into advertising data.

Example of how to encode the UUID 0x180a into advertising data.

**Parameters**

- \( w16 \) – UUID value (16-bits)

**Returns**

The comma separated values for UUID 16 value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_UUID_32_ENCODE(w32)`

Encode 32-bit UUID into array values in little-endian format.

Helper macro to encode 32-bit UUID values into advertising data.

Example of how to encode the UUID 0x180a01af into advertising data.

**Parameters**

- \( w32 \) – UUID value (32-bits)

**Returns**

The comma separated values for UUID 32 value that may be used directly as an argument for `BT_DATA_BYTES`. 
**BT_UUID_STR_LEN**

Recommended length of user string buffer for Bluetooth UUID.

The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

**BT_UUID_GAP_VAL**

Generic Access UUID value.

**BT_UUID_GAP**

Generic Access.

**BT_UUID_GATT_VAL**

Generic attribute UUID value.

**BT_UUID_GATT**

Generic Attribute.

**BT_UUID_IAS_VAL**

Immediate Alert Service UUID value.

**BT_UUID_IAS**

Immediate Alert Service.

**BT_UUID_LLS_VAL**

Link Loss Service UUID value.

**BT_UUID_LLS**

Link Loss Service.

**BT_UUID_TPS_VAL**

Tx Power Service UUID value.

**BT_UUID_TPS**

Tx Power Service.

**BT_UUID_CTS_VAL**

Current Time Service UUID value.

**BT_UUID_CTS**

Current Time Service.

**BT_UUID_RTUS_VAL**

Reference Time Update Service UUID value.

**BT_UUID_RTUS**

Reference Time Update Service.
BT_UUID_NDSTS_VAL
   Next DST Change Service UUID value.

BT_UUID_NDSTS
   Next DST Change Service.

BT_UUID_GS_VAL
   Glucose Service UUID value.

BT_UUID_GS
   Glucose Service.

BT_UUID_HTS_VAL
   Health Thermometer Service UUID value.

BT_UUID_HTS
   Health Thermometer Service.

BT_UUID_DIS_VAL
   Device Information Service UUID value.

BT_UUID_DIS
   Device Information Service.

BT_UUID_NAS_VAL
   Network Availability Service UUID value.

BT_UUID_NAS
   Network Availability Service.

BT_UUID_WDS_VAL
   Watchdog Service UUID value.

BT_UUID_WDS
   Watchdog Service.

BT_UUID_HRS_VAL
   Heart Rate Service UUID value.

BT_UUID_HRS
   Heart Rate Service.

BT_UUID_PAS_VAL
   Phone Alert Service UUID value.

BT_UUID_PAS
   Phone Alert Service.
BT_UUID_BAS_VAL
  Battery Service UUID value.

BT_UUID_BAS
  Battery Service.

BT_UUID_BPS_VAL
  Blood Pressure Service UUID value.

BT_UUID_BPS
  Blood Pressure Service.

BT_UUID_ANS_VAL
  Alert Notification Service UUID value.

BT_UUID_ANS
  Alert Notification Service.

BT_UUID_HIDS_VAL
  HID Service UUID value.

BT_UUID_HIDS
  HID Service.

BT_UUID_SPS_VAL
  Scan Parameters Service UUID value.

BT_UUID_SPS
  Scan Parameters Service.

BT_UUID_RSCS_VAL
  Running Speed and Cadence Service UUID value.

BT_UUID_RSCS
  Running Speed and Cadence Service.

BT_UUID_AIOS_VAL
  Automation IO Service UUID value.

BT_UUID_AIOS
  Automation IO Service.

BT_UUID_CSC_VAL
  Cycling Speed and Cadence Service UUID value.

BT_UUID_CSC
  Cycling Speed and Cadence Service.
Cyclic Power Service UUID value.

Cycling Power Service.

Location and Navigation Service UUID value.

Location and Navigation Service.

Environmental Sensing Service UUID value.

Environmental Sensing Service.

Body Composition Service UUID value.

Body Composition Service.

User Data Service UUID value.

User Data Service.

Weight Scale Service UUID value.

Weight Scale Service.

Bond Management Service UUID value.

Bond Management Service.

Continuous Glucose Monitoring Service UUID value.

Continuous Glucose Monitoring Service.
BT_UUID_IPSS_VAL
   IP Support Service UUID value.

BT_UUID_IPSS
   IP Support Service.

BT_UUID_IPS_VAL
   Indoor Positioning Service UUID value.

BT_UUID_IPS
   Indoor Positioning Service.

BT_UUID_POS_VAL
   Pulse Oximeter Service UUID value.

BT_UUID_POS
   Pulse Oximeter Service.

BT_UUID_HPS_VAL
   HTTP Proxy Service UUID value.

BT_UUID_HPS
   HTTP Proxy Service.

BT_UUID_TDS_VAL
   Transport Discovery Service UUID value.

BT_UUID_TDS
   Transport Discovery Service.

BT_UUID_OTS_VAL
   Object Transfer Service UUID value.

BT_UUID_OTS
   Object Transfer Service.

BT_UUID_FMS_VAL
   Fitness Machine Service UUID value.

BT_UUID_FMS
   Fitness Machine Service.

BT_UUID_MESH_PROV_VAL
   Mesh Provisioning Service UUID value.

BT_UUID_MESH_PROV
   Mesh Provisioning Service.
BT_UUID_MESH_PROXY_VAL
Mesh Proxy Service UUID value.

BT_UUID_MESH_PROXY
Mesh Proxy Service.

BT_UUID_MESH_PROXY_SOLICITATION_VAL
Proxy Solicitation UUID value.

BT_UUID_RCSRV_VAL
Reconnection Configuration Service UUID value.

BT_UUID_RCSRV
Reconnection Configuration Service.

BT_UUID_IDS_VAL
Insulin Delivery Service UUID value.

BT_UUID_IDS
Insulin Delivery Service.

BT_UUID_BSS_VAL
Binary Sensor Service UUID value.

BT_UUID_BSS
Binary Sensor Service.

BT_UUID_ECS_VAL
Emergency Configuration Service UUID value.

BT_UUID_ECS
Emergency Configuration Service.

BT_UUID_ACLS_VAL
Authorization Control Service UUID value.

BT_UUID_ACLS
Authorization Control Service.

BT_UUID_PAMS_VAL
Physical Activity Monitor Service UUID value.

BT_UUID_PAMS
Physical Activity Monitor Service.

BT_UUID_AICS_VAL
Audio Input Control Service UUID value.
6.1. Bluetooth

**BT_UUID_AICS**
Audio Input Control Service.

**BT_UUID_VCS_VAL**
Volume Control Service UUID value.

**BT_UUID_VCS**
Volume Control Service.

**BT_UUID_VOCS_VAL**
Volume Offset Control Service UUID value.

**BT_UUID_VOCS**
Volume Offset Control Service.

**BT_UUID_CSIS_VAL**
Coordinated Set Identification Service UUID value.

**BT_UUID_CSIS**
Coordinated Set Identification Service.

**BT_UUID_DTS_VAL**
Device Time Service UUID value.

**BT_UUID_DTS**
Device Time Service.

**BT_UUID_MCS_VAL**
Media Control Service UUID value.

**BT_UUID_MCS**
Media Control Service.

**BT_UUID_GMCS_VAL**
Generic Media Control Service UUID value.

**BT_UUID_GMCS**
Generic Media Control Service.

**BT_UUID_CTES_VAL**
Constant Tone Extension Service UUID value.

**BT_UUID_CTES**
Constant Tone Extension Service.

**BT_UUID_TBS_VAL**
Telephone Bearer Service UUID value.
BT_UUID_TBS
   Telephone Bearer Service.

BT_UUID_GTBS_VAL
   Generic Telephone Bearer Service UUID value.

BT_UUID_GTBS
   Generic Telephone Bearer Service.

BT_UUID_MICS_VAL
   Microphone Control Service UUID value.

BT_UUID_MICS
   Microphone Control Service.

BT_UUID_ASCS_VAL
   Audio Stream Control Service UUID value.

BT_UUID_ASCS
   Audio Stream Control Service.

BT_UUID_BASS_VAL
   Broadcast Audio Scan Service UUID value.

BT_UUID_BASS
   Broadcast Audio Scan Service.

BT_UUID_PACS_VAL
   Published Audio Capabilities Service UUID value.

BT_UUID_PACS
   Published Audio Capabilities Service.

BT_UUID_BASIC_AUDIO_VAL
   Basic Audio Announcement Service UUID value.

BT_UUID_BASIC_AUDIO
   Basic Audio Announcement Service.

BT_UUID_BROADCAST_AUDIO_VAL
   Broadcast Audio Announcement Service UUID value.

BT_UUID_BROADCAST_AUDIO
   Broadcast Audio Announcement Service.

BT_UUID_CAS_VAL
   Common Audio Service UUID value.
BT_UUID_CAS
  Common Audio Service.

BT_UUID_HAS_VAL
  Hearing Access Service UUID value.

BT_UUID_HAS
  Hearing Access Service.

BT_UUID_TMAS_VAL
  Telephony and Media Audio Service UUID value.

BT_UUID_TMAS
  Telephony and Media Audio Service.

BT_UUID_PBA_VAL
  Public Broadcast Announcement Service UUID value.

BT_UUID_PBA
  Public Broadcast Announcement Service.

BT_UUID_GATT_PRIMARY_VAL
  GATT Primary Service UUID value.

BT_UUID_GATT_PRIMARY
  GATT Primary Service.

BT_UUID_GATT_SECONDARY_VAL
  GATT Secondary Service UUID value.

BT_UUID_GATT_SECONDARY
  GATT Secondary Service.

BT_UUID_GATT_INCLUDE_VAL
  GATT Include Service UUID value.

BT_UUID_GATT_INCLUDE
  GATT Include Service.

BT_UUID_GATT_CHRC_VAL
  GATT Characteristic UUID value.

BT_UUID_GATT_CHRC
  GATT Characteristic.

BT_UUID_GATT_CEP_VAL
  GATT Characteristic Extended Properties UUID value.
BT_UUID_GATT_CEP
  GATT Characteristic Extended Properties.

BT_UUID_GATT_CUD_VAL
  GATT Characteristic User Description UUID value.

BT_UUID_GATT_CUD
  GATT Characteristic User Description.

BT_UUID_GATT_CCC_VAL
  GATT Client Characteristic Configuration UUID value.

BT_UUID_GATT_CCC
  GATT Client Characteristic Configuration.

BT_UUID_GATT_SCC_VAL
  GATT Server Characteristic Configuration UUID value.

BT_UUID_GATT_SCC
  GATT Server Characteristic Configuration.

BT_UUID_GATT_CPF_VAL
  GATT Characteristic Presentation Format UUID value.

BT_UUID_GATT_CPF
  GATT Characteristic Presentation Format.

BT_UUID_GATT_CAF_VAL
  GATT Characteristic Aggregated Format UUID value.

BT_UUID_GATT_CAF
  GATT Characteristic Aggregated Format.

BT_UUID_VALID_RANGE_VAL
  Valid Range Descriptor UUID value.

BT_UUID_VALID_RANGE
  Valid Range Descriptor.

BT_UUID_HIDS_EXT_REPORT_VAL
  HID External Report Descriptor UUID value.

BT_UUID_HIDS_EXT_REPORT
  HID External Report Descriptor.

BT_UUID_HIDS_REPORT_REF_VAL
  HID Report Reference Descriptor UUID value.
BT_UUID_HIDS_REPORT_REF
HID Report Reference Descriptor.

BT_UUID_VAL_TRIGGER_SETTING_VAL
Value Trigger Setting Descriptor UUID value.

BT_UUID_VAL_TRIGGER_SETTING
Value Trigger Setting Descriptor.

BT_UUID_ES_CONFIGURATION_VAL
Environmental Sensing Configuration Descriptor UUID value.

BT_UUID_ES_CONFIGURATION
Environmental Sensing Configuration Descriptor.

BT_UUID_ES_MEASUREMENT_VAL
Environmental Sensing Measurement Descriptor UUID value.

BT_UUID_ES_MEASUREMENT
Environmental Sensing Measurement Descriptor.

BT_UUID_ES_TRIGGER_SETTING_VAL
Environmental Sensing Trigger Setting Descriptor UUID value.

BT_UUID_ES_TRIGGER_SETTING
Environmental Sensing Trigger Setting Descriptor.

BT_UUID_TM_TRIGGER_SETTING_VAL
Time Trigger Setting Descriptor UUID value.

BT_UUID_TM_TRIGGER_SETTING
Time Trigger Setting Descriptor.

BT_UUID_GAP_DEVICE_NAME_VAL
GAP Characteristic Device Name UUID value.

BT_UUID_GAP_DEVICE_NAME
GAP Characteristic Device Name.

BT_UUID_GAP_APPEARANCE_VAL
GAP Characteristic Appearance UUID value.

BT_UUID_GAP_APPEARANCE
GAP Characteristic Appearance.

BT_UUID_GAP_PPF_VAL
GAP Characteristic Peripheal Privacy Flag UUID value.
BT_UUID_GAP_PPF
  GAP Characteristic Peripheral Privacy Flag.

BT_UUID_GAP_RA_VAL
  GAP Characteristic Reconnection Address UUID value.

BT_UUID_GAP_RA
  GAP Characteristic Reconnection Address.

BT_UUID_GAP_PPCP_VAL
  GAP Characteristic Peripheral Preferred Connection Parameters UUID value.

BT_UUID_GAP_PPCP
  GAP Characteristic Peripheral Preferred Connection Parameters.

BT_UUID_GATT_SC_VAL
  GATT Characteristic Service Changed UUID value.

BT_UUID_GATT_SC
  GATT Characteristic Service Changed.

BT_UUID_ALERT_LEVEL_VAL
  GATT Characteristic Alert Level UUID value.

BT_UUID_ALERT_LEVEL
  GATT Characteristic Alert Level.

BT_UUID_TPS_TX_POWER_LEVEL_VAL
  TPS Characteristic Tx Power Level UUID value.

BT_UUID_TPS_TX_POWER_LEVEL
  TPS Characteristic Tx Power Level.

BT_UUID_GATT_DT_VAL
  GATT Characteristic Date Time UUID value.

BT_UUID_GATT_DT
  GATT Characteristic Date Time.

BT_UUID_GATT_DW_VAL
  GATT Characteristic Day of Week UUID value.

BT_UUID_GATT_DW
  GATT Characteristic Day of Week.

BT_UUID_GATT_DDT_VAL
  GATT Characteristic Day Date Time UUID value.
BT_UUID_GATT_DDT
  GATT Characteristic Day Date Time.

BT_UUID_GATT_ET256_VAL
  GATT Characteristic Exact Time 256 UUID value.

BT_UUID_GATT_ET256
  GATT Characteristic Exact Time 256.

BT_UUID_GATT_DST_VAL
  GATT Characteristic DST Offset UUID value.

BT_UUID_GATT_DST
  GATT Characteristic DST Offset.

BT_UUID_GATT_TZ_VAL
  GATT Characteristic Time Zone UUID value.

BT_UUID_GATT_TZ
  GATT Characteristic Time Zone.

BT_UUID_GATT_LTI_VAL
  GATT Characteristic Local Time Information UUID value.

BT_UUID_GATT_LTI
  GATT Characteristic Local Time Information.

BT_UUID_GATT_TDST_VAL
  GATT Characteristic Time with DST UUID value.

BT_UUID_GATT_TDST
  GATT Characteristic Time with DST.

BT_UUID_GATT_TA_VAL
  GATT Characteristic Time Accuracy UUID value.

BT_UUID_GATT_TA
  GATT Characteristic Time Accuracy.

BT_UUID_GATT_TS_VAL
  GATT Characteristic Time Source UUID value.

BT_UUID_GATT_TS
  GATT Characteristic Time Source.

BT_UUID_GATT_RTI_VAL
  GATT Characteristic Reference Time Information UUID value.
BT_UUID_GATT_RTI
GATT Characteristic Reference Time Information.

BT_UUID_GATT_TUCP_VAL
GATT Characteristic Time Update Control Point UUID value.

BT_UUID_GATT_TUCP
GATT Characteristic Time Update Control Point.

BT_UUID_GATT_TUS_VAL
GATT Characteristic Time Update State UUID value.

BT_UUID_GATT_TUS
GATT Characteristic Time Update State.

BT_UUID_GATT_GM_VAL
GATT Characteristic Glucose Measurement UUID value.

BT_UUID_GATT_GM
GATT Characteristic Glucose Measurement.

BT_UUID_BAS_BATTERY_LEVEL_VAL
BAS Characteristic Battery Level UUID value.

BT_UUID_BAS_BATTERY_LEVEL
BAS Characteristic Battery Level.

BT_UUID_BAS_BATTERY_POWER_STATE_VAL
BAS Characteristic Battery Power State UUID value.

BT_UUID_BAS_BATTERY_POWER_STATE
BAS Characteristic Battery Power State.

BT_UUID_BAS_BATTERY_LEVEL_STATE_VAL
BAS Characteristic Battery Level State UUID value.

BT_UUID_BAS_BATTERY_LEVEL_STATE
BAS Characteristic Battery Level State.

BT_UUID_HTS_MEASUREMENT_VAL
HTS Characteristic Temperature Measurement UUID value.

BT_UUID_HTS_MEASUREMENT
HTS Characteristic Temperature Measurement Value.

BT_UUID_HTS_TEMP_TYP_VAL
HTS Characteristic Temperature Type UUID value.
BT_UUID_HTS_TEMP_TYP
   HTS Characteristic Temperature Type.

BT_UUID_HTS_TEMP_INT_VAL
   HTS Characteristic Intermediate Temperature UUID value.

BT_UUID_HTS_TEMP_INT
   HTS Characteristic Intermediate Temperature.

BT_UUID_HTS_TEMP_C_VAL
   HTS Characteristic Temperature Celsius UUID value.

BT_UUID_HTS_TEMP_C
   HTS Characteristic Temperature Celsius.

BT_UUID_HTS_TEMP_F_VAL
   HTS Characteristic Temperature Fahrenheit UUID value.

BT_UUID_HTS_TEMP_F
   HTS Characteristic Temperature Fahrenheit.

BT_UUID_HTS_INTERVAL_VAL
   HTS Characteristic Measurement Interval UUID value.

BT_UUID_HTS_INTERVAL
   HTS Characteristic Measurement Interval.

BT_UUID_HIDS_BOOT_KB_IN_REPORT_VAL
   HID Characteristic Boot Keyboard Input Report UUID value.

BT_UUID_HIDS_BOOT_KB_IN_REPORT
   HID Characteristic Boot Keyboard Input Report.

BT_UUID_DIS_SYSTEM_ID_VAL
   DIS Characteristic System ID UUID value.

BT_UUID_DIS_SYSTEM_ID
   DIS Characteristic System ID.

BT_UUID_DIS_MODEL_NUMBER_VAL
   DIS Characteristic Model Number String UUID value.

BT_UUID_DIS_MODEL_NUMBER
   DIS Characteristic Model Number String.

BT_UUID_DIS_SERIAL_NUMBER_VAL
   DIS Characteristic Serial Number String UUID value.
BT_UUID_DIS_SERIAL_NUMBER
  DIS Characteristic Serial Number String.

BT_UUID_DIS_FIRMWARE_REVISION_VAL
  DIS Characteristic Firmware Revision String UUID value.

BT_UUID_DIS_FIRMWARE_REVISION
  DIS Characteristic Firmware Revision String.

BT_UUID_DIS_HARDWARE_REVISION_VAL
  DIS Characteristic Hardware Revision String UUID value.

BT_UUID_DIS_HARDWARE_REVISION
  DIS Characteristic Hardware Revision String.

BT_UUID_DIS_SOFTWARE_REVISION_VAL
  DIS Characteristic Software Revision String UUID value.

BT_UUID_DIS_SOFTWARE_REVISION
  DIS Characteristic Software Revision String.

BT_UUID_DIS_MANUFACTURER_NAME_VAL
  DIS Characteristic Manufacturer Name String UUID Value.

BT_UUID_DIS_MANUFACTURER_NAME
  DIS Characteristic Manufacturer Name String.

BT_UUID_GATT_IEEE_RCDL_VAL
  GATT Characteristic IEEE Regulatory Certification Data List UUID Value.

BT_UUID_GATT_IEEE_RCDL
  GATT Characteristic IEEE Regulatory Certification Data List.

BT_UUID_CTS_CURRENT_TIME_VAL
  CTS Characteristic Current Time UUID value.

BT_UUID_CTS_CURRENT_TIME
  CTS Characteristic Current Time.

BT_UUID_MAGN_DECLINATION_VAL
  Magnetic Declination Characteristic UUID value.

BT_UUID_MAGN_DECLINATION
  Magnetic Declination Characteristic.

BT_UUID_GATT_LLAT_VAL
  GATT Characteristic Legacy Latitude UUID Value.
BT_UUID_GATT_LLAT
GATT Characteristic Legacy Latitude.

BT_UUID_GATT_LLON_VAL
GATT Characteristic Legacy Longitude UUID Value.

BT_UUID_GATT_LLON
GATT Characteristic Legacy Longitude.

BT_UUID_GATT_POS_2D_VAL
GATT Characteristic Position 2D UUID Value.

BT_UUID_GATT_POS_2D
GATT Characteristic Position 2D.

BT_UUID_GATT_POS_3D_VAL
GATT Characteristic Position 3D UUID Value.

BT_UUID_GATT_POS_3D
GATT Characteristic Position 3D.

BT_UUID_GATT_SR_VAL
GATT Characteristic Scan Refresh UUID Value.

BT_UUID_GATT_SR
GATT Characteristic Scan Refresh.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT_VAL
HID Boot Keyboard Output Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT
HID Boot Keyboard Output Report Characteristic.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT_VAL
HID Boot Mouse Input Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT
HID Boot Mouse Input Report Characteristic.

BT_UUID_GATT_GMC_VAL
GATT Characteristic Glucose Measurement Context UUID Value.

BT_UUID_GATT_GMC
GATT Characteristic Glucose Measurement Context.

BT_UUID_GATT_BPM_VAL
GATT Characteristic Blood Pressure Measurement UUID Value.
BT_UUID_GATT_BPM
GATT Characteristic Blood Pressure Measurement.

BT_UUID_GATT_ICP_VAL
GATT Characteristic Intermediate Cuff Pressure UUID Value.

BT_UUID_GATT_ICP
GATT Characteristic Intermediate Cuff Pressure.

BT_UUID_HRS_MEASUREMENT_VAL
HRS Characteristic Measurement Interval UUID value.

BT_UUID_HRS_MEASUREMENT
HRS Characteristic Measurement Interval.

BT_UUID_HRS_BODY_SENSOR_VAL
HRS Characteristic Body Sensor Location.

BT_UUID_HRS_BODY_SENSOR
HRS Characteristic Control Point.

BT_UUID_HRS_CONTROL_POINT_VAL
HRS Characteristic Control Point UUID value.

BT_UUID_HRS_CONTROL_POINT
HRS Characteristic Control Point.

BT_UUID_GATT_REM_VAL
GATT Characteristic Removable UUID Value.

BT_UUID_GATT_REM
GATT Characteristic Removable.

BT_UUID_GATT_SRVREQ_VAL
GATT Characteristic Service Required UUID Value.

BT_UUID_GATT_SRVREQ
GATT Characteristic Service Required.

BT_UUID_GATT_SC_TEMP_C_VAL
GATT Characteristic Scientific Temperature in Celsius UUID Value.

BT_UUID_GATT_SC_TEMP_C
GATT Characteristic Scientific Temperature in Celsius.

BT_UUID_GATT_STRING_VAL
GATT Characteristic String UUID Value.
BT_UUID_GATT_STRING
  GATT Characteristic String.

BT_UUID_GATT_NETA_VAL
  GATT Characteristic Network Availability UUID Value.

BT_UUID_GATT_NETA
  GATT Characteristic Network Availability.

BT_UUID_GATT_ALRTS_VAL
  GATT Characteristic Alert Status UUID Value.

BT_UUID_GATT_ALRTS
  GATT Characteristic Alert Status.

BT_UUID_GATT_RCP_VAL
  GATT Characteristic Ringer Control Point UUID Value.

BT_UUID_GATT_RCP
  GATT Characteristic Ringer Control Point.

BT_UUID_GATT_RS_VAL
  GATT Characteristic Ringer Setting UUID Value.

BT_UUID_GATT_RS
  GATT Characteristic Ringer Setting.

BT_UUID_GATT_ALRTCID_MASK_VAL
  GATT Characteristic Alert Category ID Bit Mask UUID Value.

BT_UUID_GATT_ALRTCID_MASK
  GATT Characteristic Alert Category ID Bit Mask.

BT_UUID_GATT_ALRTCID_VAL
  GATT Characteristic Alert Category ID UUID Value.

BT_UUID_GATT_ALRTCID
  GATT Characteristic Alert Category ID.

BT_UUID_GATT_ALRTNCP_VAL
  GATT Characteristic Alert Notification Control Point Value.

BT_UUID_GATT_ALRTNCP
  GATT Characteristic Alert Notification Control Point.

BT_UUID_GATT_UALRTS_VAL
  GATT Characteristic Unread Alert Status UUID Value.
BT_UUID_GATT_UALRTS
GATT Characteristic Unread Alert Status.

BT_UUID_GATT_NALRT_VAL
GATT Characteristic New Alert UUID Value.

BT_UUID_GATT_NALRT
GATT Characteristic New Alert.

BT_UUID_GATT_SNALRTC_VAL
GATT Characteristic Supported New Alert Category UUID Value.

BT_UUID_GATT_SNALRTC
GATT Characteristic Supported New Alert Category.

BT_UUID_GATT_SUALRTC_VAL
GATT Characteristic Supported Unread Alert Category UUID Value.

BT_UUID_GATT_SUALRTC
GATT Characteristic Supported Unread Alert Category.

BT_UUID_GATT_BPF_VAL
GATT Characteristic Blood Pressure Feature UUID Value.

BT_UUID_GATT_BPF
GATT Characteristic Blood Pressure Feature.

BT_UUID_HIDS_INFO_VAL
HID Information Characteristic UUID value.

BT_UUID_HIDS_INFO
HID Information Characteristic.

BT_UUID_HIDS_REPORT_MAP_VAL
HID Report Map Characteristic UUID value.

BT_UUID_HIDS_REPORT_MAP
HID Report Map Characteristic.

BT_UUID_HIDS_CTRL_POINT_VAL
HID Control Point Characteristic UUID value.

BT_UUID_HIDS_CTRL_POINT
HID Control Point Characteristic.

BT_UUID_HIDS_REPORT_VAL
HID Report Characteristic UUID value.
BT_UUID_HIDS_REPORT
    HID Report Characteristic.

BT_UUID_HIDS_PROTOCOL_MODE_VAL
    HID Protocol Mode Characteristic UUID value.

BT_UUID_HIDS_PROTOCOL_MODE
    HID Protocol Mode Characteristic.

BT_UUID_GATT_SIW_VAL
    GATT Characteristic Scan Interval Windows UUID Value.

BT_UUID_GATT_SIW
    GATT Characteristic Scan Interval Windows.

BT_UUID_DIS_PNP_ID_VAL
    DIS Characteristic PnP ID UUID value.

BT_UUID_DIS_PNP_ID
    DIS Characteristic PnP ID.

BT_UUID_GATT_GF_VAL
    GATT Characteristic Glucose Feature UUID Value.

BT_UUID_GATT_GF
    GATT Characteristic Glucose Feature.

BT_UUID_RECORD_ACCESS_CONTROL_POINT_VAL
    Record Access Control Point Characteristic value.

BT_UUID_RECORD_ACCESS_CONTROL_POINT
    Record Access Control Point.

BT_UUID_RSC_MEASUREMENT_VAL
    RSC Measurement Characteristic UUID value.

BT_UUID_RSC_MEASUREMENT
    RSC Measurement Characteristic.

BT_UUID_RSC_FEATURE_VAL
    RSC Feature Characteristic UUID value.

BT_UUID_RSC_FEATURE
    RSC Feature Characteristic.

BT_UUID_SC_CONTROL_POINT_VAL
    SC Control Point Characteristic UUID value.
BT_UUID_SC_CONTROL_POINT
SC Control Point Characteristic.

BT_UUID_GATT_DI_VAL
GATT Characteristic Digital Input UUID Value.

BT_UUID_GATT_DI
GATT Characteristic Digital Input.

BT_UUID_GATT_DO_VAL
GATT Characteristic Digital Output UUID Value.

BT_UUID_GATT_DO
GATT Characteristic Digital Output.

BT_UUID_GATT_AI_VAL
GATT Characteristic Analog Input UUID Value.

BT_UUID_GATT_AI
GATT Characteristic Analog Input.

BT_UUID_GATT_AO_VAL
GATT Characteristic Analog Output UUID Value.

BT_UUID_GATT_AO
GATT Characteristic Analog Output.

BT_UUID_GATT_AGGR_VAL
GATT Characteristic Aggregate UUID Value.

BT_UUID_GATT_AGGR
GATT Characteristic Aggregate.

BT_UUID_CSC_MEASUREMENT_VAL
CSC Measurement Characteristic UUID value.

BT_UUID_CSC_MEASUREMENT
CSC Measurement Characteristic.

BT_UUID_CSC_FEATURE_VAL
CSC Feature Characteristic UUID value.

BT_UUID_CSC_FEATURE
CSC Feature Characteristic.

BT_UUID_SENSOR_LOCATION_VAL
Sensor Location Characteristic UUID value.
**BT_UUID_SENSOR_LOCATION**
Sensor Location Characteristic.

**BT_UUID_GATT_PLX_SCM_VAL**
GATT Characteristic PLX Spot-Check Measurement UUID Value.

**BT_UUID_GATT_PLX_SCM**
GATT Characteristic PLX Spot-Check Measurement.

**BT_UUID_GATT_PLX_CM_VAL**
GATT Characteristic PLX Continuous Measurement UUID Value.

**BT_UUID_GATT_PLX_CM**
GATT Characteristic PLX Continuous Measurement.

**BT_UUID_GATT_PLX_F_VAL**
GATT Characteristic PLX Features UUID Value.

**BT_UUID_GATT_PLX_F**
GATT Characteristic PLX Features.

**BT_UUID_GATT_POPE_VAL**
GATT Characteristic Pulse Oximetry Pulastile Event UUID Value.

**BT_UUID_GATT_POPE**
GATT Characteristic Pulse Oximetry Pulsatile Event.

**BT_UUID_GATT_POCP_VAL**
GATT Characteristic Pulse Oximetry Control Point UUID Value.

**BT_UUID_GATT_POCP**
GATT Characteristic Pulse Oximetry Control Point.

**BT_UUID_GATT_CPS_CPM_VAL**
GATT Characteristic Cycling Power Measurement UUID Value.

**BT_UUID_GATT_CPS_CPM**
GATT Characteristic Cycling Power Measurement.

**BT_UUID_GATT_CPS_CPV_VAL**
GATT Characteristic Cycling Power Vector UUID Value.

**BT_UUID_GATT_CPS_CPV**
GATT Characteristic Cycling Power Vector.

**BT_UUID_GATT_CPS_CPF_VAL**
GATT Characteristic Cycling Power Feature UUID Value.
BT_UUID_GATT_CPS_CPF
GATT Characteristic Cycling Power Feature.

BT_UUID_GATT_CPS_CPCP_VAL
GATT Characteristic Cycling Power Control Point UUID Value.

BT_UUID_GATT_CPS_CPCP
GATT Characteristic Cycling Power Control Point.

BT_UUID_GATT_LOC_SPD_VAL
GATT Characteristic Location and Speed UUID Value.

BT_UUID_GATT_LOC_SPD
GATT Characteristic Location and Speed.

BT_UUID_GATT_NAV_VAL
GATT Characteristic Navigation UUID Value.

BT_UUID_GATT_NAV
GATT Characteristic Navigation.

BT_UUID_GATT_PQ_VAL
GATT Characteristic Position Quality UUID Value.

BT_UUID_GATT_PQ
GATT Characteristic Position Quality.

BT_UUID_GATT_LNF_VAL
GATT Characteristic LN Feature UUID Value.

BT_UUID_GATT_LNF
GATT Characteristic LN Feature.

BT_UUID_GATT_LNCP_VAL
GATT Characteristic LN Control Point UUID Value.

BT_UUID_GATT_LNCP
GATT Characteristic LN Control Point.

BT_UUID_ELEVATION_VAL
Elevation Characteristic UUID value.

BT_UUID_ELEVATION
Elevation Characteristic.

BT_UUID_PRESSURE_VAL
Pressure Characteristic UUID value.
BT_UUID_PRESSURE
   Pressure Characteristic.

BT_UUID_TEMPERATURE_VAL
   Temperature Characteristic UUID value.

BT_UUID_TEMPERATURE
   Temperature Characteristic.

BT_UUID_HUMIDITY_VAL
   Humidity Characteristic UUID value.

BT_UUID_HUMIDITY
   Humidity Characteristic.

BT_UUID_TRUE_WIND_SPEED_VAL
   True Wind Speed Characteristic UUID value.

BT_UUID_TRUE_WIND_SPEED
   True Wind Speed Characteristic.

BT_UUID_TRUE_WIND_DIR_VAL
   True Wind Direction Characteristic UUID value.

BT_UUID_TRUE_WIND_DIR
   True Wind Direction Characteristic.

BT_UUID_APPARENT_WIND_SPEED_VAL
   Apparent Wind Speed Characteristic UUID value.

BT_UUID_APPARENT_WIND_SPEED
   Apparent Wind Speed Characteristic.

BT_UUID_APPARENT_WIND_DIR_VAL
   Apparent Wind Direction Characteristic UUID value.

BT_UUID_APPARENT_WIND_DIR
   Apparent Wind Direction Characteristic.

BT_UUID_GUST_FACTOR_VAL
   Gust Factor Characteristic UUID value.

BT_UUID_GUST_FACTOR
   Gust Factor Characteristic.

BT_UUID_POLLEN_CONCENTRATION_VAL
   Pollen Concentration Characteristic UUID value.
BT_UUID_POLLEN_CONCENTRATION
Pollen Concentration Characteristic.

BT_UUID_UV_INDEX_VAL
UV Index Characteristic UUID value.

BT_UUID_UV_INDEX
UV Index Characteristic.

BT_UUID_IRRADIANCE_VAL
Irradiance Characteristic UUID value.

BT_UUID_IRRADIANCE
Irradiance Characteristic.

BT_UUID_RAINFALL_VAL
Rainfall Characteristic UUID value.

BT_UUID_RAINFALL
Rainfall Characteristic.

BT_UUID_WIND_CHILL_VAL
Wind Chill Characteristic UUID value.

BT_UUID_WIND_CHILL
Wind Chill Characteristic.

BT_UUID_HEAT_INDEX_VAL
Heat Index Characteristic UUID value.

BT_UUID_HEAT_INDEX
Heat Index Characteristic.

BT_UUID_DEW_POINT_VAL
Dew Point Characteristic UUID value.

BT_UUID_DEW_POINT
Dew Point Characteristic.

BT_UUID_GATT_TREND_VAL
GATT Characteristic Trend UUID Value.

BT_UUID_GATT_TREND
GATT Characteristic Trend.

BT_UUID_DESC_VALUE_CHANGED_VAL
Descriptor Value Changed Characteristic UUID value.
Descriptor Value Changed Characteristic.

GATT Characteristic Aerobic Heart Rate Low Limit UUID Value.

GATT Characteristic Aerobic Heart Rate Lower Limit.

GATT Characteristic Aerobic Threshold UUID Value.

GATT Characteristic Aerobic Threshold.

GATT Characteristic Age UUID Value.

GATT Characteristic Age.

GATT Characteristic Anaerobic Heart Rate Low Limit UUID Value.

GATT Characteristic Anaerobic Heart Rate Lower Limit.

GATT Characteristic Anaerobic Heart Rate Upper Limit UUID Value.

GATT Characteristic Anaerobic Heart Rate Upper Limit.

GATT Characteristic Anaerobic Threshold UUID Value.

GATT Characteristic Anaerobic Threshold.

GATT Characteristic Aerobic Heart Rate Upper Limit UUID Value.

GATT Characteristic Aerobic Heart Rate Upper Limit.

GATT Characteristic Date of Birth UUID Value.
BT_UUID_GATT_DATE_BIRTH
GATT Characteristic Date of Birth.

BT_UUID_GATT_DATE_THRASS_VAL
GATT Characteristic Date of Threshold Assessment UUID Value.

BT_UUID_GATT_DATE_THRASS
GATT Characteristic Date of Threshold Assessment.

BT_UUID_GATT_EMAIL_VAL
GATT Characteristic Email Address UUID Value.

BT_UUID_GATT_EMAIL
GATT Characteristic Email Address.

BT_UUID_GATT_FBHRLL_VAL
GATT Characteristic Fat Burn Heart Rate Lower Limit UUID Value.

BT_UUID_GATT_FBHRLL
GATT Characteristic Fat Burn Heart Rate Lower Limit.

BT_UUID_GATT_FBHRUL_VAL
GATT Characteristic Fat Burn Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_FBHRUL
GATT Characteristic Fat Burn Heart Rate Upper Limit.

BT_UUID_GATT_FIRST_NAME_VAL
GATT Characteristic First Name UUID Value.

BT_UUID_GATT_FIRST_NAME
GATT Characteristic First Name.

BT_UUID_GATT_5ZHRL_VAL
GATT Characteristic Five Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_5ZHRL
GATT Characteristic Five Zone Heart Rate Limits.

BT_UUID_GATT_GENDER_VAL
GATT Characteristic Gender UUID Value.

BT_UUID_GATT_GENDER
GATT Characteristic Gender.

BT_UUID_GATT_HR_MAX_VAL
GATT Characteristic Heart Rate Max UUID Value.
BT_UUID_GATT_HR_MAX
GATT Characteristic Heart Rate Max.

BT_UUID_GATT_HEIGHT_VAL
GATT Characteristic Height UUID Value.

BT_UUID_GATT_HEIGHT
GATT Characteristic Height.

BT_UUID_GATT_HC_VAL
GATT Characteristic Hip Circumference UUID Value.

BT_UUID_GATT_HC
GATT Characteristic Hip Circumference.

BT_UUID_GATT_LAST_NAME_VAL
GATT Characteristic Last Name UUID Value.

BT_UUID_GATT_LAST_NAME
GATT Characteristic Last Name.

BT_UUID_GATT_MRHR_VAL
GATT Characteristic Maximum Recommended Heart Rate> UUID Value.

BT_UUID_GATT_MRHR
GATT Characteristic Maximum Recommended Heart Rate.

BT_UUID_GATT_RHR_VAL
GATT Characteristic Resting Heart Rate UUID Value.

BT_UUID_GATT_RHR
GATT Characteristic Resting Heart Rate.

BT_UUID_GATT_AEANTHR_VAL
GATT Characteristic Sport Type for Aerobic and Anaerobic Thresholds UUID Value.

BT_UUID_GATT_AEANTHR
GATT Characteristic Sport Type for Aerobic and Anaerobic Threshold.

BT_UUID_GATT_3ZHRL_VAL
GATT Characteristic Three Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_3ZHRL
GATT Characteristic Three Zone Heart Rate Limits.

BT_UUID_GATT_2ZHRL_VAL
GATT Characteristic Two Zone Heart Rate Limits UUID Value.
BT_UUID_GATT_2ZHRL
GATT Characteristic Two Zone Heart Rate Limits.

BT_UUID_GATT_VO2_MAX_VAL
GATT Characteristic VO2 Max UUID Value.

BT_UUID_GATT_VO2_MAX
GATT Characteristic VO2 Max.

BT_UUID_GATT_WC_VAL
GATT Characteristic Waist Circumference UUID Value.

BT_UUID_GATT_WC
GATT Characteristic Waist Circumference.

BT_UUID_GATT_WEIGHT_VAL
GATT Characteristic Weight UUID Value.

BT_UUID_GATT_WEIGHT
GATT Characteristic Weight.

BT_UUID_GATT_DBCHINC_VAL
GATT Characteristic Database Change Increment UUID Value.

BT_UUID_GATT_DBCHINC
GATT Characteristic Database Change Increment.

BT_UUID_GATT_USRIDX_VAL
GATT Characteristic User Index UUID Value.

BT_UUID_GATT_USRIDX
GATT Characteristic User Index.

BT_UUID_GATT_BCF_VAL
GATT Characteristic Body Composition Feature UUID Value.

BT_UUID_GATT_BCF
GATT Characteristic Body Composition Feature.

BT_UUID_GATT_BCM_VAL
GATT Characteristic Body Composition Measurement UUID Value.

BT_UUID_GATT_BCM
GATT Characteristic Body Composition Measurement.

BT_UUID_GATT_WM_VAL
GATT Characteristic Weight Measurement UUID Value.
BT_UUID_GATT_WM
   GATT Characteristic Weight Measurement.

BT_UUID_GATT_WSF_VAL
   GATT Characteristic Weight Scale Feature UUID Value.

BT_UUID_GATT_WSF
   GATT Characteristic Weight Scale Feature.

BT_UUID_GATT_USRCP_VAL
   GATT Characteristic User Control Point UUID Value.

BT_UUID_GATT_USRCP
   GATT Characteristic User Control Point.

BT_UUID_MAGN_FLUX_DENSITY_2D_VAL
   Magnetic Flux Density - 2D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_2D
   Magnetic Flux Density - 2D Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_3D_VAL
   Magnetic Flux Density - 3D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_3D
   Magnetic Flux Density - 3D Characteristic.

BT_UUID_GATT_LANG_VAL
   GATT Characteristic Language UUID Value.

BT_UUID_GATT_LANG
   GATT Characteristic Language.

BT_UUID_BAR_PRESSURE_TREND_VAL
   Barometric Pressure Trend Characteristic UUID value.

BT_UUID_BAR_PRESSURE_TREND
   Barometric Pressure Trend Characteristic.

BT_UUID_BMS_CONTROL_POINT_VAL
   Bond Management Control Point UUID value.

BT_UUID_BMS_CONTROL_POINT
   Bond Management Control Point.

BT_UUID_BMS_FEATURE_VAL
   Bond Management Feature UUID value.
BT_UUID_BMS_FEATURE
Bond Management Feature.

BT_UUID_CENTRAL_ADDR_RES_VAL
Central Address Resolution Characteristic UUID value.

BT_UUID_CENTRAL_ADDR_RES
Central Address Resolution Characteristic.

BT_UUID_CGM_MEASUREMENT_VAL
CGM Measurement Characteristic value.

BT_UUID_CGM_MEASUREMENT
CGM Measurement Characteristic.

BT_UUID_CGM_FEATURE_VAL
CGM Feature Characteristic value.

BT_UUID_CGM_FEATURE
CGM Feature Characteristic.

BT_UUID_CGM_STATUS_VAL
CGM Status Characteristic value.

BT_UUID_CGM_STATUS
CGM Status Characteristic.

BT_UUID_CGM_SESSION_START_TIME_VAL
CGM Session Start Time Characteristic value.

BT_UUID_CGM_SESSION_START_TIME
CGM Session Start Time.

BT_UUID_CGM_SESSION_RUN_TIME_VAL
CGM Session Run Time Characteristic value.

BT_UUID_CGM_SESSION_RUN_TIME
CGM Session Run Time.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT_VAL
CGM Specific Ops Control Point Characteristic value.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT
CGM Specific Ops Control Point.

BT_UUID_GATT_IPC_VAL
GATT Characteristic Indoor Positioning Configuration UUID Value.
BT_UUID_GATT_IPC
GATT Characteristic Indoor Positioning Configuration.

BT_UUID_GATT_LAT_VAL
GATT Characteristic Latitude UUID Value.

BT_UUID_GATT_LAT
GATT Characteristic Latitude.

BT_UUID_GATT_LON_VAL
GATT Characteristic Longitude UUID Value.

BT_UUID_GATT_LON
GATT Characteristic Longitude.

BT_UUID_GATT_LNCOORD_VAL
GATT Characteristic Local North Coordinate UUID Value.

BT_UUID_GATT_LNCOORD
GATT Characteristic Local North Coordinate.

BT_UUID_GATT_LECOORD_VAL
GATT Characteristic Local East Coordinate UUID Value.

BT_UUID_GATT_LECOORD
GATT Characteristic Local East Coordinate.

BT_UUID_GATT_FN_VAL
GATT Characteristic Floor Number UUID Value.

BT_UUID_GATT_FN
GATT Characteristic Floor Number.

BT_UUID_GATT_ALT_VAL
GATT Characteristic Altitude UUID Value.

BT_UUID_GATT_ALT
GATT Characteristic Altitude.

BT_UUID_GATT_UNCERTAINTY_VAL
GATT Characteristic Uncertainty UUID Value.

BT_UUID_GATT_UNCERTAINTY
GATT Characteristic Uncertainty.

BT_UUID_GATT_LOC_NAME_VAL
GATT Characteristic Location Name UUID Value.
BT_UUID_GATT_LOC_NAME
GATT Characteristic Location Name.

BT_UUID_URI_VAL
URI UUID value.

BT_UUID_URI
URI.

BT_UUID_HTTP_HEADERS_VAL
HTTP Headers UUID value.

BT_UUID_HTTP_HEADERS
HTTP Headers.

BT_UUID_HTTP_STATUS_CODE_VAL
HTTP Status Code UUID value.

BT_UUID_HTTP_STATUS_CODE
HTTP Status Code.

BT_UUID_HTTP_ENTITY_BODY_VAL
HTTP Entity Body UUID value.

BT_UUID_HTTP_ENTITY_BODY
HTTP Entity Body.

BT_UUID_HTTP_CONTROL_POINT_VAL
HTTP Control Point UUID value.

BT_UUID_HTTP_CONTROL_POINT
HTTP Control Point.

BT_UUID_HTTPS_SECURITY_VAL
HTTPS Security UUID value.

BT_UUID_HTTPS_SECURITY
HTTPS Security.

BT_UUID_GATT_TDS_CP_VAL
GATT Characteristic TDS Control Point UUID Value.

BT_UUID_GATT_TDS_CP
GATT Characteristic TDS Control Point.

BT_UUID_OTS_FEATURE_VAL
OTS Feature Characteristic UUID value.
6.1. Bluetooth

**BT_UUID_OTS_FEATURE**
OTS Feature Characteristic.

**BT_UUID_OTS_NAME_VAL**
OTS Object Name Characteristic UUID value.

**BT_UUID_OTS_NAME**
OTS Object Name Characteristic.

**BT_UUID_OTS_TYPE_VAL**
OTS Object Type Characteristic UUID value.

**BT_UUID_OTS_TYPE**
OTS Object Type Characteristic.

**BT_UUID_OTS_SIZE_VAL**
OTS Object Size Characteristic UUID value.

**BT_UUID_OTS_SIZE**
OTS Object Size Characteristic.

**BT_UUID_OTS_FIRST_CREATED_VAL**
OTS Object First-Created Characteristic UUID value.

**BT_UUID_OTS_FIRST_CREATED**
OTS Object First-Created Characteristic.

**BT_UUID_OTS_LAST_MODIFIED_VAL**
OTS Object Last-Modified Characteristic UUID value.

**BT_UUID_OTS_LAST_MODIFIED**
OTS Object Last-Modified Characteristic.

**BT_UUID_OTS_ID_VAL**
OTS Object ID Characteristic UUID value.

**BT_UUID_OTS_ID**
OTS Object ID Characteristic.

**BT_UUID_OTS_PROPERTIES_VAL**
OTS Object Properties Characteristic UUID value.

**BT_UUID_OTS_PROPERTIES**
OTS Object Properties Characteristic.

**BT_UUID_OTS_ACTION_CP_VAL**
OTS Object Action Control Point Characteristic UUID value.
BT_UUID_OTS_ACTION_CP
OTS Object Action Control Point Characteristic.

BT_UUID_OTS_LIST_CP_VAL
OTS Object List Control Point Characteristic UUID value.

BT_UUID_OTS_LIST_CP
OTS Object List Control Point Characteristic.

BT_UUID_OTS_LIST_FILTER_VAL
OTS Object List Filter Characteristic UUID value.

BT_UUID_OTS_LIST_FILTER
OTS Object List Filter Characteristic.

BT_UUID_OTS_CHANGED_VAL
OTS Object Changed Characteristic UUID value.

BT_UUID_OTS_CHANGED
OTS Object Changed Characteristic.

BT_UUID_GATT_RPAO_VAL
GATT Characteristic Resolvable Private Address Only UUID Value.

BT_UUID_GATT_RPAO
GATT Characteristic Resolvable Private Address Only.

BT_UUID_OTS_TYPE_UNSPECIFIED_VAL
OTS Unspecified Object Type UUID value.

BT_UUID_OTS_TYPE_UNSPECIFIED
OTS Unspecified Object Type.

BT_UUID_OTS_DIRECTORY_LISTING_VAL
OTS Directory Listing UUID value.

BT_UUID_OTS_DIRECTORY_LISTING
OTS Directory Listing.

BT_UUID_GATT_FMF_VAL
GATT Characteristic Fitness Machine Feature UUID Value.

BT_UUID_GATT_FMF
GATT Characteristic Fitness Machine Feature.

BT_UUID_GATT_TD_VAL
GATT Characteristic Treadmill Data UUID Value.
BT_UUID_GATT_TD
  GATT Characteristic Treadmill Data.

BT_UUID_GATT_CTD_VAL
  GATT Characteristic Cross Trainer Data UUID Value.

BT_UUID_GATT_CTD
  GATT Characteristic Cross Trainer Data.

BT_UUID_GATT_STPCD_VAL
  GATT Characteristic Step Climber Data UUID Value.

BT_UUID_GATT_STPCD
  GATT Characteristic Step Climber Data.

BT_UUID_GATT_STRCD_VAL
  GATT Characteristic Stair Climber Data UUID Value.

BT_UUID_GATT_STRCD
  GATT Characteristic Stair Climber Data.

BT_UUID_GATT_RD_VAL
  GATT Characteristic Rower Data UUID Value.

BT_UUID_GATT_RD
  GATT Characteristic Rower Data.

BT_UUID_GATT_IBD_VAL
  GATT Characteristic Indoor Bike Data UUID Value.

BT_UUID_GATT_IBD
  GATT Characteristic Indoor Bike Data.

BT_UUID_GATT_TRSTAT_VAL
  GATT Characteristic Training Status UUID Value.

BT_UUID_GATT_TRSTAT
  GATT Characteristic Training Status.

BT_UUID_GATT_SSR_VAL
  GATT Characteristic Supported Speed Range UUID Value.

BT_UUID_GATT_SSR
  GATT Characteristic Supported Speed Range.

BT_UUID_GATT_SIR_VAL
  GATT Characteristic Supported Inclination Range UUID Value.
BT_UUID_GATT_SIR
    GATT Characteristic Supported Inclination Range.

BT_UUID_GATT_SRLR_VAL
    GATT Characteristic Supported Resistance Level Range UUID Value.

BT_UUID_GATT_SRLR
    GATT Characteristic Supported Resistance Level Range.

BT_UUID_GATT_SHRR_VAL
    GATT Characteristic Supported Heart Rate Range UUID Value.

BT_UUID_GATT_SHRR
    GATT Characteristic Supported Heart Rate Range.

BT_UUID_GATT_SPR_VAL
    GATT Characteristic Supported Power Range UUID Value.

BT_UUID_GATT_SPR
    GATT Characteristic Supported Power Range.

BT_UUID_GATT_FMCP_VAL
    GATT Characteristic Fitness Machine Control Point UUID Value.

BT_UUID_GATT_FMCP
    GATT Characteristic Fitness Machine Control Point.

BT_UUID_GATT_FMS_VAL
    GATT Characteristic Fitness Machine Status UUID Value.

BT_UUID_GATT_FMS
    GATT Characteristic Fitness Machine Status.

BT_UUID_MESH_PROV_DATA_IN_VAL
    Mesh Provisioning Data In UUID value.

BT_UUID_MESH_PROV_DATA_IN
    Mesh Provisioning Data In.

BT_UUID_MESH_PROV_DATA_OUT_VAL
    Mesh Provisioning Data Out UUID value.

BT_UUID_MESH_PROV_DATA_OUT
    Mesh Provisioning Data Out.

BT_UUID_MESH_PROXY_DATA_IN_VAL
    Mesh Proxy Data In UUID value.
Mesh Proxy Data In.

Mesh Proxy Data Out UUID value.

Mesh Proxy Data Out.

GATT Characteristic New Number Needed UUID Value.

GATT Characteristic New Number Needed.

GATT Characteristic Average Current UUID Value.

GATT Characteristic Average Current.

GATT Characteristic Average Voltage UUID Value.

GATT Characteristic Average Voltage.

GATT Characteristic Boolean UUID Value.

GATT Characteristic Boolean.

GATT Characteristic Chromatic Distance From Planckian UUID Value.

GATT Characteristic Chromatic Distance From Planckian.

GATT Characteristic Chromaticity Coordinates UUID Value.

GATT Characteristic Chromaticity Coordinates.

GATT Characteristic Chromaticity In CCT And Duv Values UUID Value.
BT_UUID_GATT_CRCCT
  GATT Characteristic Chromaticity In CCT And Duv Values.

BT_UUID_GATT_CRT_VAL
  GATT Characteristic Chromaticity Tolerance UUID Value.

BT_UUID_GATT_CRT
  GATT Characteristic Chromaticity Tolerance.

BT_UUID_GATT_CIEIDX_VAL
  GATT Characteristic CIE 13.3-1995 Color Rendering Index UUID Value.

BT_UUID_GATT_CIEIDX
  GATT Characteristic CIE 13.3-1995 Color Rendering Index.

BT_UUID_GATT_COEFFICIENT_VAL
  GATT Characteristic Coefficient UUID Value.

BT_UUID_GATT_COEFFICIENT
  GATT Characteristic Coefficient.

BT_UUID_GATT_CCTEMP_VAL
  GATT Characteristic Correlated Color Temperature UUID Value.

BT_UUID_GATT_CCTEMP
  GATT Characteristic Correlated Color Temperature.

BT_UUID_GATT_COUNT16_VAL
  GATT Characteristic Count 16 UUID Value.

BT_UUID_GATT_COUNT16
  GATT Characteristic Count 16.

BT_UUID_GATT_COUNT24_VAL
  GATT Characteristic Count 24 UUID Value.

BT_UUID_GATT_COUNT24
  GATT Characteristic Count 24.

BT_UUID_GATT_CNTRCODE_VAL
  GATT Characteristic Country Code UUID Value.

BT_UUID_GATT_CNTRCODE
  GATT Characteristic Country Code.

BT_UUID_GATT_DATEUTC_VAL
  GATT Characteristic Date UTC UUID Value.
BT_UUID_GATT_DATEUTC  
GATT Characteristic Date UTC.

BT_UUID_GATT_EC_VAL  
GATT Characteristic Electric Current UUID Value.

BT_UUID_GATT_EC  
GATT Characteristic Electric Current.

BT_UUID_GATT_ECR_VAL  
GATT Characteristic Electric Current Range UUID Value.

BT_UUID_GATT_ECR  
GATT Characteristic Electric Current Range.

BT_UUID_GATT_ECSPEC_VAL  
GATT Characteristic Electric Current Specification UUID Value.

BT_UUID_GATT_ECSPEC  

BT_UUID_GATT_ECSTAT_VAL  
GATT Characteristic Electric Current Statistics UUID Value.

BT_UUID_GATT_ECSTAT  
GATT Characteristic Electric Current Statistics.

BT_UUID_GATT_ENERGY_VAL  
GATT Characteristic Energy UUID Value.

BT_UUID_GATT_ENERGY  
GATT Characteristic Energy.

BT_UUID_GATT_EPOD_VAL  
GATT Characteristic Energy In A Period Of Day UUID Value.

BT_UUID_GATT_EPOD  
GATT Characteristic Energy In A Period Of Day.

BT_UUID_GATT_EVTSTAT_VAL  
GATT Characteristic Event Statistics UUID Value.

BT_UUID_GATT_EVTSTAT  
GATT Characteristic Event Statistics.

BT_UUID_GATT_FSTR16_VAL  
GATT Characteristic Fixed String 16 UUID Value.
BT_UUID_GATT_FSTR16
GATT Characteristic Fixed String 16.

BT_UUID_GATT_FSTR24_VAL
GATT Characteristic Fixed String 24 UUID Value.

BT_UUID_GATT_FSTR24
GATT Characteristic Fixed String 24.

BT_UUID_GATT_FSTR36_VAL
GATT Characteristic Fixed String 36 UUID Value.

BT_UUID_GATT_FSTR36
GATT Characteristic Fixed String 36.

BT_UUID_GATT_FSTR8_VAL
GATT Characteristic Fixed String 8 UUID Value.

BT_UUID_GATT_FSTR8
GATT Characteristic Fixed String 8.

BT_UUID_GATT_GENLVL_VAL
GATT Characteristic Generic Level UUID Value.

BT_UUID_GATT_GENLVL
GATT Characteristic Generic Level.

BT_UUID_GATT_GTIN_VAL
GATT Characteristic Global Trade Item Number UUID Value.

BT_UUID_GATT_GTIN
GATT Characteristic Global Trade Item Number.

BT_UUID_GATT_IILLUM_VAL
GATT Characteristic Illuminance UUID Value.

BT_UUID_GATT_IILLUM
GATT Characteristic Illuminance.

BT_UUID_GATT_LUMEFF_VAL
GATT Characteristic Luminous Efficacy UUID Value.

BT_UUID_GATT_LUMEFF
GATT Characteristic Luminous Efficacy.

BT_UUID_GATT_LUMNRG_VAL
GATT Characteristic Luminous Energy UUID Value.
BT_UUID_GATT_LUMNRG
   GATT Characteristic Luminous Energy.

BT_UUID_GATT_LUMEXP_VAL
   GATT Characteristic Luminous Exposure UUID Value.

BT_UUID_GATT_LUMEXP
   GATT Characteristic Luminous Exposure.

BT_UUID_GATT_LUMFLX_VAL
   GATT Characteristic Luminous Flux UUID Value.

BT_UUID_GATT_LUMFLX
   GATT Characteristic Luminous Flux.

BT_UUID_GATT_LUMFLXR_VAL
   GATT Characteristic Luminous Flux Range UUID Value.

BT_UUID_GATT_LUMFLXR
   GATT Characteristic Luminous Flux Range.

BT_UUID_GATT_LUMINT_VAL
   GATT Characteristic Luminous Intensity UUID Value.

BT_UUID_GATT_LUMINT
   GATT Characteristic Luminous Intensity.

BT_UUID_GATT_MASSFLOW_VAL
   GATT Characteristic Mass Flow UUID Value.

BT_UUID_GATT_MASSFLOW
   GATT Characteristic Mass Flow.

BT_UUID_GATT_PERLGH_T VAL
   GATT Characteristic Perceived Lightness UUID Value.

BT_UUID_GATT_PERLGH_T
   GATT Characteristic Perceived Lightness.

BT_UUID_GATT_PER8_VAL
   GATT Characteristic Percentage 8 UUID Value.

BT_UUID_GATT_PER8
   GATT Characteristic Percentage 8.

BT_UUID_GATT_PWR_VAL
   GATT Characteristic Power UUID Value.
BT_UUID_GATT_PWR
GATT Characteristic Power.

BT_UUID_GATT_PWRSPEC_VAL
GATT Characteristic Power Specification UUID Value.

BT_UUID_GATT_PWRSPEC
GATT Characteristic Power Specification.

BT_UUID_GATT_RRICR_VAL
GATT Characteristic Relative Runtime In A Current Range UUID Value.

BT_UUID_GATT_RRICR
GATT Characteristic Relative Runtime In A Current Range.

BT_UUID_GATT_RRIGLR_VAL
GATT Characteristic Relative Runtime In A Generic Level Range UUID Value.

BT_UUID_GATT_RRIGLR
GATT Characteristic Relative Runtime In A Generic Level Range.

BT_UUID_GATT_RVIVR_VAL
GATT Characteristic Relative Value In A Voltage Range UUID Value.

BT_UUID_GATT_RVIVR
GATT Characteristic Relative Value In A Voltage Range.

BT_UUID_GATT_RVIIR_VAL
GATT Characteristic Relative Value In A Illuminance Range UUID Value.

BT_UUID_GATT_RVIIR
GATT Characteristic Relative Value In A Illuminance Range.

BT_UUID_GATT_RVIPOD_VAL
GATT Characteristic Relative Value In A Period Of Day UUID Value.

BT_UUID_GATT_RVIPOD
GATT Characteristic Relative Value In A Period Of Day.

BT_UUID_GATT_RVITR_VAL
GATT Characteristic Relative Value In A Temperature Range UUID Value.

BT_UUID_GATT_RVITR
GATT Characteristic Relative Value In A Temperature Range.

BT_UUID_GATT_TEMP8_VAL
GATT Characteristic Temperature 8 UUID Value.
BT_UUID_GATT_TEMP8
  GATT Characteristic Temperature 8.

BT_UUID_GATT_TEMP8_IPOD_VAL
  GATT Characteristic Temperature 8 In A Period Of Day UUID Value.

BT_UUID_GATT_TEMP8_IPOD
  GATT Characteristic Temperature 8 In A Period Of Day.

BT_UUID_GATT_TEMP8_STAT_VAL
  GATT Characteristic Temperature 8 Statistics UUID Value.

BT_UUID_GATT_TEMP8_STAT
  GATT Characteristic Temperature 8 Statistics.

BT_UUID_GATT_TEMP_RNG_VAL
  GATT Characteristic Temperature Range UUID Value.

BT_UUID_GATT_TEMP_RNG
  GATT Characteristic Temperature Range.

BT_UUID_GATT_TEMP_STAT_VAL
  GATT Characteristic Temperature Statistics UUID Value.

BT_UUID_GATT_TEMP_STAT
  GATT Characteristic Temperature Statistics.

BT_UUID_GATT_TIM_DC8_VAL
  GATT Characteristic Time Decihour 8 UUID Value.

BT_UUID_GATT_TIM_DC8
  GATT Characteristic Time Decihour 8.

BT_UUID_GATT_TIM_EXP8_VAL
  GATT Characteristic Time Exponential 8 UUID Value.

BT_UUID_GATT_TIM_EXP8
  GATT Characteristic Time Exponential 8.

BT_UUID_GATT_TIM_H24_VAL
  GATT Characteristic Time Hour 24 UUID Value.

BT_UUID_GATT_TIM_H24
  GATT Characteristic Time Hour 24.

BT_UUID_GATT_TIM_MS24_VAL
  GATT Characteristic Time Millisecond 24 UUID Value.
BT_UUID_GATT_TIM_MS24
GATT Characteristic Time Millisecond 24.

BT_UUID_GATT_TIM_S16_VAL
GATT Characteristic Time Second 16 UUID Value.

BT_UUID_GATT_TIM_S16
GATT Characteristic Time Second 16.

BT_UUID_GATT_TIM_S8_VAL
GATT Characteristic Time Second 8 UUID Value.

BT_UUID_GATT_TIM_S8
GATT Characteristic Time Second 8.

BT_UUID_GATT_V_VAL
GATT Characteristic Voltage UUID Value.

BT_UUID_GATT_V
GATT Characteristic Voltage.

BT_UUID_GATT_V_SPEC_VAL
GATT Characteristic Voltage Specification UUID Value.

BT_UUID_GATT_V_SPEC
GATT Characteristic Voltage Specification.

BT_UUID_GATT_V_STAT_VAL
GATT Characteristic Voltage Statistics UUID Value.

BT_UUID_GATT_V_STAT
GATT Characteristic Voltage Statistics.

BT_UUID_GATT_VOLF_VAL
GATT Characteristic Volume Flow UUID Value.

BT_UUID_GATT_VOLF
GATT Characteristic Volume Flow.

BT_UUID_GATT_CRCOORD_VAL
GATT Characteristic Chromaticity Coordinate (not Coordinates) UUID Value.

BT_UUID_GATT_CRCOORD
GATT Characteristic Chromaticity Coordinate (not Coordinates)

BT_UUID_GATT_RCF_VAL
GATT Characteristic RC Feature UUID Value.
BT_UUID_GATT_RCF
GATT Characteristic RC Feature.

BT_UUID_GATT_RCS_SET_VAL
GATT Characteristic RC Settings UUID Value.

BT_UUID_GATT_RCS_SET
GATT Characteristic RC Settings.

BT_UUID_GATT_RCCP_VAL
GATT Characteristic Reconnection Configuration Control Point UUID Value.

BT_UUID_GATT_RCCP
GATT Characteristic Reconnection Configuration Control Point.

BT_UUID_GATT_IDD_SC_VAL
GATT Characteristic IDD Status Changed UUID Value.

BT_UUID_GATT_IDD_SC
GATT Characteristic IDD Status Changed.

BT_UUID_GATT_IDD_S_VAL
GATT Characteristic IDD Status UUID Value.

BT_UUID_GATT_IDD_S
GATT Characteristic IDD Status.

BT_UUID_GATT_IDD_AS_VAL
GATT Characteristic IDD Announciation Status UUID Value.

BT_UUID_GATT_IDD_AS
GATT Characteristic IDD Announciation Status.

BT_UUID_GATT_IDD_F_VAL
GATT Characteristic IDD Features UUID Value.

BT_UUID_GATT_IDD_F
GATT Characteristic IDD Features.

BT_UUID_GATT_IDD_SRCP_VAL
GATT Characteristic IDD Status Reader Control Point UUID Value.

BT_UUID_GATT_IDD_SRCP
GATT Characteristic IDD Status Reader Control Point.

BT_UUID_GATT_IDD_CCP_VAL
GATT Characteristic IDD Command Control Point UUID Value.
BT_UUID_GATT_IDD_CCP
   GATT Characteristic IDD Command Control Point.

BT_UUID_GATT_IDD_CD_VAL
   GATT Characteristic IDD Command Data UUID Value.

BT_UUID_GATT_IDD_CD
   GATT Characteristic IDD Command Data.

BT_UUID_GATT_IDD_RACP_VAL
   GATT Characteristic IDD Record Access Control Point UUID Value.

BT_UUID_GATT_IDD_RACP
   GATT Characteristic IDD Record Access Control Point.

BT_UUID_GATT_IDD_HD_VAL
   GATT Characteristic IDD History Data UUID Value.

BT_UUID_GATT_IDD_HD
   GATT Characteristic IDD History Data.

BT_UUID_GATT_CLIENT_FEATURES_VAL
   GATT Characteristic Client Supported Features UUID value.

BT_UUID_GATT_CLIENT_FEATURES
   GATT Characteristic Client Supported Features.

BT_UUID_GATT_DB_HASH_VAL
   GATT Characteristic Database Hash UUID value.

BT_UUID_GATT_DB_HASH
   GATT Characteristic Database Hash.

BT_UUID_GATT_BSS_CP_VAL
   GATT Characteristic BSS Control Point UUID Value.

BT_UUID_GATT_BSS_CP
   GATT Characteristic BSS Control Point.

BT_UUID_GATT_BSS_R_VAL
   GATT Characteristic BSS Response UUID Value.

BT_UUID_GATT_BSS_R
   GATT Characteristic BSS Response.

BT_UUID_GATT_EMG_ID_VAL
   GATT Characteristic Emergency ID UUID Value.
BT_UUID_GATT_EMG_ID
GATT Characteristic Emergency ID.

BT_UUID_GATT_EMG_TXT_VAL
GATT Characteristic Emergency Text UUID Value.

BT_UUID_GATT_EMG_TXT
GATT Characteristic Emergency Text.

BT_UUID_GATT_ACS_S_VAL
GATT Characteristic ACS Status UUID Value.

BT_UUID_GATT_ACS_S
GATT Characteristic ACS Status.

BT_UUID_GATT_ACS_DI_VAL
GATT Characteristic ACS Data In UUID Value.

BT_UUID_GATT_ACS_DI
GATT Characteristic ACS Data In.

BT_UUID_GATT_ACS_DON_VAL
GATT Characteristic ACS Data Out Notify UUID Value.

BT_UUID_GATT_ACS_DON
GATT Characteristic ACS Data Out Notify.

BT_UUID_GATT_ACS_DOI_VAL
GATT Characteristic ACS Data Out Indicate UUID Value.

BT_UUID_GATT_ACS_DOI
GATT Characteristic ACS Data Out Indicate.

BT_UUID_GATT_ACS_CP_VAL
GATT Characteristic ACS Control Point UUID Value.

BT_UUID_GATT_ACS_CP
GATT Characteristic ACS Control Point.

BT_UUID_GATT_EBPM_VAL
GATT Characteristic Enhanced Blood Pressure Measurement UUID Value.

BT_UUID_GATT_EBPM
GATT Characteristic Enhanced Blood Pressure Measurement.

BT_UUID_GATT_EICP_VAL
GATT Characteristic Enhanced Intermediate Cuff Pressure UUID Value.
BT_UUID_GATT_EICP
GATT Characteristic Enhanced Intermediate Cuff Pressure.

BT_UUID_GATT_BPR_VAL
GATT Characteristic Blood Pressure Record UUID Value.

BT_UUID_GATT_BPR
GATT Characteristic Blood Pressure Record.

BT_UUID_GATT_RU_VAL
GATT Characteristic Registered User UUID Value.

BT_UUID_GATT_RU
GATT Characteristic Registered User.

BT_UUID_GATT_BR_EDR_HD_VAL
GATT Characteristic BR-EDR Handover Data UUID Value.

BT_UUID_GATT_BR_EDR_HD
GATT Characteristic BR-EDR Handover Data.

BT_UUID_GATT_BT_SIG_D_VAL
GATT Characteristic Bluetooth SIG Data UUID Value.

BT_UUID_GATT_BT_SIG_D
GATT Characteristic Bluetooth SIG Data.

BT_UUID_GATT_SERVER_FEATURES_VAL
GATT Characteristic Server Supported Features UUID value.

BT_UUID_GATT_SERVER_FEATURES
GATT Characteristic Server Supported Features.

BT_UUID_GATT_PHY_AMF_VAL
GATT Characteristic Physical Activity Monitor Features UUID Value.

BT_UUID_GATT_PHY_AMF
GATT Characteristic Physical Activity Monitor Features.

BT_UUID_GATT_GEN_AID_VAL
GATT Characteristic General Activity Instantaneous Data UUID Value.

BT_UUID_GATT_GEN_AID
GATT Characteristic General Activity Instantaneous Data.

BT_UUID_GATT_GEN_ASD_VAL
GATT Characteristic General Activity Summary Data UUID Value.
6.1. Bluetooth 2017

```
BT_UUID_GATT_GEN_ASD
   GATT Characteristic General Activity Summary Data.

BT_UUID_GATT_CR_AID_VAL
   GATT Characteristic CardioRespiratory Activity Instantaneous Data UUID Value.

BT_UUID_GATT_CR_AID
   GATT Characteristic CardioRespiratory Activity Instantaneous Data.

BT_UUID_GATT_CR_ASD_VAL
   GATT Characteristic CardioRespiratory Activity Summary Data UUID Value.

BT_UUID_GATT_CR_ASD
   GATT Characteristic CardioRespiratory Activity Summary Data.

BT_UUID_GATT_SC_ASD_VAL
   GATT Characteristic Step Counter Activity Summary Data UUID Value.

BT_UUID_GATT_SC_ASD
   GATT Characteristic Step Counter Activity Summary Data.

BT_UUID_GATT_SLP_AID_VAL
   GATT Characteristic Sleep Activity Instantaneous Data UUID Value.

BT_UUID_GATT_SLP_AID
   GATT Characteristic Sleep Activity Instantaneous Data.

BT_UUID_GATT_SLP_ASD_VAL
   GATT Characteristic Sleep Activity Summary Data UUID Value.

BT_UUID_GATT_SLP_ASD
   GATT Characteristic Sleep Activity Summary Data.

BT_UUID_GATT_PHY_AMCP_VAL
   GATT Characteristic Physical Activity Monitor Control Point UUID Value.

BT_UUID_GATT_PHY_AMCP
   GATT Characteristic Physical Activity Monitor Control Point.

BT_UUID_GATT_ACS_VAL
   GATT Characteristic Activity Current Session UUID Value.

BT_UUID_GATT_ACS
   GATT Characteristic Activity Current Session.

BT_UUID_GATT_PHY_ASDESC_VAL
   GATT Characteristic Physical Activity Session Descriptor UUID Value.
```
BT_UUID_GATT_PHY_ASDESC
GATT Characteristic Physical Activity Session Descriptor.

BT_UUID_GATT_PREF_U_VAL
GATT Characteristic Preffered Units UUID Value.

BT_UUID_GATT_PREF_U
GATT Characteristic Preffered Units.

BT_UUID_GATT_HRES_H_VAL
GATT Characteristic High Resolution Height UUID Value.

BT_UUID_GATT_HRES_H
GATT Characteristic High Resolution Height.

BT_UUID_GATT_MID_NAME_VAL
GATT Characteristic Middle Name UUID Value.

BT_UUID_GATT_MID_NAME
GATT Characteristic Middle Name.

BT_UUID_GATT_STRDLEN_VAL
GATT Characteristic Stride Length UUID Value.

BT_UUID_GATT_STRDLEN
GATT Characteristic Stride Length.

BT_UUID_GATT_HANDEDNESS_VAL
GATT Characteristic Handedness UUID Value.

BT_UUID_GATT_HANDEDNESS
GATT Characteristic Handedness.

BT_UUID_GATT_DEVICE_WP_VAL
GATT Characteristic Device Wearing Position UUID Value.

BT_UUID_GATT_DEVICE_WP
GATT Characteristic Device Wearing Position.

BT_UUID_GATT_4ZHRL_VAL
GATT Characteristic Four Zone Heart Rate Limit UUID Value.

BT_UUID_GATT_4ZHRL
GATT Characteristic Four Zone Heart Rate Limit.

BT_UUID_GATT_HIET_VAL
GATT Characteristic High Intensity Exercise Threshold UUID Value.
BT_UUID_GATT_HIET
GATT Characteristic High Intensity Exercise Threshold.

BT_UUID_GATT_AG_VAL
GATT Characteristic Activity Goal UUID Value.

BT_UUID_GATT_AG
GATT Characteristic Activity Goal.

BT_UUID_GATT_SIN_VAL
GATT Characteristic Sedentary Interval Notification UUID Value.

BT_UUID_GATT_SIN
GATT Characteristic Sedentary Interval Notification.

BT_UUID_GATT_CI_VAL
GATT Characteristic Caloric Intake UUID Value.

BT_UUID_GATT_CI
GATT Characteristic Caloric Intake.

BT_UUID_GATT_TMAPR_VAL
GATT Characteristic TMAP Role UUID Value.

BT_UUID_GATT_TMAPR
GATT Characteristic TMAP Role.

BT_UUID_AICS_STATE_VAL
Audio Input Control Service State value.

BT_UUID_AICS_STATE
Audio Input Control Service State.

BT_UUID_AICS_GAIN_SETTINGS_VAL
Audio Input Control Service Gain Settings Properties value.

BT_UUID_AICS_GAIN_SETTINGS
Audio Input Control Service Gain Settings Properties.

BT_UUID_AICS_INPUT_TYPE_VAL
Audio Input Control Service Input Type value.

BT_UUID_AICS_INPUT_TYPE
Audio Input Control Service Input Type.

BT_UUID_AICS_INPUT_STATUS_VAL
Audio Input Control Service Input Status value.
BT_UUID_AICS_INPUT_STATUS
Audio Input Control Service Input Status.

BT_UUID_AICS_CONTROL_VAL
Audio Input Control Service Control Point value.

BT_UUID_AICS_CONTROL
Audio Input Control Service Control Point.

BT_UUID_AICS_DESCRIPTION_VAL
Audio Input Control Service Input Description value.

BT_UUID_AICS_DESCRIPTION
Audio Input Control Service Input Description.

BT_UUID_VCS_STATE_VAL
Volume Control Setting value.

BT_UUID_VCS_STATE
Volume Control Setting.

BT_UUID_VCS_CONTROL_VAL
Volume Control Control point value.

BT_UUID_VCS_CONTROL
Volume Control Control point.

BT_UUID_VCS_FLAGS_VAL
Volume Control Flags value.

BT_UUID_VCS_FLAGS
Volume Control Flags.

BT_UUID_VOCS_STATE_VAL
Volume Offset State value.

BT_UUID_VOCS_STATE
Volume Offset State.

BT_UUID_VOCS_LOCATION_VAL
Audio Location value.

BT_UUID_VOCS_LOCATION
Audio Location.

BT_UUID_VOCS_CONTROL_VAL
Volume Offset Control Point value.
BT_UUID_VOCS_CONTROL
    Volume Offset Control Point.

BT_UUID_VOCS_DESCRIPTION_VAL
    Volume Offset Audio Output Description value.

BT_UUID_VOCS_DESCRIPTION
    Volume Offset Audio Output Description.

BT_UUID_CSIS_SET_SIRK_VAL
    Set Identity Resolving Key value.

BT_UUID_CSIS_SET_SIRK
    Set Identity Resolving Key.

BT_UUID_CSIS_SET_SIZE_VAL
    Set size value.

BT_UUID_CSIS_SET_SIZE
    Set size.

BT_UUID_CSIS_SET_LOCK_VAL
    Set lock value.

BT_UUID_CSIS_SET_LOCK
    Set lock.

BT_UUID_CSIS_RANK_VAL
    Rank value.

BT_UUID_CSIS_RANK
    Rank.

BT_UUID_GATT_EDKM_VAL
    GATT Characteristic Encrypted Data Key Material UUID Value.

BT_UUID_GATT_EDKM
    GATT Characteristic Encrypted Data Key Material.

BT_UUID_GATT_AE32_VAL
    GATT Characteristic Apparent Energy 32 UUID Value.

BT_UUID_GATT_AE32
    GATT Characteristic Apparent Energy 32.

BT_UUID_GATT_AP_VAL
    GATT Characteristic Apparent Power UUID Value.
BT_UUID_GATT_AP
GATT Characteristic Apparent Power.

BT_UUID_GATT_CO2CONC_VAL
GATT Characteristic CO2 Concentration UUID Value.

BT_UUID_GATT_CO2CONC
GATT Characteristic CO2 Concentration.

BT_UUID_GATT_COS_VAL
GATT Characteristic Cosine of the Angle UUID Value.

BT_UUID_GATT_COS
GATT Characteristic Cosine of the Angle.

BT_UUID_GATT_DEVTF_VAL
GATT Characteristic Device Time Feature UUID Value.

BT_UUID_GATT_DEVTF
GATT Characteristic Device Time Feature.

BT_UUID_GATT_DEVTP_VAL
GATT Characteristic Device Time Parameters UUID Value.

BT_UUID_GATT_DEVTP
GATT Characteristic Device Time Parameters.

BT_UUID_GATT_DEVT_VAL
GATT Characteristic Device Time UUID Value.

BT_UUID_GATT_DEVT
GATT Characteristic String.

BT_UUID_GATT_DEVTCP_VAL
GATT Characteristic Device Time Control Point UUID Value.

BT_UUID_GATT_DEVTCP
GATT Characteristic Device Time Control Point.

BT_UUID_GATT_TCLD_VAL
GATT Characteristic Time Change Log Data UUID Value.

BT_UUID_GATT_TCLD
GATT Characteristic Time Change Log Data.

BT_UUID_MCS_PLAYER_NAME_VAL
Media player name value.
BT_UUID_MCS_PLAYER_NAME
Media player name.

BT_UUID_MCS_ICON_OBJ_ID_VAL
Media Icon Object ID value.

BT_UUID_MCS_ICON_OBJ_ID
Media Icon Object ID.

BT_UUID_MCS_ICON_URL_VAL
Media Icon URL value.

BT_UUID_MCS_ICON_URL
Media Icon URL.

BT_UUID_MCS_TRACK_CHANGED_VAL
Track Changed value.

BT_UUID_MCS_TRACK_CHANGED
Track Changed.

BT_UUID_MCS_TRACK_TITLE_VAL
Track Title value.

BT_UUID_MCS_TRACK_TITLE
Track Title.

BT_UUID_MCS_TRACK_DURATION_VAL
Track Duration value.

BT_UUID_MCS_TRACK_DURATION
Track Duration.

BT_UUID_MCS_TRACK_POSITION_VAL
Track Position value.

BT_UUID_MCS_TRACK_POSITION
Track Position.

BT_UUID_MCS_PLAYBACK_SPEED_VAL
Playback Speed value.

BT_UUID_MCS_PLAYBACK_SPEED
Playback Speed.

BT_UUID_MCS_SEEKING_SPEED_VAL
Seeking Speed value.
BT_UUID_MCS_SEEKING_SPEED
Seeking Speed.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID_VAL
Track Segments Object ID value.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID
Track Segments Object ID.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID_VAL
Current Track Object ID value.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID
Current Track Object ID.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID_VAL
Next Track Object ID value.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID
Next Track Object ID.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID_VAL
Parent Group Object ID value.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID
Parent Group Object ID.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID_VAL
Group Object ID value.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID
Group Object ID.

BT_UUID_MCS_PLAYING_ORDER_VAL
Playing Order value.

BT_UUID_MCS_PLAYING_ORDER
Playing Order.

BT_UUID_MCS_PLAYING_ORDERS_VAL
Playing Orders supported value.

BT_UUID_MCS_PLAYING_ORDERS
Playing Orders supported.

BT_UUID_MCS_MEDIA_STATE_VAL
Media State value.
6.1. Bluetooth

- **BT_UUID_MCS_MEDIA_STATE**
  Media State.

- **BT_UUID_MCS_MEDIA_CONTROL_POINT_VAL**
  Media Control Point value.

- **BT_UUID_MCS_MEDIA_CONTROL_POINT**
  Media Control Point.

- **BT_UUID_MCS_MEDIA_CONTROL_OPCODES_VAL**
  Media control opcodes supported value.

- **BT_UUID_MCS_MEDIA_CONTROL_OPCODES**
  Media control opcodes supported.

- **BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID_VAL**
  Search result object ID value.

- **BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID**
  Search result object ID.

- **BT_UUID_MCS_SEARCH_CONTROL_POINT_VAL**
  Search control point value.

- **BT_UUID_MCS_SEARCH_CONTROL_POINT**
  Search control point.

- **BT_UUID_GATT_E32_VAL**
  GATT Characteristic Energy 32 UUID Value.

- **BT_UUID_GATT_E32**
  GATT Characteristic Energy 32.

- **BT_UUID_OTS_TYPE_MPL_ICON_VAL**
  Media Player Icon Object Type value.

- **BT_UUID_OTS_TYPE_MPL_ICON**
  Media Player Icon Object Type.

- **BT_UUID_OTS_TYPE_TRACK_SEGMENT_VAL**
  Track Segments Object Type value.

- **BT_UUID_OTS_TYPE_TRACK_SEGMENT**
  Track Segments Object Type.

- **BT_UUID_OTS_TYPE_TRACK_VAL**
  Track Object Type value.
BT_UUID_OTS_TYPE_TRACK
Track Object Type.

BT_UUID_OTS_TYPE_GROUP_VAL
Group Object Type value.

BT_UUID_OTS_TYPE_GROUP
Group Object Type.

BT_UUID_GATT_CTEE_VAL
GATT Characteristic Constant Tone Extension Enable UUID Value.

BT_UUID_GATT_CTEE
GATT Characteristic Constant Tone Extension Enable.

BT_UUID_GATT_ACTEML_VAL
GATT Characteristic Advertising Constant Tone Extension Minimum Length UUID Value.

BT_UUID_GATT_ACTEML
GATT Characteristic Advertising Constant Tone Extension Minimum Length.

BT_UUID_GATT_ACTEMTC_VAL
GATT Characteristic Advertising Constant Tone Extension Minimum Transmit Count UUID Value.

BT_UUID_GATT_ACTEMTC
GATT Characteristic Advertising Constant Tone Extension Minimum Transmit Count.

BT_UUID_GATT_ACTETD_VAL
GATT Characteristic Advertising Constant Tone Extension Transmit Duration UUID Value.

BT_UUID_GATT_ACTETD
GATT Characteristic Advertising Constant Tone Extension Transmit Duration.

BT_UUID_GATT_ACTEI_VAL
GATT Characteristic Advertising Constant Tone Extension Interval UUID Value.

BT_UUID_GATT_ACTEI
GATT Characteristic Advertising Constant Tone Extension Interval.

BT_UUID_GATT_ACTEP_VAL
GATT Characteristic Advertising Constant Tone Extension PHY UUID Value.

BT_UUID_GATT_ACTEP
GATT Characteristic Advertising Constant Tone Extension PHY.

BT_UUID_TBS_PROVIDER_NAME_VAL
Bearer Provider Name value.
6.1. Bluetooth

**BT_UUID_TBS_PROVIDER_NAME**
Bearer Provider Name.

**BT_UUID_TBS_UCI_VAL**
Bearer UCI value.

**BT_UUID_TBS_UCI**
Bearer UCI.

**BT_UUID_TBS_TECHNOLOGY_VAL**
Bearer Technology value.

**BT_UUID_TBS_TECHNOLOGY**
Bearer Technology.

**BT_UUID_TBS_URI_LIST_VAL**
Bearer URI Prefixes Supported List value.

**BT_UUID_TBS_URI_LIST**
Bearer URI Prefixes Supported List.

**BT_UUID_TBS_SIGNAL_STRENGTH_VAL**
Bearer Signal Strength value.

**BT_UUID_TBS_SIGNAL_STRENGTH**
Bearer Signal Strength.

**BT_UUID_TBS_SIGNAL_INTERVAL_VAL**
Bearer Signal Strength Reporting Interval value.

**BT_UUID_TBS_SIGNAL_INTERVAL**
Bearer Signal Strength Reporting Interval.

**BT_UUID_TBS_LIST_CURRENT_CALLS_VAL**
Bearer List Current Calls value.

**BT_UUID_TBS_LIST_CURRENT_CALLS**
Bearer List Current Calls.

**BT_UUID_CCID_VAL**
Content Control ID value.

**BT_UUID_CCID**
Content Control ID.

**BT_UUID_TBS_STATUS_FLAGS_VAL**
Status flags value.
BT_UUID_TBS_STATUS_FLAGS
Status flags.

BT_UUID_TBS_INCOMING_URI_VAL
Incoming Call Target Caller ID value.

BT_UUID_TBS_INCOMING_URI
Incoming Call Target Caller ID.

BT_UUID_TBS_CALL_STATE_VAL
Call State value.

BT_UUID_TBS_CALL_STATE
Call State.

BT_UUID_TBS_CALL_CONTROL_POINT_VAL
Call Control Point value.

BT_UUID_TBS_CALL_CONTROL_POINT
Call Control Point.

BT_UUID_TBS_OPTIONAL_OPCODES_VAL
Optional Opcodes value.

BT_UUID_TBS_OPTIONAL_OPCODES
Optional Opcodes.

BT_UUID_TBS_TERMINATE_REASON_VAL
Terminate reason value

BT_UUID_TBS_TERMINATE_REASON
Terminate reason

BT_UUID_TBS_INCOMING_CALL_VAL
Incoming Call value.

BT_UUID_TBS_INCOMING_CALL
Incoming Call.

BT_UUID_TBS_FRIENDLY_NAME_VAL
Incoming Call Friendly name value.

BT_UUID_TBS_FRIENDLY_NAME
Incoming Call Friendly name.
BT_UUID_MICS_MUTE_VAL
Microphone Control Service Mute value.

BT_UUID_MICS_MUTE
Microphone Control Service Mute.

BT_UUID_ASCS_ASE_SNK_VAL
Audio Stream Endpoint Sink Characteristic value.

BT_UUID_ASCS_ASE_SNK
Audio Stream Endpoint Sink Characteristic.

BT_UUID_ASCS_ASE_SRC_VAL
Audio Stream Endpoint Source Characteristic value.

BT_UUID_ASCS_ASE_SRC
Audio Stream Endpoint Source Characteristic.

BT_UUID_ASCS_ASE_CP_VAL
Audio Stream Endpoint Control Point Characteristic value.

BT_UUID_ASCS_ASE_CP
Audio Stream Endpoint Control Point Characteristic.

BT_UUID_BASS_CONTROL_POINT_VAL
Broadcast Audio Scan Service Scan State value.

BT_UUID_BASS_CONTROL_POINT
Broadcast Audio Scan Service Scan State.

BT_UUID_BASS_RECV_STATE_VAL
Broadcast Audio Scan Service Receive State value.

BT_UUID_BASS_RECV_STATE
Broadcast Audio Scan Service Receive State.

BT_UUID_PACS_SNK_VAL
Sink PAC Characteristic value.

BT_UUID_PACS_SNK
Sink PAC Characteristic.

BT_UUID_PACS_SNK_LOC_VAL
Sink PAC Locations Characteristic value.

BT_UUID_PACS_SNK_LOC
Sink PAC Locations Characteristic.
BT_UUID_PACS_SRC_VAL
   Source PAC Characteristic value.

BT_UUID_PACS_SRC
   Source PAC Characteristic.

BT_UUID_PACS_SRC_LOC_VAL
   Source PAC Locations Characteristic value.

BT_UUID_PACS_SRC_LOC
   Source PAC Locations Characteristic.

BT_UUID_PACS_AVAILABLE_CONTEXT_VAL
   Available Audio Contexts Characteristic value.

BT_UUID_PACS_AVAILABLE_CONTEXT
   Available Audio Contexts Characteristic.

BT_UUID_PACS_SUPPORTED_CONTEXT_VAL
   Supported Audio Context Characteristic value.

BT_UUID_PACS_SUPPORTED_CONTEXT
   Supported Audio Context Characteristic.

BT_UUID_GATT_NH4CONC_VAL
   GATT Characteristic Ammonia Concentration UUID Value.

BT_UUID_GATT_NH4CONC
   GATT Characteristic Ammonia Concentration.

BT_UUID_GATT_COCONC_VAL
   GATT Characteristic Carbon Monoxide Concentration UUID Value.

BT_UUID_GATT_COCONC
   GATT Characteristic Carbon Monoxide Concentration.

BT_UUID_GATT_CH4CONC_VAL
   GATT Characteristic Methane Concentration UUID Value.

BT_UUID_GATT_CH4CONC
   GATT Characteristic Methane Concentration.

BT_UUID_GATT_NO2CONC_VAL
   GATT Characteristic Nitrogen Dioxide Concentration UUID Value.

BT_UUID_GATT_NO2CONC
   GATT Characteristic Nitrogen Dioxide Concentration.
BT_UUID_GATT_NONCH4CONC_VAL
GATT Characteristic Non-Methane Volatile Organic Compounds Concentration UUID Value.

BT_UUID_GATT_NONCH4CONC
GATT Characteristic Non-Methane Volatile Organic Compounds Concentration.

BT_UUID_GATT_O3CONC_VAL
GATT Characteristic Ozone Concentration UUID Value.

BT_UUID_GATT_O3CONC
GATT Characteristic Ozone Concentration.

BT_UUID_GATT_PM1CONC_VAL
GATT Characteristic Particulate Matter - PM1 Concentration UUID Value.

BT_UUID_GATT_PM1CONC
GATT Characteristic Particulate Matter - PM1 Concentration.

BT_UUID_GATT_PM25CONC_VAL
GATT Characteristic Particulate Matter - PM2.5 Concentration UUID Value.

BT_UUID_GATT_PM25CONC
GATT Characteristic Particulate Matter - PM2.5 Concentration.

BT_UUID_GATT_PM10CONC_VAL
GATT Characteristic Particulate Matter - PM10 Concentration UUID Value.

BT_UUID_GATT_PM10CONC
GATT Characteristic Particulate Matter - PM10 Concentration.

BT_UUID_GATT_SO2CONC_VAL
GATT Characteristic Sulfur Dioxide Concentration UUID Value.

BT_UUID_GATT_SO2CONC
GATT Characteristic Sulfur Dioxide Concentration.

BT_UUID_GATT_SF6CONC_VAL
GATT Characteristic Sulfur Hexafluoride Concentration UUID Value.

BT_UUID_GATT_SF6CONC
GATT Characteristic Sulfur Hexafluoride Concentration.

BT_UUID_HAS_HEARING_AID_FEATURES_VAL
Hearing Aid Features Characteristic value.

BT_UUID_HAS_HEARING_AID_FEATURES
Hearing Aid Features Characteristic.
BT_UUID_HAS_PRESET_CONTROL_POINT_VAL
  Hearing Aid Preset Control Point Characteristic value.

BT_UUID_HAS_PRESET_CONTROL_POINT
  Hearing Aid Preset Control Point Characteristic.

BT_UUID_HAS_ACTIVE_PRESET_INDEX_VAL
  Active Preset Index Characteristic value.

BT_UUID_HAS_ACTIVE_PRESET_INDEX
  Active Preset Index Characteristic.

BT_UUID_GATT_FSTR64_VAL
  GATT Characteristic Fixed String 64 UUID Value.

BT_UUID_GATT_FSTR64
  GATT Characteristic Fixed String 64.

BT_UUID_GATT_HITEMP_VAL
  GATT Characteristic High Temperature UUID Value.

BT_UUID_GATT_HITEMP
  GATT Characteristic High Temperature.

BT_UUID_GATT_HV_VAL
  GATT Characteristic High Voltage UUID Value.

BT_UUID_GATT_HV
  GATT Characteristic High Voltage.

BT_UUID_GATT_LD_VAL
  GATT Characteristic Light Distribution UUID Value.

BT_UUID_GATT_LD
  GATT Characteristic Light Distribution.

BT_UUID_GATT_LO_VAL
  GATT Characteristic Light Output UUID Value.

BT_UUID_GATT_LO
  GATT Characteristic Light Output.

BT_UUID_GATT_LST_VAL
  GATT Characteristic Light Source Type UUID Value.

BT_UUID_GATT_LST
  GATT Characteristic Light Source Type.
BT_UUID_GATT_NOISE_VAL
    GATT Characteristic Noise UUID Value.

BT_UUID_GATT_NOISE
    GATT Characteristic Noise.

BT_UUID_GATT_RRCC_TP_VAL
    GATT Characteristic Relative Runtime in a Correlated Color Temperature Range UUID Value.

BT_UUID_GATT_RRCC_TP
    GATT Characteristic Relative Runtime in a Correlated Color Temperature Range.

BT_UUID_GATT_TIM_S32_VAL
    GATT Characteristic Time Second 32 UUID Value.

BT_UUID_GATT_TIM_S32
    GATT Characteristic Time Second 32.

BT_UUID_GATT_VOCCONC_VAL
    GATT Characteristic VOC Concentration UUID Value.

BT_UUID_GATT_VOCCONC
    GATT Characteristic VOC Concentration.

BT_UUID_GATT_VF_VAL
    GATT Characteristic Voltage Frequency UUID Value.

BT_UUID_GATT_VF
    GATT Characteristic Voltage Frequency.

BT_UUID_BAS_BATTERY_CRIT_STATUS_VAL
    BAS Characteristic Battery Critical Status UUID Value.

BT_UUID_BAS_BATTERY_CRIT_STATUS
    BAS Characteristic Battery Critical Status.

BT_UUID_BAS_BATTERY_HEALTH_STATUS_VAL
    BAS Characteristic Battery Health Status UUID Value.

BT_UUID_BAS_BATTERY_HEALTH_STATUS
    BAS Characteristic Battery Health Status.

BT_UUID_BAS_BATTERY_HEALTH_INF_VAL
    BAS Characteristic Battery Health Information UUID Value.

BT_UUID_BAS_BATTERY_HEALTH_INF
    BAS Characteristic Battery Health Information.

6.1. Bluetooth
BT_UUID_BAS_BATTERY_INF_VAL
BAS Characteristic Battery Information UUID Value.

BT_UUID_BAS_BATTERY_INF
BAS Characteristic Battery Information.

BT_UUID_BAS_BATTERY_LEVEL_STATUS_VAL
BAS Characteristic Battery Level Status UUID Value.

BT_UUID_BAS_BATTERY_LEVEL_STATUS
BAS Characteristic Battery Level Status.

BT_UUID_BAS_BATTERY_TIME_STATUS_VAL
BAS Characteristic Battery Time Status UUID Value.

BT_UUID_BAS_BATTERY_TIME_STATUS
BAS Characteristic Battery Time Status.

BT_UUID_GATT_ESD_VAL
GATT Characteristic Estimated Service Date UUID Value.

BT_UUID_GATT_ESD
GATT Characteristic Estimated Service Date.

BT_UUID_BAS_BATTERY_ENERGY_STATUS_VAL
BAS Characteristic Battery Energy Status UUID Value.

BT_UUID_BAS_BATTERY_ENERGY_STATUS
BAS Characteristic Battery Energy Status.

BT_UUID_GATT_SL_VAL
GATT Characteristic LE GATT Security Levels UUID Value.

BT_UUID_GATT_SL
GATT Characteristic LE GATT Security Levels.

Enums

enum [anonymous]
    Bluetooth UUID types.

Values:

enumerator BT_UUID_TYPE_16
    UUID type 16-bit.

e enumerator BT_UUID_TYPE_32
    UUID type 32-bit.

enumerator BT_UUID_TYPE_128
    UUID type 128-bit.

Functions

int bt_uuid_cmp(const struct bt_uuid *u1, const struct bt_uuid *u2)
    Compare Bluetooth UUIDs.
    Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128
    bits format before comparing.

    Parameters
    • u1 – First Bluetooth UUID to compare
    • u2 – Second Bluetooth UUID to compare

    Returns
    negative value if u1 < u2, 0 if u1 == u2, else positive

bool bt_uuid_create(struct bt_uuid *uuid, const uint8_t *data, uint8_t data_len)
    Create a bt_uuid from a little-endian data buffer.
    Create a bt_uuid from a little-endian data buffer. The data_len parameter is used to determine
    whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is
    not allowed over the air.

    Parameters
    • uuid – Pointer to the bt_uuid variable
    • data – pointer to UUID stored in little-endian data buffer
    • data_len – length of the UUID in the data buffer

    Returns
    true if the data was valid and the UUID was successfully created.

void bt_uuid_to_str(const struct bt_uuid *uuid, char *str, size_t len)
    Convert Bluetooth UUID to string.
    Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

    Parameters
    • uuid – Bluetooth UUID
    • str – pointer where to put converted string
    • len – length of str
struct bt_uuid
   
   #include <uuid.h> This is a ‘tentative’ type and should be used as a pointer only.

struct bt_uuid_16
   
   #include <uuid.h>

Public Members

struct bt_uuid uuid
   
   UUID generic type.

uint16_t val
   
   UUID value, 16-bit in host endianness.

struct bt_uuid_32
   
   #include <uuid.h>

Public Members

struct bt_uuid uuid
   
   UUID generic type.

uint32_t val
   
   UUID value, 32-bit in host endianness.

struct bt_uuid_128
   
   #include <uuid.h>

Public Members

struct bt_uuid uuid
   
   UUID generic type.

uint8_t val[16]
   
   UUID value, 128-bit in little-endian format.

Bluetooth: Basic Audio Profile

This document describes how to run Basic Audio Profile functionality which includes:

- Capabilities and Endpoint discovery
- Audio Stream Endpoint procedures

Commands
bap --help
Subcommands:
  init
  select_broadcast :<stream>
  create_broadcast :[preset <preset_name>] [enc <broadcast_code>]

**Example Central**  Connect and establish a stream:
uart:\$ bt init
uart:\$ bap init
uart:\$ bt connect <address>
uart:\$ gatt exchange-mtu
uart:\$ bap discover sink
uart:\$ bap config sink 0
uart:\$ bap qos
uart:\$ bap enable

Or using connect command:

uart:\$ bt init
uart:\$ bap init
uart:\$ bt connect <address>
uart:\$ gatt exchange-mtu
uart:\$ bap discover sink
uart:\$ bap connect sink 0

Disconnect and release:

uart:\$ bap disable
uart:\$ bap release

Example Peripheral  Listen:

uart:\$ bt init
uart:\$ bap init
uart:\$ bt advertise on

Server initiated disable and release:

uart:\$ bap disable
uart:\$ bap release

Example Broadcast Source  Create and establish a broadcast source stream:

uart:\$ bap init
uart:\$ bap create_broadcast
uart:\$ bap start_broadcast

Stop and release a broadcast source stream:

uart:\$ bap stop_broadcast
uart:\$ bap delete_broadcast

Example Broadcast Sink  Scan for and establish a broadcast sink stream. The command bap create_broadcast_sink 0xEF6716 will either use existing periodic advertising sync (if exist) or start scanning and sync to the periodic advertising before syncing to the BIG.

uart:\$ bap init
uart:\$ bap broadcast_scan on
Found broadcaster with ID 0xEF6716 and addr 3D:A5:F9:35:0B:19 (random) and sid 0x00
uart:\$ bap create_broadcast_sink 0xEF6716
Attempting to PA sync to the broadcaster
PA synced to broadcast with broadcast ID 0xEF6716

(continues on next page)

uart:~$ bap qos
Enable  The `enable` command attempts to enable the stream previously configured, if the remote peer accepts then the ISO connection procedure is also initiated.

```
uart:~$ bap enable [context]
uart:~$ bap enable Media
```

Start  The `start` command is only necessary when acting as a sink as it indicates to the source the stack is ready to start receiving data.

```
uart:~$ bap start
```

Disable  The `disable` command attempts to disable the stream previously enabled, if the remote peer accepts then the ISO disconnection procedure is also initiated.

```
uart:~$ bap disable
```

Stop  The `stop` command is only necessary when acting as a sink as it indicates to the source the stack is ready to stop receiving data.

```
uart:~$ bap stop
```

Release  The `release` command releases the current stream and its configuration.

```
uart:~$ bap stop
```
List  The `list` command list the available streams.

Bluetooth: Broadcast Audio Profile Broadcast Assistant

This document describes how to run the BAP Broadcast Assistant functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Broadcast Assistant is responsible for offloading scan for a resource restricted device, such that scanning does not drain the battery. The Broadcast Assistant shall support scanning for periodic advertisements and may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Broadcast Assistant will typically be phones or laptops. The Broadcast Assistant scans for periodic advertisements and transfer information to the server.
It is necessary to have `BT_DEBUG_BAP_BROADCAST_ASSISTANT` enabled for using the Broadcast Assistant interactively.

When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the Broadcast Assistant can discover BASS on the connected device calling `bap_broadcast_assistant discover`, which will start a discovery for the BASS UUIDs and store the handles, and subscribe to all notifications.

**Example usage**

**Setup**

```
uart:~$ bt init
```

**When connected**  Start scanning for periodic advertisements for a server:

**Note:** The Broadcast Assistant will not actually start scanning for periodic advertisements, as that feature is still, at the time of writing, not implemented.

```
uart:~$ bap_broadcast_assistant discover
<dbg> bt_bap_broadcast_assistant.char_discover_func: Found 1 BASS receive states
<dbg> bt_bap_broadcast_assistant.read_recv_state_cb: src_id 0, PA 0, BIS 0, encrypt 0,
-> addr 00:00:00:00:00:00 (public), sid 0, metadata_len 0
uart:~$ bap_broadcast_assistant scan_start
<dbg> bt_bap_broadcast_assistant.write_func: err: 0x00, handle 0x001e
```

Adding a source to the receive state:

```
uart:~$ bap_broadcast_assistant add_src 11:22:33:44:55:66 public 5 1 1
BASS recv state: src_id 0, addr 11:22:33:44:55:66 (public), sid 5, sync_state 1,
-> encrypt_state 000000000000000000000000000000000
[0]: BIS sync 0, metadata_len 0
```

**Bluetooth: Broadcast Audio Profile Scan Delegator**

This document describes how to run the Scan Delegator functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Scan Delegator may optionally support the periodic advertisements synchronization transfer (PAST) protocol.
The Scan Delegator server typically resides on devices that have inputs or outputs.

It is necessary to have `BT_DEBUG_BAP_SCAN_DELEGATOR` enabled for using the Scan Delegator interactively.

The Scan Delegator can currently only set the sync state of a receive state, but does not actually support syncing with periodic advertisements yet.

```shell
bap_scan_delegator --help
bap_scan_delegator - Bluetooth BAP Scan Delegator shell commands
Subcommands:
  init :Initialize the service and register callbacks
  synced :Set server scan state <src_id> <pa_synced> <bis_syncs> <enc_state>
```

Example Usage

**Setup**

```shell
uart:~$ bt init
uart:~$ bt advertise on
Advertising started
```

**When connected** Set sync state for a source:

```shell
uart:~$ bap_scan_delegator synced 0 1 3 0
```

Bluetooth: Common Audio Profile Shell

This document describes how to run the Common Audio Profile functionality.

**CAP Acceptor** The Acceptor will typically be a resource-constrained device, such as a headset, earbud or hearing aid. The Acceptor can initialize a Coordinated Set Identification Service instance, if it is in a pair with one or more other CAP Acceptors.

**Using the CAP Acceptor** When the Bluetooth stack has been initialized (`bt init`), the Acceptor can be registered by calling `cap_acceptor init`, which will register the CAS and CSIS services, as well as register callbacks.

```shell
cap_acceptor --help
cap_acceptor - Bluetooth CAP acceptor shell commands
Subcommands:
  init :Initialize the service and register callbacks [size <int>] [rank <int>] [not-lockable] [sirk <data>]
  lock :Lock the set
  release :Release the set [force]
  print_sirk :Print the currently used SIRK
  set_sirk_rsp :Set the response used in SIRK requests <accept, accept_enc, reject, oob>
```

Besides initializing the CAS and the CSIS, there are also commands to lock and release the CSIS instance, as well as printing and modifying access to the SIRK of the CSIS.

6.1. Bluetooth
**CAP Initiator**  The Initiator will typically be a resource-rich device, such as a phone or PC. The Initiator can discover CAP Acceptors’s CAS and optional CSIS services. The CSIS service can be read to provide information about other CAP Acceptors in the same Coordinated Set. The Initiator can execute stream control procedures on sets of devices, either ad-hoc or Coordinated, and thus provides an easy way to setup multiple streams on multiple devices at once.

**Using the CAP Initiator**  When the Bluetooth stack has been initialized (bt init), the Initiator can discover CAS and the optionally included CSIS instance by calling (cap_initiator discover).

```plaintext
cap_initiator --help
```
cap_initiator - Bluetooth CAP initiator shell commands
Subcommands:

- **discover** :Discover CAS
- **unicast-start** :Unicast Start [csip] [sinks <cnt> (default 1)] [sources <cnt> (default 1)] [conns <cnt> | all] (default 1)
- **unicast-list** :Unicast list streams
- **unicast-update** :Unicast Update <all | stream [stream [stream...]]>
- **unicast-stop** :Unicast stop all streams

Before being able to perform any stream operation, the device must also perform the bap discover operation to discover the ASEs and PAC records. The bap init command also needs to be called.

**When connected**  Discovering CAS and CSIS on a device:

```plaintext
uart:~$ cap_initiator discover
discovery completed with CSIS
```

Discovering ASEs and PAC records on a device:

```plaintext
uart:~$ bap discover
conn 0x81cc260: #0: codec 0x81d5b28 dir 0x01 codec 0x06 cid 0x0000 vid 0x0000 count 5
data #0: type 0x01 len 2
    00000000: f5 |. |
data #1: type 0x02 len 1
data #2: type 0x03 len 1
data #3: type 0x04 len 4
    00000000: 1e 00 f0 |... |
data #4: type 0x05 len 1
meta #0: type 0x01 len 2
    00000000: 06 |. |
dir 1 loc 1
snk ctx 6 src ctx 6
Conn: 0x81cc260, Sink #0: ep 0x81e4248
Conn: 0x81cc260, Sink #1: ep 0x81e46a8
conn 0x81cc260: #0: codec 0x81d5f00 dir 0x02 codec 0x06 cid 0x0000 vid 0x0000 count 5
data #0: type 0x01 len 2
    00000000: f5 |. |
data #1: type 0x02 len 1
data #2: type 0x03 len 1
data #3: type 0x04 len 4
    00000000: 1e 00 f0 |... |
data #4: type 0x05 len 1
meta #0: type 0x01 len 2
    00000000: 06 |. |
dir 2 loc 1
(continues on next page)
Both of the above commands should be done for each device that you want to use in the set. To use multiple devices, simply connect to more and then use `bt select` the device to execute the commands on.

Once all devices have been connected and the respective discovery commands have been called, the `cap_initiator unicast-start` command can be used to put one or more streams into the streaming state.

```
uart:~$ cap_initiator unicast-start sinks 1 sources 0 conns all
Setting up 1 sinks and 0 sources on each (2) conn
Starting 1 streams
Unicast start completed
```

To stop all the streams that has been started, the `cap_initiator unicast-stop` command can be used.

```
uart:~$ cap_initiator unicast-stop
Unicast stopped for group 0x81e41c0 completed
```

### Bluetooth: Call Control Profile

This document describes how to run the call control functionality, both as a client and as a (telephone bearer service (TBS)) server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

#### Telephone Bearer Service Client

The telephone bearer service client will typically exist on a resource restricted device, such as headphones, but may also exist on e.g. phones or laptops. The call control client will also thus typically be the advertiser. The client can control the states of calls on a server using the call control point.

It is necessary to have `BT_DEBUG_TBS_CLIENT` enabled for using the client interactively.

#### Using the telephone bearer service client

When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the telephone bearer service client can discover TBS on the connected device calling `tbs_client discover`, which will start a discovery for the TBS UUIDs and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Since a server may have multiple TBS instances, most of the `tbs_client` commands will take an index (starting from 0) as input. Joining calls require at least 2 call IDs, and all call indexes shall be on the same TBS instance.

A server may also have a GTBS instance, which is an abstraction layer for all the telephone bearers on the server. If the server has both GTBS and TBS, the client may subscribe and use either when sending requests if `BT_TBS_CLIENT_GTBS` is enabled.

```
tbs_client --help
```

```
tbs_client - Bluetooth TBS_CLIENT shell commands
Subcommands:
discover :Discover TBS [subscribe]
set_signal_reporting_interval :Set the signal reporting interval
  [<{instance_index, gtbs}>] <interval>
originate :Originate a call [<{instance_index, gtbs}>]
```

(continues on next page)
In the following examples, notifications from GTBS is ignored, unless otherwise specified.

**Example usage**

**Setup**

```
uart:~$ bt init
uart:~$ bt advertise on
Advertising started
```

**When connected**  Placing a call:

```
uart:~$ tbs_client discover
<dbg> bt_tbs_client.primary_discover_func: Discover complete, found 1 instances (GTBS→found)
<dbg> bt_tbs_client.discover_func: Setup complete for 1 / 1 TBS
<dbg> bt_tbs_client.discover_func: Setup complete GTBS
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state
(continues on next page)```
Placing a call on GTBS:

```bash
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state
  with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode
  for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state
  with URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state
  with URI tel:123
```

It is necessary to set an outgoing caller ID before placing a call.

Accepting incoming call from peer device:

```bash
<dbg> bt_tbs_client.incoming_uri_notify_handler: tel:123
<dbg> bt_tbs_client.in_call_notify_handler: tel:456
<dbg> bt_tbs_client.friendly_name_notify_handler: Peter
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the incoming state
  with URI tel:456
uart:~$ tbs_client accept 0 5
<dbg> bt_tbs_client.call_cp_callback_handler: Status: success for the accept opcode
  for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the active state
  with URI tel
```

Terminate call:

```bash
uart:~$ tbs_client terminate 0 5
<dbg> bt_tbs_client.termination_reason_notify_handler: ID 0x05, reason 0x06
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the terminate opcode
  for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler:
```

**Telephone Bearer Service (TBS)**  The telephone bearer service is a service that typically resides on devices that can make calls, including calls from apps such as Skype, e.g. (smart)phones and PCs.

It is necessary to have `BT_DEBUG_TBS` enabled for using the TBS server interactively.

**Using the telephone bearer service**  TBS can be controlled locally, or by a remote device (when in a call). For example a remote device may initiate a call to the device with the TBS server, or the TBS server...
may initiate a call to remote device, without a TBS_CLIENT client. The TBS implementation is capable of fully controlling any call.

```
tbs --help
```

---

### Subcommands:

<table>

---

### Example Usage

#### Setup

```
uart:~$ bt init
```

#### When connected

- Answering a call for a peer device originated by a client:

```
<dbg> bt_tbs.write_call_cp: Index 0: Processing the originate opcode
<dbg> bt_tbs.originate_call: New call with call index 1
<dbg> bt_tbs.write_call_cp: Index 0: Processed the originate opcode with status success for call index 1
uart:~$ tbs remote_answer 1
TBS succeeded for call_id: 1
```

- Incoming call from a peer device, accepted by client:

```
uart:~$ tbs incoming 0 tel:123 tel:456 Peter
TBS succeeded for call_id: 4
<dbg> bt_tbs.bt_tbs_remote_incoming: New call with call index 4
<dbg> bt_tbs.write_call_cp: Index 0: Processed the accept opcode with status success for call index 4
```
Bluetooth: Coordinated Set Identification Profile

This document describes how to run the coordinated set identification functionality, both as a client and as a server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Set Coordinator (Client) The client will typically be a resource-rich device, such as a smartphone or a laptop. The client is able to lock and release members of a coordinated set. While the coordinated set is locked, no other clients may lock the set.

To lock a set, the client must connect to each of the set members it wants to lock. This implementation will always try to connect to all the members of the set, and at the same time. Thus if the set size is 3, then BT_MAX_CONN shall be at least 3.

If the locks on set members shall persists through disconnects, it is necessary to bond with the set members. If you need to bond with multiple set members, make sure that BT_MAX PAIRED is correctly configured.

Using the Set Coordinator When the Bluetooth stack has been initialized (bt init), and a set member device has been connected, the call control client can be initialized by calling csip_set_coordinator init, which will start a discovery for the TBS uuids and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Once the client has connected and discovered the handles, then it can read the set information, which is needed to identify other set members. The client can then scan for and connect to the remaining set members, and once all the members has been connected to, it can lock and release the set.

It is necessary to enable BT_DEBUG_CSIP_SET_COORDINATOR to properly use the set coordinator.

Example usage

Setup

```
uart:~$ init
```

When connected Discovering sets on a device:

```
uart:~$ csip_set_coordinator init
<dbg> bt_csip_set_coordinator.primary_discover_func: [ATTRIBUTE] handle 0x0048
<dbg> bt_csip_set_coordinator.primary_discover_func: Discover complete, found 1 instances
```

(continues on next page)
<dbg> bt_csip_set_coordinator.discover_func: Setup complete for 1 / 1
Found 1 sets on device
<dbg> bt_csip_set_coordinator discover_sets
uart:~$ csip_set_coordinator discover_sets
<dbg> bt_csip_set_coordinator.Set SIRK
36 04 9a dc 66 3a a1 a1 |6...f:
1d 9a 2f 41 01 73 3e 01 |..A.s>.

<dbg> bt_csip_set_coordinator.notify_func: Instance 0 lock was released
Set released
**Coordinated Set Member (Server)**  The server on devices that are part of a set, consisting of at least two devices, e.g. a pair of earbuds.

**Using the Set Member**

```bash
csip_set_member --help
```

```
csip_set_member  - Bluetooth CSIP set member shell commands
```

Subcommands:

- `register`: Initialize the service and register callbacks `[size <int>]` `[rank <int>]` `[not-lockable]` `[sirk <data>]`
- `update_psri`: Update the advertised PSRI
- `lock`: Lock the set
- `release`: Release the set `[force]`
- `print_sirk`: Print the currently used SIRK
- `set_sirk_rsp`: Set the response used in SIRK requests `<accept, accept_enc, reject, oob>`

**Example Usage**

Setup

```bash
uart:~$ bt init
uart:~$ csip_set_member register
```

**Bluetooth: Isochronous Channels**

**Commands**

```bash
iso --help
iso  - Bluetooth ISO shell commands
```

Subcommands:

- `cig_create`: `[dir=tx,rx,txrx]` `[interval]` `[packing]` `[framing]` `[latency]` `[sdu]` `[phy]` `[rtn]`
- `cig_term`: Terminate the CIG
- `connect`: Connect ISO Channel
- `listen`: `<dir=tx,rx,txrx>` `[security level]`
- `send`: Send to ISO Channel `[count]`
- `disconnect`: Disconnect ISO Channel
- `create-big`: Create a BIG as a broadcaster `[enc <broadcast code>]`
- `broadcast`: Broadcast on ISO channels
- `sync-big`: Synchronize to a BIG as a receiver `<BIS bitfield>` `[mse]` `[timeout]` `[enc <broadcast code>]`
- `term-big`: Terminate a BIG

1. [Central] Create CIG:

Requires to be connected:

```bash
uart:~$ iso cig_create
CIG created
```

2. [Peripheral] Listen to ISO connections

```bash
uart:~$ iso listen txrx
```

3. [Central] Connect ISO channel:
Media control for Generic Audio Content Control

This document describes how to run the media control functionality, using the shell, both as a client and as a server.

The media control server consists of two parts. There is a media player (mpl) that contains the logic to handle media, and there is a media control service (mcs) that serves as a GATT-based interface to the player. The media control client consists of one part, the GATT-based client (mcc).

The media control server may include an object transfer service (ots) and the media control client may include an object transfer client (otc). When these are included, a richer set of functionality is available.

The media control server and client both implement the Generic Media Control Service (only), and do not use any underlying Media Control Services.

Note that in the examples below, in many cases the debug output has been removed and long outputs may have been shortened to make the examples shorter and clearer.

Also note that this documentation does not list all shell commands, it just shows examples of some of them. The set of commands is explorable from the mcc shell and the mpl shell, by typing `mcc` or `mpl` and pressing TAB. A help text for each command can be found by doing `mcc <command> help` or `mpl <command> help`.

Overview  A media player has a name and an icon that allows identification of the player for the user.

The content of the media player is structured into tracks and groups. A media player has a number of groups. A group contains tracks and other groups. (In this implementation, a group only contains tracks, not other groups.) Tracks can be divided into segments.

An active player will have a current track. This is the track that is playing now (if the player is playing). The current track has a title, a duration (given in hundredths of a second) and a position - the current position of the player within the track.

There is also a current group (the group of the current track), a parent group (the parent group of the current group) and a next track.

The media player is in a state, which will be one of playing, paused, seeking or inactive. When playing, playback happens at a given playback speed, and the tracks are played according to the playing order, which is one of the playing orders supported. Track changes are signalled as notifications of the track changed characteristic. When seeking (fast forward or fast rewind), the track position is moved according to the seeking speed.

The opcodes supported tells which operations are supported by the player by writing to the media control point. There is also a search control point that allows to search for groups and tracks according to various criteria, with the result returned in the search results.
Finally, the content control ID is used to associate the media player with an audio stream.

**Media Control Client (MCP)** The media control client is used to control, and to get information from, a media control server. Control is done by writing to one of the two control points, or by writing to other writable characteristics. Getting information is done by reading characteristics, or by configuring the server to send notifications.

**Using the media control client** Before use, the media control client must be initialized by the command `mcc init`.

To achieve a connection to the peer, the `bt` commands must be used - `bt init` followed by `bt advertise on` (or `bt connect` if the server is advertising).

When the media control client is connected to a media control server, the client can discover the server’s Generic Media Control Service, by giving the command `mcc discover_mcs`. This will store the handles of the service, and (optionally, but default) subscribe to all notifications.

After discovery, the media control client can read and write characteristics, including the media control point and the search control point.

**Example usage**

**Setup**

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mcc init
MCC init complete

uart:~$ bt advertise on
Advertising started
```

**When connected** Service discovery (GMCS and included OTS):

```
uart:~$ mcc discover_mcs
<dbg> bt_mcc.bt_mcc_discover_mcs: start discovery of MCS primary service
<dbg> bt_mcc.discover_primary_func: [ATTRIBUTE] handle 0x00ae
<dbg> bt_mcc.discover_primary_func: Primary discovery complete
<dbg> bt_mcc.discover_primary_func: UUID: 2800
<dbg> bt_mcc.discover_primary_func: UUID: 8fd7
<dbg> bt_mcc.discover_primary_func: Start discovery of MCS characteristics
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b0
<dbg> bt_mcc.discover_mcs_char_func: Player name, UUID: 8fa0
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b2
<dbg> bt_mcc.discover_mcs_char_func: Icon Object, UUID: 8fa1
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b4
<dbg> bt_mcc.discover_mcs_char_func: Icon URI, UUID: 8fa2
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b6
<dbg> bt_mcc.discover_mcs_char_func: Track Changed, UUID: 8fa3
<dbg> bt_mcc.discover_mcs_char_func: Subscribing - handle: 0x00b6
[
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00ea
<dbg> bt_mcc.discover_mcs_char_func: Content Control ID, UUID: 8fb5
```

(continues on next page)
Reading characteristics - the player name and the track duration as examples:

```
uart:~$ mcc read_player_name
Player name: My media player
4d 79 20 6d 65 64 69 61 20 70 6c 61 79 65 72 |My media player
```

```
uart:~$ mcc read_track_duration
Track duration: 6300
```

Note that the value of some characteristics may be truncated due to being too long to fit in the ATT packet. Increasing the ATT MTU may help:

```
uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
```

```
uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for Alison)
```

Writing characteristics - track position as an example:

The track position is where the player “is” in the current track. Read the track position, change it by writing to it, confirm by reading it again.

```
uart:~$ mcc read_track_position
Track Position: 0
```

```
uart:~$ mcc set_track_position 500
Track Position: 500
```

```
uart:~$ mcc read_track_position
Track Position: 500
```

Controlling the player via the control point:

Writing to the control point allows the client to request the server to do operations like play, pause, fast forward, change track, change group and so on. Some operations (e.g. goto track) take an argument. Currently, raw opcode values are used as input to the control point shell command. These opcode values can be found in the mpl.h header file.
Send the play command (opcode “1”), the command to go to track (opcode “52”) number three, and the pause command (opcode “2”):

```
uart:~$ mcc set_cp 1
Media State: 1
Operation: 1, result: 1
Operation: 1, param: 0

uart:~$ mcc set_cp 52 3
Track changed
Track title: Interlude #3 (Levanto Seventy)
Track duration: 7800
Track Position: 0
Current Track Object ID: 0x000000000104
Next Track Object ID: 0x000000000105
Operation: 52, result: 1
Operation: 52, param: 3

uart:~$ mcc set_cp 2
Media State: 2
Operation: 2, result: 1
Operation: 2, param: 0
```

Using the included object transfer client When object transfer is supported by both the client and the server, a larger set of characteristics is available. These include object IDs for the various track and group objects. These IDs can be used to select and download the corresponding objects from the server's object transfer service.

Read the object ID of the current group object:

```
uart:~$ mcc read_current_group_obj_id
Current Group Object ID: 0x000000000107
```

Select the object with that ID:

```
uart:~$ mcc ots_select 0x107
Selecting object succeeded
```

Read the object's metadata:

```
uart:~$ mcc ots_read_metadata
Reading object metadata succeeded
<inf> bt_mcc: Object's meta data:
<inf> bt_mcc: Current size :35
<inf> bt_ots: --- Displaying 1 metadata records ---
<inf> bt_ots: Object ID: 0x000000000107
<inf> bt_ots: Object name: Joe Pass - Guitar Inte
<inf> bt_ots: Object Current Size: 35
<inf> bt_ots: Object Allocate Size: 35
<inf> bt_ots: Type: Group Obj Type
<inf> bt_ots: Properties:0x4
<inf> bt_ots: - read permitted
```

Read the object itself:

The object received is a group object. It consists of a series of records consisting of a type (track or group) and an object ID.

6.1. Bluetooth
uart:~$ mcc ots_read_current_group_object
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000102
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000103
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000104
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000105
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000106

Search

The search control point takes as its input a sequence of search control items, each consisting of length, type (e.g. track name or artist name) and parameter (the track name or artist name to search for). If the result is successful, the search results are stored in an object in the object transfer service. The ID of the search results ID object can be read from the search results object ID characteristic. The search result object can then be downloaded as for the current group object above. (Note that the search results object ID is empty until a search has been done.)

This implementation has a working implementation of the search functionality interface and the server-side search control point parameter parsing. But the actual searching is faked, the same results are returned no matter what is searched for.

There are two commands for search, one (mcc set_scp_raw) allows to input the search control point parameter (the sequence of search control items) as a string. The other (mcc set_scp_ioptest) does preset IOP test searches and takes the round number of the IOP search control point test as a parameter.

Before the search, the search results object ID is empty

uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000000
<dbg> bt_mcc.mcc_read_search_results_obj_id_cb: Zero-length Search Results Object ID

Run the search corresponding to the fourth round of the IOP test:

The search control point parameter generated by this command and parameter has one search control item. The length field (first octet) is 16 (0x10). (The length of the length field itself is not included.) The type field (second octet) is 0x04 (search for a group name). The parameter (the group name to search for) is “TSPX_Group_Name”.

uart:~$ mcc set_scp_ioptest 4
Search string:
00000000: 10 04 54 53 50 4f 75 70 5f 4e 61 6d |..TSPX_G roup_Nam|
00000010: 65 |e |
Search control point notification result code: 1
Search Results Object ID: 0x000000000107
Search Control Point set

After the successful search, the search results object ID has a value:

uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000107

Media Control Service (MCS)

The media control service (mcs) and the associated media player (mpl) typically reside on devices that can provide access to, and serve, media content, like PCs and smartphones.

As mentioned above, the media player (mpl) has the player logic, while the media control service (mcs) has the GATT-based interface. This separation is done so that the media player can also be used without the GATT-based interface.
Using the media control service and the media player  The media control service and the media player are in general controlled remotely, from the media control client.

Before use, the media control client must be initialized by the command mpl init.

As for the client, the bt commands are used for connecting - bt init followed by bt connect <address> <address type> (or bt advertise on if the server is advertising).

Example Usage

Setup

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mpl init
[Large amounts of debug output]

uart:~$ bt connect F9:33:3B:67:D2:A7 (random)
Connection pending
Connected: F9:33:3B:67:D2:A7 (random)
```

When connected  Control is done from the client.

The server will give debug output related to the various operations performed by the client.

Example: Debug output by the server when the client gives the “next track” command:

```
[00:13:29.932,373] <dbg> bt_mcs.control_point_write: Opcode: 49
[00:13:29.932,403] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,495] <dbg> bt_mpl.do_next_track: Track ID before: 0x000000000104
[00:13:29.932,586] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,617] <dbg> bt_mcs.mpl_track_changed_cb: Notifying track change
[00:13:29.932,800] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 13500
[00:13:29.932,861] <dbg> bt_mcs.mpl_operation_cb: Notifying control point - opcode: 49, result: 1
```

Some server commands are available. These commands force notifications of the various characteristics, for testing that the client receives notifications. The values sent in the notifications caused by these testing commands are independent of the media player, so they do not correspond the actual values of the characteristics nor to the actual state of the media player.

Example: Force (fake value) notification of the track duration:

```
uart:~$ mpl duration_changed_cb
[00:15:17.491,058] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 12000
```

6.1. Bluetooth
Bluetooth: Telephone and Media Audio Profile Shell

This document describes how to run the Telephone and Media Audio Profile functionality. Unlike most other low-layer profiles, TMAP is a profile that exists and has a service (TMAS) on all devices. Thus both the initiator and acceptor (or central and peripheral) should do a discovery of the remote device's TMAS to see what TMAP roles they support.

Using the TMAP Shell  When the Bluetooth stack has been initialized (bt init), the TMAS can be registered by by calling tmap init.

<td>:Discover TMAS on remote device</td>
</tr>
</tbody>
</table>

6.1.11 Bluetooth Shell

The Bluetooth Shell is an application based on the Shell module. It offer a collection of commands made to easily interact with the Bluetooth stack.

Bluetooth Shell Setup and Usage

First you need to build and flash your board with the Bluetooth shell. For how to do that, see the Getting Started Guide. The Bluetooth shell itself is located in tests/bluetooth/shell/.

When it's done, connect to the CLI using your favorite serial terminal application. You should see the following prompt:

```
uart:~$
```

For more details on general usage of the shell, see Shell.

The first step is enabling Bluetooth. To do so, use the bt init command. The following message is printed to confirm Bluetooth has been initialized.

```
uart:~$ bt init
Bluetooth initialized
Settings Loaded
[00:02:26.771,148] <inf> fs_nvs: nvs_mount: 8 Sectors of 4096 bytes
[00:02:26.771,148] <inf> fs_nvs: nvs_mount: alloc wra: 0, fe8
[00:02:26.771,179] <inf> fs_nvs: nvs_mount: data wra: 0, 0
    → (0x0002)
[00:02:26.778,015] <inf> bt_hci_core: hci_vs_init: HW Variant: nRF52x (0x0002)
[00:02:26.778,045] <inf> bt_hci_core: hci_vs_init: Firmware: Standard Bluetooth controller (0x00) Version 3.2 Build 99
[00:02:26.778,656] <inf> bt_hci_core: bt_init: No ID address. App must call settings_load()
[00:02:26.778,666] <inf> bt_hci_core: bt_init: No ID address. App must call settings_load()
[00:02:26.794,799] <inf> bt_hci_core: bt_dev_show_info: LMP: version 5.3 (0x0c)
```

2062 Chapter 6. Connectivity
Identities

Identities are a Zephyr host concept, allowing a single physical device to behave like multiple logical Bluetooth devices.

The shell allows the creation of multiple identities, to a maximum that is set by the Kconfig symbol CONFIG_BT_ID_MAX. To create a new identity, use `bt id-create` command. You can then use it by selecting it with its ID `bt id-select <id>`. Finally, you can list all the available identities with `id-show`.

Scan for devices

Start scanning by using the `bt scan on` command. Depending on the environment you're in, you may see a lot of lines printed on the shell. To stop the scan, run `bt scan off`, the scrolling should stop.

Here is an example of what you can expect:

```
uart:~$ bt scan on
Bluetooth active scan enabled
[DEVICE]: CB:01:1A:2D:6E:AE (random), AD evt type 0, RSSI -78 C:1 S:1 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 20:C2:EE:59:85:5B (random), AD evt type 3, RSSI -62 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: E3:72:76:87:2F:E8 (random), AD evt type 3, RSSI -74 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 1E:19:25:8A:CB:84 (random), AD evt type 3, RSSI -67 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 26:42:F3:D5:A0:86 (random), AD evt type 3, RSSI -73 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 0C:61:D1:B9:5D:9E (random), AD evt type 3, RSSI -87 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 20:C2:EE:59:85:5B (random), AD evt type 3, RSSI -66 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 25:3F:7A:EE:0F:55 (random), AD evt type 3, RSSI -83 C:0 S:0 D:0 SR:0 E:0
  → Prim: LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
uart:~$ bt scan off
Scan successfully stopped
```

As you can see, this can lead to a high number of results. To reduce that number and easily find a specific device, you can enable scan filters. There are four types of filters: by name, by RSSI, by address and by periodic advertising interval. To apply a filter, use the `bt scan-set-filter` command followed by the type of filters. You can add multiple filters by using the commands again.

For example, if you want to look only for devices with the name `test shell`:

```
uart:~$ bt scan-filter-set name "test shell"
```

Or if you want to look for devices at a very close range:

```
uart:~$ bt scan-filter-set rssi -40
RSSI cutoff set at -40 dB
```

Finally, if you want to remove all filters:

```
uart:~$ bt scan-filter-clear all
```

You can use the command `bt scan on` to create an active scanner, meaning that the scanner will ask the advertisers for more information by sending a scan request packet. Alternatively, you can create a passive scanner by using the `bt scan passive` command, so the scanner will not ask the advertiser for more information.
Connecting to a device

To connect to a device, you need to know its address and type of address and use the `bt connect` command with the address and the type as arguments.

Here is an example:

```
Connection pending
Remote LMP version 5.3 (0x0c) subversion 0xffff manufacturer 0x05f1
LE Features: 0x000000000001412f
LE PHY updated: TX PHY LE 2M, RX PHY LE 2M
LE conn param req: int (0x0018, 0x0028) lat 0 to 42
LE conn param updated: int 0x0028 lat 0 to 42
```

You can list the active connections of the shell using the `bt connections` command. The shell maximum number of connections is defined by `CONFIG_BT_MAX_CONN`. You can disconnect from a connection with the `bt disconnect <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` command.

**Note:** If you were scanning just before, you can connect to the last scanned device by simply running the `bt connect` command.

Alternatively, you can use the `bt connect-name <name>` command to automatically enable scanning with a name filter and connect to the first match.

Advertising

Begin advertising by using the `bt advertise on` command. This will use the default parameters and advertise a resolvable private address with the name of the device. You can choose to use the identity address instead by running the `bt advertise on identity` command. To stop advertising use the `bt advertise off` command.

To enable more advanced features of advertising, you should create an advertiser using the `bt adv-create` command. Parameters for the advertiser can be passed either at the creation of it or by using the `bt adv-param` command. To begin advertising with this newly created advertiser, use the `bt adv-start` command, and then the `bt adv-stop` command to stop advertising.

When using the custom advertisers, you can choose if it will be connectable or scannable. This leads to four options: `conn-scan`, `conn-nscan`, `nconn-scan` and `nconn-nscan`. Those parameters are mandatory when creating an advertiser or updating its parameters.

For example, if you want to create a connectable and scannable advertiser and start it:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x200022f0
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

You may notice that with this, the custom advertiser does not advertise the device name; you need to enable it. Continuing from the previous example:

```
uart:~$ bt adv-stop
Advertiser set stopped
uart:~$ bt adv-param conn-scan name
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```
You should now see the name of the device in the advertising data. You can also set the advertising data manually by using the `bt adv-data` command. The following example shows how to set the advertiser name with it:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x20002348
uart:~$ bt adv-data 1009426C7565746F6F7272656E656C6C
uart:~$ bt adv-start
Advertise[0] 0x20002348 set started
```

The data must be formatted according to the Bluetooth Core Specification (see version 5.3, vol. 3, part C, 11). In this example, the first octet is the size of the data (the data and one octet for the data type), the second one is the type of data, 0x09 is the Complete Local Name and the remaining data are the name in ASCII. So, on the other device you should see the name `Bluetooth-Shell`.

When advertising, if others devices use an active scanner, you may receive scan request packets. To visualize those packets, you can add scan-reports to the parameters of your advertiser.

### Directed Advertising

It is possible to use directed advertising on the shell if you want to reconnect to a device. The following example demonstrates how to create a directed advertiser with the address specified right after the parameter `directed`. The `low` parameter indicates that we want to use the low duty cycle mode, and the `dir-rpa` parameter is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement.

```
uart:~$ bt adv-create conn-scan directed D7:54:03:CE:F3:B4 random low dir-rpa
Created adv id: 0, adv: 0x20002348
```

After that, you can start the advertiser and then the target device will be able to reconnect.

### Extended Advertising

Let's now have a look at some extended advertising features. To enable extended advertising, use the `ext-adv` parameter.

```
uart:~$ bt adv-create conn-nscan ext-adv name-ad
Created adv id: 0, adv: 0x200022f0
uart:~$ bt adv-start
Advertise[0] 0x200022f0 set started
```

This will create an extended advertiser, that is connectable and non-scannable.

### Filter Accept List

It's possible to create a list of allowed addresses that can be used to connect to those addresses automatically. Here is how to do it:

```
uart:~$ bt fal-add 66:C8:80:2A:05:73 random
uart:~$ bt fal-connect on
```

The shell will then connect to the first available device. In the example, if both devices are advertising at the same time, we will connect to the first address added to the list.

The Filter Accept List can also be used for scanning or advertising by using the option `fal`. For example, if we want to scan for a bunch of selected addresses, we can set up a Filter Accept List:

```
uart:~$ bt fal-add 65:4B:9E:83:AF:73 random
uart:~$ bt scan on fal
```

6.1. Bluetooth
You should see only those three addresses reported by the scanner.

**Enabling security**

When connected to a device, you can enable multiple levels of security, here is the list for Bluetooth LE:

- 1 No encryption and no authentication;
- 2 Encryption and no authentication;
- 3 Encryption and authentication;
- 4 Bluetooth LE Secure Connection.

To enable security, use the `bt security <level>` command. For levels requiring authentication (level 3 and above), you must first set the authentication method. To do it, you can use the `bt auth all` command. After that, when you will set the security level, you will be asked to confirm the passkey on both devices. On the shell side, do it with the command `bt auth-passkey-confirm`.

**Pairing** Enabling authentication requires the devices to be bondable. By default the shell is bondable. You can make the shell not bondable using `bt bondable off`. You can list all the devices you are paired with using the command `bt bonds`.

The maximum number of paired devices is set using `CONFIG_BT_MAX_PAIRED`. You can remove a paired device using `bt clear <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` or remove all paired devices with the command `bt clear all`.

**GATT**

The following examples assume that you have two devices already connected.

To perform service discovery on the client side, use the `gatt discover` command. This should print all the services that are available on the GATT server.

On the server side, you can register pre-defined test services using the `gatt register` command. When done, you should see the newly added services on the client side when running the discovery command.

You can now subscribe to those new services on the client side. Here is an example on how to subscribe to the test service:

```
uart:~$ gatt subscribe 26 25
Subscribed
```

The server can now notify the client with the command `gatt notify`.

Another option available through the GATT command is initiating the MTU exchange. To do it, use the `gatt exchange-mtu` command. To update the shell maximum MTU, you need to update Kconfig symbols in the configuration file of the shell. For more details, see `bluetooth_mtu_update_sample`.

**L2CAP**

The `l2cap` command exposes parts of the L2CAP API. The following example shows how to register a LE PSM, connect to it from another device and send 3 packets of 14 octets each.

The example assumes that the two devices are already connected.

On device A, register the LE PSM:

```
uart:~$ l2cap register 29
L2CAP psm 41 sec_level 1 registered
```
On device B, connect to the registered LE PSM and send data:

```
uart:~$ l2cap connect 29
Chan sec: 1
L2CAP connection pending
Channel 0x20000210 connected
Channel 0x20000210 status 1
uart:~$ l2cap send 3 14
Rem 2
Rem 1
Rem 0
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
```

On device A, you should have received the data:

```
Incoming conn 0x20002398
Channel 0x20000210 status 1
Channel 0x20000210 connected
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff ff ff ff ff ff ff |........ ...... |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff ff ff ff ff ff ff |........ ...... |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff ff ff ff ff ff ff |........ ...... |
```

**Logging**

You can configure the logging level per module at runtime. This depends on the maximum logging level that is compiled in. To configure, use the `log` command. Here are some examples:

- List the available modules and their current logging level

```
uart:~$ log status
```

- Disable logging for `bt_hci_core`

```
uart:~$ log disable bt_hci_core
```

- Enable error logs for `bt_att` and `bt_smp`

```
uart:~$ log enable err bt_att bt_smp
```

- Disable logging for all modules

```
uart:~$ log disable
```

- Enable warning logs for all modules

```
uart:~$ log enable wrn
```
6.2 Networking

The networking section contains information regarding the network stack of the Zephyr kernel. Use the information to understand the principles behind the operation of the stacks and how they were implemented.

6.2.1 Overview

**Supported Features**

- **Source Tree Layout**

`Supported Features`

**IPv6**
The support for IPv6 is enabled by default. Various IPv6 sub-options can be enabled or disabled depending on networking needs.

- Developer can set the number of unicast and multicast IPv6 addresses that are active at the same time.
- The IPv6 address for the device can be set either statically or dynamically using SLAAC (Stateless Address Auto Configuration) (RFC 4862).
- The system also supports multiple IPv6 prefixes and the maximum IPv6 prefix count can be configured at build time.
- The IPv6 neighbor cache can be disabled if not needed, and its size can be configured at build time.
- The IPv6 neighbor discovery support (RFC 4861) is enabled by default.
- Multicast Listener Discovery v2 support (RFC 3810) is enabled by default.
- IPv6 header compression (6lo) is available for IPv6 connectivity for Bluetooth IPSP (RFC 7668) and IEEE 802.15.4 networks (RFC 4944).

**IPv4**
The legacy IPv4 is supported by the networking stack. It cannot be used by IEEE 802.15.4 or Bluetooth IPSP as those network technologies support only IPv6. IPv4 can be used in Ethernet based networks. By default IPv4 support is disabled.

- DHCP (Dynamic Host Configuration Protocol) client is supported (RFC 2131).
- The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.

**Dual stack support**
The networking stack allows a developer to configure the system to use both IPv6 and IPv4 at the same time.

**UDP**
User Datagram Protocol (RFC 768) is supported. The developer can send UDP datagrams (client side support) or create a listener to receive UDP packets destined to certain port (server side support).

**TCP**
Transmission Control Protocol (RFC 793) is supported. Both server and client roles can be used the the application. The amount of TCP sockets that are available to applications can be configured at build time.

**BSD Sockets API**
Support for a subset of a BSD sockets compatible API is implemented. Both blocking and non-blocking datagram (UDP) and stream (TCP) sockets are supported.
• **Secure Sockets API** Experimental support for TLS/DTLS secure protocols and configuration options for sockets API. Secure functions for the implementation are provided by mbedTLS library.

• **MQTT** Message Queue Telemetry Transport (ISO/IEC PRF 20922) is supported. A sample mqtt-publisher-sample client application for MQTT v3.1.1 is implemented.

• **CoAP** Constrained Application Protocol (RFC 7252) is supported. Both coap-client-sample and coap-server-sample sample applications are implemented.

• **LWM2M** OMA Lightweight Machine-to-Machine Protocol (LwM2M specification 1.0.2) is supported via the “Bootstrap”, “Client Registration”, “Device Management & Service Enablement” and “Information Reporting” interfaces. The required core LwM2M objects are implemented as well as several IPSO Smart Objects. (LwM2M specification 1.1.1) is supported in similar manner when enabled with a Kconfig option. lwm2m-client-sample implements the library as an example.

• **DNS** Domain Name Service (RFC 1035) client functionality is supported. Applications can use the DNS API to query domain name information or IP addresses from the DNS server. Both IPv4 (A) and IPv6 (AAAA) records can be queried. Both multicast DNS (mDNS) (RFC 6762) and link-local multicast name resolution (LLMNR) (RFC 4795) are supported.

• **Network Management API**. Applications can use network management API to listen management events generated by core stack when for example IP address is added to the device, or network interface is coming up etc.

• **Wi-Fi Management API**. Applications can use Wi-Fi management API to manage the interface, in example to connect to Wi-Fi network and to scan available Wi-Fi networks.

• **Wi-Fi Network Manager API**. Wi-Fi Network Managers can now register themselves to the Wi-Fi stack. The Network Managers can then implement the Wi-Fi Management API and manage the Wi-Fi interface.

• **Multiple Network Technologies**. The Zephyr OS can be configured to support multiple network technologies at the same time simply by enabling them in Kconfig: for example, Ethernet, Wi-Fi and 802.15.4 support. Note that no automatic IP routing functionality is provided between these technologies. Applications can send data according to their needs to desired network interface.

• **Minimal Copy Network Buffer Management**. It is possible to have minimal copy network data path. This means that the system tries to avoid copying application data when it is sent to the network.

• **Virtual LAN support**. Virtual LANs (VLANs) allow partitioning of physical ethernet networks into logical networks. See VLAN support for more details.

• **Network traffic classification**. The sent and received network packets can be prioritized depending on application needs. See traffic classification for more details.

• **Time Sensitive Networking**. The gPTP (generalized Precision Time Protocol) is supported. See gPTP support for more details.

• **Network shell**. The network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. The net-shell is useful when developing network software. See network shell for more details.

Additionally these network technologies (link layers) are supported in Zephyr OS v1.7 and later:

• IEEE 802.15.4

• Bluetooth

• Ethernet

• SLIP (IP over serial line). Used for testing with QEMU. It provides ethernet interface to host system (like Linux) and test applications can be run in Linux host and send network data to Zephyr OS device.
Source Tree Layout

The networking stack source code tree is organized as follows:

subsys/net/ip/
   This is where the IP stack code is located.

subsys/net/l2/
   This is where the IP stack layer 2 code is located. This includes generic support for Bluetooth IPSP adaptation, Ethernet, IEEE 802.15.4 and Wi-Fi.

subsys/net/lib/
   Application-level protocols (DNS, MQTT, etc.) and additional stack components (BSD Sockets, etc.).

include/net/
   Public API header files. These are the header files applications need to include to use IP networking functionality.

tsamples/net/
   Sample networking code. This is a good reference to get started with network application development.

tests/net/
   Test applications. These applications are used to verify the functionality of the IP stack, but are not the best source for sample code (see samples/net instead).

6.2.2 Network Stack Architecture

Network Packet Processing Statistics

This page describes how to get information about network packet processing statistics inside network stack.

Network stack contains infrastructure to figure out how long the network packet processing takes either in sending or receiving path. There are two Kconfig options that control this. For transmit (TX) path the option is called CONFIG_NET_PKT_TXTIME_STATS and for receive (RX) path the options is called CONFIG_NET_PKT_RXTIME_STATS. Note that for TX, all kind of network packet statistics is collected. For RX, only UDP, TCP or raw packet type network packet statistics is collected.

After enabling these options, the net stats network shell command will show this information:

<table>
<thead>
<tr>
<th></th>
<th>TX net_pkt</th>
<th>RX net_pkt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg TX net_pkt (11484) time</td>
<td>67 us</td>
<td>43 us</td>
</tr>
</tbody>
</table>

Note: The values above and below are from emulated qemu_x86 board and UDP traffic

The TX time tells how long it took for network packet from its creation to when it was sent to the network. The RX time tells the time from its creation to when it was passed to the application. The values are in microseconds. The statistics will be collected per traffic class if there are more than one transmit or receive queues defined in the system. These are controlled by CONFIG_NET_TC_TX_COUNT and CONFIG_NET_TC_RX_COUNT options.

If you enable CONFIG_NET_PKT_TXTIME_STATS_DETAIL or CONFIG_NET_PKT_RXTIME_STATS_DETAIL options, then additional information for TX or RX network packets are collected when the network packet traverses the IP stack.

After enabling these options, the net stats will show this information:
The numbers inside the brackets contain information how many microseconds it took for a network packet to go from previous state to next.

In the TX example above, the values are averages over 18902 packets and contain this information:

- Packet was created by application so the time is 0.
- Packet is about to be placed to transmit queue. The time it took from network packet creation to this state, is 22 microseconds in this example.
- The correct TX thread is invoked, and the packet is read from the transmit queue. It took 15 microseconds from previous state.
- The network packet was just sent and the network stack is about to free the network packet. It took 23 microseconds from previous state.
- In total it took on average 60 microseconds to get the network packet sent. The value 63 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

In the RX example above, the values are averages over 18892 packets and contain this information:

- Packet was created network device driver so the time is 0.
- Packet is about to be placed to receive queue. The time it took from network packet creation to this state, is 9 microseconds in this example.
- The correct RX thread is invoked, and the packet is read from the receive queue. It took 6 microseconds from previous state.
- The network packet is then processed and placed to correct socket queue. It took 11 microseconds from previous state.
- The last value tells how long it took from there to the application. Here the value is 13 microseconds.
- In total it took on average 39 microseconds to get the network packet sent. The value 42 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

The Zephyr network stack is a native network stack specifically designed for Zephyr OS. It consists of layers, each meant to provide certain services to other layers. Network stack functionality is highly configurable via Kconfig options.

- **High level overview of the network stack**
- **Network data flow**
  - Data receiving (RX)
  - Data sending (TX)
- **Network packet processing statistics**

### High level overview of the network stack

The network stack is layered and consists of the following parts:

- **Network Application.** The network application can either use the provided application-level protocol libraries or access the BSD socket API directly to create a network connection, send or receive data, and close a connection. The application can also use the network management API to configure the network and set related parameters such as network link options, starting a scan (when
Fig. 12: Network stack overview
applicable), listen network configuration events, etc. The network interface API can be used to set IP address to a network interface, taking the network interface down, etc.

• **Network Protocols.** This provides implementations for various protocols such as
  – Application-level network protocols like CoAP, LWM2M, and MQTT. See [application protocols chapter](#) for information about them.
  – Core network protocols like IPv6, IPv4, UDP, TCP, ICMPv4, and ICMPv6. You access these protocols by using the [BSD socket API](#).

• **Network Interface Abstraction.** This provides functionality that is common in all the network interfaces, such as setting network interface down, etc. There can be multiple network interfaces in the system. See [network interface overview](#) for more details.

• **L2 Network Technologies.** This provides a common API for sending and receiving data to and from an actual network device. See [L2 overview](#) for more details. These network technologies include Ethernet, IEEE 802.15.4, Bluetooth, CANBUS, etc. Some of these technologies support IPv6 header compression (6Lo), see RFC 6282 for details. For example ARP for IPv4 is done by the Ethernet component.

• **Network Device Drivers.** The actual low-level device drivers handle the physical sending or receiving of network packets.

**Network data flow**

An application typically consists of one or more threads that execute the application logic. When using the [BSD socket API](#), the following things will happen.

**Data receiving (RX)**

1. A network data packet is received by a device driver.
2. The device driver allocates enough network buffers to store the received data. The network packet is placed in the proper RX queue (implemented by `k_fifo`). By default there is only one receive queue in the system, but it is possible to have up to 8 receive queues. These queues will process incoming packets with different priority. See [Traffic Classification](#) for more details. The receive queues also act as a way to separate the data processing pipeline (bottom-half) as the device driver is running in an interrupt context and it must do its processing as fast as possible.
3. The network packet is then passed to the correct L2 driver. The L2 driver can check if the packet is proper and modify it if needed, e.g. strip L2 header and frame check sequence, etc.
4. The packet is processed by a network interface. The network statistics are collected if enabled by `CONFIG_NET_STATISTICS`.
5. The packet is then passed to L3 processing. If the packet is IP based, then the L3 layer checks if the packet is a proper IPv6 or IPv4 packet.
6. A socket handler then finds an active socket to which the network packet belongs and puts it in a queue for that socket, in order to separate the networking code from the application. Typically the application is run in userspace context and the network stack is run in kernel context.
7. The application will then receive the data and can process it as needed. The application should have used the [BSD socket API](#) to create a socket that will receive the data.

**Data sending (TX)**

1. The application should use the [BSD socket API](#) when sending the data.
2. The application data is prepared for sending to kernel space and then copied to internal net_buf structures.
Packet received from the network
1
Allocate buffers and put packet to RX queue
2
Network packet passed to correct L2 driver, Ethernet headers stripped and packet checked
3
Passed to Network Interface for further processing
4
IPv4 headers parsed and stripped
5
UDP headers parsed and stripped. Packet added to socket queue
6
Packet retrieved from socket queue. Data copied into application buffers.
7
Recv returns
8
Receiving UDP packet

Fig. 13: Network RX data flow
6.2. Networking

Device driver retrieves packet from the FIFO and sends it to the network.

Data physically sent

The network packet is classified and placed to proper transmit queue. Packet checked and L2 headers for the network packet are added.

UDP protocol header is added in front of the data.

The network stack checks if interface is set up and enabled and sends the data.

Net_packet structure created, user data copied to it. Packet marshalled to kernel space.

Application calls send() from socket API.

IPv4 headers added in front.

IPv4 Header Compression

Fig. 14: Network TX data flow
3. Depending on the socket type, a protocol header is added in front of the data. For example, if the socket is a UDP socket, then a UDP header is constructed and placed in front of the data.

4. An IP header is added to the network packet for a UDP or TCP packet.

5. The network stack will check that the network interface is properly set for the network packet, and also will make sure that the network interface is enabled before the data is queued to be sent.

6. The network packet is then classified and placed to the proper transmit queue (implemented by `k_fifo`). By default there is only one transmit queue in the system, but it is possible to have up to 8 transmit queues. These queues will process the sent packets with different priority. See Traffic Classification for more details. After the transmit packet classification, the packet is checked by the correct L2 layer module. The L2 module will do additional checks for the data and it will also create any L2 headers for the network packet. If everything is ok, the data is given to the network device driver to be sent out.

7. The device driver will send the packet to the network.

Note that in both the TX and RX data paths, the queues (`k_fifos`) form separation points where data is passed from one thread to another. These threads might run in different contexts (kernel vs. userspace) and with different priorities.

**Network packet processing statistics**

See information about network processing statistics [here](#).

### 6.2.3 Network Connectivity API

Applications should use the BSD socket API defined in `include/zephyr/net/socket.h` to create a connection, send or receive data, and close a connection. The same API can be used when working with UDP or TCP data. See BSD socket API for more details.

See sockets-echo-server-sample and sockets-echo-client-sample applications how to create a simple server or client BSD socket based application.

The legacy connectivity API in `include/zephyr/net/net_context.h` should not be used by applications.

### 6.2.4 Networking with the host system

Networking with native_posix board

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in native_posix board
  - Step 3 - Connect to console (optional)

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a native_posix board.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in native_posix board. The Zephyr native_posix board instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.
Prerequisites  On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

Basic Setup  For the steps below, you will need three terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminal #3 is the console to the running Zephyr native_posix instance (optional).

Step 1 - Create Ethernet interface  Before starting native_posix with network emulation, a network interface should be created.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

Step 2 - Start app in native_posix board  Build and start the `echo_server` sample application.

In terminal #2, type:

```
west build -b native_posix samples/net/sockets/echo_server
west build -t run
```

Step 3 - Connect to console (optional)  The console window should be launched automatically when the Zephyr instance is started but if it does not show up, you can manually connect to the console. The native_posix board will print a string like this when it starts:

```
UART connected to pseudotty: /dev/pts/5
```

You can manually connect to it like this:

```
screen /dev/pts/5
```

Networking with QEMU Ethernet

- Prerequisites
- Basic Setup
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in QEMU board

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in QEMU.
In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The Zephyr instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

**Prerequisites** On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
$ git clone https://github.com/zephyrproject-rtos/net-tools
```

**Basic Setup** For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.

When configuring the Zephyr instance, you must select the correct Ethernet driver for QEMU connectivity:

- For `qemu_x86`, select Intel(R) PRO/1000 Gigabit Ethernet driver Ethernet driver. Driver is called `e1000` in Zephyr source tree.
- For `qemu_cortex_m3`, select TI Stellaris MCU family ethernet driver Ethernet driver. Driver is called `stellaris` in Zephyr source tree.
- For `mps2_an385`, select SMSC911x/9220 Ethernet driver Ethernet driver. Driver is called `smsc911x` in Zephyr source tree.
- For `qemu_cortex_a53`, Intel(R) PRO/1000 Gigabit Ethernet driver Ethernet driver is selected by default.

**Step 1 - Create Ethernet interface** Before starting QEMU with network connectivity, a network interface should be created in the host system.

In terminal #1, type:

```bash
$ ./net-setup.sh
```

You can tweak the behavior of the `net-setup.sh` script. See various options by running `net-setup.sh` like this:

```bash
$ ./net-setup.sh --help
```

**Step 2 - Start app in QEMU board** Build and start the sockets-echo-server-sample sample application. In this example, the `qemu_x86` board is used.

In terminal #2, type:

```bash
$ west build -b qemu_x86 samples/net/sockets/echo_server -- -DEXTRA_CONF_FILE=overlay-e1000.conf
$ west build -t run
```

Exit QEMU by pressing CTRL+A x.

**Networking with QEMU**
This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a QEMU virtual machine (built for Zephyr targets such as qemu_x86 and qemu_cortex_m3). Some virtual ARM boards (such as qemu_cortex_a53) only support a single UART, in this case QEMU Ethernet is preferred, see Networking with QEMU Ethernet for details.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The QEMU instance is connected to a Linux host using a serial port, and SLIP is used to transfer data between the Zephyr application and Linux (over a chain of virtual connections).

### Prerequisites
On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
git clone https://github.com/zephyrproject-rtos/net-tools
cd net-tools
make
```

Note: If you get an error about AX_CHECK_COMPILE_FLAG, install package autoconf-archive package on Debian/Ubuntu.

### Basic Setup
For the steps below, you will need at least 4 terminal windows:

- Terminal #1 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminals #2, #3, and #4 are terminal windows with net-tools being the current directory (cd net-tools)

### Step 1 - Create helper socket
Before starting QEMU with network emulation, a Unix socket for the emulation should be created.

In terminal #2, type:

```bash
./loop-socat.sh
```
Step 2 - Start TAP device routing daemon

In terminal #3, type:

```
sudo ./loop-slip-tap.sh
```

For applications requiring DNS, you may need to restart the host’s DNS server at this point, as described in *Setting up Zephyr and NAT/masquerading on host to access Internet*.

Step 3 - Start app in QEMU

Build and start the *echo_server* sample application.

In terminal #1, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server
west build -t run
```

If you see an error from QEMU about unix:/tmp/slip.sock, it means you missed Step 1 above.

Step 4 - Run apps on host

Now in terminal #4, you can run various tools to communicate with the application running in QEMU.

You can start with pings:

```
ping 192.0.2.1
ping6 2001:db8::1
```

You can use the netcat (“nc”) utility, connecting using UDP:

```
echo foobar | nc -6 -u 2001:db8::1 4242
```

If *echo_server* is compiled with TCP support (now enabled by default for the *echo_server* sample, `CONFIG_NET_TCP=y`):

```
echo foobar | nc -u 192.0.2.1 4242
```

```
echo foobar | nc -6 -q2 2001:db8::1 4242
```

**Note:** Use Ctrl+C to exit.

You can also use the telnet command to achieve the above.

Step 5 - Stop supporting daemons

When you are finished with network testing using QEMU, you should stop any daemons or helpers started in the initial steps, to avoid possible networking or routing problems such as address conflicts in local network interfaces. For example, stop them if you switch from testing networking with QEMU to using real hardware, or to return your host laptop to normal Wi-Fi use.

To stop the daemons, press Ctrl+C in the corresponding terminal windows (you need to stop both *loop-slip-tap.sh* and *loop-socat.sh*).

Exit QEMU by pressing CTRL+A x.

Setting up Zephyr and NAT/masquerading on host to access Internet

To access the internet from a Zephyr application, some additional setup on the host may be required. This setup is common for both application running in QEMU and on real hardware, assuming that a development board is connected to the development host. If a board is connected to a dedicated router, it should not be needed.
To access the internet from a Zephyr application using IPv4, a gateway should be set via DHCP or configured manually. For applications using the “Settings” facility (with the config option `CONFIG_NET_CONFIG_SETTINGS` enabled), set the `CONFIG_NET_CONFIG_MY_IPV4_GW` option to the IP address of the gateway. For apps not using the “Settings” facility, set up the gateway by calling the `net_if_ipv4_set_gw()` at runtime.

To access the internet from a custom application running in QEMU, NAT (masquerading) should be set up for QEMU’s source address. Assuming `192.0.2.1` is used, the following command should be run as root:

```
iptables -t nat -A POSTROUTING -j MASQUERADE -s 192.0.2.1
```

Additionally, IPv4 forwarding should be enabled on the host, and you may need to check that other firewall (iptables) rules don’t interfere with masquerading. To enable IPv4 forwarding the following command should be run as root:

```
sysctl -w net.ipv4.ip_forward=1
```

Some applications may also require a DNS server. A number of Zephyr-provided samples assume by default that the DNS server is available on the host (IP `192.0.2.2`), which, in modern Linux distributions, usually runs at least a DNS proxy. When running with QEMU, it may be required to restart the host’s DNS, so it can serve requests on the newly created TAP interface. For example, on Debian-based systems:

```
service dnsmasq restart
```

An alternative to relying on the host’s DNS server is to use one in the network. For example, `8.8.8.8` is a publicly available DNS server. You can configure it using `CONFIG_DNS_SERVER1` option.

### Network connection between two QEMU VMs

Unlike the VM-to-Host setup described above, VM-to-VM setup is automatic. For sample applications that support this mode (such as the `echo_server` and `echo_client` samples), you will need two terminal windows, set up for Zephyr development.

#### Terminal #1:
```
west build -b qemu_x86 samples/net/sockets/echo_server
```

This will start QEMU, waiting for a connection from a client QEMU.

#### Terminal #2:
```
west build -b qemu_x86 samples/net/sockets/echo_client
```

This will start a second QEMU instance, where you should see logging of data sent and received in both.

### Running multiple QEMU VMs of the same sample

If you find yourself wanting to run multiple instances of the same Zephyr sample application, which do not need to talk to each other, use the `QEMU_INSTANCE` argument.

Start `socat` and `tunslip6` manually (instead of using the `loop-xxx.sh` scripts) for as many instances as you want. Use the following as a guide, replacing MAIN or OTHER.

#### Terminal #1:
```
socat PTY,link=/tmp/slip.dev.MAIN UNIX-LISTEN:/tmp/slip.sock.MAIN
$ZEPHYR_BASE/../net-tools/tunslip6 -t tap.MAIN -T -s /tmp/slip.dev.MAIN 2001:db8::1/64
# Now run Zephyr
make -C build run QEMU_INSTANCE=MAIN
```
This page describes how to set up networking between a Linux host and a Zephyr application running on USB supported devices.

The board is connected to Linux host using USB cable and provides an Ethernet interface to the host. The sockets-echo-server-sample application from the Zephyr source distribution is run on supported board. The board is connected to a Linux host using a USB cable providing an Ethernet interface to the host.

Basic Setup

To communicate with the Zephyr application over a newly created Ethernet interface, we need to assign IP addresses and set up a routing table for the Linux host. After plugging a USB cable from the board to the Linux host, the cdc_ether driver registers a new Ethernet device with a provided MAC address.

You can check that network device is created and MAC address assigned by running dmesg from the Linux host.

cdc_ether 1-2.7:1.0 eth0: register 'cdc_ether' at usb-0000:00:01.2-2.7, CDC Ethernet

We need to set it up and assign IP addresses as explained in the following section.

Choosing IP addresses

To establish network connection to the board we need to choose IP address for the interface on the Linux host.

It make sense to choose addresses in the same subnet we have in Zephyr application. IP addresses usually set in the project configuration files and may be checked also from the shell with following commands. Connect a serial console program (such as puTTY) to the board, and enter this command to the Zephyr shell:

shell> net iface

Interface 0xa800e580 (Ethernet)

Link addr : 00:00:5E:00:53:00
MTU : 1500
IPv6 unicast addresses (max 2):
    fe80::200:5eff:fe00:5300 autoconf preferred infinite
    2001:db8::1 manual preferred infinite

(continues on next page)
IPv4 unicast addresses (max 1):
  192.0.2.1 manual preferred infinite

This command shows that one IPv4 address and two IPv6 addresses have been assigned to the board. We can use either IPv4 or IPv6 for network connection depending on the board network configuration.

Next step is to assign IP addresses to the new Linux host interface, in the following steps enx00005e005301 is the name of the interface on my Linux system.

Setting IPv4 address and routing

```bash
# ip address add dev enx00005e005301 192.0.2.2
# ip link set enx00005e005301 up
# ip route add 192.0.2.0/24 dev enx00005e005301
```

Setting IPv6 address and routing

```bash
# ip address add dev enx00005e005301 2001:db8::2
# ip link set enx00005e005301 up
# ip -6 route add 2001:db8::/64 dev enx00005e005301
```

Testing connection  From the host we can test the connection by pinging Zephyr IP address of the board with:

```bash
$ ping 192.0.2.1
PING 192.0.2.1 (192.0.2.1) 56(84) bytes of data.
64 bytes from 192.0.2.1: icmp_seq=1 ttl=64 time=2.30 ms
64 bytes from 192.0.2.1: icmp_seq=2 ttl=64 time=1.43 ms
64 bytes from 192.0.2.1: icmp_seq=3 ttl=64 time=2.45 ms
...```

Networking with QEMU User

- **Introduction**
- **Using SLIRP with Zephyr**
- **Limitations**

This page is intended to serve as a starting point for anyone interested in using QEMU SLIRP with Zephyr.

**Introduction**  SLIRP is a network backend which provides the complete TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As there are no dependencies on the host, SLIRP is simple to setup.

By default, QEMU uses the 10.0.2.X/24 network and runs a gateway at 10.0.2.2. All traffic intended for the host network has to travel through this gateway, which will filter out packets based on the QEMU command line parameters. This gateway also functions as a DHCP server for all GOS, allowing them to be automatically assigned with an IP address starting from 10.0.2.15.

Using SLIRP with Zephyr

In order to use SLIRP with Zephyr, the user has to set the Kconfig option to enable User Networking.

```
CONFIG_NET_QEMU_USER=y
```

Once this configuration option is enabled, all QEMU launches will use SLIRP. In the default configuration, Zephyr only enables User Networking, and does not pass any arguments to it. This means that the Guest will only be able to communicate to the QEMU gateway, and any data intended for the host machine will be dropped by QEMU.

In general, QEMU User Networking can take in a lot of arguments including,

- Information about host/guest port forwarding. This must be provided to create a communication channel between the guest and host.
- Information about network to use. This may be valuable if the user does not want to use the default 10.0.2.X network.
- Tell QEMU to start DHCP server at user-defined IP address.
- ID and other information.

As this information varies with every use case, it is difficult to come up with good defaults that work for all. Therefore, Zephyr Implementation offloads this to the user, and expects that they will provide arguments based on requirements. For this, there is a Kconfig string which can be populated by the user.

```
CONFIG_NET_QEMU_USER_EXTRA_ARGS="net=192.168.0.0/24,hostfwd=tcp::8080-:8080"
```

This option is appended as-is to the QEMU command line. Therefore, any problems with this command line will be reported by QEMU only. Here's what this particular example will do,

- Make QEMU use the 192.168.0.0/24 network instead of the default.
- Enable forwarding of any TCP data received from port 8080 of host to port 8080 of guest, and vice versa.

Limitations

If the user does not have any specific networking requirements other than the ability to access a web page from the guest, user networking (slirp) is a good choice. However, it has several limitations

- There is a lot of overhead so the performance is poor.
- The guest is not directly accessible from the host or the external network.
- In general, ICMP traffic does not work (so you cannot use ping within a guest).
- As port mappings need to be defined before launching qemu, clients which use dynamically generated ports cannot communicate with external network.
- There is a bug in the SLIRP implementation which filters out all IPv6 packets from the guest. See https://bugs.launchpad.net/qemu/+bug/1724590 for details. Therefore, IPv6 will not work with User Networking.

Networking with multiple Zephyr instances

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create configuration files
  - Step 2 - Create Ethernet interfaces
  - Step 3 - Setup network bridging
This page describes how to set up a virtual network between multiple Zephyr instances. The Zephyr instances could be running inside QEMU or could be native_posix board processes. The Linux host can be used to route network traffic between these systems.

**Prerequisites** On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

**Basic Setup** For the steps below, you will need five terminal windows:

- Terminal #1 and #2 are terminal windows with net-tools being the current directory (`cd net-tools`)
- Terminal #3, where you setup bridging in Linux host
- Terminal #4 and #5 are your usual Zephyr development terminal, with the Zephyr environment initialized.

As there are multiple ways to setup the Zephyr network, the example below uses qemu_x86 board with e1000 Ethernet controller and native_posix board to simplify the setup instructions. You can use other QEMU boards and drivers if needed, see Networking with QEMU Ethernet for details. You can also use two or more native_posix board Zephyr instances and connect them together.

**Step 1 - Create configuration files** Before starting QEMU with network connectivity, a network interfaces for each Zephyr instance should be created in the host system. The default setup for creating network interface cannot be used here as that is for connecting one Zephyr instance to Linux host.

For Zephyr instance #1, create file called `zephyr1.conf` to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:11"
IPV6_ADDR_1="2001:db8:100::2"
IPV6_ROUTE_1="2001:db8:100::/64"
IPV4_ADDR_1="198.51.100.2/24"
IPV4_ROUTE_1="198.51.100.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

For Zephyr instance #2, create file called `zephyr2.conf` to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:22"
IPV6_ADDR_1="2001:db8:200::2"
IPV6_ROUTE_1="2001:db8:200::/64"
IPV4_ADDR_1="203.0.113.2/24"
IPV4_ROUTE_1="203.0.113.0/24"
```

(continues on next page)
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1

Step 2 - Create Ethernet interfaces
The following net-setup.sh commands should be typed in net-tools directory (cd net-tools).

In terminal #1, type:

./net-setup.sh -c zephyr1.conf -i zeth.1

In terminal #2, type:

./net-setup.sh -c zephyr2.conf -i zeth.2

Step 3 - Setup network bridging
In terminal #3, type:

sudo brctl addbr zeth-br
sudo brctl addif zeth-br zeth.1
sudo brctl addif zeth-br zeth.2
sudo ifconfig zeth-br up

Step 4 - Start Zephyr instances
In this example we start sockets-echo-server-sample and sockets-echo-client-sample applications. You can use other applications too as needed.

In terminal #4, if you are using QEMU, type this:

west build -d build/server -b qemu_x86 -t run \
    samples/net/sockets/echo_server -- \
    -DEXTRA_CONF_FILE=overlay-e1000.conf \
    -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
    -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
    -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
    -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
    -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
    -DCONFIG_ETH_QEMU_IFACE_NAME="zeth.1" \
    -DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:01"

or if you want to use native_posix board, type this:

west build -d build/server -b native_posix -t run \
    samples/net/sockets/echo_server -- \
    -DEXTRA_CONF_FILE=overlay-e1000.conf \
    -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
    -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
    -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
    -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
    -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
    -DCONFIG_ETH_NATIVE_POSIX_DRV_NAME="zeth.1" \
    -DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR="00:00:5e:00:53:01" \
    -DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n

In terminal #5, if you are using QEMU, type this:
Networking with QEMU and IEEE 802.15.4

### Basic Setup

- **Step 1 - Compile and start echo-server**
- **Step 2 - Compile and start echo-client**

This page describes how to set up a virtual network between two QEMUs that are connected together via UART and are running IEEE 802.15.4 link layer between them. Note that this only works in Linux host.

#### Basic Setup

For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with `echo-server` Zephyr sample application.
- Terminal #2 is terminal window with `echo-client` Zephyr sample application.

If you want to capture the transferred network data, you must compile the `monitor_15_4` program in `net-tools` directory.

Open a terminal window and type:

```
cd $ZEPHYR_BASE/../net-tools
make monitor_15_4
```

#### Step 1 - Compile and start echo-server

In terminal #1, type:

```
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -DEXTRA_CONF_FILE=overlay-qemu_802154.conf
west build -t server -d build/server
```

Also if you have firewall enabled in your host, you need to allow traffic between `zeth.1`, `zeth.2` and `zeth-br` interfaces.
If you want to capture the network traffic between the two QEMUs, type:

```
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -G Unix␣ → Makefiles -DEXTRA_CONF_FILE=overlay-qemu_802154.conf -DPCAP=.capture.pcap
west build -t server -d build/server
```

Note that the `make` must be used for `server` target if packet capture option is set in command line. The `build/server/capture.pcap` file will contain the transferred data.

**Step 2 - Compile and start echo-client**

In terminal #2, type:

```
wes build -b qemu_x86 -d build/client samples/net/sockets/echo_client -- -DEXTRA␣ → CONF_FILE=overlay-qemu_802154.conf
west build -t client -d build/client
```

You should see data passed between the two QEMUs. Exit QEMU by pressing CTRL+A x.

**Networking with Arm FVP User Mode**

- **Introduction**
- **Using Arm FVP User Mode Networking with Zephyr**
- **Limitations**

This page is intended to serve as a starting point for anyone interested in using Arm FVP user mode networking with Zephyr.

**Introduction**

User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running.

By default, Arm FVP uses the 172.20.51.0/24 network and runs a gateway at 172.20.51.254. This gateway also functions as a DHCP server for the GOS, allowing it to be automatically assigned with an IP address 172.20.51.1.

More details about Arm FVP user mode networking can be obtained from here: https://developer.arm.com/documentation/100964/latest/Introduction-to-Fast-Models/User-mode-networking

**Using Arm FVP User Mode Networking with Zephyr**

Arm FVP user mode networking can be enabled in any applications and it doesn't need any configurations on the host system. This feature has been enabled in DHCPv4 client sample. See Sample DHCPv4 client application

**Limitations**

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
• If setup fails, or the parameter syntax is incorrect, there is no error reporting.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

• QEMU using SLIP (Serial Line Internet Protocol).
  – Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See Networking with QEMU for details.

• QEMU using built-in Ethernet driver.
  – Here IP packets are exchanged between Zephyr and the host system via QEMU’s built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See Networking with QEMU Ethernet for details.

• QEMU using SLIRP (Qemu User Networking).
  – QEMU User Networking is implemented using “slirp”, which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See Networking with QEMU User for details.

• Arm FVP (User Mode Networking).
  – User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. See Networking with Arm FVP User Mode for details.

• native_posix board.
  – The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. An Ethernet driver exists in Zephyr for this purpose. See Networking with native_posix board for details.

• USB device networking.
  – Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See USB Device Networking for details.

• Connecting multiple Zephyr instances together.
  – If you have multiple Zephyr instances, either QEMU or native_posix ones, and want to create a connection between them, see Networking with multiple Zephyr instances for details.

• Simulating IEEE 802.15.4 network between two QEMUs.
  – Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See Networking with QEMU and IEEE 802.15.4 for details.

### 6.2.5 Monitor Network Traffic

- **Host Configuration**
- **Zephyr Configuration**
- **Wireshark Configuration**
It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture-sample sample application from the Zephyr source distribution for configuration options that need to be enabled.

Host Configuration

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
git clone https://github.com/zephyrproject-rtos/net-tools
```

The net-tools project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:

```bash
./net-setup.sh -c zeth-tunnel.conf
```

This script will create following IPIP tunnel interfaces:

<table>
<thead>
<tr>
<th>Interface name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zeth-ip6ip</td>
<td>IPv6-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip</td>
<td>IPv4-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip6</td>
<td>IPv4-over-IPv6 tunnel</td>
</tr>
<tr>
<td>zeth-ip6ip6</td>
<td>IPv6-over-IPv6 tunnel</td>
</tr>
</tbody>
</table>

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example net-capture.py script from net-tools project to print or save the captured network packets. The net-capture.py provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```bash
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
```

The net-capture.py has following command line options:

- `Listen captured network data from Zephyr and save it optionally to pcap file.

  ./.net-capture.py 
  -i | --interface <network interface>

(continues on next page)
Listen this interface for the data

[-p | --port <UDP port>]
UDP port (default is 4242) where the capture data is received

[-q | --quiet]
Do not print packet information

[-t | --type <L2 type of the data>]
Scapy L2 type name of the UDP payload, default is Ether

[-w | --write <pcap file name>]
Write the received data to file in PCAP format

Instead of the net-capture.py script, you can for example use netcat to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

nc -l -u 2001:db8:200::2 4242 > /dev/null

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

**Zephyr Configuration**

In this example, we use native_posix board. You can also use any other board that supports networking.

In terminal #3, type:

```
west build -b native_posix samples/net/capture -- -DCONFIG_NATIVE_UART_AUTOATTACH_=\n_DEFAULT_CMD="gnome-terminal -- screen %s"
```

To see the Zephyr console and shell, start Zephyr instance like this:

```
build/zephyr/zephyr.exe -attach_uart
```

Any other application can be used too, just make sure that suitable configuration options are enabled (see samples/net/capture/prj.conf file for examples).

The network capture can be configured automatically if needed, but currently the capture sample application does not do that. User has to use net-shell to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The net-shell has net capture setup command for doing that. The command syntax is

```
net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>
<remote> is the (outer) endpoint IP address
<local> is the (inner) local IP address
<peer> is the (inner) peer IP address
Local and Peer IP addresses can have UDP port number in them (optional)
like 198.0.51.2:9000 or [2001:db8:100::2]:4242
```

In Zephyr console, type:

```
net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2
```

This command will create the tunneling interface. The 192.0.2.2 is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The 2001:db8:200::1 tells the local IP address for the tunnel, the 2001:db8:200::2 is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunnel.
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998

and like this for IPv4-over-IPv4 tunnel

net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998

If the port number is omitted, then 4242 UDP port is used as a default.

The current monitoring configuration can be checked like this:

```
uart:~$ net capture
Network packet capture disabled
Device    Capture Tunnel
          iface   iface Local Peer
NET_CAPTURE0 -   1 [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

which will print the current configuration. As we have not yet enabled monitoring, the Capture iface is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The 2 tells the network interface which traffic we want to capture. In this example, the 2 is the native_posix board Ethernet interface. Note that we send the network traffic to the same interface that we are monitoring in this example. The monitoring system avoids to capture already captured network traffic as that would lead to recursion. You can use net iface command to see what network interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would cause recursion loop. The captured network traffic can be sent to some other network interface if configured so. Just set the <remote-ip-addr> option properly in net capture setup so that the IP tunnel is attached to desired network interface. The capture status can be checked again like this:

```
uart:~$ net capture
Network packet capture enabled
Device    Capture Tunnel
          iface   iface Local Peer
NET_CAPTURE0 2   1 [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

After enabling the monitoring, the system will send captured (either received or sent) network packets to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
net capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use net-shell for configuring the monitoring. The network capture API functions can be called by the application if needed.

**Wireshark Configuration**

The Wireshark tool can be used to monitor the captured network traffic in a useful way.

You can monitor either the tunnel interfaces or the zeth interface. In order to see the actual captured data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.
6.2.6 Networking APIs

Network APIs

BSD Sockets

- **Overview**
- **Secure Sockets**
  - TLS credentials subsystem
  - Secure Socket Creation
  - Secure Sockets options
- **Socket offloading**
  - Offloaded socket creation
  - Dealing with multiple offloaded interfaces
- **API Reference**
  - BSD Sockets
  - TLS Credentials

**Overview**  Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespace by default, to avoid name conflicts with well-known names like close(), which may be part of libc or other POSIX compatibility libraries. If enabled by CONFIG_NET_SOCKETS_POSIX_NAMES, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using CONFIG_NET_SOCKETS config option and implements the following operations: socket(), close(), recv(), recvfrom(), send(), sendto(), connect(), bind(), listen(), accept(), fcntl() (to set non-blocking mode), getsockopt(), setsockopt(), poll(), select(), getaddrinfo(), getnameinfo().

Based on the namespace requirements above, these operations are by default exposed as functions with zsock_ prefix, e.g. zsock_socket() and zsock_close(). If the config option CONFIG_NET_SOCKETS_POSIX_NAMES is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like close() and fcntl() (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like recv() and send() to actually process (receive or send) less data than requested by the user (on SOCK_STREAM type sockets). For example, a call recv(sock, 1000, 0) may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.
Secure Sockets  Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See net_ip_protocol_secure type for supported secure protocol versions.

To enable secure sockets, set the CONFIG_NET_SOCKETS_SOCKOPT_TLS option. To enable DTLS support, use CONFIG_NET_SOCKETS_ENABLE_DTLS option.

TLS credentials subsystem  TLS credentials must be registered in the system before they can be used with secure sockets. See tls_credential_add() for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type sec_tag_t, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- TLS_CREDENTIAL_CA_CERTIFICATE
- TLS_CREDENTIAL_SERVER_CERTIFICATE
- TLS_CREDENTIAL_PRIVATE_KEY
- TLS_CREDENTIAL_PSK
- TLS_CREDENTIAL_PSK_ID

An example registration of CA certificate (provided in ca_certificate array) looks like this:

```c
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE, ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

Secure Socket Creation  A secure socket can be created by specifying secure protocol type, for instance:

```c
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```c
sec_tag_t sec_tag_opt[] = {
    CA_CERTIFICATE_TAG,
};
ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST, sec_tag_opt, sizeof(sec_tag_opt));
char host[] = "google.com";
ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host));
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

Secure Sockets options  Secure sockets offer the following options for socket management:

```c

```
Defines

TLS_SEC_TAG_LIST
Socket option to select TLS credentials to use.
It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.

TLS_HOSTNAME
Write-only socket option to set hostname.
It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

TLS_CIPHERSUITE_LIST
Socket option to select ciphersuites to use.
It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).

TLS_CIPHERSUITE_USED
Read-only socket option to read a ciphersuite chosen during TLS handshake.
It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

TLS_PEER_VERIFY
Write-only socket option to set peer verification level for TLS connection.
This option accepts an integer with a peer verification level, compatible with mbedTLS values:
• 0 - none
• 1 - optional
• 2 - required
If not set, socket will use mbedTLS defaults (none for servers, required for clients).

TLS_DTLS_ROLE
Write-only socket option to set role for DTLS connection.
This option is irrelevant for TLS connections, as for them role is selected based on connect()/listen() usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:
• 0 - client
• 1 - server

TLS_ALPN_LIST
Socket option for setting the supported Application Layer Protocols.
It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

TLS_DTLS_HANDSHAKE_TIMEOUT_MIN
Socket option to set DTLS handshake timeout.
The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.
## TLS_DTLS_HANDSHAKE_TIMEOUT_MAX

**TLS_CERT_NOCOPY**

Socket option for preventing certificates from being copied to the mbedTLS heap if possible.

The option is only effective for DER certificates and is ignored for PEM certificates.

**TLS_NATIVE**

TLS socket option to use with offloading.

The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.

Note, that this option is only applicable if socket dispatcher is used (CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the first socket option set on a newly created socket. After that, the application may use SO_BINDTODEVICE to choose the dedicated network interface for the underlying TCP/UDP socket.

**TLS_SESSION_CACHE**

Socket option to control TLS session caching on a socket.

Accepted values:

- 0 - Disabled.
- 1 - Enabled.

**TLS_SESSION_CACHE_PURGE**

Write-only socket option to purge session cache immediately.

This option accepts any value.

**TLS_DTLS_CID**

Write-only socket option to control DTLS CID.

The option accepts an integer, indicating the setting. Accepted vaules for the option are: 0, 1 and 2. Effective when set before connecting to the socket.

- 0 - DTLS CID will be disabled.
- 1 - DTLS CID will be enabled, and a 0 length CID value to be sent to the peer.
- 2 - DTLS CID will be enabled, and the most recent value set with TLS_DTLS_CID_VALUE will be sent to the peer. Otherwise, a random value will be used.

**TLS_DTLS_CID_STATUS**

Read-only socket option to get DTLS CID status.

The option accepts a pointer to an integer, indicating the setting upon return. Returned vaules for the option are:

- 0 - DTLS CID is disabled.
- 1 - DTLS CID is received on the downlink.
- 2 - DTLS CID is sent to the uplink.
- 3 - DTLS CID is used in both directions.
TLS_DTLS_CID_VALUE
Socket option to set or get the value of the DTLS connection ID to be used for the DTLS session.
The option accepts a byte array, holding the CID value.

TLS_DTLS_PEER_CID_VALUE
Read-only socket option to get the value of the DTLS connection ID received from the peer.
The option accepts a pointer to a byte array, holding the CID value upon return. The optlen returned will be 0 if the peer did not provide a connection ID, otherwise will contain the length of the CID value.

Socket offloading  Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with `CONFIG_NET_SOCKETS_OFFLOAD` option. A network driver that wants to register a new socket implementation should use `NET_SOCKET_OFFLOAD_REGISTER` macro. The macro accepts the following parameters:

- **socket_name** - an arbitrary name for the socket implementation.
- **prio** - socket implementation priority, the higher priority is, the earlier particular implementation is processed when creating a new socket. Lower numeric value indicate higher priority.
- **_family** - socket family implemented by the offloaded socket. `AF_UNSPEC` indicate any family.
- **_is_supported** - a filtering function, used to verify whether particular socket family, type and protocol are supported by the offloaded socket implementation.
- **_handler** - a function compatible with `socket()` API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in `socket_op_vtable` struct.

The function registered for socket creation should allocate a new file descriptor using `z_reserve_fd()` function. Any additional actions, specific to the creation of a particular offloaded socket implementation should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with `z_finalize_fd()` function. The finalize function allows to register a `socket_op_vtable` structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with `net_if_socket_offload_set()` function. The function registers the function used to create an offloaded socket (the same as the one provided in `NET_SOCKET_OFFLOAD_REGISTER`) at the network interface.

**Offloaded socket creation**  When application creates a new socket with `socket()` function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as `AF_UNSPEC`), the corresponding `_is_supported` function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i.e. `_is_supported` returns true) will create a new socket with its `_handler` function.

The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create
a socket. Therefore it’s important to give the highest priority to the implementation that should be the system default.

The socket priority for native socket implementation is configured with Kconfig. Use CONFIG_NET_SOCKETS_TLS_PRIORITY to set the priority for the native TLS sockets. Use CONFIG_NET_SOCKETS_PRIORITY_DEFAULT to set the priority for the remaining native sockets.

Dealing with multiple offloaded interfaces As the socket() function does not allow to specify which network interface should be used by a socket, it’s not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use SO_BINDTODEVICE socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER Kconfig option.

When enabled, the application can specify the network interface to use with setsockopt() function:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_DGRAM, IPPROTO_UDP);

struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, TLS_NATIVE socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then be bound to a particular network interface:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);

int tls_native = 1;

/* The socket is "dispatched" to a native TLS socket implementation.
 * The underlying socket is a "dispatcher" socket now.
 */
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));

struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The underlying socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

In case no SO_BINDTODEVICE socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.
BSD Sockets

group bsd_sockets

BSD Sockets compatible API.

Defines

ZSOCK_POLLIN

zsock_poll: Poll for readability

ZSOCK_POLLPRI

zsock_poll: Compatibility value, ignored

ZSOCK_POLLOUT

zsock_poll: Poll for writability

ZSOCK_POLLERR

zsock_poll: Poll results in error condition (output value only)

ZSOCK_POLLPING

zsock_poll: Poll detected closed connection (output value only)

ZSOCK_POLLNVAL

zsock_poll: Invalid socket (output value only)

ZSOCK_MSG_PEEK

zsock_recv: Read data without removing it from socket input queue

ZSOCK_MSG_TRUNC

zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK_MSG_DONTWAIT

zsock_recv/zsock_send: Override operation to non-blocking

ZSOCK_MSG_WAITALL

zsock_recv: block until the full amount of data can be returned

ZSOCK_SHUT_RD

zsock_shutdown: Shut down for reading

ZSOCK_SHUT_WR

zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR

zsock_shutdown: Shut down for both reading and writing
SOL_TLS
  Protocol level for TLS.
  Here, the same socket protocol level for TLS as in Linux was used.

TLS_PEER_VERIFY_NONE
  Peer verification disabled.

TLS_PEER_VERIFY_OPTIONAL
  Peer verification optional.

TLS_PEER_VERIFY_REQUIRED
  Peer verification required.

TLS_DTLS_ROLE_CLIENT
  Client role in a DTLS session.

TLS_DTLS_ROLE_SERVER
  Server role in a DTLS session.

TLS_CERT_NOCOPY_NONE
  Cert duplicated in heap.

TLS_CERT_NOCOPY_OPTIONAL
  Cert not copied in heap if DER.

TLS_SESSION_CACHE_DISABLED
  Disable TLS session caching.

TLS_SESSION_CACHE_ENABLED
  Enable TLS session caching.

TLS_DTLS_CID_DISABLED

TLS_DTLS_CID_SUPPORTED

TLS_DTLS_CID_ENABLED

TLS_DTLS_CID_STATUS_DISABLED

TLS_DTLS_CID_STATUS_DOWNLINK

TLS_DTLS_CID_STATUS_UPLINK

TLS_DTLS_CID_STATUS_BIDIRECTIONAL

AI_PASSIVE
  Address for bind() (vs for connect())
**AI_CANONNAME**
Fill in ai_canonname.

**AI_NUMERICHOST**
Assume host address is in numeric notation, don’t DNS lookup.

**AI_V4MAPPED**
May return IPv4 mapped address for IPv6.

**AI_ALL**
May return both native IPv6 and mapped IPv4 address for IPv6.

**AI_ADDRCONFIG**
IPv4/IPv6 support depends on local system config.

**AI_NUMERICSERV**
Assume service (port) is numeric.

**NI_NUMERICHOST**
`zsock_getnameinfo()` : Resolve to numeric address.

**NI_NUMERICSERV**
`zsock_getnameinfo()` : Resolve to numeric port number.

**NI_NOFQDN**
`zsock_getnameinfo()` : Return only hostname instead of FQDN

**NI_NAMEREQD**
`zsock_getnameinfo()` : Dummy option for compatibility

**NI_DGRAM**
`zsock_getnameinfo()` : Dummy option for compatibility

**NI_MAXHOST**
`zsock_getnameinfo()` : Max supported hostname length

`pollfd`

`fcntl`

`addrinfo`

**POLLIN**
POSIX wrapper for `ZSOCK_POLLIN`.

**POLLOUT**
POSIX wrapper for `ZSOCK_POLLOUT`.

---

6.2. Networking 2101
POLLERR
    POSIX wrapper for \textit{ZSOCK\_POLLERR}.

POLLHUP
    POSIX wrapper for \textit{ZSOCK\_POLLHUP}.

POLLNVAL
    POSIX wrapper for \textit{ZSOCK\_POLLNVAL}.

MSG\_PEEK
    POSIX wrapper for \textit{ZSOCK\_MSG\_PEEK}.

MSG\_TRUNC
    POSIX wrapper for \textit{ZSOCK\_MSG\_TRUNC}.

MSG\_DONTWAIT
    POSIX wrapper for \textit{ZSOCK\_MSG\_DONTWAIT}.

MSG\_WAITALL
    POSIX wrapper for \textit{ZSOCK\_MSG\_WAITALL}.

SHUT\_RD
    POSIX wrapper for \textit{ZSOCK\_SHUT\_RD}.

SHUT\_WR
    POSIX wrapper for \textit{ZSOCK\_SHUT\_WR}.

SHUT\_RDWR
    POSIX wrapper for \textit{ZSOCK\_SHUT\_RDWR}.

EAI\_BADFLAGS
    POSIX wrapper for \textit{DNS\_EAI\_BADFLAGS}.

EAI\_NONAME
    POSIX wrapper for \textit{DNS\_EAI\_NONAME}.

EAI\_AGAIN
    POSIX wrapper for \textit{DNS\_EAI\_AGAIN}.

EAI\_FAIL
    POSIX wrapper for \textit{DNS\_EAI\_FAIL}.

EAI\_NODATA
    POSIX wrapper for \textit{DNS\_EAI\_NODATA}.

EAI\_MEMORY
    POSIX wrapper for \textit{DNS\_EAI\_MEMORY}.
EAI_SYSTEM
   POSIX wrapper for DNS_EAI_SYSTEM.

EAI_SERVICE
   POSIX wrapper for DNS_EAI_SERVICE.

EAI_SOCKTYPE
   POSIX wrapper for DNS_EAI_SOCKTYPE.

EAI_FAMILY
   POSIX wrapper for DNS_EAI_FAMILY.

IFNAMSIZ

SOL_SOCKET
   sockopt: Socket-level option

SO_DEBUG
   sockopt: Recording debugging information (ignored, for compatibility)

SO_REUSEADDR
   sockopt: address reuse (ignored, for compatibility)

SO_TYPE
   sockopt: Type of the socket

SO_ERROR
   sockopt: Async error (ignored, for compatibility)

SO_DONTROUTE
   sockopt: Bypass normal routing and send directly to host (ignored, for compatibility)

SO_BROADCAST
   sockopt: Transmission of broadcast messages is supported (ignored, for compatibility)

SO_SNDBUF
   sockopt: Size of socket socket send buffer (ignored, for compatibility)

SO_RCVBUF
   sockopt: Size of socket recv buffer

SO_KEEPALIVE
   sockopt: Enable sending keep-alive messages on connections (ignored, for compatibility)

SO_OOBINLINE
   sockopt: Place out-of-band data into receive stream (ignored, for compatibility)

SO_LINGER
   sockopt: Socket lingers on close (ignored, for compatibility)
SO_REUSEPORT
sockopt: Allow multiple sockets to reuse a single port (ignored, for compatibility)

SO_RCVLOWAT
sockopt: Receive low watermark (ignored, for compatibility)

SO_SNDLOWAT
sockopt: Send low watermark (ignored, for compatibility)

SO_RCVTIMEO
sockopt: Receive timeout Applies to receive functions like recv(), but not to connect()

SO_SNDBUF
sockopt: Send timeout

SO_BINDTODEVICE
sockopt: Bind a socket to an interface

SO_ACCEPTCONN
sockopt: Socket accepts incoming connections (ignored, for compatibility)

SO_TIMESTAMPING
sockopt: Timestamp TX packets

SO_PROTOCOL
sockopt: Protocol used with the socket

SO_DOMAIN
sockopt: Domain used with SOCKET (ignored, for compatibility)

TCP_NODELAY
End Socket options for SOL_SOCKET level.
sockopt: Disable TCP buffering (ignored, for compatibility)

IP_TOS
sockopt: Set or receive the Type-Of-Service value for an outgoing packet.

IPV6_V6ONLY
sockopt: Don't support IPv4 access (ignored, for compatibility)

IPV6_TCLASS
sockopt: Set or receive the traffic class value for an outgoing packet.

SO_PRIORITY
sockopt: Socket priority

SO_TXTIME
sockopt: Socket TX time (when the data should be sent)
SCM_TXTIME

SO_SOCKS5
    sockopt: Enable SOCKS5 for Socket

SOMAXCONN
    listen: The maximum backlog queue length (ignored, for compatibility)

ZSOCK_FD_SETSIZE
    Number of file descriptors which can be added to zsock_fd_set.

fd_set

FD_SETSIZE

zsock_timerval

Typedefs

typedef struct zsock_fd_set zsock_fd_set

Functions

void *zsock_get_context_object(int sock)
    Obtain a file descriptor's associated net context.

With CONFIG_USERSPACE enabled, the kernel's object permission system must apply to
socket file descriptors. When a socket is opened, by default only the caller has permission,
access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object
associated with a network socket file descriptor with '__net_socket'. All pointers to instances
of these will be known to the kernel as kernel objects with type K_OBJ_NET_SOCKET.

This API is intended for threads that need to grant access to the object associated with a
particular file descriptor to another thread. The returned pointer represents the underlying
K_OBJ_NET_SOCKET and may be passed to APIs like k_object_access_grant().

In a system like Linux which has the notion of threads running in processes in a shared vir-
tual address space, this sort of management is unnecessary as the scope of file descriptors is
implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to
implement a process-like model due to the lack of memory virtualization hardware. They use
discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access
its memory; the pointer can only be used to make permission assignment calls, which follow
exactly the rules for other kernel objects like device drivers and IPC.

Parameters

• sock – file descriptor
Returns

pointer to associated network socket object, or NULL if the file descriptor wasn’t
valid or the caller had no access permission

int zsock_socket(int family, int type, int proto)
Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as socket() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object associated with the returned file descriptor.

See also:

zsock_get_context_object()

int zsock_socketpair(int family, int type, int proto, int *sv)
Create an unnamed pair of connected sockets.

See POSIX.1-2017 article for normative description. This function is also exposed as socketpair() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_close(int sock)
Close a network socket.

Close a network socket. This function is also exposed as close() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX close() function).

int zsock_shutdown(int sock, int how)
Shutdown socket send/receive operations.

See POSIX.1-2017 article for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as shutdown() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
Bind a socket to a local network address.

See POSIX.1-2017 article for normative description. This function is also exposed as bind() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
Connect a socket to a peer network address.

See POSIX.1-2017 article for normative description. This function is also exposed as connect() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_listen(int sock, int backlog)
Set up a STREAM socket to accept peer connections.

See POSIX.1-2017 article for normative description. This function is also exposed as listen() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
Accept a connection on listening socket.

See POSIX.1-2017 article for normative description. This function is also exposed as accept() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as sendto() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)
    Send data to a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as send() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)
    Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as sendmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
    Receive data from an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as recvfrom() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)
    Receive data from a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as recv() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_ioctl(int sock, unsigned long request, va_list ap)
    Control underlying socket parameters.

See POSIX.1-2017 article for normative description. This function enables querying or manipulating underlying socket parameters. Currently supported @p request values include ZFD_IOCTL_FIONBIO, and ZFD_IOCTL_FIONREAD, to set non-blocking mode, and query the number of bytes available to read, respectively. This function is also exposed as ioctl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX ioctl() function).

int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)
    Efficiently poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is also exposed as poll() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX poll() function).

int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
    Get various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as getsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
    Set various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as setsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
Get peer name.
See POSIX.1-2017 article for normative description. This function is also exposed as getpeername() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
Get socket name.
See POSIX.1-2017 article for normative description. This function is also exposed as getsockname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_gethostname(char *buf, size_t len)
Get local host name.
See POSIX.1-2017 article for normative description. This function is also exposed as gethostname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline char *zsock_inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert network address from internal to numeric ASCII form.
See POSIX.1-2017 article for normative description. This function is also exposed as inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_inet_pton(sa_family_t family, const char *src, void *dst)
Convert network address from numeric ASCII form to internal representation.
See POSIX.1-2017 article for normative description. This function is also exposed as inet_pton() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
Resolve a domain name to one or more network addresses.
See POSIX.1-2017 article for normative description. This function is also exposed as getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void zsock_freeaddrinfo(struct zsock_addrinfo *ai)
Free results returned by zsock_getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

const char *zsock_gai_strerror(int errcode)
Convert zsock_getaddrinfo() error code to textual message.
See POSIX.1-2017 article for normative description. This function is also exposed as gai_strerror() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
Resolve a network address to a domain name or ASCII address.
See POSIX.1-2017 article for normative description. This function is also exposed as getnameinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int socket(int family, int type, int proto)
POSIX wrapper for zsock_socket.

static inline int socketpair(int family, int type, int proto, int sv[2])
POSIX wrapper for zsock_socketpair.

static inline int close(int sock)
POSIX wrapper for zsock_close.
static inline int shutdown(int sock, int how)
    POSIX wrapper for zsock_shutdown.
static inline int bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
    POSIX wrapper for zsock_bind.
static inline int connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
    POSIX wrapper for zsock_connect.
static inline int listen(int sock, int backlog)
    POSIX wrapper for zsock_listen.
static inline int accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_accept.
static inline ssize_t send(int sock, const void *buf, size_t len, int flags)
    POSIX wrapper for zsock_send.
static inline ssize_t recv(int sock, void *buf, size_t max_len, int flags)
    POSIX wrapper for zsock_recv.
static inline int zsock_fcntl_wrapper(int sock, int cmd, ...)
static inline int ioctl(int sock, unsigned long request, ...)
static inline ssize_t sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
    POSIX wrapper for zsock_sendto.
static inline ssize_t sendmsg(int sock, const struct msghdr *message, int flags)
    POSIX wrapper for zsock_sendmsg.
static inline ssize_t recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
    POSIX wrapper for zsock_recvfrom.
static inline int poll(struct zsock_pollfd *fds, int nfds, int timeout)
    POSIX wrapper for zsock_poll.
static inline int getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
    POSIX wrapper for zsock_getsockopt.
static inline int setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
    POSIX wrapper for zsock_setsockopt.
static inline int getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_getpeername.
static inline int getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_getsockname.
static inline int getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
    POSIX wrapper for zsock_getaddrinfo.
static inline void freeaddrinfo(struct zsock_addrinfo *ai)
    POSIX wrapper for zsock_freeaddrinfo.
static inline const char *gai_strerror(int errcode)
    POSIX wrapper for zsock_gai_strerror.
static inline int getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)

    POSIX wrapper for zsock_getnameinfo.

static inline int gethostname(char *buf, size_t len)

    POSIX wrapper for zsock_gethostname.

static inline int inet_pton(sa_family_t family, const char *src, void *dst)

    POSIX wrapper for zsock_inet_pton.

static inline char *inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)

    POSIX wrapper for zsock_inet_ntop.

int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)

    Legacy function to poll multiple sockets for events.

    See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as select() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX select() function).

void ZSOCK_FD_ZERO(zsock_fd_set *set)

    Initialize (clear) fd_set.

    See POSIX.1-2017 article for normative description. This function is also exposed as FD_ZERO() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)

    Check whether socket is a member of fd_set.

    See POSIX.1-2017 article for normative description. This function is also exposed as FD_ISSET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)

    Remove socket from fd_set.

    See POSIX.1-2017 article for normative description. This function is also exposed as FD_CLR() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_SET(int fd, zsock_fd_set *set)

    Add socket to fd_set.

    See POSIX.1-2017 article for normative description. This function is also exposed as FD_SET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)

static inline void FD_ZERO(zsock_fd_set *set)
static inline int FD_ISSET(int fd, zsock_fd_set *set)
static inline void FD_CLR(int fd, zsock_fd_set *set)
static inline void FD_SET(int fd, zsock_fd_set *set)

struct zsock_pollfd

    #include <socket.h>
struct zsock_addrinfo
#include <socket.h>

struct ifreq
#include <socket.h> Interface description structure.

struct zsock_fd_set
#include <socket_select.h>

TLS Credentials

group tls_credentials
TLS credentials management.

Typedefs

typedef int sec_tag_t
Secure tag, a reference to TLS credential.
Secure tag can be used to reference credential after it was registered in the system.

Note: Some TLS credentials come in pairs:
• TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
• TLS_CREDENTIAL_PSK with TLS_CREDENTIAL_PSK_ID. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.

 Enums

e num tls_credential_type
TLS credential types.
Values:

enumerator TLS_CREDENTIAL_NONE
Unspecified credential.

e num TLS_CREDENTIAL_CA_CERTIFICATE
A trusted CA certificate.
Use this to authenticate remote servers. Used with certificate-based ciphersuites.

e num TLS_CREDENTIAL_SERVER_CERTIFICATE
A public server certificate.
Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.
enumerator TLS_CREDENTIAL_PRIVATE_KEY
  
  Private key.
  
  Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

tls_credential_add

tls_credential_get

Functions

Add a TLS credential.

This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

Parameters

- tag – A security tag that credential will be referenced with.
- type – A TLS/DTLS credential type.
- cred – A TLS/DTLS credential.
- credlen – A TLS/DTLS credential length.

Return values

- 0 – TLS credential successfully added.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOMEM – Not enough memory to add new TLS credential.
- -EXIST – TLS credential of specific tag and type already exists.

Get a TLS credential.

This function gets an already registered TLS credential, referenced by tag secure tag of type.

Parameters

- tag – A security tag of requested credential.
- type – A TLS/DTLS credential type of requested credential.
- cred – A buffer for TLS/DTLS credential.
- credlen – A buffer size on input. TLS/DTLS credential length on output.

Return values

- 0 – TLS credential successfully obtained.
- -EACCES – Access to the TLS credential subsystem was denied.
- ENOENT – Requested TLS credential was not found.
- EFBIG – Requested TLS credential does not fit in the buffer provided.

```c
int tls_credential_delete(sec_tag_t tag, enum tls_credential_type type)
```

Delete a TLS credential.

This function removes a TLS credential, referenced by `tag` secure tag of `type`.

**Parameters**
- `tag` – A security tag corresponding to removed credential.
- `type` – A TLS/DTLS credential type of removed credential.

**Return values**
- 0 – TLS credential successfully deleted.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOENT – Requested TLS credential was not found.

### IPv4/IPv6 Primitives and Helpers

- **Overview**
- **API Reference**

**Overview**  
Miscellaneous defines and helper functions for IP addresses and IP protocols.

**API Reference**

**group ip_4_6**

IPv4/IPv6 primitives and helpers.

**Defines**

- `PF_UNSPEC`  
  Unspecified protocol family.
- `PF_INET`  
  IP protocol family version 4.
- `PF_INET6`  
  IP protocol family version 6.
- `PF_PACKET`  
  Packet family.
- `PF_CAN`  
  Controller Area Network.
- `PF_NET_MGMT`  
  Network management info.
PF_LOCAL
Inter-process communication

PF_UNIX
Inter-process communication

AF_UNSPEC
Unspecified address family.

AF_INET
IP protocol family version 4.

AF_INET6
IP protocol family version 6.

AF_PACKET
Packet family.

AF_CAN
Controller Area Network.

AF_NET_MGMT
Network management info.

AF_LOCAL
Inter-process communication

AF_UNIX
Inter-process communication

ntohs(x)
Convert 16-bit value from network to host byte order.

**Parameters**
- x – The network byte order value to convert.

**Returns**
Host byte order value.

ntohl(x)
Convert 32-bit value from network to host byte order.

**Parameters**
- x – The network byte order value to convert.

**Returns**
Host byte order value.

ntohll(x)
Convert 64-bit value from network to host byte order.

**Parameters**
- x – The network byte order value to convert.
Returns
Host byte order value.

htons(x)
Convert 16-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.

Returns
Network byte order value.

htonl(x)
Convert 32-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.

Returns
Network byte order value.

htonll(x)
Convert 64-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.

Returns
Network byte order value.

NET_IPV6_ADDR_SIZE

NET_IPV4_ADDR_SIZE

ALIGN_H(x)

ALIGN_D(x)

CMSG_FIRSTHDR(msghdr)

CMSG_NXTHDR(msghdr, cmsg)

CMSG_DATA(cmsg)

CMSG_SPACE(length)

CMSG_LEN(length)

INET_ADDRSTRLEN
Max length of the IPv4 address as a string.
Defined by POSIX.

INET6_ADDRSTRLEN
Max length of the IPv6 address as a string.
Takes into account possible mapped IPv4 addresses.
net_ipaddr_copy(dest, src)
Copy an IPv4 or IPv6 address.

**Parameters**
- `dest` – Destination IP address.
- `src` – Source IP address.

**Returns**
Destination address.

**Typedefs**

typedef unsigned short int sa_family_t
Socket address family type.

typedef size_t socklen_t
Length of a socket address.

** Enums**

enum net_ip_protocol
Protocol numbers from IANA/BSD.

*Values:*

enumerator IPPROTO_IP = 0
IP protocol (pseudo-val for `setsockopt()`)

enumerator IPPROTO_ICMP = 1
ICMP protocol

enumerator IPPROTO_IGMP = 2
IGMP protocol

enumerator IPPROTO_IPIP = 4
IPIP tunnels

enumerator IPPROTO_TCP = 6
TCP protocol

enumerator IPPROTO_UDP = 17
UDP protocol

enumerator IPPROTO_IPV6 = 41
IPv6 protocol

enumerator IPPROTO_ICMPV6 = 58
ICMPv6 protocol.
enumerator IPPROTO_RAW = 255
    RAW IP packets

enum net_ip_protocol_secure
    Protocol numbers for TLS protocols.
    
    Values:
    
    enumerator IPPROTO_TLS_1_0 = 256
        TLS 1.0 protocol.
    
    enumerator IPPROTO_TLS_1_1 = 257
        TLS 1.1 protocol.
    
    enumerator IPPROTO_TLS_1_2 = 258
        TLS 1.2 protocol.
    
    enumerator IPPROTO_DTLS_1_0 = 272
        DTLS 1.0 protocol.
    
    enumerator IPPROTO_DTLS_1_2 = 273
        DTLS 1.2 protocol.

enum net_sock_type
    Socket type.
    
    Values:
    
    enumerator SOCK_STREAM = 1
        Stream socket type
    
    enumerator SOCK_DGRAM
        Datagram socket type.
    
    enumerator SOCK_RAW
        RAW socket type

enum net_ip_mtu
    Values:
    
    enumerator NET_IPV6_MTU = 1280
        IPv6 MTU length.
        We must be able to receive this size IPv6 packet without fragmentation.
    
    enumerator NET_IPV4_MTU = 576
        IPv4 MTU length.
        We must be able to receive this size IPv4 packet without fragmentation.

6.2. Networking
enum net_priority
    Network packet priority settings described in IEEE 802.1Q Annex I.1.
    Values:
    enumerator NET_PRIORITY_BK = 1
        Background (lowest)
    enumerator NET_PRIORITY_BE = 0
        Best effort (default)
    enumerator NET_PRIORITY_EE = 2
        Excellent effort
    enumerator NET_PRIORITY_CA = 3
        Critical applications (highest)
    enumerator NET_PRIORITY_VI = 4
        Video, < 100 ms latency and jitter
    enumerator NET_PRIORITY_VO = 5
        Voice, < 10 ms latency and jitter
    enumerator NET_PRIORITY_IC = 6
        Internetwork control
    enumerator NET_PRIORITY_NC = 7
        Network control

enum net_addr_state
    What is the current state of the network address.
    Values:
    enumerator NET_ADDR_ANY_STATE = -1
        Default (invalid) address type.
    enumerator NET_ADDR_TENTATIVE = 0
        Tentative address
    enumerator NET_ADDR_PREFERRED
        Preferred address
    enumerator NET_ADDR_DEPRECATED
        Deprecated address

enum net_addr_type
    How the network address is assigned to network interface.
    Values:
enumerator NET_ADDR_ANY = 0
    Default value.
    This is not a valid value.

enumerator NET_ADDR_AUTOCONF
    Auto configured address.

enumerator NET_ADDR_DHCP
    Address is from DHCP.

enumerator NET_ADDR_MANUAL
    Manually set address.

enumerator NET_ADDR_OVERRIDABLE
    Manually set address which is overridable by DHCP.

Functions

static inline bool net_ipv6_is_addr_loopback(struct in6_addr *addr)
    Check if the IPv6 address is a loopback address (::1).

    Parameters
    • addr – IPv6 address

    Returns
    True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct in6_addr *addr)
    Check if the IPv6 address is a multicast address.

    Parameters
    • addr – IPv6 address

    Returns
    True if address is multicast address, False otherwise.

struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)
static inline bool net_ipv6_is_my_addr(struct in6_addr *addr)
    Check if IPv6 address is found in one of the network interfaces.

    Parameters
    • addr – IPv6 address

    Returns
    True if address was found, False otherwise.

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
static inline bool net_ipv6_is_my_maddr(struct in6_addr *maddr)
    Check if IPv6 multicast address is found in one of the network interfaces.

    Parameters
    • maddr – Multicast IPv6 address

6.2. Networking
Returns
True if address was found, False otherwise.

static inline bool net_ipv6_is_prefix(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)
Check if two IPv6 addresses are same when compared after prefix mask.

Parameters
• addr1 – First IPv6 address.
• addr2 – Second IPv6 address.
• length – Prefix length (max length is 128).

Returns
True if IPv6 prefixes are the same, False otherwise.

static inline bool net_ipv4_is_addr_loopback(const struct in_addr *addr)
Check if the IPv4 address is a loopback address (127.0.0.0/8).

Parameters
• addr – IPv4 address

Returns
True if address is a loopback address, False otherwise.

static inline bool net_ipv4_is_addr_unspecified(const struct in_addr *addr)
Check if the IPv4 address is unspecified (all bits zero)

Parameters
• addr – IPv4 address

Returns
True if the address is unspecified, false otherwise.

static inline bool net_ipv4_is_addr_mcast(const struct in_addr *addr)
Check if the IPv4 address is a multicast address.

Parameters
• addr – IPv4 address

Returns
True if address is multicast address, False otherwise.

static inline void net_ipv4_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv4 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.
static inline void net_ipv6_addr_copy_raw(uint8_t *dest, const uint8_t *src)
    Copy an IPv6 address raw buffer.

    Parameters
    • dest – Destination IP address.
    • src – Source IP address.

static inline bool net_ipv4_addr_cmp(const struct in_addr *addr1, const struct in_addr *addr2)
    Compare two IPv4 addresses.

    Parameters
    • addr1 – Pointer to IPv4 address.
    • addr2 – Pointer to IPv4 address.

    Returns
    True if the addresses are the same, false otherwise.

static inline bool net_ipv4_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
    Compare two raw IPv4 address buffers.

    Parameters
    • addr1 – Pointer to IPv4 address buffer.
    • addr2 – Pointer to IPv4 address buffer.

    Returns
    True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
    Compare two IPv6 addresses.

    Parameters
    • addr1 – Pointer to IPv6 address.
    • addr2 – Pointer to IPv6 address.

    Returns
    True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
    Compare two raw IPv6 address buffers.

    Parameters
    • addr1 – Pointer to IPv6 address buffer.
    • addr2 – Pointer to IPv6 address buffer.

    Returns
    True if the addresses are the same, false otherwise.

static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
    Check if the given IPv6 address is a link local address.

    Parameters
    • addr – A valid pointer on an IPv6 address

    Returns
    True if it is, false otherwise.
static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
Check if the given IPv6 address is a unique local address.

Parameters
• addr – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

const struct in6_addr *net_ipv6_unspecified_address(void)
Return pointer to any (all bits zeros) IPv6 address.

Returns
Any IPv6 address.

const struct in_addr *net_ipv4_unspecified_address(void)
Return pointer to any (all bits zeros) IPv4 address.

Returns
Any IPv4 address.

const struct in_addr *net_ipv4_broadcast_address(void)
Return pointer to broadcast (all bits ones) IPv4 address.

Returns
Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
Check if the given address belongs to same subnet that has been configured for the interface.

Parameters
• iface – A valid pointer on an interface
• addr – IPv4 address

Returns
True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address is a broadcast address.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address

Returns
True if address is a broadcast address, false otherwise.

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)
Check if the IPv4 address is assigned to any network interface in the system.

Parameters
• addr – A valid pointer on an IPv4 address

Returns
True if IPv4 address is found in one of the network interfaces, False otherwise.
static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)
Check if the IPv6 address is unspecified (all bits zero)

Parameters
• addr – IPv6 address.

Returns
True if the address is unspecified, false otherwise.

static inline bool net_ipv6_is_addr_solicited_node(const struct in6_addr *addr)
Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
• addr – IPv6 address.

Returns
True if the address is solicited node address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_scope(const struct in6_addr *addr, int scope)
Check if the IPv6 address is a given scope multicast address (FFyx::).

Parameters
• addr – IPv6 address
• scope – Scope to check

Returns
True if the address is in given scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_global(const struct in6_addr *addr)
Check if the IPv6 address is a global multicast address (FFxE::/16).

Parameters
• addr – IPv6 address.

Returns
True if the address is global multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface(const struct in6_addr *addr)
Check if the IPv6 address is an interface scope multicast address (FFx1::).

Parameters
• addr – IPv6 address.

Returns
True if the address is an interface scope multicast address, false otherwise.
static inline bool net_ipv6_is_addr_mcast_link(const struct in6_addr *addr)
    Check if the IPv6 address is a link local scope multicast address (FFx2::).

Parameters

• addr – IPv6 address.

Returns

True if the address is a link local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_mesh(const struct in6_addr *addr)
    Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

Parameters

• addr – IPv6 address.

Returns

True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)
    Check if the IPv6 address is a site scope multicast address (FFx5::).

Parameters

• addr – IPv6 address.

Returns

True if the address is a site scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)
    Check if the IPv6 address is an organization scope multicast address (FFx8::).

Parameters

• addr – IPv6 address.

Returns

True if the address is an organization scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)
    Check if the IPv6 address belongs to certain multicast group.

Parameters

• addr – IPv6 address.
• group – Group id IPv6 address, the values must be in network byte order

Returns

True if the IPv6 multicast address belongs to given multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)
    Check if the IPv6 address belongs to the all nodes multicast group.

Parameters

• addr – IPv6 address

Returns

True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)
    Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

Parameters

• addr – IPv6 address

Returns

True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise.
• addr – IPv6 address.

Returns
True if the address is a interface scope all nodes multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)
Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)
Create solicited node IPv6 multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
• src – IPv6 address.
• dst – IPv6 address.

static inline void net_ipv6_addr_create(struct in6_addr *addr, uint16_t addr0, uint16_t addr1, uint16_t addr2, uint16_t addr3, uint16_t addr4, uint16_t addr5, uint16_t addr6, uint16_t addr7)
Construct an IPv6 address from eight 16-bit words.

Parameters
• addr – IPv6 address
• addr0 – 16-bit word which is part of the address
• addr1 – 16-bit word which is part of the address
• addr2 – 16-bit word which is part of the address
• addr3 – 16-bit word which is part of the address
• addr4 – 16-bit word which is part of the address
• addr5 – 16-bit word which is part of the address
• addr6 – 16-bit word which is part of the address
• addr7 – 16-bit word which is part of the address

static inline void net_ipv6_addr_create_ll_allnodes_mcast(struct in6_addr *addr)
Create link local allnodes multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_ll_allrouters_mcast(struct in6_addr *addr)
Create link local allrouters multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_iid(struct in6_addr *addr, struct net_linkaddr *lladdr)
Create IPv6 address interface identifier.

Parameters
• `addr` – IPv6 address
• `lladdr` – Link local address

static inline bool net_ipv6_addr_based_on_ll(const struct `in6_addr` *addr, const struct `net_linkaddr` *lladdr)

Check if given address is based on link layer address.

**Returns**
True if it is, False otherwise

static inline struct `sockaddr_in6` *net_sin6(const struct `sockaddr` *addr)

Get `sockaddr_in6` from sockaddr.

This is a helper so that the code calling this function can be made shorter.

**Parameters**
• `addr` – Socket address

**Returns**
Pointer to IPv6 socket address

static inline struct `sockaddr_in` *net_sin(const struct `sockaddr` *addr)

Get `sockaddr_in` from sockaddr.

This is a helper so that the code calling this function can be made shorter.

**Parameters**
• `addr` – Socket address

**Returns**
Pointer to IPv4 socket address

static inline struct `sockaddr_in6_ptr` *net_sin6_ptr(const struct `sockaddr_ptr` *addr)

Get `sockaddr_in6_ptr` from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

**Parameters**
• `addr` – Socket address

**Returns**
Pointer to IPv6 socket address

static inline struct `sockaddr_in_ptr` *net_sin_ptr(const struct `sockaddr_ptr` *addr)

Get `sockaddr_in_ptr` from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

**Parameters**
• `addr` – Socket address

**Returns**
Pointer to IPv4 socket address

static inline struct `sockaddr_ll_ptr` *net_sll_ptr(const struct `sockaddr_ptr` *addr)

Get `sockaddr_ll_ptr` from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

**Parameters**
• `addr` – Socket address

**Returns**
Pointer to linklayer socket address
static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_can_ptr from sockaddr_ptr.
This is a helper so that the code needing this functionality can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to CAN socket address

int net_addr_pton(sa_family_t family, const char *src, void *dst)
Convert a string to IP address.

Note: This function doesn’t do precise error checking, do not use for untrusted strings.

Parameters
• family – IP address family (AF_INET or AF_INET6)
• src – IP address in a null terminated string
• dst – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr
  if family is AF_INET6

Returns
0 if ok, < 0 if error

char *net_addr_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert IP address to string form.

Parameters
• family – IP address family (AF_INET or AF_INET6)
• src – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr
  if family is AF_INET6
• dst – Buffer for IP address as a null terminated string
• size – Number of bytes available in the buffer

Returns
dst pointer if ok, NULL if error

bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)
Parse a string that contains either IPv4 or IPv6 address and optional port, and store the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42 [2001:db8::2] 2001:db::42 Note that the str_len parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in sockaddr is not modified.

Parameters
• str – String that contains the IP address.
• str_len – Length of the string to be parsed.
• addr – Pointer to user supplied struct sockaddr.

Returns
True if parsing could be done, false otherwise.
static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)

Compare TCP sequence numbers.

This function compares TCP sequence numbers, accounting for wraparound effects.

**Parameters**

- seq1 – First sequence number
- seq2 – Seconds sequence number

**Returns**

- < 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2

static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)

Check that one TCP sequence number is greater.

This is convenience function on top of `net_tcp_seq_cmp()`.

**Parameters**

- seq1 – First sequence number
- seq2 – Seconds sequence number

**Returns**

True if seq > seq2

int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)

Convert a string of hex values to array of bytes.

The syntax of the string is “ab:02:98:fa:42:01”

**Parameters**

- buf – Pointer to memory where the bytes are written.
- buf_len – Length of the memory area.
- src – String of bytes.

**Returns**

0 if ok, <0 if error

int net_tx_priority2tc(enum net_priority prio)

Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

**Parameters**

- prio – Network priority

**Returns**

Tx traffic class that handles that priority network traffic.

int net_rx_priority2tc(enum net_priority prio)

Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

**Parameters**

- prio – Network priority

**Returns**

Rx traffic class that handles that priority network traffic.

static inline enum net_priority net_vlan2priority(uint8_t priority)

Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

**Parameters**

- priority – Network VLAN priority
• priority – VLAN priority

**Returns**

Network priority

```c
static inline uint8_t net_priority2vlan(enum net_priority priority)
```

Convert network packet priority to network packet VLAN priority.

**Parameters**

• priority – Packet priority

**Returns**

VLAN priority (PCP)

```c
const char *net_family2str(sa_family_t family)
```

Return network address family value as a string.

This is only usable for debugging.

**Parameters**

• family – Network address family code

**Returns**

Network address family as a string, or NULL if family is unknown.

```c
struct in6_addr
    #include <net_ip.h> IPv6 address struct.

struct in_addr
    #include <net_ip.h> IPv4 address struct.

struct sockaddr_in6
    #include <net_ip.h> Socket address struct for IPv6.

struct sockaddr_in6_ptr
    #include <net_ip.h>

struct sockaddr_in
    #include <net_ip.h> Socket address struct for IPv4.

struct sockaddr_in_ptr
    #include <net_ip.h>

struct sockaddr_ll
    #include <net_ip.h> Socket address struct for packet socket.

struct sockaddr_ll_ptr
    #include <net_ip.h>

struct sockaddr_can_ptr
    #include <net_ip.h>

struct iovec
    #include <net_ip.h>
```
struct msghdr
    #include <net_ip.h>

struct cmsghdr
    #include <net_ip.h>

struct sockaddr
    #include <net_ip.h> Generic sockaddr struct.
    Must be cast to proper type.

struct net_tuple
    #include <net_ip.h> IPv6/IPv4 network connection tuple.

Public Members

struct net_addr *remote_addr
    IPv6/IPv4 remote address.

struct net_addr *local_addr
    IPv6/IPv4 local address

uint16_t remote_port
    UDP/TCP remote port

uint16_t local_port
    UDP/TCP local port

enum net_ip_protocol ip_proto
    IP protocol

DNS Resolve

- Overview
- Sample usage
- API Reference

Overview  The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME.

If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES Kconfig variable.

The multicast DNS (mDNS) client resolver support can be enabled by setting CONFIG_MDNS_RESOLVER Kconfig option. See IETF RFC6762 for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the CONFIG_LLMNR_RESOLVER Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: subsys/net/lib/dns/Kconfig. The DNS resolver API can be found at include/zephyr/net/dns_resolve.h.
Sample usage  See DNS resolve sample application for details.

API Reference

group dns_resolve
   DNS resolving library.

Defines

DNS_MAX_NAME_SIZE
   Max size of the resolved name.

Typedefs

typedef void (*dns_resolve_cb_t)(enum dns_resolve_status status, struct dns_addrinfo *info, void *user_data)
   DNS resolve callback.
   The DNS resolve callback is called after a successful DNS resolving. The resolver can call this
   callback multiple times, one for each resolved address.

   Param status
      The status of the query: DNS_EAI_INPROGRESS returned for each resolved address DNS_EAI_ALLDONE mark end of the resolving, info is set to NULL in this case DNS_EAI_CANCELED if the query was canceled manually or time-out happened DNS_EAI_FAIL if the name cannot be resolved by the server DNS_EAI_NODATA if there is no such name other values means that an error happened.

   Param info
      Query results are stored here.

   Param user_data
      The user data given in dns_resolve_name() call.

Enums

denum dns_query_type
   DNS query type enum.

   Values:

      enumerator DNS_QUERY_TYPE_A = 1
      IPv4 query.

      enumerator DNS_QUERY_TYPE_AAAA = 28
      IPv6 query.

enum dns_resolve_status
   Status values for the callback.

   Values:
enumerator DNS_EAI_BADFLAGS = -1
Invalid value for ai_flags field.

enumerator DNS_EAI_NONAME = -2
NAME or SERVICE is unknown.

enumerator DNS_EAI_AGAIN = -3
Temporary failure in name resolution.

enumerator DNS_EAI_FAIL = -4
Non-recoverable failure in name res.

enumerator DNS_EAI_NODATA = -5
No address associated with NAME.

enumerator DNS_EAI_FAMILY = -6
ai_family not supported

enumerator DNS_EAI_SOCKTYPE = -7
ai_socktype not supported

enumerator DNS_EAI_SERVICE = -8
SRV not supported for ai_socktype.

enumerator DNS_EAI_ADDRFAMILY = -9
Address family for NAME not supported.

enumerator DNS_EAI_MEMORY = -10
Memory allocation failure.

enumerator DNS_EAI_SYSTEM = -11
System error returned in errno.

enumerator DNS_EAI_OVERFLOW = -12
Argument buffer overflow.

enumerator DNS_EAI_INPROGRESS = -100
Processing request in progress.

enumerator DNS_EAI_CANCELED = -101
Request canceled.

enumerator DNS_EAI_NOTCANCELED = -102
Request not canceled.

enumerator DNS_EAI_ALLDONE = -103
All requests done.
enumerator DNS_EAI_IDN_ENCODE = -105
IDN encoding failed.

dense dns_resolve_context_state
Values:

enumerator DNS_RESOLVE_CONTEXT_ACTIVE
enumerator DNS_RESOLVE_CONTEXT_DEACTIVATING
enumerator DNS_RESOLVE_CONTEXT_INACTIVE

Functions

int dns_resolve_init(struct dns_resolve_context *ctx, const char *dns_servers_str[], const struct sockaddr *dns_servers_sa[])
Init DNS resolving context.
This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as struct sockaddr (or both). Note that the recommended way to resolve DNS names is to use the dns_get_addr_info() API. In that case user does not need to call dns_resolve_init() as the DNS servers are already setup by the system.

Parameters

• ctx – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.
• dns_servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:353
• dns_servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int dns_resolve_close(struct dns_resolve_context *ctx)
Close DNS resolving context.
This releases DNS resolving context and marks the context unusable. Caller must call the dns_resolve_init() again to make context usable.

Parameters

• ctx – DNS context

Returns
0 if ok, <0 if error.

int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[], const struct sockaddr *servers_sa[])
Reconfigure DNS resolving context.
Reconfigures DNS context with new server list.
Parameters

- **ctx** – DNS context
- **servers_str** – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4: 10.0.9.1 IPv4 + port: 10.0.9.1:53 IPv6: 2001:db8::22:42 IPv6 + port: [2001:db8::22:42]:5353
- **servers_sa** – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns

0 if ok, <0 if error.

```c
int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)
```

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

Parameters

- **ctx** – DNS context
- **dns_id** – DNS id of the pending query

Returns

0 if ok, <0 if error.

```c
int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char *query_name, enum dns_query_type query_type)
```

Cancel a pending DNS query using id, name and type.

This releases DNS resources used by a pending query.

Parameters

- **ctx** – DNS context
- **query_name** – Name of the resource we are trying to query (hostname)
- **query_type** – Type of the query (A or AAAA)

Returns

0 if ok, <0 if error.

```c
int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```

Resolve DNS name.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

Parameters

- **ctx** – DNS context
- **query** – What the caller wants to resolve.
- **type** – What kind of data the caller wants to get.
- **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**

0 if resolving was started ok, < 0 otherwise

```c
static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```

Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

**Parameters**

• **query** – What the caller wants to resolve.
• **type** – What kind of data the caller wants to get.
• **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**

0 if resolving was started ok, < 0 otherwise

```c
static inline int dns_cancel_addr_info(uint16_t dns_id)
```

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

**Parameters**

• **dns_id** – DNS id of the pending query

**Returns**

0 if ok, <0 if error.
struct dns_addrinfo
#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.

struct dns_resolve_context
#include <dns_resolve.h> DNS resolve context structure.

Public Members

struct sockaddr *dns_server
DNS server information.

struct net_context *net_ctx
Connection to the DNS server.

uint8_t *is_mdns
Is this server mDNS one.

uint8_t *is_llmnr
Is this server LLMNR one.

struct k_mutex *lock
Prevent concurrent access.

k_timeout_t buf_timeout
This timeout is also used when a buffer is required from the buffer pools.

enum dns_resolve_context_state *state
Is this context in use.

struct dns_pending_query
#include <dns_resolve.h> Result callbacks.
We have multiple callbacks here so that it is possible to do multiple queries at the same time.
Contents of this structure can be inspected and changed only when the lock is held.

Public Members

struct k_work_delayable timer
Timeout timer.

struct dns_resolve_context *ctx
Back pointer to ctx, needed in timeout handler.

dns_resolve_cb_t cb
Result callback.
A null value indicates the slot is not in use.
void *user_data
  User data.

k_timeout_t timeout
  TX timeout.

const char *query
  String containing the thing to resolve like www.example.com.
  This is set to a non-null value when the query is started, and is not used thereafter.
  If the query completed at a point where the work item was still pending the pointer
  is cleared to indicate that the query is complete, but release of the query slot will be
deferred until a request for a slot determines that the work item has been released.

enum dns_query_type query_type
  Query type.

uint16_t id
  DNS id of this query.

uint16_t query_hash
  Hash of the DNS name + query type we are querying.
  This hash is calculated so we can match the response that we are receiving. This is
  needed mainly for mDNS which is setting the DNS id to 0, which means that the id
  alone cannot be used to find correct pending query.

Network Management

- Overview
- Requesting a defined procedure
- Listening to network events
- Defining a network management procedure
- Signaling a network event
- API Reference

Overview  The Network Management APIs allow applications, as well as network layer code itself, to
call defined network routines at any level in the IP stack, or receive notifications on relevant network
events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or
Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at
build time for management routines that are not used. Distinct and statically defined APIs for net-
work management procedures are not used. Instead, defined procedure handlers are registered by
using a NET_MGMT_REGISTER_REQUEST_HANDLER macro. Procedure requests are done through a single
net_mgmt() API that invokes the registered handler for the corresponding request.

The current implementation is experimental and may change and improve in future releases.
Requesting a defined procedure  All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

Listening to network events  You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

Two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

**Warning:** Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function must check the event code (passed as an argument) against the specific network events it will handle, regardless of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(False positives can occur for events which have the same layer and layer code.)

An example follows.

```c
/*
 * Set of events to handle. 
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                     uint32_t mgmt_event,
                     struct net_if *iface)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    } else {
        /* Spurious (false positive) invocation. */
    }
}
```

(continues on next page)
void register_cb(void)
{
    net_mgmt_init_event_callback(&iface_callback, callback_handler,
        EVENT_IFACE_SET);
    net_mgmt_init_event_callback(&ipv4_callback, callback_handler,
        EVENT_IPV4_SET);
    net_mgmt_add_event_callback(&iface_callback);
    net_mgmt_add_event_callback(&ipv4_callback);
}

See include/zephyr/net/net_event.h for available generic core events that can be listened to.

Defining a network management procedure You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if L2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the include/zephyr/net/net_event.h header file. But in case of an L2 technology, let’s say Ethernet, these would be found in include/zephyr/net/ethernet.h

You define your handler modeled with this signature:

```c
static int your_handler(uint32_t mgmt_event, struct net_if *iface,
    void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```c
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```c
net_mgmt(<mgmt_request code>, ...);
```

Signaling a network event You can signal a specific network event using the net_mgmt_event_notify() function and provide the network event code. See include/zephyr/net/net_mgmt.h for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example include/zephyr/net/ieee802154_mgmt.h would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

API Reference

**group net_mgmt**

Network Management.

**Defines**

```c
net_mgmt(_mgmt_request, _iface, _data, _len)
NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)
NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)
```
Typedefs

typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net_if *iface, void *data, size_t len)

Signature which all Net MGMT request handler need to follow.

**Param mgmt_request**
The exact request value the handler is being called through

**Param iface**
A valid pointer on struct net_if if the request is meant to be tight to a network interface. NULL otherwise.

**Param data**
A valid pointer on a data understood by the handler. NULL otherwise.

**Param len**
Length in byte of the memory pointed by data.

typedef void (*net_mgmt_event_handler_t)(struct net_mgmt_event_callback *cb, uint32_t mgmt_event, struct net_if *iface)

Define the user's callback handler function signature.

**Param cb**
Original struct net_mgmt_event_callback owning this handler.

**Param mgmt_event**
The network event being notified.

**Param iface**
A pointer on a struct net_if to which the the event belongs to, if it's an event on an iface. NULL otherwise.

Functions

static inline void net_mgmt_init_event_callback(struct net_mgmt_event_callback *cb, net_mgmt_event_handler_t handler, uint32_t mgmt_event_mask)

Helper to initialize a struct net_mgmt_event_callback properly.

**Parameters**

- cb – A valid application's callback structure pointer.
- handler – A valid handler function pointer.
- mgmt_event_mask – A mask of relevant events for the handler

void net_mgmt_add_event_callback(struct net_mgmt_event_callback *cb)

Add a user callback.

**Parameters**

- cb – A valid pointer on user's callback to add.

void net_mgmt_del_event_callback(struct net_mgmt_event_callback *cb)

Delete a user callback.

**Parameters**

- cb – A valid pointer on user's callback to delete.
void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net_if *iface, const void *info, size_t length)

Used by the system to notify an event.

Note: info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

Parameters

• mgmt_event – The actual network event code to notify
• iface – a valid pointer on a struct net_if if only the event is based on an iface. NULL otherwise.
• info – a valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
• length – size of the data pointed by info pointer.

static inline void net_mgmt_event_notify(uint32_t mgmt_event, struct net_if *iface)

int net_mgmt_event_wait(uint32_t mgmt_event_mask, uint32_t *raised_event, struct net_if **iface, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask.

Parameters

• mgmt_event_mask – A mask of relevant events to wait on.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
• iface – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.
• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
• info_length – tells how long the info memory area is. Only valid if the info is not NULL.
• timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns

0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int net_mgmt_event_wait_on_iface(struct net_if *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask for a specific iface.

Parameters

• iface – a pointer on a valid network interface to listen event to
• mgmt_event_mask – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
• `info_length` – tells how long the info memory area is. Only valid if the info is not NULL.
• `timeout` – A timeout delay. `K_FOREVER` can be used to wait indefinitely.

**Returns**

0 on success, a negative error code otherwise. `-ETIMEDOUT` will be specifically returned if the timeout kick-in instead of an actual event.

```c
void net_mgmt_event_init(void)
```

Used by the core of the network stack to initialize the network event processing.

```c
struct net_event_ipv6_addr
#include <net_event.h> Network Management event information structure Used to pass information on network events like `NET_EVENT_IPV6_ADDR_ADD`, `NET_EVENT_IPV6_ADDR_DEL`, `NET_EVENT_IPV6_MADDR_ADD` and `NET_EVENT_IPV6_MADDR_DEL` when `CONFIG_NET_MGMT_EVENT_INFO` enabled and event generator pass the information.
```

```c
struct net_event_ipv6_nbr
#include <net_event.h> Network Management event information structure Used to pass information on network events like `NET_EVENT_IPV6_NBR_ADD` and `NET_EVENT_IPV6_NBR_DEL` when `CONFIG_NET_MGMT_EVENT_INFO` enabled and event generator pass the information.
```

**Note:** : `idx` will be `-1` in case of `NET_EVENT_IPV6_NBR_DEL` event.

```c
struct net_event_ipv6_route
#include <net_event.h> Network Management event information structure Used to pass information on network events like `NET_EVENT_IPV6_ROUTE_ADD` and `NET_EVENT_IPV6_ROUTE_DEL` when `CONFIG_NET_MGMT_EVENT_INFO` enabled and event generator pass the information.
```

```c
struct net_event_ipv6_prefix
#include <net_event.h> Network Management event information structure Used to pass information on network events like `NET_EVENT_IPV6_PREFIX_ADD` and `NET_EVENT_IPV6_PREFIX_DEL` when `CONFIG_NET_MGMT_EVENT_INFO` is enabled and event generator pass the information.
```

```c
struct net_mgmt_event_callback
#include <net_mgmt.h> Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.
```

**Public Members**

```c
sys_snodet node
```

Meant to be used internally, to insert the callback into a list.

So nobody should mess with it.

```c
net_mgmt_event_handler_t handler
```

Actual callback function being used to notify the owner.
struct k_sem *sync_call

Semaphore meant to be used internally for the synchronous net_mgmt_event_wait() function.

uint32_t event_mask

A mask of network events on which the above handler should be called in case those events come.

Note that only the command part is treated as a mask, matching one to several commands.
Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

uint32_t raised_event

Internal place holder when a synchronous event wait is successfully unlocked on a event.

union net_mgmt_event_callback.[anonymous] [anonymous]

A mask of network events on which the above handler should be called in case those events come.

Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

Network Statistics

- Overview
- API Reference

Overview  Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

By default, the system collects network statistics per network interface. This can be controlled by CONFIG_NET_STATISTICS_PER_INTERFACE option.

The CONFIG_NET_STATISTICS_USER_API option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See Network Management for details.

The CONFIG_NET_STATISTICS_ETHERNET option can be set to collect generic Ethernet statistics. If the CONFIG_NET_STATISTICS_ETHERNET_VENDOR option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the CONFIG_NET_SHELL option is set, then network shell can show statistics information with net stats command.

API Reference

group net_stats

Network statistics library.
Defines

`NET_TC_TX_STATS_COUNT`

`NET_TC_RX_STATS_COUNT`

Typedefs

typedef uint32_t net_stats_t
    Network statistics counter.

struct net_stats_bytes
    #include <net_stats.h> Number of bytes sent and received.

    Public Members

    `net_stats_t sent`
        Number of bytes sent.

    `net_stats_t received`
        Number of bytes received.

struct net_stats_pkts
    #include <net_stats.h> Number of network packets sent and received.

    Public Members

    `net_stats_t tx`
        Number of packets sent.

    `net_stats_t rx`
        Number of packets received.

struct net_stats_ip
    #include <net_stats.h> IP layer statistics.

    Public Members

    `net_stats_t recv`
        Number of received packets at the IP layer.

    `net_stats_t sent`
        Number of sent packets at the IP layer.
\texttt{net_stats_t} \texttt{forwarded} \\
Number of forwarded packets at the IP layer.

\texttt{net_stats_t} \texttt{drop} \\
Number of dropped packets at the IP layer.

\begin{verbatim}
struct net_stats_ip_errors
    #include <net_stats.h>  // IP layer error statistics.

    Public Members

    net_stats_t vhlerr \\
    Number of packets dropped due to wrong IP version or header length.

    net_stats_t hblenerr \\
    Number of packets dropped due to wrong IP length, high byte.

    net_stats_t lblenerr \\
    Number of packets dropped due to wrong IP length, low byte.

    net_stats_t fragerr \\
    Number of packets dropped because they were IP fragments.

    net_stats_t chkerr \\
    Number of packets dropped due to IP checksum errors.

    net_stats_t protoerr \\
    Number of packets dropped because they were neither ICMP, UDP nor TCP.
\end{verbatim}

\begin{verbatim}
struct net_stats_icmp
    #include <net_stats.h>  // ICMP statistics.

    Public Members

    net_stats_t recv \\
    Number of received ICMP packets.

    net_stats_t sent \\
    Number of sent ICMP packets.

    net_stats_t drop \\
    Number of dropped ICMP packets.

    net_stats_t typeerr \\
    Number of ICMP packets with a wrong type.
\end{verbatim}
net_stats_t chkerr
   Number of ICMP packets with a bad checksum.

struct net_stats_tcp
   #include <net_stats.h> TCP statistics.

   Public Members

   struct net_stats_bytes bytes
      Amount of received and sent TCP application data.

   net_stats_t resent
      Amount of retransmitted data.

   net_stats_t drop
      Number of dropped packets at the TCP layer.

   net_stats_t recv
      Number of received TCP segments.

   net_stats_t sent
      Number of sent TCP segments.

   net_stats_t seg_drop
      Number of dropped TCP segments.

   net_stats_t chkerr
      Number of TCP segments with a bad checksum.

   net_stats_t ackerr
      Number of received TCP segments with a bad ACK number.

   net_stats_t rsterr
      Number of received bad TCP RST (reset) segments.

   net_stats_t rst
      Number of received TCP RST (reset) segments.

   net_stats_t retransmit
      Number of retransmitted TCP segments.

   net_stats_t conndrop
      Number of dropped connection attempts because too few connections were available.

   net_stats_t connrst
      Number of connection attempts for closed ports, triggering a RST.

struct net_stats_udp
   #include <net_stats.h> UDP statistics.
Public Members

`net_stats_t drop`
Number of dropped UDP segments.

`net_stats_t recv`
Number of received UDP segments.

`net_stats_t sent`
Number of sent UDP segments.

`net_stats_t chkerr`
Number of UDP segments with a bad checksum.

```c
struct net_stats_ipv6_nd
#include <net_stats.h> IPv6 neighbor discovery statistics.
```

```c
struct net_stats_ipv6_mld
#include <net_stats.h> IPv6 multicast listener daemon statistics.
```

Public Members

```c
net_stats_t recv
Number of received IPv6 MLD queries.
```

```c
net_stats_t sent
Number of sent IPv6 MLD reports.
```

```c

    #include <net_stats.h> Ethernet checksum statistics.

struct net_stats_eth_hw_timestamp
    #include <net_stats.h> Ethernet hardware timestamp statistics.

struct net_stats_eth
    #include <net_stats.h> All Ethernet specific statistics.

struct net_stats_ppp
    #include <net_stats.h> All PPP specific statistics.

Public Members

    net_stats_t drop
        Number of received and dropped PPP frames.
Network Timeout

Overview  Zephyr’s network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (\texttt{INT32\_MAX}), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The net_timeout API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

Use  The simplest use of this API is:

1. Configure a network timeout using \texttt{net_timeout\_set()}.  
2. Use \texttt{net_timeout\_evaluate()} to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use \texttt{net_timeout\_evaluate()} again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use \texttt{net_timeout\_remaining()} to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.
The `net_timeout` contains a `sys_snode_t` that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use `net_timeout_evaluate()` on all instances to determine the next timeout event to occur.

`net_timeout_deadline()` may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

**API Reference**

group net_timeout

Network long timeout primitives and helpers.

**Defines**

`NET_TIMEOUT_MAX_VALUE`

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing “deadline” to “now” with enough “slop” to handle any observable latency due to “now” advancing past “deadline”.

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.

**Functions**

`void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)`

Configure a network timeout structure.

**Parameters**

- `timeout` – a pointer to the timeout state.
- `lifetime` – the duration of the timeout in seconds.
- `now` – the time at which the timeout started counting down, in milliseconds. This is generally a captured value of `k_uptime_get_32()`.

`int64_t net_timeout_deadline(const struct net_timeout *timeout, int64_t now)`

Return the 64-bit system time at which the timeout will complete.

**Note:** Correct behavior requires invocation of `net_timeout_evaluate()` at its specified intervals.

**Parameters**

- `timeout` – state a pointer to the timeout state, initialized by `net_timeout_set()` and maintained by `net_timeout_evaluate()`.
- `now` – the full-precision value of `k_uptime_get()` relative to which the deadline will be calculated.

**Returns**

the value of `k_uptime_get()` at which the timeout will expire.
```c
uint32_t net_timeout_remaining(const struct net_timeout *timeout, uint32_t now)
Calculate the remaining time to the timeout in whole seconds.

Note: This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

Note: Correct behavior requires invocation of `net_timeout_evaluate()` at its specified intervals.

Parameters

• timeout – a pointer to the timeout state
• now – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

Return values

• 0 – if the timeout has completed.
• positive – the remaining duration of the timeout, in seconds.
```

```c
uint32_t net_timeout_evaluate(struct net_timeout *timeout, uint32_t now)
Update state to reflect elapsed time and get new delay.
This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

Parameters

• timeout – a pointer to the timeout state
• now – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

Return values

• 0 – if the timeout has completed
• positive – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.
```

```c
#include <net_timeout.h>
Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

Public Members

```c
struct net_timeout

#include <net_timeout.h> Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

Public Members

```c
sys_snode_t node
Used to link multiple timeouts that share a common timer infrastructure.

For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.

Networking Context The net_context API is not meant for application use. Application should use BSD Sockets API instead.

6.2. Networking 2151
Promiscuous Mode

- Overview
- Sample usage
- API Reference

**Overview**  Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

**Sample usage**  First the promiscuous mode needs to be turned ON by the application like this:

```c
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for 
            "interface %p (%d)\n", iface, ret);
    }
}
```

If there is no error, then the application can start to wait for network data:

```c
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }
    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```c
ret = net_promisc_mode_off(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already disabled\n");
    } else {
        printf("Cannot disable promiscuous mode for 
            "interface %p (%d)\n", iface, ret);
    }
}
```

See net-promiscuous-mode-sample for a more comprehensive example.

**API Reference**
group promiscuous

Promiscuous mode support.

Functions

static inline struct net_pkt *net_promisc_mode_wait_data(k_timeout_t timeout)
Start to wait received network packets.

Parameters

• timeout – How long to wait before returning.

Returns

Received net_pkt, NULL if not received any packet.

static inline int net_promisc_mode_on(struct net_if *iface)
Enable promiscuous mode for a given network interface.

Parameters

• iface – Network interface

Returns

0 if ok, <0 if error

static inline int net_promisc_mode_off(struct net_if *iface)
Disable promiscuous mode for a given network interface.

Parameters

• iface – Network interface

Returns

0 if ok, <0 if error

Simple Network Time Protocol Library

Overview

The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4).
SNTP provides a way to synchronize clocks in computer networks.

API Reference

group sntp

Simple Network Time Protocol API.

Functions

int sntp_init(struct sntp_ctx *ctx, struct sockaddr *addr, socklen_t addr_len)
Initialize SNTP context.

Parameters

• ctx – Address of sntp context.
addr – IP address of NTP/SNTP server.
addr_len – IP address length of NTP/SNTP server.

Returns
0 if ok, <0 if error.

int sntp_query(struct sntp_ctx *ctx, uint32_t timeout, struct sntp_time *time)
Perform SNTP query.

Parameters
- ctx – Address of sntp context.
- timeout – Timeout of waiting for sntp response (in milliseconds).
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

void sntp_close(struct sntp_ctx *ctx)
Release SNTP context.

Parameters
- ctx – Address of sntp context.

int sntp_simple(const char *server, uint32_t timeout, struct sntp_time *time)
Convenience function to query SNTP in one-shot fashion.
Convenience wrapper which calls getaddrinfo(), sntp_init(), sntp_query(), and sntp_close().

Parameters
- server – Address of server in format addr[:port]
- timeout – Query timeout
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

struct sntp_ctx
#include <sntp.h> SNTP context.

Public Members

uint32_t expected_orig_ts
Timestamp when the request was sent from client to server.
This is used to check if the originated timestamp in the server reply matches the one in client request.

struct sntp_time
#include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970.
SOCKS5 Proxy Support

- **Overview**
- **SOCKS5 API**
- **SOCKS5 Proxy Usage in MQTT**

**Overview**  The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this SOCKS5 Wikipedia article for a detailed overview of how SOCKS5 works.

**SOCKS5 API**  The SOCKS5 support is enabled by `CONFIG_SOCKS` Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling `setsockopt()` like this:

```c
static int set_proxy(int sock, const struct sockaddr *proxy_addr,
                    socklen_t proxy_addrlen)
{
    int ret;

    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5, proxy_addr, proxy_addrlen);
    if (ret < 0) {
        return -errno;
    }

    return 0;
}
```

**SOCKS5 Proxy Usage in MQTT**  For MQTT client, there is `mqtt_client_set_proxy()` API that the application can call to setup SOCKS5 proxy. See `mqtt-publisher-sample` for usage example.

Trickle Timer Library

- **Overview**
- **API Reference**

The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

**API Reference**

```
group trickle
  Trickle algorithm library.
```
Typedefs

typedef void (*net_trickle_cb_t)(struct net_trickle *trickle, bool do_suppress, void *user_data)

Trickle timer callback.
The callback is called after Trickle timeout expires.

**Param trickle**
The trickle context to use.

**Param do_suppress**
Is TX allowed (true) or not (false).

**Param user_data**
The user data given in `net_trickle_start()` call.

Functions

int net_trickle_create(struct net_trickle *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)

Create a Trickle timer.

**Parameters**
- trickle – Pointer to Trickle struct.
- Imin – Imin configuration parameter in ms.
- Imax – Max number of doublings.
- k – Redundancy constant parameter. See RFC 6206 for details.

**Returns**
Return 0 if ok and <0 if error.

int net_trickle_start(struct net_trickle *trickle, net_trickle_cb_t cb, void *user_data)

Start a Trickle timer.

**Parameters**
- trickle – Pointer to Trickle struct.
- cb – User callback to call at time T within the current trickle interval
- user_data – User pointer that is passed to callback.

**Returns**
Return 0 if ok and <0 if error.

int net_trickle_stop(struct net_trickle *trickle)

Stop a Trickle timer.

**Parameters**
- trickle – Pointer to Trickle struct.

**Returns**
Return 0 if ok and <0 if error.

void net_trickle_consistency(struct net_trickle *trickle)

To be called by the protocol handler when it hears a consistent network transmission.

**Parameters**
- trickle – Pointer to Trickle struct.
void net_trickle_inconsistency(struct net_trickle *trickle)
To be called by the protocol handler when it hears an inconsistent network transmission.

Parameters
  • trickle – Pointer to Trickle struct.

static inline bool net_trickle_is_running(struct net_trickle *trickle)
Check if the Trickle timer is running or not.

Parameters
  • trickle – Pointer to Trickle struct.

Returns
  Return True if timer is running and False if not.

struct net_trickle
#include <trickle.h> The variable names are taken directly from RFC 6206 when applicable.
Note that the struct members should not be accessed directly but only via the Trickle API.

Public Members

uint32_t Imin
  Min interval size in ms.

uint8_t Imax
  Max number of doublings.

uint8_t k
  Redundancy constant.

uint32_t I
  Current interval size.

uint32_t Istart
  Start of the interval in ms.

uint8_t c
  Consistency counter.

uint32_t Imax_abs
  Max interval size in ms (not doublings)

net_trickle_cb_t cb
  Callback to be called when timer expires.

Websocket Client API

- Overview
- Websocket Transport
Overview The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this Websocket Wikipedia article for a detailed overview of how Websocket works.

For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.

Websocket Transport The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling `CONFIG_MQTT_LIB_WEBSOCKET` and `CONFIG_WEBSOCKET_CLIENT` Kconfig options.

First a socket needs to be created and connected to the Websocket server:

```c
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...
```

The Websocket transport socket is then created like this:

```c
ws_sock = websocket_connect(sock, &config, timeout, user_data);
```

The Websocket socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the `websocket_xxx()` API or normal BSD socket API functions can be used to send and receive application data.

```c
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len,
        WEBSOCKET_OPCODE_DATA_BINARY, true, true,
        K_FOREVER);
...
ret = send(ws_sock, buf_to_send, buf_len, 0);
```

If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the `websocket_send_msg()` must be used.

When done, the Websocket transport socket must be closed. User should handle the lifecycle(close/re-use) of tcp socket after `websocket_disconnect`.

```c
ret = close(ws_sock);
or
ret = websocket_disconnect(ws_sock);
```

API Reference

**group websocket**

Websocket API.

**Defines**

```c
WEB_SOCKET_FLAG_FINAL
Message type values.
Returned in `websocket_recv_msg()` Final frame
```
WEBSOCKET_FLAG_TEXT
Textual data

WEBSOCKET_FLAG_BINARY
Binary data

WEBSOCKET_FLAG_CLOSE
Closing connection.

WEBSOCKET_FLAG_PING
Ping message

WEBSOCKET_FLAG_PONG
Pong message

**Typedefs**

typedef int (*websocket_connect_cb_t)(int ws_sock, struct http_request *req, void *user_data)
Callback called after Websocket connection is established.

**Param ws_sock**
Websocket id

**Param req**
HTTP handshake request

**Param user_data**
A valid pointer on some user data or NULL

**Return**
0 if ok, <0 if there is an error and connection should be aborted

**Enums**

enum websocket_opcode

**Values:**

enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00

enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01

enumerator WEBSOCKET_OPCODE_DATA_BINARY = 0x02

enumerator WEBSOCKET_OPCODE_CLOSE = 0x08

enumerator WEBSOCKET_OPCODE_PING = 0x09

enumerator WEBSOCKET_OPCODE_PONG = 0x0A
Functions

```c
int websocket_connect(int http_sock, struct websocket_request *req, int32_t timeout, void *user_data)
```

Connect to a server that provides Websocket service.

The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

**Parameters**

- `http_sock` – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- `req` – Websocket request. User should allocate and fill the request data.
- `timeout` – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.
- `user_data` – User specified data that is passed to the callback.

**Returns**

Websocket id to be used when sending/receiving Websocket data.

```c
int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum websocket_opcode opcode, bool mask, bool final, int32_t timeout)
```

Send websocket msg to peer.

The function will automatically add websocket header to the message.

**Parameters**

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `payload` – Websocket data to send.
- `payload_len` – Length of the data to be sent.
- `opcode` – Operation code (text, binary, ping, pong, close)
- `mask` – Mask the data, see RFC 6455 for details
- `final` – Is this final message for this message send. If final == false, then the first message must have valid opcode and subsequent messages must have opcode WEBSOCKET_OPCODE_CONTINUE. If final == true and this is the only message, then opcode should have proper opcode (text or binary) set.
- `timeout` – How long to try to send the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

**Returns**

<0 if error, >=0 amount of bytes sent

```c
int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type, uint64_t *remaining, int32_t timeout)
```

Receive websocket msg from peer.

The function will automatically remove websocket header from the message.

**Parameters**

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `buf` – Buffer where websocket data is read.
- `buf_len` – Length of the data buffer.
- `message_type` – Type of the message.
• remaining – How much there is data left in the message after this read.
• timeout – How long to try to receive the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

Return values
• >=0 – amount of bytes received.
• -EAGAIN – on timeout.
• -ENOTCONN – on socket close.
• -errno – other negative errno value in case of failure.

int websocket_disconnect(int ws_sock)
Close websocket.
One must call websocket_connect() after this call to re-establish the connection.

Parameters
• ws_sock – Websocket id returned by websocket_connect().

static inline void websocket_init(void)

struct websocket_request
#include <websocket.h> Websocket client connection request.
This contains all the data that is needed when doing a Websocket connection request.

Public Members

const char *host
Host of the Websocket server when doing HTTP handshakes.

const char *url
URL of the Websocket.

http_header_cb_t optional_headers_cb
User supplied callback function to call when optional headers need to be sent.
This can be NULL, in which case the optional_headers field in http_request is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

const char **optional_headers
A NULL terminated list of any optional headers that should be added to the HTTP request.
May be NULL. If the optional_headers_cb is specified, then this field is ignored.

websocket_connect_cb_t cb
User supplied callback function to call when a connection is established.

const struct http_parser_settings *http_cb
User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake.
This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.
Network Packet Capture

Overview  The net_capture API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using net-shell or automatically by using the net_capture API.

Sample usage  See Network capture sample application and Monitor Network Traffic for details.

API Reference

group net_capture

Network packet capture support functions.

Functions

int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct device **dev)

Setup network packet capturing support.

Parameters

• remote_addr – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.

• my_local_addr – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.

• peer_addr – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.

• dev – Network capture device. This is returned to the caller.

Returns

0 if ok, <0 if network packet capture setup failed

static inline int net_capture_cleanup(const struct device *dev)

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

Parameters

• dev – Network capture device. User must allocate using the net_capture_setup() function.
Returns
0 if ok, <0 if network packet capture cleanup failed

static inline int net_capture_enable(const struct device *dev, struct net_if *iface)
Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured
network packets are placed in UDP packets that are sent to tunnel peer.

Parameters
• dev – Network capture device
• iface – Network interface we are starting to capture packets.

Returns
0 if ok, <0 if network packet capture enable failed

static inline bool net_capture_is_enabled(const struct device *dev)
Is network packet capture enabled or disabled.

Parameters
• dev – Network capture device

Returns
True if enabled, False if network capture is disabled.

static inline int net_capture_disable(const struct device *dev)
Disable network packet capturing support.

Parameters
• dev – Network capture device

Returns
0 if ok, <0 if network packet capture disable failed

static inline int net_capture_send(const struct device *dev, struct net_if *iface, struct net_pkt *pkt)
Send captured packet.

Parameters
• dev – Network capture device
• iface – Network interface the packet is being sent
• pkt – The network packet that is sent

Returns
0 if ok, <0 if network packet capture send failed

Network Buffer Management

Network Buffer

• Overview
• Creating buffers
• Common Operations
• Reference Counting
• API Reference
Overview  Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in include/zephyr/net/buf.h:

Creating buffers  Network buffers are created by first defining a pool of them:

```c
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```c
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as `net_buf_alloc()` gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```c
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through k_fifo kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a net_buffer may have a fragment chain attached to it, instead of using the `k_fifo_put()` and `k_fifo_get()` APIs, special `net_buf_put()` and `net_buf_get()` APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the `net_buf_slist_put()` and `net_buf_slist_get()` functions must be used instead of `sys_slist_append()` and `sys_slist_get()`.

Common Operations  The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it's good to understand the basic names of operations used with them:

Add  Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```c
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

Remove  Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```c
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

Push  Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data
pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```c
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
```

**Pull**

Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```c
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

**Reference Counting**

Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

**API Reference**

`group net_buf`

Network buffer library.

**Defines**

`NET_BUF_SIMPLE_DEFINE(_name, _size)`

Define a `net_buf_simple` stack variable.

This is a helper macro which is used to define a `net_buf_simple` object on the stack.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)`

Define a static `net_buf_simple` variable.

This is a helper macro which is used to define a static `net_buf_simple` object.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE(_size)`

Define a `net_buf_simple` stack variable and get a pointer to it.

This is a helper macro which is used to define a `net_buf_simple` object on the stack and the get a pointer to it as follows:
struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);

After creating the object it needs to be initialized by calling net_buf_simple_init().

Parameters

• _size – Maximum data storage for the buffer.

Returns

Pointer to stack-allocated net_buf_simple object.

NET_BUF_EXTERNAL_DATA

Flag indicating that the buffer’s associated data pointer, points to externally allocated memory. Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the net_buf API user. Such net_buf is exclusively instantiated via net_buf_alloc_with_data() function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the net_buf but no the data pointer in it.

NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)

Define a new pool for buffers using the heap for the data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using k_malloc, so CONFIG_HEAP_MEM_POOL_SIZE must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

• _name – Name of the pool variable.

• _count – Number of buffers in the pool.

• _ud_size – User data space to reserve per buffer.

• _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)

Define a new pool for buffers based on fixed-size data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters
• _name – Name of the pool variable.
• _count – Number of buffers in the pool.
• _data_size – Maximum data payload per buffer.
• _ud_size – User data space to reserve per buffer.
• _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _ud_size, _destroy)
Define a new pool for buffers with variable size payloads.

Defines a net_buf_POOL struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters
• _name – Name of the pool variable.
• _count – Number of buffers in the pool.
• _data_size – Total amount of memory available for data payloads.
• _ud_size – User data space to reserve per buffer.
• _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)
Define a new pool for buffers.

Defines a net_buf_POOL struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters
• _name – Name of the pool variable.
• _count – Number of buffers in the pool.
• _size – Maximum data size for each buffer.
• _ud_size – Amount of user data space to reserve.
• _destroy – Optional destroy callback when buffer is freed.

Typedefs

typedef struct net_buf *(*net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)
Network buffer allocator callback.

The allocator callback is called when net_buf_append_bytes needs to allocate a new net_buf.
**Param timeout**
Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Param user_data**
The user data given in net_buf_append_bytes call.

**Return**
pointer to allocated net_buf or NULL on error.

**Functions**

```c
static inline void net_buf_simple_init(struct net_buf_simple *buf, size_t reserve_head)

Initialize a net_buf_simple object.

This needs to be called after creating a net_buf_simple object using the NET_BUF_SIMPLE macro.

**Parameters**
- buf – Buffer to initialize.
- reserve_head – Headroom to reserve.
```

```c
void net_buf_simple_init_with_data(struct net_buf_simple *buf, void *data, size_t size)

Initialize a net_buf_simple object with data.

Initialized buffer object with external data.

**Parameters**
- buf – Buffer to initialize.
- data – External data pointer
- size – Amount of data the pointed data buffer if able to fit.
```

```c
static inline void net_buf_simple_reset(struct net_buf_simple *buf)

Reset buffer.

Reset buffer data so it can be reused for other purposes.

**Parameters**
- buf – Buffer to reset.
```

```c
void net_buf_simple_clone(const struct net_buf_simple *original, struct net_buf_simple *clone)

Clone buffer state, using the same data buffer.

Initializes a buffer to point to the same data as an existing buffer. Allows operations on the same data without altering the length and offset of the original.

**Parameters**
- original – Buffer to clone.
- clone – The new clone.
```

```c
void *net_buf_simple_add(struct net_buf_simple *buf, size_t len)

Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

**Parameters**
- buf – Buffer to update.
- len – Number of bytes to increment the length with.
```
Returns
The original tail of the buffer.

```c
void *net_buf_simple_add_mem(struct net_buf_simple *buf, const void *mem, size_t len)
```

Copy given number of bytes from memory to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters
- `buf` – Buffer to update.
- `mem` – Location of data to be added.
- `len` – Length of data to be added

Returns
The original tail of the buffer.

```c
uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)
```

Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters
- `buf` – Buffer to update.
- `val` – byte value to be added.

Returns
Pointer to the value added

```c
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```c
void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```c
void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
```

Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- `buf` – Buffer to update.
- `val` – 24-bit value to be added.
void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_be32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_le48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_be48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_le64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.
void net_buf_simple_add_be64(struct net_buf_simple *buf, uint64_t val)
    Add 64-bit value at the end of the buffer.
    Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 64-bit value to be added.

void *net_buf_simple_remove_mem(struct net_buf_simple *buf, size_t len)
    Remove data from the end of the buffer.
    Removes data from the end of the buffer by modifying the buffer length.

    Parameters
    • buf – Buffer to update.
    • len – Number of bytes to remove.

    Returns
    New end of the buffer data.

uint8_t net_buf_simple_remove_u8(struct net_buf_simple *buf)
    Remove a 8-bit value from the end of the buffer.
    Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 8-bit values.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    The 8-bit removed value

uint16_t net_buf_simple_remove_le16(struct net_buf_simple *buf)
    Remove and convert 16 bits from the end of the buffer.
    Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit little
    endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    16-bit value converted from little endian to host endian.

uint16_t net_buf_simple_remove_be16(struct net_buf_simple *buf)
    Remove and convert 16 bits from the end of the buffer.
    Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit big
    endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    16-bit value converted from big endian to host endian.

uint32_t net_buf_simple_remove_le24(struct net_buf_simple *buf)
    Remove and convert 24 bits from the end of the buffer.
    Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 24-bit little
    endian data.

    Parameters
• buf – A valid pointer on a buffer.

**Returns**
24-bit value converted from little endian to host endian.

```c
uint32_t net_buf_simple_remove_be24(struct net_buf_simple *buf)
```
Remove and convert 24 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 24-bit big endian data.

**Parameters**
• buf – A valid pointer on a buffer.

**Returns**
24-bit value converted from big endian to host endian.

```c
uint32_t net_buf_simple_remove_le32(struct net_buf_simple *buf)
```
Remove and convert 32 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 32-bit little endian data.

**Parameters**
• buf – A valid pointer on a buffer.

**Returns**
32-bit value converted from little endian to host endian.

```c
uint32_t net_buf_simple_remove_be32(struct net_buf_simple *buf)
```
Remove and convert 32 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 32-bit big endian data.

**Parameters**
• buf – A valid pointer on a buffer.

**Returns**
48-bit value converted from little endian to host endian.

```c
uint64_t net_buf_simple_remove_le48(struct net_buf_simple *buf)
```
Remove and convert 48 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 48-bit little endian data.

**Parameters**
• buf – A valid pointer on a buffer.

**Returns**
48-bit value converted from big endian to host endian.

```c
uint64_t net_buf_simple_remove_be48(struct net_buf_simple *buf)
```
Remove and convert 48 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 48-bit big endian data.

**Parameters**
• buf – A valid pointer on a buffer.
uint64_t net_buf_simple_remove_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

void *net_buf_simple_push(struct net_buf_simple *buf, size_t len)
Prepare data to be added to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

void *net_buf_simple_push_mem(struct net_buf_simple *buf, const void *mem, size_t len)
Copy given number of bytes from memory to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• mem – Location of data to be added.
• len – Length of data to be added.

Returns
The new beginning of the buffer data.

void net_buf_simple_push_le16(struct net_buf_simple *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.
void net_buf_simple_push_be16(struct net_buf_simple *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 16-bit value to be pushed to the buffer.

void net_buf_simple_push_u8(struct net_buf_simple *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 8-bit value to be pushed to the buffer.

void net_buf_simple_push_le24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_be24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_le32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_be32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_le48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 48-bit value to be pushed to the buffer.
void net_buf_simple_push_be48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_le64(struct net_buf_simple *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

void net_buf_simple_push_be64(struct net_buf_simple *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

void *net_buf_simple_pull(struct net_buf_simple *buf, size_t len)
Remove data from the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New beginning of the buffer data.

void *net_buf_simple_pull_mem(struct net_buf_simple *buf, size_t len)
Remove data from the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
Pointer to the old location of the buffer data.

uint8_t net_buf_simple_pull_u8(struct net_buf_simple *buf)
Remove a 8-bit value from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 8-bit values.
Parameters

- **buf** – A valid pointer on a buffer.

Returns

The 8-bit removed value

```c
uint16_t net_buf_simple_pull_le16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

```c
uint16_t net_buf_simple_pull_be16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

```c
uint32_t net_buf_simple_pull_le24(struct net_buf_simple *buf)
```

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 24-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

24-bit value converted from little endian to host endian.

```c
uint32_t net_buf_simple_pull_be24(struct net_buf_simple *buf)
```

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 24-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

24-bit value converted from big endian to host endian.

```c
uint32_t net_buf_simple_pull_le32(struct net_buf_simple *buf)
```

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 32-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

32-bit value converted from little endian to host endian.
uint32_t net_buf_simple_pull_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
   Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit big endian data.

   Parameters
   • buf – A valid pointer on a buffer.

   Returns
   32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
   Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit little endian data.

   Parameters
   • buf – A valid pointer on a buffer.

   Returns
   48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
   Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit big endian data.

   Parameters
   • buf – A valid pointer on a buffer.

   Returns
   48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
   Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit little endian data.

   Parameters
   • buf – A valid pointer on a buffer.

   Returns
   64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
   Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit big endian data.

   Parameters
   • buf – A valid pointer on a buffer.

   Returns
   64-bit value converted from big endian to host endian.

static inline uint8_t *net_buf_simple_tail(struct net_buf_simple *buf)
Get the tail pointer for a buffer.
   Get a pointer to the end of the data in a buffer.

   Parameters
   • buf – Buffer.
Returns
Tail pointer for the buffer.

size_t net_buf_simple_headroom(struct net_buf_simple *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer

Returns
Number of bytes available in the beginning of the buffer.

size_t net_buf_simple_tailroom(struct net_buf_simple *buf)
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

uint16_t net_buf_simple_max_len(struct net_buf_simple *buf)
Check maximum net_buf_simple::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes usable behind the net_buf_simple::data pointer.

static inline void net_buf_simple_save(struct net_buf_simple *buf, struct net_buf_simple_state *state)
Save the parsing state of a buffer.
Saves the parsing state of a buffer so it can be restored later.

Parameters
• buf – Buffer from which the state should be saved.
• state – Storage for the state.

static inline void net_buf_simple_restore(struct net_buf_simple *buf, struct net_buf_simple_state *state)
Restore the parsing state of a buffer.
Restores the parsing state of a buffer from a state previously stored by net_buf_simple_save().

Parameters
• buf – Buffer to which the state should be restored.
• state – Stored state.

struct net_buf_pool *net_buf_pool_get(int id)
Looks up a pool based on its ID.

Parameters
• id – Pool ID (e.g. from buf->pool_id).

Returns
Pointer to pool.
int net_buf_id(struct net_buf *buf)

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of meta-data contexts with the buffers of a pool.

Parameters

• buf – Network buffer.

Returns

Zero-based index for the buffer.

struct net_buf *net_buf_alloc_fixed(struct net_buf_pool *pool, k_timeout_t timeout)

Allocate a new fixed buffer from a pool.

Parameters

• pool – Which pool to allocate the buffer from.

• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

static inline struct net_buf *net_buf_alloc(struct net_buf_pool *pool, k_timeout_t timeout)

Parameters

• pool – Which pool to allocate the buffer from.

• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_len(struct net_buf_pool *pool, size_t size, k_timeout_t timeout)

Allocate a new variable length buffer from a pool.

Parameters

• pool – Which pool to allocate the buffer from.

• size – Amount of data the buffer must be able to fit.

• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size, k_timeout_t timeout)

Allocate a new buffer from a pool but with external data pointer.
Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

**Parameters**
- **pool** – Which pool to allocate the buffer from.
- **data** – External data pointer
- **size** – Amount of data the pointed data buffer if able to fit.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

**Returns**
- New buffer or NULL if out of buffers.

```c
struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)
```

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

**Parameters**
- **fifo** – Which FIFO to take the buffer from.
- **timeout** – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Returns**
- New buffer or NULL if the FIFO is empty.

```c
static inline void net_buf_destroy(struct net_buf *buf)
```

Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy callback is given to NET_BUF_POOL_*_DEFINE() then there is no need to use this API.

**Parameters**
- **buf** – Buffer to destroy.

```c
void net_buf_reset(struct net_buf *buf)
```

Reset buffer.

Reset buffer data and flags so it can be reused for other purposes.

**Parameters**
- **buf** – Buffer to reset.

```c
void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)
```

Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

**Parameters**
- **buf** – Buffer to initialize.
- **reserve** – How much headroom to reserve.

```c
void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)
```

Put a buffer into a list.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the list.
Parameters

- list – Which list to append the buffer to.
- buf – Buffer.

```c
struct net_buf *net_buf_slist_get(sys_slist_t *list)
```

Get a buffer from a list.

If the buffer had any fragments, these will automatically be recovered from the list as well and be placed to the buffer's fragment list.

Parameters

- list – Which list to take the buffer from.

Returns

New buffer or NULL if the FIFO is empty.

```c
void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)
```

Put a buffer to the end of a FIFO.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the FIFO.

Parameters

- fifo – Which FIFO to put the buffer to.
- buf – Buffer.

```c
void net_buf_unref(struct net_buf *buf)
```

Decrement the reference count of a buffer.

The buffer is put back into the pool if the reference count reaches zero.

Parameters

- buf – A valid pointer on a buffer

```c
struct net_buf *net_buf_ref(struct net_buf *buf)
```

Increment the reference count of a buffer.

Parameters

- buf – A valid pointer on a buffer

Returns

the buffer newly referenced

```c
struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)
```

Clone buffer.

Duplicate given buffer including any data and headers currently stored.

Parameters

- buf – A valid pointer on a buffer
  - timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns

Cloned buffer or NULL if out of buffers.

```c
static inline void *net_buf_user_data(const struct net_buf *buf)
```

Get a pointer to the user data of a buffer.

Parameters
• **buf** – A valid pointer on a buffer

**Returns**
Pointer to the user data of the buffer.

static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

**Parameters**
• **buf** – Buffer to initialize.
• **reserve** – How much headroom to reserve.

static inline void *net_buf_add(struct net_buf *buf, size_t len)
Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

**Parameters**
• **buf** – Buffer to update.
• **len** – Number of bytes to increment the length with.

**Returns**
The original tail of the buffer.

static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

**Parameters**
• **buf** – Buffer to update.
• **mem** – Location of data to be added.
• **len** – Length of data to be added

**Returns**
The original tail of the buffer.

static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

**Parameters**
• **buf** – Buffer to update.
• **val** – byte value to be added.

**Returns**
Pointer to the value added

static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
• **buf** – Buffer to update.
• **val** – 16-bit value to be added.
static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be added.

static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.
static inline void net_buf_add_be48(struct net_buf *buf, uint64_t val)
    Add 48-bit value at the end of the buffer.
    Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 48-bit value to be added.

static inline void net_buf_add_le64(struct net_buf *buf, uint64_t val)
    Add 64-bit value at the end of the buffer.
    Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 64-bit value to be added.

static inline void net_buf_add_be64(struct net_buf *buf, uint64_t val)
    Add 64-bit value at the end of the buffer.
    Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct net_buf *buf, size_t len)
    Remove data from the end of the buffer.
    Removes data from the end of the buffer by modifying the buffer length.

    Parameters
    • buf – Buffer to update.
    • len – Number of bytes to remove.

    Returns
    New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct net_buf *buf)
    Remove a 8-bit value from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 8-bit values.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct net_buf *buf)
    Remove and convert 16 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit little endian
    data.

    Parameters
    • buf – A valid pointer on a buffer.
Returns
16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.
static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

static inline void *net_buf_push(struct net_buf *buf, size_t len)
Prepare data to be added at the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.
static inline void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• mem – Location of data to be added.
• len – Length of data to be added.

Returns
The new beginning of the buffer data.

static inline void net_buf_push_u8(struct net_buf *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 8-bit value to be pushed to the buffer.

static inline void net_buf_push_le16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

static inline void net_buf_push_be16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

static inline void net_buf_push_le24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

static inline void net_buf_push_be24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.
static inline void net_buf_push_le32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_be32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_le48(struct net_buf *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_be48(struct net_buf *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_le64(struct net_buf *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.
Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 64-bit value to be pushed to the buffer.

static inline void net_buf_push_be64(struct net_buf *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.
Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 64-bit value to be pushed to the buffer.

static inline void *net_buf_pull(struct net_buf *buf, size_t len)
Remove data from the beginning of the buffer.
Removes data from the beginning of the buffer by modifying the data pointer and buffer length.
Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

Returns

New beginning of the buffer data.

```c
static inline void *net_buf_pull_mem(struct net_buf *buf, size_t len)
```

Removes data from the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

Returns

Pointer to the old beginning of the buffer data.

```c
static inline uint8_t net_buf_pull_u8(struct net_buf *buf)
```

Same idea as with `net_buf_pull()`, but a helper for operating on 8-bit values.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

The 8-bit removed value.

```c
static inline uint16_t net_buf_pull_le16(struct net_buf *buf)
```

Same idea as with `net_buf_pull()`, but a helper for operating on 16-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

```c
static inline uint16_t net_buf_pull_be16(struct net_buf *buf)
```

Same idea as with `net_buf_pull()`, but a helper for operating on 16-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

```c
static inline uint32_t net_buf_pull_le24(struct net_buf *buf)
```

Same idea as with `net_buf_pull()`, but a helper for operating on 24-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

24-bit value converted from little endian to host endian.
static inline uint32_t net_buf_pull_be24(struct net_buf *buf)
    Remove and convert 24 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 24-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_le32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_be32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer

    Returns
    32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer

    Returns
    48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer

    Returns
    48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le64(struct net_buf *buf)
    Remove and convert 64 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 64-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer

    Returns
    64-bit value converted from little endian to host endian.
static inline uint64_t net_buf_pull_be64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.

static inline size_t net_buf_tailroom(struct net_buf *buf)
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

static inline size_t net_buf_headroom(struct net_buf *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer

Returns
Number of bytes available in the beginning of the buffer.

static inline uint16_t net_buf_max_len(struct net_buf *buf)
Check maximum net_buf::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes usable behind the net_buf::data pointer.

static inline uint8_t *net_buf_tail(struct net_buf *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

Parameters
• buf – Buffer.

Returns
Tail pointer for the buffer.

struct net_buf *net_buf_frag_last(struct net_buf *frags)
Find the last fragment in the fragment list.

Returns
Pointer to last fragment in the list.

void net_buf_frag_insert(struct net_buf *parent, struct net_buf *frag)
Insert a new fragment to a chain of bufs.
Insert a new fragment into the buffer fragments list after the parent.
Note: This function takes ownership of the fragment reference so the caller is not required to unref.
Parameters

- **parent** – Parent buffer/fragment.
- **frag** – Fragment to insert.

```c
struct net_buf *net_buf_frag_add(struct net_buf *head, struct net_buf *frag)
```

Add a new fragment to the end of a chain of bufs.

Append a new fragment into the buffer fragments list.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters

- **head** – Head of the fragment chain.
- **frag** – Fragment to add.

Returns

New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

```c
struct net_buf *net_buf_frag_del(struct net_buf *parent, struct net_buf *frag)
```

Delete existing fragment from a chain of bufs.

Parameters

- **parent** – Parent buffer/fragment, or NULL if there is no parent.
- **frag** – Fragment to delete.

Returns

Pointer to the buffer following the fragment, or NULL if it had no further fragments.

```c
size_t net_buf_linearize(void *dst, size_t dst_len, struct net_buf *src, size_t offset, size_t len)
```

Copy bytes from net_buf chain starting at offset to linear buffer.

Copy (extract) `len` bytes from src net_buf chain, starting from `offset` in it, to a linear buffer `dst`. Return number of bytes actually copied, which may be less than requested, if net_buf chain doesn't have enough data, or destination buffer is too small.

Parameters

- **dst** – Destination buffer
- **dst_len** – Destination buffer length
- **src** – Source net_buf chain
- **offset** – Starting offset to copy from
- **len** – Number of bytes to copy

Returns

number of bytes actually copied

```c
size_t net_buf_append_bytes(struct net_buf *buf, size_t len, const void *value, k_timeout_t timeout, net_buf_allocator_cb allocate_cb, void *user_data)
```

Append data to a list of net_buf.

Append data to a net_buf. If there is not enough space in the net_buf then more net_buf will be added, unless there are no free net_buf and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

Parameters

- **buf** – Network buffer.
• len – Total length of input data
• value – Data to be added
• timeout – Timeout is passed to the net_buf allocator callback.
• allocate_cb – When a new net_buf is required, use this callback.
• user_data – A user data pointer to be supplied to the allocate_cb. This pointer is can be anything from a mem_pool or a net_pkt, the logic is left up to the allocate_cb function.

Returns
Length of data actually added. This may be less than input length if other timeout than K_FOREVER was used, and there were no free fragments in a pool to accommodate all data.

static inline struct net_buf *net_buf_skip(struct net_buf *buf, size_t len)
Skip N number of bytes in a net_buf.
Skip N number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the net_buf list.

Parameters
• buf – Network buffer.
• len – Total length of data to be skipped.

Returns
Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos is 0xffff otherwise.

static inline size_t net_buf_frags_len(struct net_buf *buf)
Calculate amount of bytes stored in fragments.
Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters
• buf – Buffer to start off with.

Returns
Number of bytes in the buffer and its fragments.

struct net_buf_simple
#include <buf.h> Simple network buffer representation.
This is a simpler variant of the net_buf object (in fact net_buf uses net_buf_simple internally). It doesn’t provide any kind of reference counting, user data, dynamic allocation, or in general the ability to pass through kernel objects such as FIFOs.
The main use of this is for scenarios where the meta-data of the normal net_buf isn’t needed and causes too much overhead. This could be e.g. when the buffer only needs to be allocated on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

Public Members

uint8_t *data
Pointer to the start of data in the buffer.
uint16_t len
   Length of the data behind the data pointer.
   To determine the max length, use net_buf_simple_max_len(), not size!

uint16_t size
   Amount of data that net_buf_simple::__buf can store.

struct net_buf_simple_state
   #include <buf.h> Parsing state of a buffer.
   This is used for temporarily storing the parsing state of a buffer while giving control of the
   parsing to a routine which we don’t control.

Public Members

uint16_t offset
   Offset of the data pointer from the beginning of the storage.

uint16_t len
   Length of data.

struct net_buf
   #include <buf.h> Network buffer representation.
   This struct is used to represent network buffers. Such buffers are normally defined through
   the NET_BUF_POOL_*_DEFINE() APIs and allocated using the net_buf_alloc() API.

Public Members

sys_snode_t node
   Allow placing the buffer into sys_slist_t.

struct net_buf *frags
   Fragments associated with this buffer.

uint8_t ref
   Reference count.

uint8_t flags
   Bit-field of buffer flags.

uint8_t pool_id
   Where the buffer should go when freed up.

uint8_t *data
   Pointer to the start of data in the buffer.
```c
uint16_t len
    Length of the data behind the data pointer.

uint16_t size
    Amount of data that this buffer can store.

uint8_t user_data[]
    System metadata for this buffer.
```

```c
struct net_buf_data_cb
    #include <buf.h>
```

```c
struct net_buf_data_alloc
    #include <buf.h>
```

```c
struct net_buf_pool
    #include <buf.h> Network buffer pool representation.
    This struct is used to represent a pool of network buffers.
```

**Public Members**

```c
struct k_lifo free
    LIFO to place the buffer into when free.

const uint16_t buf_count
    Number of buffers in pool.

uint16_t uninit_count
    Number of uninitialized buffers.

void (*const destroy)(struct net_buf *buf)
    Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc
    Data allocation handlers.
```

```c
struct net_buf_pool_fixed
    #include <buf.h>
```

**Packet Management**

- **Overview**
  - **Architectural notes**
- **Memory management**
  - **Allocation**
Overview  Network packets are the main data the networking stack manipulates. Such data is represented through the `net_pkt` structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called `net_pkt` in this document.

The data structure and the whole API around it are defined in include/zephyr/net/net_pkt.h.

Architectural notes  There are two network packets flows within the stack, TX for the transmission path, and RX for the reception one. In both paths, each `net_pkt` is written and read from the beginning to the end, or more specifically from the headers to the payload.

Memory management

Allocation  All `net_pkt` objects come from a pre-defined pool of struct `net_pkt`. Such pool is defined via

```
NET_PKT_SLAB_DEFINE(name, count)
```

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw `net_pkt` can be done through:

```
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw `net_pkt` is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the `net_pkt` and its buffer can be allocated at once:

```
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.

Buffer allocation  The `net_pkt` object does not define its own buffer, but instead uses an existing object for this: `net_buf`. (See Network Buffer for more information). However, it mostly hides the usage of such a buffer because `net_pkt` brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a `net_pkt` needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```
Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via `net_pkt_alloc_with_buffer()`. It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```c
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:

```c
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

```c
pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 800 bytes and no extra header space. But a:

```c
pkt = net_pkt_rx_alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 1514 bytes, the MTU + Ethernet header space.
